The population of KFUPM part-time graduate students during the period of 2001-2006 is shown in Table 8 while the plot of logarithmic project population (log P) against units of time (n) for KFUPM part-time graduate students is illustrated in Figure 4.

$\text{Log } P_t = 2.390935 \text{ (log of 246)}$

$b = 0.064$ *from the graph fig 1.4*

Substituting this value in to the geometrical model

Table 8. Population of KFUPM part-time graduate students during the period 2001-2006

Year	Interval = n	Population = P	log P
2001	1	246	2.390935
2002	2	229	2.359835
2003	3	286	2.456366
2004	4	345	2.537819
2005	5	456	2.658965
2006	6	440	2.643453

Figure 4. Plot of logarithmic project population (log P) against units of time (n) for KFUPM part-time graduate students

Population change Rate

$y = 0.064x + 2.2838$
$R^2 = 0.8932$
$\text{Log P}_{2010} = \text{Log P}_t + n\text{Log }(1 + r)$

$= 2.390935 + n\ 0.064$

Therefore

$\text{Log }(1 + r) = 0.064$

$1 + r = 10^{0.064}$ if $10^{0.064} = 1.158777$

Then

$1 + r = 1.158777$

$r = 1.158777 - 1 = 0.158777$ is the rate of increase in population of enrolled Part time graduate in KFUPM

The forecasted population can be obtained by putting in the above rate of population growth in the following formula: $P_{t+n} = P_t (1 + r)^n$

$P_{2010} = 246 * (1 + 0.158777)^{10} = 1073.826$

Hence, if all conditions remain the same, the forecasted population of part-time graduate student enrolment at KFUPM by 2010 will be 1074 students.

Extrapolating 2010 Enrollment of KFUPM Faculty and Staff

The population of KFUPM faculty and staff during the period of 2001-2005 is shown in Table 9 while the plot of logarithmic project population (log P) against units of time (n) for KFUPM faculty and staff is illustrated in Figure 5.

$\text{Log P}_{2005} = 3.345178$ (log of 2214)

$b = 0.0067$ *from the graph fig. 1.5*

Substituting this value in to the geometrical model

$\text{Log P}_{2010} = \text{Log P}_t + n\text{Log }(1 + r)$

$= 3.345178 + n\ 0.0067$

Therefore,

Table 9. Population of KFUPM faculty and staff during the period 2001-2005

Year	Interval = n	Total Number of staff Population Per Year	log P
2001	1	2089	3.319938
2002	2	2109	3.324077
2003	3	2177	3.337858
2004	4	2193	3.341039
2005	5	2214	3.345178

Figure 5. Plot of logarithmic project population (log P) against units of time (n) for KFUPM faculty and staff
Log $(1 + r) = 0.0067$

$1 + r = 10^{0.0067}$ if $10^{0.0067} = 1.015547$

Then

$1 + r = 1.158777$

$r = 1.158777 - 1 = 0.015547$ is the rate of increase in population of staff and faculty in KFUPM

The forecasted population can be obtained by putting in the above rate of population growth in the following formula: $P_{t+n} = P_t (1 + r)^n$

$P_{2010} = 2214 * (1 + 0.015547)^5 = 2391.541$

Hence, the forecasted population of faculty and staff members at KFUPM by 2010 if all conditions remain the same will be 2392 staff and faculty.

FORECASTING LEISURE AND RECREATION FACILITIES

The purpose of this analysis is to determine the sufficiency of existing spaces allocated to various leisure and recreation services at KFUPM in

Table 10. Summary of extrapolated population for all KFUPM work forces by 2010

SN	Type	Extrapolated Population
1	Graduate Students (GS)	435
2	Undergraduate Students (US)	6328
3	Part-Time Graduate Students (PTGS)	1074
4	Faculty and Staff (F/S)	2392

order to identify the needs and gaps. Multiplying the extrapolated population and the appropriate LOS (level of service requirements) can obtain the projected needs for each of the amenities and services. A summary of extrapolated population for all KFUPM work forces by 2010 is shown in Table 10.

Projected needs of KFUPM recreation spaces

The most applicable guideline was found in University Space Planning (Bareither & Schillinger, 1996). They introduced a method to calculate the needs for recreation space separately from instructional activity. They assume that 12.1 net ASF of recreation space should be provided for each undergraduate student and the same amount of space be made available for 25 percent of the graduate students, since they do not normally participate as intensively in recreation; also 12.1 ASF per person should be made available for 15 percent of the academic and non-academic staff.

- Recreation Spaces for Faculty/Staff
- Projected Recreation Spaces for faculty and staff = [15 percent SSOFF CAMPUS + RF/S] * 12.1 ASF Where 15 percent SSOFF CAMPUS = Staff Staying off Campus, and RF/S = Resident Faculty/Staff on campus
- Projected total staff population by 2010 = 2392

- In the year 2005, Resident Faculty/Staff on campus is equal to 891 while total Faculty/Staff population is equal to 2214

  Therefore,

- When the faculty and staff population will be 2392 in 2010; Faculty/Staff on campus is expected to be equal to 2392 * 891/2214 = 963

- For recreation space planning = 963 * 4 = 3852 where 4 is the average family size over the entire on campus residents

- Staff staying off campus = Projected total staff population - Projected Staff on campus = 2392 – 963 = 1429
  15 percent SSOFF CAMPUS = 0.15*1429 =214

- Projected Recreation Space for faculty/staff = [214 + 3852] * 12.1 ASF per person = 46198.6 GSF equal to 4570.5 M2 (Square Meters)

- Recreation Spaces for Students

- Projected Recreation Space for students = [TUG + TGS + 15 percent PTGS] * 12.1 ASF

- Projected Recreation Space for students = [6328+ 435 + 161] * 12.1 ASF per Person = 83780 GSF equal to 7783.2 M2 (Square Meters)

- Projected needs of KFUPM sport spaces

- Sport Spaces for Faculty/Staff

- Projected Sport Spaces for faculty and staff = [214 + 3852] * 4.9175 ASF = 19994.5 GSF equal to 1857.4 M2 (Square Meters)

- Student Athletic Outdoor space

- Projected Sport Spaces for students = [6328 + 435 + 161] * 4.9175 ASF = 34049 GSF equal to 3163.1 M2 (Square Meters)

Spatial Gap in Leisure and Recreation Facilities

A summary of space needs and gap for KFUPM leisure and recreation facilities are shown in Table 11.

It is seen that until 2010 space for student's leisure and recreation facilities will lack by 5805.9 sq. m. which should be provided in an urgent basis (see appendix for actions need to be taken by KFUPM administration and their corresponding costs).

PONDERING ALTERNATIVE IMPROVEMENT OPTIONS: A THOUGHT PROVOKE

Leisure and recreation facilities provide an avenue to develop healthy and social individuals as well as a strong community that has strong interactions among its component members. This paper suggests that the sport facilities available on campus for faculty, staff and students are adequate in terms of facilities and quantity. The quality, however, of these services requires improvement in regular

Table 11. Need-gap analysis of KFUPM leisure, recreation and sport facilities

Services	Students			Faculty & Staff		
	Current Space [m²]	Projected Space [m²]	Deficiency [m²]	Current Space [m²]	Projected Space [m²]	Deficiency [m²]
Leisure & Recreation	1,977.3	7,783.2	- *5805.9*	5358	4570.5*	Non
	22,815.3	3,163.1	Non	8569.5	1857.4*	Non

* Leisure, recreation and sport facilities for faculty and staff do not lack enough space but they extremely lack quality, organization, management and immense of unused and underutilized spaces

and proper maintenance (*preventive maintenance approach*). The recreation facilities for students, on the other hand, require major provision and improvement and seem to be lacking in both quantity and quality.

Some catering services and educational materials, sport newspapers and magazines and internet or TV stations outlets should be provided in these services and facilities. A new system of operation and management of the sport facilities should be introduced to allow maximum utilization of the services. Based on the qualitative assessment of current leisure, recreation and sport facilities following areas of improvement have been chalked out which need immediate attention and strategic planning for physical development,

1. There is need to upgrade facilities in the community centre to make it a central focus of leisure and recreation for the campus residents from both social and cultural point of views. The centre should be designed and equipped not only to serve kids, young and middle age peoples, but also to old aged members. Their needs should be considered and integrated in strategic plan and design;
2. There is a need for extended and well equipped walking and jogging trails in both student and faculty areas;
3. There is a significant lack of social areas for time-to-time interaction in the campus and being socialized and have some refreshing talks in order to get relief from hectic and stressful daily life. Within the campus some open space should be designed with greeneries, shading, barbeque facility and the like so the community would be able to spend quality time outside home;
4. There are very minimal park-like outdoor spaces in the academic area where faculties and students can get together during the break hours;
5. There is need for active-park in the student and faculty areas, including prospects of cof-

fee shops, fast food restaurants, shaded sitting arrangements, etc. in such parks, which will provide good platform for interaction and social activities;
6. From the community centre initiatives should be taken to arrange educational trips and sight-seeing visits to historic and important places in Saudi Arabia. This will broaden the horizon of knowledge and experience; and
7. There are prospects of introducing yearly inter-collegiate student competition in ways that brings the whole community together during the mid-semester break.

Table A1. Action plan for the selected viable alternatives for improving the leisure and recreation facilities at KFUPM

Service	Facility based improvements	Estimated cost of provision	Urgency level	Time Frame	HRD Based Improvements	Estimated cost of provision	Urgency level	Time Frame
Leisure and Recreation	Students recreation facilities need to be improved. Extra 6000 sq. m. needed space for students. More open space with greeneries and shades needs to be designed and developed for the community residents. Needs for extended and well equipped (e.g., waste bin, shaded sitting arrangements, etc.) walking and jogging trails	40,000,000 SR	Somewhat urgent	2010-2011	Appoint training staff on hospitality, leisure and recreation business. Appoint trained professional for management and maintenance of open spaces and arrange different recreational events there for the community residents of different gender and age groups	350,000 SR per year	Urgent	2009-2010
Sport	Improve in quality is needed i.e. proper and regular maintenance, self-educational programs, local cafeteria, etc.	-	Urgent	2009-2010	Introduce new system or review existing system of operation, maintenance and management for improved services. Appoint sport facilities coordinator responsible for the above functions	60,000 per year	Urgent	2009-2010

Chapter 39
Promoting Success in the Introduction of Health Information Systems

ABSTRACT

The significant number of publications describing unsuccessful cases in the introduction of health information systems makes it advisable to analyze the factors that may be contributing to such failures. However, the very notion of success is not equally assumed in all publications. Based in a literature review, the authors argue that the introduction of systems must be based in an eclectic combination of knowledge fields, adopting methodologies that strengthen the role of organizational culture and human resources in this project, as a whole. On the other hand, the authors argue that the introduction of systems should be oriented by a previously defined matrix of factors, against which the success can be measured.

1. INTRODUCTION

The success behind the Introduction of Information Systems (IIS) can be as important as the system itself. Notwithstanding its qualities, if a system is not successfully introduced it will not achieve its primary goal: enhancing the performance of a company. On the contrary, it may contribute to

the degradation of operations and become a risk factor in the business field.

Several reports of unsuccessful introduction of information systems cases in the health field (Ash, Marc, & Enrico, 2004; Avison & Young, 2007; Balka, 2003; Heeks, 2006), as well as our personal knowledge of a few cases, led us to the investigation and identification of the factors that should be explored in order to promote the success of IIS in this area. This analysis will contribute to

a wider investigation where we intend to develop a change management methodology for the introduction of health information systems.

Current organizational context is extremely dynamic, so the performance, the success and the very survival of organizations depend on their capacity to adapt themselves or even to take the lead in change. On the other hand, information systems assume a significant role in supporting the organizations business processes. This reality raises several questions. Will the organizations successfully rise up to this challenge? How effective will their answers be? Have the existent theories and models revealed themselves effective for the Introduction of Information Systems in organizations? If so, can they be improved? These are some of the questions that frame this investigation.

In this investigation, the term "Introduction of Systems" does not refer only to the entry of the system but also, in a wider sense, to the complete development of an information system, with all tangible and intangible effects associated with the information system introduction or change.

In the following sections we analyze different areas that frame the development of these systems and different risk factors associated with the IIS, we highlight the role of change management in the promotion of success in information systems and the importance of human resource management in this process, we identify some of the references that should be considered in the promotion of successful IIS, we discuss the criteria that should be observed when measuring success and, finally, we list a few conclusions.

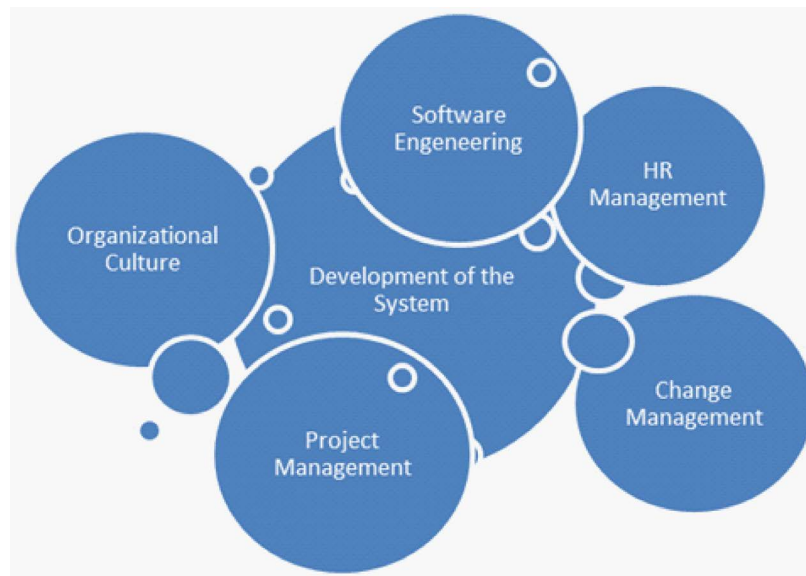
2. THE NATURE OF SYSTEMS DEVELOPMENT

The available literature reports several unsuccessful cases in the introduction of health information systems (Avison & Young, 2007; Day, 2007; Heeks, 2006). This lack of success is mainly explained by a development process lag between the final organization and the organization for which the system was developed. This lag stems primarily from social and human questions that do not receive the appropriate consideration (Brooke & Maguire, 1998).

The development of systems is generally approached as a technological question. However, the body of literature reveals another perspective, according to which information systems should be primarily regarded as social systems (Kukafka, 2003; Ryan, 2010). The influence of this interpretative perspective in practice has been growing. This work intends to follow and deepen this perspective. If information systems are more than a decision-making support tool and if the projects go beyond the applications of the system development cycle described in manuals, then technicians need to understand a whole new set of questions, mainly social and organizational questions.

Figure 1 depicts a set of fields, without assuming an exhaustive character, and reveals that the development of systems, even in a relatively static situation, is a complex area. But considering that most organizations work in dynamic environments, the degree of complexity is significantly higher.

Methodologies for the development of information systems are mainly focused in a subset of organizational problems. Stuart Maguire (2000) proposes a higher alignment between technologies and the business area of the organizations where these technologies are being introduced. The author underlines the distinction between a simple implementation, with a more technological nature, and the introduction of a system with a higher social inclination, where all organizational process-induced changes are taken into consideration. In the present article, as was previously mentioned, we will pursue the latter perspective. Historically, Information System developers tried to reduce the complexity of this organizational

Figure 1. Areas that influence system development


change, mainly focusing in the technical questions that the process involved.

The development of systems is a complex process, with numerous opportunities for things to take the wrong turn (Agrawal, 2010; Yeo, 2002). Methodologies are necessary in order to control the complexity of the process, conferring discipline to the information system development process (Maguire, 2000).

The adoption of generally accepted methodologies in the development of systems does not guarantee the successful implementation of information systems. Traditional methodologies still have weaknesses and fields in need of improvement (Koh & Maguire, 2009; Laudon & Laudon, 2010).

3. RISK FACTORS IN THE INTRODUCTION OF SYSTEMS

Many information systems are introduced believing in a premise of immediate success. This assumption leads to the neglect of risk management measures that could minimize the consequences of possible failures. Organizations seek a successful system implementation while performing their normal business activity. However, new systems are not introduced from zero, they are introduced in organizations that hold a certain degree of complexity and in that sense they imply risks that should be analyzed a priori, so that a business continuity plan can be prepared.

Business impact analysis should identify revenue loss; customer loss; business credibility loss; and the capacity for recovery. The organization should consider all the options that could minimize part of the risk attached to the introduction of a new system. Organizations should be prepared to absorb the effects of an unsuccessful system introduction in their business. Risk planning should involve the identification of risk factors, the evaluation of business impacts and the provision of a business continuity plan. However, it would be wrong to assume that predicting a risk guarantees its control. Some authors consider that a successful system introduction is as important as the system itself (Kolltveit, Hennestad, & Grønhaug, 2007; Kwon & Zmud, 1987).

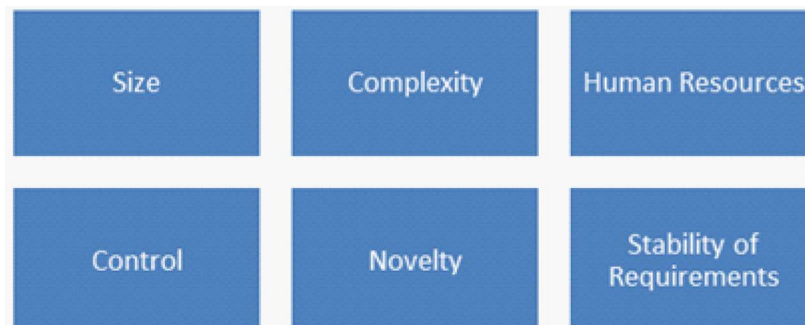
The introduction of systems should be based in methodologies that fit each situation. One of the downsides of adopting an external IIS support methodology is the time spent in human resource training and full comprehension of the system, and the methodology can ultimately not be appropriate to the organizational culture. Some authors describe risk management as the ability to foresee what might go wrong in a project (Hoffer, George, & Valacich, 2004). According to these authors, big projects hold higher risks than small projects. One other factor that should be considered in risk analysis is the definition of the requirements. A system where requirement compliance is easy and highly structured is less risky than a system with confusing, poorly structured and subjective requisites. The maturity of the technology supporting the project can equally condition the risk. The development of a system based in a mature technology is less risky than one based in a recent, non-standardized technology. The involvement of potential users in the system development process contributes to decrease the risk of failure.

The specific business area and organizational culture of each organization should be equally and deeply analyzed, so that the adoption of measures and methodologies fits that reality. The introduction of health systems has been the object of several case studies that can be used as a reference for future interventions (Ash, Chin, Sittig, & Dykstra, 2005; Phansalkar, Weir, Morris, & Warner, 2008; Waring & Wainwright, 2002).

Ward and Peppard (2002) identified six general categories (Figure 2) that frame possible risks faced by a project. The magnitude of the impact from the risks in each category depends on the nature of the developed/implemented system.

Groundbreaking approaches are considered necessary by several authors for the implementation of health Information Systems. There are several unsuccessful cases in the introduction of new systems, but very few of them are actually thoroughly studied in order to establish what went wrong. The few cases that are subjected to post-implementation audits are analyzed through a technological point of view only, when significant problems are essentially organizational and political (Waring & Wainwright, 2002). Most problems stem from insufficiencies in the new system modeling, from cultural conflicts between departments and from the interaction between internal or external project teams.

The introduction of information systems is based in the analysis of requirements that are afterwards translated into an agreement between the client and the system supplier entity. However, those requirements remain stagnated in time while the environment and the needs of the client organization evolve. The initial premise of an information system project should be the likelihood of change (Maguire, 2004). In this sense, methodologies should offer the necessary flexibility to accommodate possible changes. If there is one thing certain in the development of

Figure 2. Risk categories (adapted from Ward & Peppard, 2002)


systems is that changes will be necessary. Whether these changes refer to a line of code or a complete system remodeling is a question of scale.

Contemplating these perspectives while introducing the systems can contribute to the process enhancement. But in all likelihood, this will remain an inaccurate science.

4. CHANGE MANAGEMENT

The line of thought concerning change management in the introduction of technologies is based in planned approaches (Teixeira & Rocha, 2009), following Kurt Lewin's works (1951). In practice, however, this assumes a more reactive character than the one initially planned. This reactive character plays a preponderant role in what are known as the emerging change management methodologies (Cameron & Green, 2004). Generally, and despite being planned according to different stages, changes are influenced by internal and external organizational dynamics. Uncertainty and ever-changing organizational rules ultimately condition the outlined change plan and imply substantial adjustments that favor the discrepancy between the predicted plan and change operationalization.

One of the significant influences in the effectiveness of the change process is the interdependent relationship established between three dimensions (Orlikowski & Hofman, 1997): technology, organizational context (culture, structure, roles and responsibilities), and the adopted change model. The ideal interaction between these three dimensions (Figure 3) should be compatible, or at least not contradictory.

Let us consider the relationship between the change model and the adopted technology. If the technology is closed and does not allow any customization from users, the adopted change model will be relatively stiff and traditional. Similarly, if the technology is dominated and its impacts well understood, a traditionally planned change implementation will be advisable. How-

ever, if the technology is new and the experience with it very small, or if it is opened and customizable for users, a model with a higher improvisation and adaptation capacity, that offers the necessary flexibility to the organization during the adaptation and learning process, is advisable.

The relationship between the change model and the organizational context is equally significant. A flexible change model will likely be inadequate in organizations with an extremely stiff and/or bureaucratic structure. But it will possibly be advisable in organizations with a more informal character or a more cooperative culture.

Finally, lets us focus on the relationship between the technology and the organizational context. The adoption of a certain technology should suit and adapt itself to the model and the organizational structure, in order to enhance the success of the organization. Thus, there should be a strong alignment in the relationship between the adopted technology and the organizational structure, so that the technology does not become a barrier to organizational processes and so that the organization can fully enjoy the technology it intends to adopt.

Despite de developments observed in Software Engineering and Project Management in the last few decades, resistance to change is still identified as one of the main causes in unsuccessful

Figure 3. Alignment between change model, technology and organization
information system projects (Calvo-Manzano et al., 2010). Resistance to change is a natural human resource trait in every organizational environment. It is therefore necessary for any change process to be based in good practices, contributing to an improved success index in these projects.

5. THE ROLE OF HUMAN RESOURCE MANAGEMENT

The development of information systems was, for several decades, considered a discipline with a technological nature Information system professionals developed systems, partially helped by users, based in project management methodologies and other technical tools. The high failure rate observed in the development of certain systems questioned the technological focus of the discipline (Kukafka, 2003; Maguire, 2007).

The impact of information systems is growing, inside and outside organizational boundaries. It is therefore important that people responsible for the introduction of systems hold communication and leadership skills, as well as management skills, in order to render these processes easier (Ryan, 2010).

According to Maguire (Maguire, 2007), despite the existence of an abundant literature concerning Human Resource Management and Information Systems, almost no studies integrate both areas.

The introduction of systems directly impacts individual responsibility and business process organization. It should therefore be preceded by an evaluation of training necessities, as well as a training plan that minimizes the impact of the transition. The execution of the training plan, and the subsequent entry of the new system, should be followed and monitored to ensure the necessary flexibility to face unexpected changes.

Information systems assume a preponderant role in organizations, helping them achieve their goals. For this reason, systems should be integrated in the organizational culture while supporting business processes (Laudon & Laudon, 2010; Luftman, Lewis, & Oldach, 1993; Wang, Archer, & Per, 2008). Otherwise, the organization may be facing a technological success and an organizational failure at the same time.

The development and the introduction of systems usually depends on different groups, from users, managers, marketers, to information system technicians and project teams, and all of them are working towards a common goal. Historically, many of the factors that contribute to the unsuccessful introduction of systems relate to human resource allocation (Abdelhamid & Madnick, 1990; Chen, Law, & Yang, 2009) or to the coordination of different groups inside the organization (Avison & Young, 2007; Day, 2007). We believe that this area would substantially benefit from the improvement of human resource management skills (Crawford & Nahmias, 2010).

6. REFERENCES TO BE CONSIDERED

Independently of the adopted options, organizations are expected to deliver the best answers to the challenges of changes, imposed by developments in information technologies, globalization or increased demands from their clients (Sims, 2002).

There is still a lot to be learned from practices and from the habit of introducing systems in organizations, considering both the upsides, improving them whenever possible, and the downsides, minimizing them (Teixeira, 2009).

Our bibliography offers many references for good practices in managing technological services (Cartlidge et al., 2007; Menken, Blokdijk, & Malone, 2009; Van Grembergen, 2009; Ward, Aggarwal, Buco, Olsson, & Weinberger, 2007). These references include public tools and norms as well as organizational and individual property knowledge (Figure 4).

Good practices are successful practices inside the industry that are formalized afterwards. How-

Figure 4. Good practices references associated to technological service management

ever, they should not be perceived as stagnated fields, but rather fields that are enriched on a daily basis with new case studies, successful testimonies and failure reports. One of the problems identified in literature and related to the adoption of methodological references is that, although they sometimes complete or complement each other, their application is usually done in an isolated manner, which leads to the loss of their complementarity potential (Kukafka, 2003).

The hospital environment constitutes a good example of what is intended in terms of different team and different skill management, and common goal prosecution. Although it is seemingly a rigorously controlled environment, this is an environment where knowledge is constantly changing, where unpredictability reigns and where the consequences of error can be fatal.

7. EVALUATION OF SUCCESS

The evaluation of success is generally a subject whose definition is prone to confusion and controversy. The health field, and particularly the health system and technology evaluation, follows a generic rule (Ammenwerth, Gräber, Herrmann, Bürkle, & König, 2003). We know that good system development, management and implementa-

tion practices tend to increase the success of its introduction. However, the measurement of this success requires the a priori identification of the factors against which it will be measured. The approaches traditionally associated with project management based their measurements in time, costs and quantity, and all of these factors are easy to measure.

Considering the conceptual nature of success when dealing with information systems, measurement factors are not consensual and they change according to different cases. The explanation lies in the strategic nature of these factors, and these factors can also be a product of adopted implementation methods (Ojiako & Greenwood, 2007). It should be noted that the introduction of systems is only beneficial when it implies changes in the nature of the work itself or in the behavior of the people inside the organization.

Behavioral sciences have increased the value attached to the notion of success, and to the factors that can promote this success in the introduction of systems (Kukafka, 2003). The criteria for the measurement of success differ according to the different points of view through which they can be analyzed. In 1992, the model developed by DeLone and McLean, updated in 2003 (Delone & McLean, 2003), offered the first systematization of the measuring categories for the evaluation

of success in information systems. But this approach did not include the notion that different stakeholders could legitimately hold different success measurements and perceptions concerning the same system. This was added by Seldon, Staples, Patnayakuni, and Bowtell (1999) in his appreciation of the DeLone model.

The health field congregates different and well defined professional groups, whose perceptions of success evaluation in information systems can significantly vary (Connell & Young, 2007), according to the evaluation parameters of each group.

In addition to the generic models and tools for the evaluation of success in information systems, the available publications also propose specific tools and models for the health field (Kushniruk, 2002; Ojiako & Greenwood, 2007; Talmon et al., 2009; Topacan, Basoglu, & Daim, 2008; Yusof, Kuljis, Papazafeiropoulou, & Stergioulas, 2008). Each proposal is based in different evaluation parameters. Sometimes these parameters, divided in categories and subcategories, approach the same problem but they end up adding another perspective to the evaluation: the methodological perspective, whose results can be different for the same evaluation.

The diversity of perspectives concerning the success in the introduction of health systems brings some authors to contend that success, in that context, is a definition matter (Talmon et al., 2009). A definition whose criteria should be defined a priori, based on a multidimensional model.

8. CONCLUSION

There are no guarantees of success in the IIS; there are, however, tools and methodologies that enhance its probability.

The technological perspective that is traditionally associated to the development of systems does not satisfy the demands of modern organizations anymore. The complexity, dynamism and uncertainty attached to health organizations render

the consideration of non-technological factors mandatory in the introduction of systems. The methodologies applied in the development of systems must be enhanced, conferring a higher synergy between internal capacities, external relationships, organizational culture and human resources. The development of systems can mainly be performed with little to no intervention from final users, but the success of its introduction depends on the participation of those who will benefit from it.

Risk management is a critical factor for success in the introduction of systems. Identifying potential risks is essential, and the adopted methodologies should include a degree of flexibility that is necessary to manage all the variables involved, in other words, a successful change management.

Change management should promote an alignment between the change model, the technology and the organization. Human resources play an essential role in this alignment, occupying the main link between all three factors. The management of technological services counts with a wide range of methodological references, and managers must base their practices in these references in order to guarantee a successful introduction of systems.

Success is a goal, but there is no agreement in its definition, however. We believe that the introduction of systems must be based in a previously defined matrix of factors, and success should be measured against those factors. This way, the entire process of change management in the introduction of systems should be oriented according to those factors.

Organizations need to incorporate guidelines from several sources and fields of knowledge, in order to minimize the risk associated to IIS. We can thus conclude that the IIS should be sustained by an eclectic combination of knowledge fields, and not by a single technological perspective of the problem.

The process behind the development of systems includes a series of circumstances that can condition their future success. A universal checklist,

contemplating all the success factors involved in the life cycle of information systems, is virtually impossible, considering the diversity of available alternatives. However, we believe that the introduction of systems is the most critical point in the development cycle, and we will continue to focus our investigation on this stage in order to propose a change management methodology for the introduction of health information systems.

Chapter 40

Work Practices to Curb Attrition in the Indian Hi-Tech Software Development Industry:
A Structurational Analysis

Anuradha Mathrani
Massey University, New Zealand

Sanjay Mathrani
Massey University, New Zealand

ABSTRACT

Whilst collaborative knowledge work is gaining momentum across national borders, there are a number of issues associated with management of human resources creating this knowledge. This is especially relevant where IT professionals learn to apply present and prior work contexts together over ICT tools. But the tenure of IT professionals is often limited, leading to loss of specialist skills and continuity of knowledge flow. Indian firms have recognised the importance of human capital as a vital knowledge resource and are making efforts to reduce attrition. This paper sheds light on how hi-tech software firms overcome the challenges associated with the high attrition of IT professionals, and provides new insights on emerging practices for retaining and motivating the agents. Findings reveal that agents have the power to bring about transformation in organisational practices. New organisational routines for retaining professionals have been implemented to motivate professionals and capture contextual knowledge into project repositories. This reduces dependency of IT firms on individuals. The study illustrates empirically the dualism between IT professionals and organisational work structures for enabling each other in knowledge industries.

INTRODUCTION

The 'flat' world concept has emerged for global knowledge work, in which developing and developed economies are collaborating together for knowledge creation (Friedman, 2006). While collaborative knowledge work gains momentum across national borders, there are a number of issues associated with management of human resources who create this knowledge. This is especially relevant in software development, where IT professionals learn to apply present and prior work contexts together, over ICT tools, to create new knowledge and develop interrelated software artefacts (Hinds & Weisband, 2003). Over time, these professionals mature as they gain appreciation of the project needs and their local work contexts. However, IT professionals have been known to have the highest employee turnover rates (Garcia-Crespo, Colomo-Palacios, & Miguel-Gomez, 2008). When experienced IT professionals leave projects mid-way, the projects are handed over to new individuals who lack the contextual knowledge for making shared decisions. Clients are cautioned about collaborating via off-shoring of software development projects, to firms who have very high employee turnover. Specifically, clients are cautioned about software firms in India, which are known for high staff turnover (Dibbern, Winkler, & Heinz, 2008). Farrell (2006) recommends to western countries that although India is a hot spot as a software development location with its skilled pool of IT professionals, the choice of outsourcing destination must be expanded to other less "overheated labour markets" (p. 92).

Indian software exporters presently lead the global outsourcing market (Friedman 2006; Kearney 2004; Moore & Martorelli, 2004), especially in software development (Eppinger & Chitkara, 2006), but the problem of attrition cannot be any longer ignored. There are many negative perceptions associated with staff turnover in IT firms. Research shows that attrition rates in Indian IT facilities have jumped to 25–30% in 2004 (Moore & Martorelli, 2004) and this trend continues to rise. This means that the tenure of IT professionals is often limited, leading to loss of specialist skills and continuity of knowledge flow when professionals frequently leave the organisation. This often leads to project overruns and delayed deliveries.

To maintain position as a leader in the software industry, Indian firms have recognised the importance of human capital as a vital knowledge resource and are making efforts to reduce attrition. In this paper, we examine five hi-tech firms to answer the research question: *how do hi-tech Indian software organisations manage IT professionals to realise a satisfied work-force and reduce the impact of staff turnover on their global work commitments?* The paper utilises Giddens structuration theory to analyse the dualism of recursive interaction between IT professionals (agents) and organisational work practices (structures) for answering the research question. Structuration theory (ST) has been widely used in knowledge management studies in different application domains (Jones & Karsten, 2008).

The next section reviews prior theory on how IT professionals are motivated in emerging hi-tech software firms. Giddens structuration theory characterised as a 'hermeneutically informed social theory' (Loyal, 2003, p. 29) has been explained next in the context of this study. Findings from empirical case studies of five hi-tech Indian software organisations are then presented. An analysis of how the organisational work space is influenced by agents (IT professionals and management), is conducted next using the structurational lens. This study sheds light on how hi-tech software organisations (agencies) overcome the challenges associated with the high attrition of IT professionals (agents), and provides new insights on emerging practices (structures) for retaining and motivating the agents. The paper concludes with discussion, implications and future research directions.

THEORETICAL BACKGROUND

Since knowledge is innately human, organisational culture theories have dominated the knowledge-based concepts to identify individual (personal) and collective (shared) domains, resulting in two dimensions of knowledge, namely tacit and explicit knowledge (Baskerville & Dulipovici, 2006). Most of the operational knowledge in organisations exists at the tacit level, which is embedded in personal skills of agents who execute them without "conscious awareness". Explicit knowledge is "rule based when the knowledge is codified into rules, instructions, specifications, standards, methodologies, classification systems, formulas, and so on" (Choo, 2006, p. 141).

Leornardi and Bailey (2008) define another aspect of knowledge in software development called implicit knowledge, which lies between explicit and tacit knowledge. This is with the assertion that work done by IT professionals in software development tends towards tacit and implicit knowledge, in which individual's creative ideas can be codified and transferred through ICT tools. However, realisation of the codified knowledge embedded in technology artefacts requires ability of knowledgeable users who have the necessary occupational knowledge and judgement to interpret the implicit knowledge. IT professionals at distributed sites translate and transform the implicit knowledge, into their local work processes (Leornardi & Bailey, 2008). In the event of an IT developer's inability to interpret meaningful information from codified artefacts, the software providers more often than not, understand this limitation, but these concerns are not voiced to the customer (Miller & Voas, 2008). This puts the software providers at cross-roads between maintaining customer release dates and motivating IT teams to extract meaningful information and implement it in the next product deliverable.

Given the important role of shared knowledge in developing software artefacts, the role of individuals authoring these artefacts cannot

be underestimated. The artefacts are partitioned into many functional modules requiring in-depth occupational knowledge, which are then combined to produce the end product. Finally, both function-specific and cross-functional knowledge is combined to integrate modules and produce work artefacts. But, if these individuals who have contributed to the artefacts leave the organisation, the new members in the project often lack the contextual knowledge to correctly interpret the implicit knowledge embedded in these artefacts. Thus, it is in the organisations interest to retain competent staff, upgrade technical competencies and set a path of creating commitment towards the organisation. Further, to reduce the impact of staff turnover on project deliverables, organisations endeavour to reduce their dependence on individuals. This is achieved by resorting to different kinds of formalised computer-based knowledge management systems (KMS), which are used for establishing backups, creating templates, setting programming preferences and associated documentation, reviewing code and testing standards, and preparing maintenance screen layouts (Cullen, 2002; Sahay, 2003). The KMS synthesise knowledge at three levels: syntactic (repositories containing clear readily available fact-based explicit knowledge in shared databases), semantic (translation of work practices into standard methods and procedures) and pragmatic (transformation of tacit and experimental knowledge into maps and models) (Carlile, 2002). Mason (2003) reinforces the KMS approach and explains these levels and their span of control: (1) the syntactic level spans language boundaries enabling explicit information exchange, (2) the semantic level spans hierarchal boundaries as procedures and standards are laid from executives to managers to development teams, and (3) the pragmatic level spans cultural boundaries to enable a corporate culture that supports collective knowledge sharing and learning. Thus, researchers are advised to adopt a culturally sensitive approach when evaluating knowledge management practices in software pro-

duction firms, as a corporate culture of autonomy, creativity and tolerance towards mistakes enables knowledge sharing (Furner et al., 2009).

The challenges faced in software development are embedded in use of collaborative technology tools, definition of work-based interactions and most importantly management of social ties at individual, team and organisational levels (Kotlarsky, Oshri, & Willcocks, 2007). To encourage individuals (IT professionals) to share artefacts (documents, instructions, examples and expert advice) for reusing and repurposing knowledge, organisations focus on performance objectives that pass through the entire life cycle of knowledge creation in developing technological solutions (Salisbury, 2008). This reduces the impact of staff turnover, as distributed knowledge is transformed into workflow processes, such as design documents, quality plans and process metrics which define best practices, and are stored in organisational repositories.

Software organisations resort to different kinds of formalised computer-based knowledge management systems to recognise individual knowledge contributions to fit team member's achievements with organisational goals. These practices include rewards for behaviour-based, performance-based, schedule-based and collaborative clan-based performances (Gosain, Gopal & Darcy, 2005). To motivate individuals to share their work habits and develop shared perceptions, management mandates certain kinds of behaviour for nourishing a collaborative culture; applaud individual and team achievements by rewarding performances, such as awards for knowledge sharing and value addition; and encourage goal-based outcomes for conforming to quality and schedules (Gosain et al., 2005; Sakthivel, 2005). Agresti (2008) suggests that software community needs to define appropriate practices to elevate IT professionals and recognise them as IT specialists. Career paths must be established and care taken to ensure that professionals feel valued for their contributions. Reward structures to emphasise recognition of

the individual and team contribution help in developing collaborative work, building collective knowledge and sharing knowledge assets among employees (Hertel, 2004; Ravichandran & Rai, 2000; Sakthivel, 2005). Sakthivel (2005) warns that "an inappropriate reward structure may kill motivation and contribution" and advises that managers "need to act as mentors, exhibit empathy, be sensitive without being aggressive, build relationships with trust, and provide detailed and regular communication with team members" (p. 311).

Livari and Huisman (2007) have observed that organisations which define more standards and formalisations as a means of imposing security, order and routinisation tend to have a more hierarchal cultural orientation. To investigate what work structures are developed by organisations to retain and upgrade staff competencies, this paper discusses structuration theory next to describe the interactions between agency, agents and structures.

STRUCTURATION THEORY

Structuration theory (ST) has been widely used in management research to understand the relationship between social structures and human agency. Giddens (1984, p. 25) defines social structure as "rules and resources, organised as properties of social systems", while human agency refers to human agents (individuals, groups and organisations) living in society. Giddens asserts that structure and agency share a dual relationship, where social structure is not independent of agency, nor is agency independent of structure. Agents continuously reflect on their practices and, with time, their actions influence social structures, while at the same time social structures also influence an individual's beliefs and perceptions. Hence both individual and collective values feed into each other as social sciences is "irretrievably hermeneutic" (Giddens, 1984, p. 345), that is, reliant on interpretation and social settings (Jones &

Karsten, 2008). The inter-relationship between institutional level dynamics and human agency is an important feature of the current globalisation process involving software development where methodologies are taken from one situation to another, adjusted, re-defined and then re-exported (Sahay, Nicholson, & Krishna, 2003).

Although ST proposes mutually constitutive duality between individuals and society, it has an underlying emphasis on individualism with individuals being described as rational, active and autonomous agents (Loyal, 2003). The agents reflexively define new social norms via structures of signification, domination and legitimation. The structures of signification communicate and inform agents and shape perceptions, the structures of domination convey further information on power and control, and the structures of legitimation bring in acceptance of re-defined social norms and behaviours. Following on with these three structures, a context where individual actors as "members of globalised and high-tech organisations" are considered, who "interpret creativity as a key resource for their membership" Sahay et al. (2003, p. 91). Further Sahay et al. explained these structures as follows: (1) Signification structures inform about a person's role (i.e., membership signifies that the person is a knowledge worker), (2) domination structures convey information of the power this person holds (i.e., members interpret creativity as a key resource for the membership, and based upon the member's expertise, the member holds a position of some power and authority), and (3) legitimation structures re-define permitted standards, transgression of which may invoke sanctions (i.e., members draw upon these resources to create new rules or reinforce existing rules, such as members identify informal dress codes and prefer to work late at night). The new rules are soon accepted as the norm in the organisation, having a high degree of collective uniformity, but may again be transformed over time as agents identify new modalities to challenge existing information,

powers and norms to signify new behaviours and patterns (Jones & Karsten, 2008).

Thus, ST does not posit a deterministic approach to syntactic (language), semantic (hierarchal) and pragmatic (cultural) boundary objects, as they are re-defined by agents (or IT professionals in the context of this study). Agents identify signification, domination and legitimation structures based upon existing practice. They link meanings in situated circumstances to transform behaviours and structures that come as a result. Recent research on practitioner perspectives indicate that structuration theory is "one of the most influential…theoretical paradigms influencing IS research in the last decade or more", and is the "theoretical lens of choice for most scholars" (Poole & DeSanctis, 2004, p. 207). However, ST should be used as a second theory to support the chosen research approach rather than as a unique theory in its own right to gain understanding of a social phenomenon (Gregson, 1989). ST allows researchers to disseminate and interpret 'real-life' experiences in different contexts. This study utilises ST to provide an analytical frame to understand how hi-tech software organisations leverage knowledge capabilities from IT professionals and reduce the impact of staff turnover.

METHODOLOGICAL DESIGN

Structuration theory rejects both positivism and strong interpretivism by adopting methodological pluralism or post-positivist research methods as a means of inquiry for social research (Jones & Karsten, 2008; Loyal, 2003). This study's research design is oriented towards a naturalistic inquiry to describe the perspectives of agents (IT professionals and senior management of IT firms) in diverse organisational settings to reveal "socially constructed reality" of different groups (Denzin & Lincoln, 2003, p. 13). The organisational settings create a flow of everyday social practices as agents identify actions to be taken within a certain

social context, and these actions are continuously reflected upon under changing social contexts (Giddens, 1984).

We should see social life, not just as society out there or just the product of the individual here, but as a series of ongoing activities and practices that people carry on, which at the same time reproduce larger institutions……Society only has form, and that form only has effects on people, in so far as structure is produced and reproduced in what people do (Giddens & Pierson, 1998, pp.76-77).

A case study research strategy is well suited to capture the knowledge of practitioners, document the experiences of practice and to develop theories from practice (Benbasat, Goldstein, & Mead, 2002). Here a multi-case study strategy has been employed with ideographic methods to gain understanding of changing work practices and attitudes within five organisational contexts.

The theoretical background has provided a foundation for measuring the practitioner knowledge. Empirical evidence of different organisational contexts are aligned with theoretical knowledge to provide a dynamic view of evolving work practices, in which agents are capable of transforming structures with their actions.

RESEARCH SETTING

There have been many recent studies in relation to software development projects in India (Dibbern et al., 2008; Leornardi & Bailey, 2008), which highlight the problems with offshoring projects to Indian firms. These studies have offered valuable insights from the client's perspective, on issues pertaining to software application development activities such as knowledge absorptive capacity, cross-cultural differences, and staff attrition amongst others. This study uses a multi-case strategy focusing on software development firms to gain insights on how some of these issues are

perceived and managed by the software provider firms and IT professionals.

Five hi-tech Indian software providers are chosen as the setting for this study. Of these, two firms (L1 and L2) are large, while the remaining three (M1, M2 and M3) are medium-sized. Participants spanned vertical levels and functional groupings, including chief executive officers (CEO), chief technology officers (CTO); chief operations officers (COO); vice-presidents (VP), project managers; developers responsible for ongoing projects; and employees from quality assurance and human resource departments.

A brief overview of these firms is as follows:

- L1 is a large IT firm with software development centres in India, China and Poland. It has over 4100 employees, with 1500 employees in India. L1 has expertise in key verticals of manufacturing, retail, logistics, financial services, telecom utilities, education media and entertainment.
- L2 is a subsidiary of a major business conglomerate group in India since 1945, with software development centres in India and Thailand. It has about 1500 employees, with 900 in India. L2 has expertise in product design, analysis and production engineering, product life cycle management and enterprise resource planning systems.
- M1 is a medium-sized IT firm with approximately 200 employees in India since 1997. They offer Web enabled application integration solutions for finance, media, insurance and retail industry, and have recently completed a large project for a major computer manufacturer in Canada and the United States, by linking their 8,000 retail offices across North America.
- M2 is a medium-sized IT firm with about 100 employees in India since 1999. M2 specialises in broadband, telecom, health and the retail sector, and has undertaken

software development projects for several Fortune 500 companies.

- M3 is a medium-sized IT firm with 90 employees in India since 1995. The capabilities of M3 include revenue optimisation solutions for airlines, automotive rental, freight transportation and hotel companies worldwide. M3 has also completed many projects for large hotel groups, casinos and budget sector groups in United States and Europe.

DATA COLLECTION AND ANALYSIS

Given the exploratory nature of our research, many open-ended interviews were conducted to allow participants to provide their perspective and control responses and yet have the space to introduce and reflect on issues that they perceive as relevant (Mishler, 1986). Using existing body of knowledge from published literature, seven contextual categories were identified and questions associated within each category were included. The exact number of interviews conducted is not confirmed, as sometimes the whole day was spent at the interview sites. The interviews also involved casual conversation with many IT professionals when they explained their working processes. The data collection was done over a period of two months with each site visited three to four times.

The first question posed to senior management was the approximate percentage of staff turnover in the last two years. It is realised that it may be difficult for any member of management to give an exact number, as this number could be subject to interviewee bias or be clouded in human error from retrospective thinking. However, the purpose of this question was to get an idea on staff attrition rates, and compare with available literature. The average attrition rates as reported by study participants was 27%, which falls in accordance with Forrester Research findings of attrition rates between 25–30% in Indian software organisations

Table 1. Staff Attrition Figures

Case	Attrition in last two years
L1	25%
L2	15%
M1	25%
M2	30 – 40%
M3	30 – 40%
Average	27%

(Moore & Martorelli 2004). Table 1 details the percentage rates as specified by the respondents.

Based upon reviews of academic research addressing knowledge management theories and organisational practices for managing human capital, questions (Table 2) were posed to senior management and software developers in the selected five organisations. The interview data collected at each site was analysed immediately after every visit. The interview responses have been grouped into seven contextual categories: (1) Company vision aligned with professional career paths, (2) IT infrastructure, (3) Leadership management and employee participation, (4) Assessment and tracking of employee efficiency, (5) Innovative, learning and risk-taking environment, (6) Training in soft skills and technical competencies, and (7) Community and team building exercises.

Table 2 lists the seven identified contextual categories and the associated questions asked to respondents within each category.

The interview data reinforced the hermeneutic or ever-evolving nature of organisational structures in which agents influence organisational practices and transform work structures. Next, the interview responses have been synthesised into the identified contexts to communicate emerging work styles in IT industry and the results are presented.

Table 2. Contextual Categories and Related Interview Questions

Context	Main questions	Sources
Company vision aligned with professional career paths	Are long term organisational goals communicated across to all employees? Do employees feel they have career progression paths?	(Colomo-Palacios et al., 2010; Galinec, 2010)
IT infrastructure (standardi-sation and policy)	Does IT infrastructure assist IT professionals to work on their projects? How do the processes deployed assist or hamper software devel-opment activities?	(Cullen, 2002; Livari & Huisman, 2007; Sahay, 2003)
Leadership management and employee participation	Are organisational strategies communicated to development teams regularly? Are management teams collaborative or is the work culture bu-reaucratic and hierarchal?	(Agerfalk & Fitzergerald, 2006; Rajamani, 2007)
Assessment and tracking of employee efficiency	Are reward systems aligned to achieving goals regularly? Are performance measurement metrics in place?	(Gosain et al., 2005; Sakthivel, 2005; Salisbury, 2008)
Innovative, learning and risk-taking environment	Does the organisational culture support independent, bold deci-sion making? Do inter-departmental groups discuss/ brain storm on projects regularly?	(Furner et al., 2009; O'Sullivan & Dooley, 2010)
Training in soft skills and technical competencies	What is the attitude of management towards IT certifications? Are there any training and professional development programs?	(Agresti, 2008; Galinec, 2010)
Community and team build-ing activities	Are there any team building activities? Does management encourage informal sessions with senior col-leagues, teams, family members, etc.?	(Rajeswari & Anantharaman, 2003)

Company Vision Aligned with Professional Career

Software development is a knowledge intensive activity where shared team experiences and individual capabilities interact in an IT-enabled environment to meet organisational goals. Pro-fessionals who work towards achieving organi-sational goals also aspire to achieve their own personal goals. Thus, realisation of organisational goals is based on the commitment and expectation from both management and knowledge workers leading to a *"win-win situation"*. This situation complicates when software providers deal with offshore clients, and only a few team members may have visited client sites to possess detailed occupational knowledge regarding the project requirements. Hence, to ensure staff remains committed to achieving goals, the business plans and future road maps are aligned with individual's professional plans.

Study findings reveal that in the two large or-ganisations (L1 and L2), organisational plans are communicated to IT professionals formally down the line. Job descriptions for each individual are reviewed when new projects are allocated detail-ing the list of projects in which the professionals are involved. The work schedules describe the activities and project deadlines. This has brought in a feeling of engagement within the individuals as each of them has a specific role to play. The professionals feel valued and recognised for con-tributing to the organisational growth. A monthly departmental meeting is the norm in both L1 and L2 in addition to weekly/daily project meetings, in which the department head presents an overview of the key milestones achieved by the company and the future directions. The medium-sized or-ganisations, due to their non-deterministic nature of software development with fewer but very demanding customers, could not afford to fail in their delivery commitments. The vice president of M2 explained that they could *"no longer take*

risks of project delays, as [their] *business contracts are short and fixed with financial penalty clauses".* This meant that if IT professionals left projects mid-way, they *"can get into a soup".* Although they do not have formal meetings describing business plans, these organisations keep IT professionals involved by informally updating them about future project plans.

Interview responses from development teams suggest that in the past IT professionals had many hierarchal levels within each grade and progression was time bound and slow. But now, if the organisational goals are achieved, they often *"speed – tracked"* up the career chain. Hence, the more projects handled successfully meant faster transition upwards in professional careers. The management of all five organisations expressed that they had linked career progressions with time and project performance, and this approach benefited both individuals and the organisations. Knowledge professionals have the need to be recognised sooner than later and these changed practices regarding career progression has motivated them to become more involved in project completion.

IT Infrastructure

Software development teams have to work under tight schedules with fragmented project knowledge distributed at provider and client sites. Additionally, client requirements too are continually changing, which implies that teams have to keep track of project changes to measure scope and effort needed for meeting deadlines. To meet these challenges organisations have created a foundation of common code of practices with defined interfaces to assist integration of the flow of changes into the software deliverable. Good knowledge management strategies involving group-ware tools connected to a centralised project repository are used with standards established for making changes. The configuration is clearly defined along with control practices with easy to

use templates which allow for re-use opportunities of the design artefacts.

Most organisations emphasised the need for centralised project portfolios enabled by organisation's network for managing the ever-evolving information, which reduced their *"dependence on an individual's memory capabilities".* The two large organisations have many international certifications which emphasise strict adherence to standardisation practices. One senior manager explained the importance of such documentation *"If it can't be documented, it cannot be transferred. We need to explain our actions."*

The three medium-sized organisations have realised how vulnerable they are to employee turnover and have recently established new work standards, and are in the process of enforcing discipline for adherence to these standards. These companies have found that documentation of standards brings a *"sense of ownership"* amongst developers, with the possibility to add relevant experiences to their knowledge capital. Moreover, it also introduced a *"sense of knowing the next correct step as it is listed in the document checklist".* One senior manager of medium-sized provider commented:

If you develop a system which is person dependent then you are not managing. So focus has now shifted to HR management, and this is not something to be taken for granted anymore. Software industry has now moved to this gear. So if a person leaves an organisation, we may have a problem for five to eight days but it is not a catastrophe so that everything comes to a halt. But there is a delay. Now we have planned our work for 18% attrition and we try to structure our processes so that a process would be executed independent of that person. Our available internal systems have standardised processes, and we build in buffers within our development work so that the target dates are not missed. Our policies are not shock proof but they help us to recover fast from such

shocks. This is important, and this is what I call project management.

The developers too have acceptance of these standard policies, as is evident by a remark made by one developer: "*The documentation is essential for the company – so we have to do it. We don't mind it… the good and the not so good go together.*"

Leadership Management and Employee Participation

Software development organisations face challenging code-driven tasks involving different software platforms and architectural designs. These tasks involve making informed decisions by IT professionals, who need to be motivated to lead the software design and development with confidence. All five organisations confirmed the importance of identifying leaders with the right disposition to interact amicably, achieve results and whom the development teams could trust. One manager of medium-sized software firm commented: *"We are wary of having loners who don't share their work with others".*

Each organisation has designated software leaders based on their area of expertise. One of the large organisations explained their induction programme in which junior developers who have recently joined the organisation participate in a half-day weekly programme with senior developers. In this programme, the senior developers share their past project experiences. This enables direct interaction between new recruits and senior teams, leading to closeness and early collaboration and building of trust. The management expressed that such programmes reinforced a culture of sharing and participation, and made leaders more accessible to junior developers. Details of how organisational strategies are disintegrated at departmental and individual level and later re-assimilated by cross-functional teams at different phases in the software life cycle are shared.

Assessment and Tracking of Employee Efficiency

Employees are an important resource who can have both, either a positive or a negative impact in an organisational context. For them to have a positive impact, they must be motivated. Accordingly organisations have defined measures to motivate and assess their employee's performance. L2 has implemented SEI's People – CMM, and are at the highest level (i.e., level 5), which implies that a culture of workforce excellence is continually established at an individual, team and organisational level for improving worker satisfaction, overall talent and professional competency of the firm (Curtis et al., 2007). L2 has identified performance metrics through (1) timely completion of tasks and (2) lower re-work rate and higher first-time pass rates in knowledge areas.

The other organisations though not formally certified have also undertaken measures to assess and track employee efficiency. The assessment and tracking is considered necessary to keep staff committed to project deadlines, and by aligning rewards and incentives based upon performance. Additionally attainment of educational/ professional qualifications, participation in knowledge groups and value addition through suggestion schemes are used to reward the IT professionals. The firms emphasise the necessity of having transparency in employee evaluation to encourage individual employees with appropriate rewards on achievement. This according to most respondents plays a major role in building of core organisational competencies. All the five organisations have performance awards such as having a variable component in their salary packet based upon assessments.

One senior manager of a medium-sized organisation commented:

Suppose he [the developer] gets Rs.100 as salary. The Rs.70 is fixed and Rs.30 is based on certain performance parameters which we have defined.

We have a very transparent system, and so he can see his performance himself. This is a computer-based system which we have developed ourselves and if he does more than 100% then we give him that additional amount also. So sometimes people here get as high as 120%, though generally a maximum a person draws is about 90%. This is of course confidential and only goes into the payroll.

Innovative and Risk-Taking Environment

All case studies highlighted the requirement for encouraging innovation and creating a risk-taking environment. However the risks should be *"calculated and informed after discussing pros and cons"*. Both large organisations have specific knowledge groups known as Pre-Development Group in L1 and Knowledge-Next in L2. IT professionals are encouraged to join these groups, which tested many software designs before defining it as a module or artefact in their standard knowledge libraries. Developers interact on blogging forums and post questions, solutions, executable files, and software code. An environment of friendly banter is created where ideas are shared and feasibility of implementation of ideas are discussed.

The medium-sized organisations are also found to encourage their teams to be creative and provide freedom to take risks; however they did not offer much on how this environment was achieved, other than maintaining a collaborative and open organisational culture.

Training in Soft Skills and Technical Competencies

Training in both soft skills and technical competencies has been considered essential by all the five organisations. Besides training IT professionals on the organisation's blueprint which outlines processes such as test plans, coding practices, and preparation of documentation in software

design and implementation, these organisations emphasised that soft skills such as communication, presentations and team building also play a major role. The large organisations have formed academic alliances with a recognised tertiary sector and offer post graduate diploma/ certificate courses to their employees.

The medium-sized organisations encouraged IT professionals to upgrade their skill-sets through professional courses, which on completion would add to their performance metrics. One medium-sized firm (M3) has contracted training sessions in soft skills to local consultants who provide in-house training on the non-technical skill-sets. Interactive training sessions are held with voice recording of presentations and discussions on non-technical issues. These recorded conversations are then played back to the groups, and the group analyses the tone, accent, pronunciations and such like. The project manager commented *"The programmers quite enjoy when they can themselves see the difference"*.

Community and Team Building Activities

All organisations agreed that community and team building activities foster a friendly and collaborative environment. Each organisation has organised some such activity. One large organisation (L1) stated that it promotes the *"Five F"* culture, that is, *"Fast, Focused, Friendly, Flexible and Fun"*, with many 5F posters displayed in the office premises. The *"Five F"* culture included weekly *"Pizza and Coke Meetings"* where senior management and development teams have informal discussions. The other large company (L2) has recently opened facilities within their office premises to include a swimming pool, gym with health instructors, badminton courts and other such club facilities to encourage their in-house staff enjoy late working hours with their development teams. These facilities are also available to employee family members at nominal charges.

The medium-sized organisations have organised activities such as *"Friends and Family Day"* in which employees and their families are either entertained inside the premises or taken out for some social event by the management. Other team building activities include playing friendly cricket matches between developers, and inviting employees and their families to some local organised event, such as local orchestra with food catering. In these events, employees and families intermingle, fostering a greater *"sense of knowing and belonging rather than just doing a job at some company"*.

DISCUSSION

The study findings have revealed how software providers (agencies) cope with management of their human knowledge assets or IT professionals (agents). Staff attrition has a huge impact on organisational structures and processes as new teams are formed when some individuals leave and others join the organisation. The new staff has to be trained, while the leaving staff's expertise has to be retained in some form in the organisational knowledge repository. Staff turnover is an unavoidable part of knowledge-based agencies, and organisations have institutionalised structures to minimise this impact. They are taking steps to bring an environment of collaboration and are motivating IT professionals to share their tacit and implicit knowledge portfolios, which can then be standardised into documented processes in the organisational repositories.

Agents have changed structures of signification, domination and legitimation, as agencies have identified social meanings to the attitudes of their knowledge workers in their efforts to control staff turnover. New work structures are emerging in organisational environments as providers believe that these structures will result in a satisfied, content and committed workforce, which eventually leads to low staff attrition.

Using interpretive schemes, this study has affirmed the significance of human capital in knowledge-based industry and explained how social agents are producing and reproducing new work structures in the software industry. The ongoing production and reproduction leads to routinisation of social structures – signification, domination and legitimation – based upon ontological security which underpins agents and agencies (Jones & Karsten, 2008). Agencies have realised the significance of human capital and identified work practices to be secure from staff attrition as they legitimise new structures (rules and resources or standards) due to the dominant role of IT professionals. Similarly, agents have realised the significance of the knowledge they impart to software projects and based upon this knowledge capital, they hold positions of power which brings in a sense of security for negotiating existing work structures, as new organisational practices are being legitimised into routines.

Empirical data findings have revealed the following structural routines based on the interaction between agents and agency:

1. Company vision has been aligned with IT professionals aspirations, as software firms have changed career progression paths from being slow and time bound to being performance-based.
2. IT infrastructure and policies have been changed to enable common code of practices through standards placed in project repositories. These standardisations help organisations to recover quickly from staff turnover.
3. IT firms have designated leaders based upon their specialists and interpersonal skills. These leaders interact with junior developers and help to bring in a collaborative work place environment.
4. Performance awards have been implemented to reward professionals on their achievements.

5. Knowledge groups have been established in large companies to enable learning and bring in an innovative and creative environment.

6. Both technical and social skills are considered necessary for bringing in a sharing and collaborative environment. This is done through professional development and also through personality improvement programmes.

7. Finally organisations have brought in an overlap of professional and personal relationships, by involving the employees families into their social circles. This has produced a sense of belonging to the organisation.

The findings show that agents and agency are not independent of each other, and sheds light on how hi-tech software organisations (agencies) overcome the challenges associated with the high attrition of IT professionals (agents). New organisational structures are evolving in knowledge-based industries as IT professionals and software firms interact on a more level ground to support of each other.

CONCLUSION

This study has examined an area of significant concern to the current Indian hi-tech industry. By providing real-life practical experiences, the study has given new insights on emerging practices (structures) for retaining and motivating the agents. Findings reveal that agents are not passive, but have the power to bring about transformation in organisational practices. New organisational routines for retaining professionals have been implemented to motivate professionals and capture contextual knowledge into project repositories. This assists to counter attrition, and at the same time reduce dependency of IT firms on individuals. The study illustrates empirically that the dualism between IT professionals and

organisational work structures enable each other in knowledge industries.

The study has applied knowledge management theories and structuration theory in the IT industry to analyse social and knowledge structures as organisations review and re-define their practices to retain and motivate their work force. Current work practices have been described within real world settings through different practitioners' experiences on how the dynamic knowledge structures are evolving for managing attrition in the knowledge industry. More research studies are needed to investigate the operational aspects of the knowledge structures in other national and industry contexts.

Chapter 41
Outsourcing in Knowledge–Based Service Firms

Ingi Runar Edvardsson
University of Akureyri, Iceland

Gudmundur Kristjan Oskarsson
University of Akureyri, Iceland

ABSTRACT

This paper reports on empirical work recently conducted on outsourcing among knowledge-based and other service firms in Iceland. The results show that knowledge-based firms outsource on a larger scale and more human resource functions than other service firms. However, they do not have a more strategic vision towards outsourcing, nor do they outsource more low knowledge-based activities than other firms. The study gives support to the resource-based view of the firm, and is in line with former studies of knowledge-based firms. The firms in the survey tend to keep their core competencies and employees in-house, and at the same time they outsource other functions that they consider non-core, such as peripheral and administrative tasks, or IT that requires technical specialization. The more innovative firms rely on outsourcing from best in class suppliers regarding training and counselling. The contribution of this study to the theory of outsourcing is that the non-routine tacit knowledge base related to firms' core competencies is not limited to knowledge-based firms, but to a large portion of service firms as well.

INTRODUCTION

The economies of developed countries are becoming more service-based and knowledge-based (Parkhe, 2007; Targowski, 2009). With the growing number of knowledge-based firms, their rising share of total value added from services (Bettencourt, Ostrom, Brown, & Roundtree, 2002), and their fast growth within the European economy (Miles, 2005) makes them into an important subject of analysis and empirical investigation.

Along with the rising share of services and knowledge in the economy, some organizational restructuring has been taking place, such as

networking and supply chain change manifested in outsourcing and offshoring. Outsourcing has grown rapidly among public and private organizations in recent years (Bryson, 2007; Di Gregorio, Musteen, & Thomas, 2009; Kadabadse & Kadabadse, 2002). In all cases, outsourcing always requires third party involvement (Jagersma & van Gorp, 2007). Outsourcing is defined here as allocating or reallocating a firm's internal activities and services to outside providers.

Very few empirical studies have been conducted on outsourcing in knowledge-based firms (KBFs). In order to fill the gap, this paper reports on recently conducted empirical work on outsourcing among service knowledge-based firms, as well as other service firms, in Iceland. More precisely, the paper analyses the strategies for outsourcing, the human resource impact, and outsourcing of core and periphery functions.

KBFs provide services to customers or other firms, and in most cases they produce an intangible output. By and large, the involvement of the customer is vital, and tacit knowledge is central to the activities of many knowledge-based firms. Currie, Michell, and Abanishe (2008, p. 96) state for instance: "Most knowledge of the type that gives competitive advantage to firms is not explicit, but tacit, since it resides in the minds of individuals, and is gained through the acquisition of skill and experience. It is this type of knowledge that is usually associated with the core capabilities of organisations". Given these characteristics of KBFs, how does outsourcing affect such firms? Can it contribute to their competitive advantage or does outsourcing weaken their core competencies? In the paper we set out to answer the following research questions: Does a theoretically oriented classification of KBFs reveal more differences in outsourcing than an empirical classification according to knowledge intensity? Do KBFs differ from other firms in the: 1) amount, 2) reasons, 3) kind of activities, and 4) benefit from outsourcing.

With reference to the theoretical perspective of the resource-based view of the firm, we assume that KBFs outsource more than other firms in order to enhance their competitive advantage; that they outsource more low knowledge-based activities, such as peripheral and administrative tasks than other firms; that they outsource fewer human resource functions than other firms, as tacit knowledge is central to many such firms. The consequence of this would be that KBFs realize more benefits out of outsourcing.

It is hoped that this study will assist managers in making a sound strategy for outsourcing, as well as setting the initial steps in building a theory of outsourcing in KBFs.

As very few firms in the survey (3%) offshored their service activities, the focus of the paper will concentrate on outsourcing.

The next section of the paper deals with theoretical debates on outsourcing. Then the research method and some information on the characteristics of KBFs and other firms in the survey are presented. We present the results on strategies and motives for outsourcing, as well as the actual benefits realized due to outsourcing. The paper ends by discussion and conclusions.

THEORETICAL FRAMEWORK

There is no consensus on the definition of KBFs. Moreover, the concepts of knowledge-based firms, knowledge intensive firms, and knowledge intensive business services (KIBS) are used more or less interchangeably. In many instances the term is either undefined or is defined indirectly, often by providing a brief list of examples (von Nordenflycht, 2010). KBFs are often defined as those firms that are staffed by a large proportion of highly qualified staff (Lee, 1999; Werr & Stjernberg, 2003). Others define KBFs as firms that "create and define problems, develop and apply new knowledge to solve the problems, and then further develop new knowledge through the action of problem solving" (Nonaka, Toyama, & Konno, 2002, p. 41). Still other researchers define KBFs

as firms struggling with ambiguity (Alvesson, 1993), while Blacker (1995) limit KBFs to those firms that are preoccupied with unfamiliar issues. Muller and Doloreax (2009, p. 65) define KIBS as "services firms that are characterised by high knowledge intensity and services to other firms and organisations, services that are predominantly non-routine". Common to most of these definitions are, thus, "the capability to solve complex problems through creative and innovative solutions" (Alvesson, 1993, p. 1000) by using highly qualified staff, either due to intensive training or university education.

A comprehensive classification of KBFs is given by von Nordenflycht (2010) where he presents a theory of the distinctive characteristics of professional service firms and their organizational implications. He identifies three distinctive characteristics of such firms: knowledge intensity, low capital intensity and a professional workforce. Knowledge intensity implies that the firm relies on an intellectually skilled workforce among frontline workers, while low capacity intensity mean that the operation of firms does not involve a significant amount of nonhuman assets, such as factory and equipment. He uses the term professionalization aside from knowledge intensity, namely self-regulation (strong control over the practice of the occupation) and ideology, e. g. ethical codes.

From these characteristics, von Nordenflycht classifies KBFs into four categories. The first one is the *classical professional firms,* like law and accounting firms, that meet all the three characteristics; high proportion of knowledge intensive staff, low capital investment in the firms, and professional workforce. *Professional campuses,* as hospitals, meet two of these criteria – knowledge intensity and professionalism – but they require an extensive capital investment. *Neo-professional firms,* such as consultant and advertisement firms, also meet two of these criteria – knowledge intensity and low capital intensity – while they do not involve professionalism. Finally, *Technology*

developers, like biotech firms and research labs, only have knowledge intensity, as they hire scientists and engineers that do not belong to traditional professional groups and such operation demands high capital intensity.

From our standpoint, it is an interesting question whether the various types of KBFs, as defined by von Nordenflycht (2010), indicate differing needs for outsourcing? From these observations we hypothesise the following:

Hypothesis 1: Traditional professional firms with a professional workforce tend to keep services in-house, while neo-professional firms are more inclined to outsource such activities.

Hypothesis 2: High investment intensity increases outsourcing, as such investments force firms to concentrate on core competencies for economic reasons.

HUMAN RESOURCES AND TACIT KNOWLEDGE

KBFs are complex, unstructured and highly customized in order to meet customers' unique needs. Knowledge staffs apply theoretical and analytical knowledge to their jobs, and in many cases they use non-routine tacit knowledge, as well as being involved in innovation and customization (Lee, 1999; Muller & Doloreux, 2009; Murray, Kotabe, & Westjohn, 2009).

The resource-based view of the firm claims that resources that are thought to be rare, valuable, and difficult to imitate are essential to the firm's success and are regarded as core competencies (Klaas, 2008; Lee, 1999). The human resources are often considered to play a critical role in developing a substantial competitive advantage of firms, and knowledge staff is often considered to contribute to the competitive advantage of KBFs. According to the core and periphery theory, the core activities of human resource management

(HRM) include top-level strategy, HR policies, employee relations, and line management responsibilities, e.g. appraisal and discipline, while other activities are considered peripheral. Strategic parts of HR should, therefore, remain in-house, while administrative and transactional functions should be outsourced (Shen, 2005). In reality, HRM outsourcing has grown in the past decades (Klaas, 2008; Galanaki & Papalexandris, 2007). Surveys show that recruitment and selection; pay and benefits; workforce reduction; training and development; legal issues; and retirement plans are the functions that are most often outsourced (Schlosser, Templer, & Ghanam, 2006; Shen, 2005; Quinn, 1999). This list indicates that outsourcing can cover any aspect of HRM, and there seems to be no absolute boundary between "core" and "periphery" issues.

From these observations we make the following hypothesis:

Hypothesis 3: Given the non-routine tacit knowledge base of KBFs, strategic parts of HRM are kept in-house.

OUTSOURCING IN KNOWLEDGE-BASED FIRMS

Given the rapid growth of outsourcing, some benefits from the process are expected by both private and public organizations. The outsourcing literature identifies three major categories for outsourcing, i.e. cost, strategy, and politics. Cost reduction, with regard to both direct and indirect costs, is one of the most cited rationales for outsourcing. This includes labour costs, transport, travel and other costs. The most prominent strategic reasons for outsourcing involve allowing the organizations to better focus on their core competencies, while others include gaining access to unique resources, knowledge and capabilities possessed by other firms (Kremic, Tukel, & Rom,

2006; Di Gregorio et al., 2009; Quinn, 1999; Parkhe, 2007; Vietor & Veytsman, 2005).

KBFs provide services to customers or other firms. In most cases, they produce an intangible output, rather than a tangible product. Another characteristic of such services is that consumption and production happen simultaneously, and the customer is highly involved in the production of services, which is not the case in manufacturing. Finally services tend to be more labour and knowledge intensive than manufacturing firms (Daft, 2007; Targowski, 2009). All these aspects, and, in particular, the different involvement of the customer, is highly relevant to the motives and realisation of outsourcing in service firms. In some services, for instance, the co-location of customers and service providers is quite important; the outsourcing potential is, therefore, limited (Bettencourt et al., 2002; Murray et al., 2009).

Lee (1999) presents a typology of the HRM policies of KBFs founded on a resource-based explanation. He argues that KBFs tend to outsource their non-core processes in order to concentrate on the building of their capabilities in their core competencies. From his theoretical analysis he put forward the proposition that KBFs will outsource only those work activities, or HR requirements, that focus on narrow, explicit knowledge. Other work activities will be kept in-house. Moreover, Lee argues that KBFs will focus on training and development activities for work activities or HR requirements that require broad, explicit knowledge; that they will focus on informal, group-oriented activities for work activities or HR requirements that require narrow, tacit knowledge; and that KBFs will focus on research and development activities for work activities or HR requirements that require broad, tacit knowledge.

Currie, Michell, and Abansihe (2008) conclude from their case study of knowledge process outsourcing in financial services that most firms tend to outsource only activities with more defined inputs and outputs. Also, that the more knowledge intensive forms or work is kept in-

house. However, they found that some high-end financial services, such as financial analytics, portfolio valuation, risk assessment etc. were outsourced, but in quite a different manner by various actors. Thus, many large organisations established branches of their operation in low-cost countries to carry out knowledge work, while pure play KPOs (start-up firms), are involved in securing and managing the customers in developed countries, whose processes will be handed over to the offshore service centres. Existing Business Process outsourcers have extended their services into the specialized market of knowledge process outsourcing, whereas professional knowledge taskers provide products and services to specific professional and functional groups, which requires them to become niche-market players, such as in health-care. Finally, knowledge builders focus on the low end of the knowledge process, such as seeking and gathering information and providing analysis of this information.

Murray et al. (2009) present a theoretical framework for a global sourcing strategy relating to knowledge-intensive business services. They propose that the more variation in the services' standards or nature, the higher the inseparability of production and consumption, and the more tacit the activity of knowledge-intensive firms, the more they tend to rely on onshore insourcing, that is to keep services in-house. However, Murray et al. (2009) propose that the more innovative the sourcing firms, the more they rely on outsourcing from best-in-class suppliers worldwide.

From these observations we put forward the following hypothesis:

Hypothesis 4: KBFs will only outsource activities of a narrow, explicit nature.

RESEARCH METHODS

A descriptive and analytical research design was selected, as the main objective was to reveal the application of outsourcing within Icelandic service firms. The research was conducted in February and March 2009 in the form of telephone interviews. The method of using telephone interviews was presumed to be the best way to obtain answers from hardworking managers, or their deputies. It has to be kept in mind that the survey was conducted during an economic crisis which may have impacted the results in several ways.

The sample list was received from the Internal Revenue Directorate in Iceland. The method of selecting firms was a stratified random sample. The selection criteria were size of firm, industry, and location within Iceland (50% in the capital area, the remainder throughout Iceland). The initial sample consisted of 539 firms, classified as service firms according to economic activity classification (Icelandic version of NACE[1]), and with five employees or more. 55 companies were out of business, leaving 484 firms in the final sample. Out of the final sample, 57 were unreachable, 21 refused to answer the questionnaire and 9 firms did not fit the selection criteria of this survey. In total, 397 managers, or their deputies, participated in the survey. That gives a response rate of 82%, which is quite high and provides a good representation of the population.

The research instrument consisted of a questionnaire that was designed by the researchers, after interviewing ten managers and specialists on the subject in Iceland (Edvardsson & Sigurdardottir, 2009), and taking note of literature reviews, especially Kadabadse and Kadabadse (2002). Background variables were used from a previous questionnaire design by the authors (Edvardsson, 2006). The questionnaire was piloted in four companies and some minor revisions made, particularly relating to concept clarity and whether more options were needed when answering the questions.

The questionnaire was made up of 25 questions. It began with the following definition of outsourcing: "the purchase of components, specific services or expertise from entities outside own company".

The first question asked whether the firm had outsourced some service activities in the past five years. The next questions dealt with whether the firm has an outsourcing strategy, what kind of activities have been outsourced, the location of outsourcing, the motives for outsourcing, the choice of the suppliers for outsourcing, whether the outsourced activities are considered as core or supporting functions, whether outsourcing has affected human resources or lowered cost. These questions were of nominal scale character. The managers were then asked about their opinions on eight propositions regarding their experience on a five-point Likert-scale, rating the propositions with one of the five arguments: strongly agree, agree, undecided, disagree or strongly disagree.

The questionnaire also included background variables like size, location, corporate profit, managers' education, gender and age. In the questions on age, number of employees, and turnover, the respondents refers to the actual number that was written in the Access-database by the interviewees responsible for the data collection.

Descriptive statistics were used to describe the sample, and a Chi-square test was used to compare groups. Differences between groups were taken as statistically significant with a p-value of <0.05. Because data are not normally distributed, the nonparametric Kruskal-Wallis test was carried out to identify significant differences between groups for mean values, with a p-value of <0.05 taken as statistically significant. As a post-hoc test, the Mann-Whitney U test was carried out, using a Bonferoni correction, meaning a reduced p-value of <0.017, taken as statistically significant when comparing 3 groups, and a p-value of <0.008, taken as statistically significant when comparing 4 groups (Field, 2005). If a p-value was less than 0.001 it is reported as <0.001, otherwise the exact value is reported. Data were analyzed using the Statistical Package for the Social Sciences (SPSS 17.0).

Two definitions of KBFs, on the one hand that by von Nordenflycht (2010), and, on the other hand, a definition based on knowledge intensity, are used simultaneously throughout all analysis in order to clarify the research question as to whether the first definition reveals more differences in outsourcing than the latter.

RESULTS

Characteristics of Knowledge-Based Firms

In 2005, 79% of firms in Iceland were micro firms with less than 10 employees, while 20.6% of the firms were SMEs (10-249) (Statistics Iceland, 2008). The firms in the survey are in general larger than the average firms in Iceland, with an average number of employees of 41.4². With regard to the size of the firms in the survey, 53.9% had fewer than 10 employees, 32.9% had 10-49 employees and 13.2% had 50 or more employees. The annual turnover was €5.5 million. This falls within the European Commission's (2005) definition of the turnover of a small firm.

Male managers in the survey were 73.8% and females 26.2%, compared to 81% male and 19% female managers in Icelandic firms in general (Statistics Iceland, 2009). Their education was as follows: 58.4% had university degrees, 33% had completed secondary education, and 8.6% had primary education. The respondents' average age was 48.4 years, and they had worked, on average, 11.6 years in the company.

Of the responding firms, 73.2% were private companies, 11.9% were co-operatives and 14.9% had other organizational forms.

It is shown in Table 1 that the greatest numbers of firms responding to the survey were firms in wholesale, retail trade, and repairs, followed by real estate and business activities. Very few firms in public administration and education participated in the survey. The table also shows the average percentage of university educated staff in each NACE category. The lowest number of university

educated staff was in wholesale and retail trade, but the highest in hi-tech- and knowledge intensive firms. The NACE classification was later sorted by the authors into two different groupings. The first is based on von Nordenflycht's (2010) classification of KBFs as can be seen in Table 2. The second grouping is based only on knowledge intensity measured as a proportion of university educated staff of total staff, as most definitions of KBFs include highly qualified staff, usually of professional status, with university education

(Table 2). The motive was to compare a theoretical model with empirical observations.

Table 2 reveals that about half of the firms in the survey are classified as non-knowledge-based firms (they belong to wholesale, retail trade, repairs; hotels and restaurants; and transport and communication). Neo-professional firms (real estate and business activities; financial intermediation) are about third of all firms, while professional firms, technology developers, and professional campuses are less than a fifth of all firms (public administration, education, health services,

Table 1. Classification of firms in the survey according to Icelandic classification of NACE

	Number	%	Average % of university educated staff
Wholesale, retail trade, repairs	109	27.5%	10.8%
Hotels, restaurants	46	11.6%	22.3%
Transport, communication	33	8.3%	11.9%
Financial intermediation	33	8.3%	44.7%
Real estate & business activities	89	22.5%	51.5%
Public administration	2	0.5%	38.2%
Education	6	1.5%	42.6%
Health services, social work	20	5.1%	48.7%
Hi-tech- and knowledge intensive*	35	8.8%	53.1%
Other services	23	5.8%	48.6%

Note: * This category was added by the research team, and deviates for the Icelandic classification of NACE.

Table 2. Classification of responding firms according to von Nordenflycht's classification, and knowledge intensity (the ratio of university educated staff as a proportion of total staff)

	Number of firms	Proportion
Non-knowledge-based firms	188	50.4%
Neo-professional firms	122	32.7%
Classical professional firms	28	7.5%
Technology developers	35	9.4%
Proportion of university educated staff		
≤25%	206	54.8%
25-50%	69	18.4%
>50%	101	26.9%

Note: Other services in Table 1 have been omitted in this and forthcoming tables, as it is impossible to figure out what kind of firms are in that category.

social work).[3] Given the small number of responding firms belonging to professional firms and professional campuses, they were merged into one group, classical professional firms. Technology developers overlap to a large extent with hi-tech- and knowledge intensive firms, although there could be some minor differences.

Table 2 shows also that a little more than half of the responding firms have less than 25% of their staff with university education; while about a fourth have more than half of their employees with university education.

There is a marked difference regarding the education of managers in the firms. More than seven out of ten managers in knowledge-based firms have a university education; while this is the case for four out of ten managers in other firms (Table 3). The difference is significant ($\chi^2(6)=46.6$, p<0.001). The higher the ratio of university educated staff, the higher the proportion of managers with a university education. The difference is significant ($\chi^2(4)101$, p<0.001).

Table 4 shows that non-knowledge firms in the survey are oldest (26.1 years of age on average), while technology developers are the youngest (13.2 years of age on average). The difference is significant (H(3)=11.23, p=0.011).

Table 3. Education of managers and knowledge classification of firms

	Primary education	Secondary education	University education	p-value[a]
Non-knowledge firms	16.2%	42.7%	41.1%	<0.001
Neo-professional firms	1.6%	25.4%	73.0%	
Professional firms	3.6%	25.0%	71.4%	
Technology developers	2.9%	20.0%	77.1%	
≤25%	15.2%	50.5%	34.3%	<0.001
25-50%	2.9%	17.6%	79.4%	
>50%	.0%	10.9%	89.1%	

[a] Chi-square test.

Table 4. Mean age of firms and knowledge classification of firms

	Mean	Std. Deviation	N	p-value[a]
Non-knowledge firms	26.15[A]	23.57	182	0.011
Neo-professional firms	23.16[B]	20.23	111	
Professional firms	22.83	19.19	24	
Technology developers	13.22 [AB]	11.99	32	
≤25%	24.67	22.68	195	0.059
25-50%	25.92	21.77	64	
>50%	19.54	18.05	95	

[a] Kruskal Wallis Test using Mann Whitney U test with reduced p-value as post hoc test.
[A] post-hoc, significant difference between technology developers and non-knowledge firms, [B] post-hoc, significant between technology developers and neo-professional firms.

Table 5 shows that technology developers have the highest average number of employees 54.5, followed by non-knowledge firms (48.7), while professional firms had 26.9 and neo-professional firms have the lowest average number of staff 24.6. The difference is significant on a Kruskal Wallis test (H(3)=8.69, p=0.034). A more limited size difference is noted between firms when they are classified according to the education of their employees.

To summarize: About half of the firms in the survey are not knowledge-based firms. More managers in the knowledge-based firms have university education, and knowledge-based firms – especially technology developers - are younger than other firms. Professional- and neo-professional firms are smaller than other firms in the survey.

AMOUNT AND REASONS FOR OUTSOURCING

Amount of Outsourcing

Outsourcing is quite common among the firms that participated in the survey. In all, 79.8% of the companies reported that they had been involved in outsourcing in the past five years.

Knowledge-based firms tend to outsource more than other firms, and the difference is significant ($\chi^2(3)$=11.84, p=0.008). Almost all professional firms outsource some service activities, and the vast majority of neo-professional firm and technological developers. Even non-knowledge-based firm outsource on a large scale (Table 6). A similar pattern is present regarding the relationship between outsourcing and knowledge intensity. The higher the intensity, the more activities are outsourced. The difference is significant ($\chi^2(2)$=11, p=0.004). These findings do not support Hypothesis 1 and 2.

Reasons for Outsourcing

Only 23.5% of the managers in the survey reported that their companies had made a strategic plan for outsourcing. Those who did have a strategy, aimed first and foremost at simplifying the operation (48.6%), cost reduction (41.7%), gaining access to expert knowledge (31.9%) and core competencies (25%). For the rest of the analysis, the authors will only focus on those firms that outsource activities.

No difference was found between KBFs and other firms as to whether they had accepted a strategy for outsourcing or not. Technology developers seemed to have an accepted strategy more often

Table 5. Average number of employees and knowledge classification of firms

	Mean	Std. Deviation	N	p-value[a]
Non-knowledge firms	48.72	138.03	186	0.034
Neo-professional firms	24.64	54.43	121	
Professional firms	26.94	48.22	27	
Technology developers	54.57	132.69	35	
≤25%	32.57	91.96	206	0.063
25-50%	26.37	91.54	69	
>50%	23.59	53.89	101

Table 6. Proportion of firms outsourcing and knowledge classification of firms

	Yes	**No**	**p-value[a]**
Non-knowledge firms	73.4%	26.6%	0.008
Neo-professional firms	82.8%	17.2%	
Professional firms	96.4%	3.6%	
Technology developers	88.6%	11.4%	
≤25%	73.3%	26.7%	0.004
25-50%	85.5%	14.5%	
>50%	88.1%	11.9%	

[a] Chi-square test.

than other firms. Nor was any relationship noted between knowledge intensity of firms and strategy.

The outsourced activities are regarded as non-core functions in general. The responding managers classified outsourcing as supporting functions in 63.5% of cases, as core competencies in 15.9% of cases, and as a mixture of core and support functions in 20.6% of cases.

No difference was found between outsourcing of core/peripheral functions and knowledge classification of firms.

Another way to look at strategic outsourcing is to analyse the reasons given for adopting it. The most common cited reason given by managers in the survey was that they outsourced to simplify the operation of the firm (42.6%); to increase expert knowledge (36.9%); to reduce cost (34.7%), while only 3.8% mentioned minimizing risks.

The research team then grouped these outsourced motives into two categories. On the one hand are motives related to lowering cost (cost reduction, reducing investments, and minimizing risk), and strategic aspects of outsourcing (reducing labour turnover, increasing external expertise, focusing on core competencies, increasing service to customers, and simplifying the operation of the firm), on the other hand. When this classification is used, 77.3% of the managers give strategic related reasons for choosing outsourcing, while

38.5% mention cost related reasons. As multiple answers were allowed in the original question, the total percentages exceed 100%.

No significant difference was found between knowledge classifications of firms and whether they outsource for cost or strategic reasons. However, technology developers outsource more for cost related reasons than other firms, and professional firms more for strategic reasons.

Kind of Activities Outsourced

When the outsourced activities of the firms in the survey were analysed, 48.3% of the firms were found to have outsourced information technology. Accounting had been outsourced by 45.7% of the firms, followed by security services (37.5%), cleaning (33.1%) and wages and salaries (17.4%). Very few firms in Iceland had outsourced education and training (1.9%) or HRM (0.3%).

The outsourced activities were later classified by the authors into four groups: Administrative tasks (accounting, wages and salaries, finance, back office processing, and call centres); peripheral tasks (cleaning, security services, canteen, and transportation); IT and information processing (information technology, and telecommunication services); and HRM (human resource management, training, consulting). Table 7 reveals that half of the responding firms outsource administrative and peripheral tasks, as well as IT and information processing, while few outsource HRM activities.

The only difference between the outsourcing of these activities and knowledge classification of firms is that technology developers and non-

Table 7. Outsourcing of services divided into four categories. Multiple answers allowed.

Administrative tasks	51.4%
Peripheral	51.4%
IT and information processing	48.6%
HRM	15.8%

knowledge firms outsource more peripheral tasks than other firms (χ^2(3)=7.87, p=0.049). This is shown in Table 8. Also, the higher the proportion of university educated staff, the more firms outsource peripheral tasks. Knowledge-based firms, especially technology developers, seem to outsource more HRM-functions than other firms (χ^2(3)=8.70, p=0.034). Again, the higher the education of staff in the firms, the more they tend to outsource HRM-tasks. These findings do not support Hypothesis 4. KBFs seem not to outsource more activities of a narrow, explicit nature than other firms.

HRM

The majority of the managers, 86.4%, reported that outsourcing had no or insignificant impact on employment, while 8.2% had lain off staff and 6.3% had transferred staff to suppliers. These findings support Hypothesis 3; KBFs tend to keep strategic parts of HRM in-house. It is worth noting that that many of the responding firms have outsourced from the beginning; hence, changes in employment have been quite limited. The managers of professional firms most often report that outsourcing has had no significant impact on the human resources, while fewest managers in

the category of technology developers chose that alternative. The latter are, however, more likely to lay off staff, and transfer staff to suppliers. The difference is not significant. Only very limited differences were noticed when firms were classified by knowledge intensity of their employees.

Realized Benefit of Outsourcing

The managers were asked specifically whether outsourcing had led to cost reductions, given the central status of cost reduction in the debate on outsourcing. Cost had actually been reduced in 48.6% of the firms in the survey, while 51.4% of firms claimed that cost had not been reduced as a consequence of outsourcing. A probable explanation is that the firms are looking more at strategic aspects, such as reduced labour turnover or improved customer services, as already noted. Table 11 shows that managers of technology developers claim, more often than managers of other firms, that cost has actually been reduced. The difference is significant (χ^2(3)=10.1, p=0.018). No difference was found between classification of firms according to knowledge intensity and cost reduction (Table 9).

When the firms reporting reduced cost are analysed further by statistical analysis, we see an

Table 8. Proportion of firms that outsource peripheral and HRM tasks

	Peripheral	IT	HMR	Administrative tasks
Non-knowledge firms	55.8%	47.1%	8.7%	50.0%
Neo-professional firms	39.6%	53.5%	16.8%	48.5%
Professional firms	40.7%	37.0%	22.2%	40.7%

interesting pattern. More cost reduction related to peripheral tasks has been achieved in non-knowledge firms than in other firms. The difference is significant (Table 10). No difference was found between cost reduction and the knowledge intensity of firms (the proportion of university educated staff).

The managers were asked to state how strongly they agreed or disagreed with the following statements regarding their experience of outsourcing: The quality of services has improved; expert knowledge has increased; cost has been reduced; risk has decreased; more focus on core competencies; and value added has increased. According to 64.1% of the managers, the focus on core

Table 10. Cost reduction related to areas of outsourcing and knowledge classification of firms

	Peripheral	IT	HMR	Administrative tasks
Non-knowledge firms	39.4%	28.8%	4.5%	36.4%
Neo-professional firms	14.3%	21.4%	0.0%	31.0%
Professional firms	8.3%	25.0%	16.7%	33.3%

[b] Expected frequency to low for a valid Chi-square test.

competencies has increased, and more than half report that expertise has increased, as well as services to customers and service quality, and risk has been reduced. Like in previous analysis, only 35% mentioned reduced cost.

A median was also calculated from the answers on a fivefold Likert-scale, from strongly agree to strongly disagree. A mean close to 1 indicates that the managers strongly agree with the statements, while a mean close to 5 indicates that they strongly disagree with the statement. An analysis of the experience of managers revealed that managers report a rather positive experience of outsourcing, as in most cases the mean scores are below 3. On two statements the managers of neo-professional firms are more positive than manages of other firms. The difference is significant (Table 11). These statements are: Improved services to customers, and value added has increased. The managers of technology developers are more positive to the statement: focus on core competencies has increased. As can be seen from Table 11, classification of firms according to knowledge intensity does not reveal much difference regarding managers' experiences of outsourcing, except that value added has increased.

DISCUSSION AND CONCLUSION

The thrust of this article has been to analyse the extent, strategy and effects of outsourcing among KBFs and other service firms in Iceland, as well as to compare the explanatory value of theoretically orientated classification of knowledge-based firms by von Nordenflycht (2010) to an empirical concept based on knowledge intensity (the proportion of university educated staff to total staff). The result of the paper shows that the theoretical classification has more explanatory value than the empirical concept, and more nuances. The theoretical classification often gave a U-shaped pattern where non-knowledge firms and technology developers showed a similar pattern and neo- and classical professional firms another pattern. The empirical observation showed a more linear pattern in most cases. The former classification did find differences regarding age and size of firms and the realized benefit of outsourcing, whereas the latter did not.

Regarding the amount, reasons and kinds of activities outsourced, our results show that KBFs outsource on a larger scale, and they do not have a more strategic vision towards outsourcing than other firms, nor do they outsource more low

knowledge-based activities. The reasons for outsourcing were more related to strategic aspects, such as a focus on core competencies, increased external expertise, and improved customer service, rather than lowering cost. That is congruent with former research in the area (Di Gregorio et al., 2009; Kremic et al., 2006; Quinn, 1999). The most common functions to be outsourced are administrative and peripheral tasks, as well as information technology, but there was no difference in that respect between KBFs and other firms, apart from the fact that the former outsource more HRM functions Outsourcing only had an insignificant effect on employment. Almost nine managers out of ten report that outsourcing had very little impact on human resources in their firms, and less than 15% had laid off staff, or transferred staff to suppliers. These findings do not give support to Hypothesis 1, 2, and 4.

The realized benefit of outsourcing was manifested in cost being reduced in the case of 48.6% of firms in the survey, the greatest saving occurring among technology developers. Non-knowledge firms reduced cost more than other firms relating to peripheral tasks.

Technology developers seem be the most involved with outsourcing. Such firms outsource most peripheral tasks, HRM functions; realize the most cost reduction, and the managers of such firms report the most positive experience of outsourcing in regard to increased focus on core competencies. This is in line with much of KBFs literature (Lee, 1999; Currie et al., 2008; Murray et al., 2008), and corresponds most closely to the resource-base view of the firm model. Their special position among firms may be a point in case: Such firms deal with complex and innovative knowledge and they have high capital intensity. Both of these facts lead them to concentrate on core competencies by outsourcing non-core functions, and HRM functions – primary training and counselling. The latter emphasis is because they need more external expertise than other firms. This gives support to the proposition by Murray

et al. (2009) that the more innovative the firms, the more they rely on outsourcing from best-in class suppliers.

There was very limited difference regarding the outsourcing pattern of classical professional and neo-professional firms in the survey. It seems, then, that professionalism does not block outsourcing, nor does the direct contact of neo-professional firms with the most recent business trends, through consulting and advertisement, encourage outsourcing. Hypothesis 2 was not confirmed, as already noted.

This research was carried out in only one country, and is based on a telephone survey. Its results should, therefore, be interpreted with care. Future research should be characterised by a more varied research design, such as case studies and interviews, as well as cross-cultural comparison. At the same time, a fuller understanding of the outsourcing pattern of knowledge-based firms would be possible, and the theory of the knowledge-based firm could benefit from such a design.

In conclusion, this study gives support to both a resource based view of the firm, as well as the outcomes of earlier studies of KBFs (Currie et al., 2008; Murray et al., 2009; Lee, 1999). The firms in the survey tend to keep their core competencies and employees in-house, whereas they outsource other functions that they consider non-core, such as peripheral and administrative tasks, or IT that needs some technical specialization. The more innovative firms rely more on outsourcing from best-in class suppliers regarding training and counselling. The contribution of this study to the theory of outsourcing is that the non-routine tacit knowledge base related to firms' core competencies is not limited to KBFs, but applies to a large portion of service firms as well.

ENDNOTES

1   NACE Code is a pan-European classification system which groups organisations accord-

ing to their business activities. It assigns a unique 5 or 6 digit code to each industry sector.

[2] One firm was an outlier with 5000 employees and being much larger than rest of the firms in the survey, it was omitted from the analysis. If the outlier had been included, the average number of employees would have been 54.

[3] All these services have a high porportion of university educated personnel, that are considered as professionals (doctors, nurses, teachers, etc.). The only deviation from the model is that health services demand extensive capital investment.

Chapter 42
Investment in Transaction–Specific Assets and Opportunistic Behavior in a Chinese Supply Chain

ABSTRACT

This chapter addresses the relationship between a supplier and the manufacturers that it serves, from the perspective of transaction cost economics theory (TCE). TCE deals with relationships between organizations, such as customers, manufacturers and suppliers. It states that investment in transaction-specific assets opens the door for opportunistic behavior by an organization's partners. Interpreted from the perspective of a supplier, the supplier's investments in transaction-specific assets, such as dedicated plant and equipment, workforce with transaction-specific skills and the development of transaction-specific relationships, will lead to opportunistic behavior on the part of the manufacturers that they serve, providing an environment where behaviors intentionally designed to take advantage of the supplier will flourish. Because the supplier will not be able to redeploy those investments to a different manufacturer if the relationship is discontinued, manufacturers will be motivated to capitalize on this vulnerability by employing behaviors such as seeking unfair price concessions, sharing proprietary information with competitors or other unethical behaviors. This study advances the application of TCE to the context of supply chain management by breaking investments in transaction-specific assets into investments in transaction-specific tangible assets, such as plant and equipment, and transaction-specific intangible assets, such as relationships and the development of human resources, and examining their impact on opportunistic behavior separately. These relationships are examined using a survey of 230 suppliers in the household appliances industry in China. Hierarchical regression analysis revealed that there was a positive relationship between suppliers' investment in transaction-specific tangible assets and opportunistic behavior by the manufacturers that they serve, but that there was a negative relationship between suppliers' investments in transaction specific intangible assets and opportunistic behavior by their manufacturers. The moderating role of contracts and relational norms was also examined.

INTRODUCTION

What leads a manufacturer to intentionally engage in behaviors that take advantage of its suppliers? Although there is a substantial body of theoretical and empirical literature related to the benefits of supplier integration, anecdotal examples of manufacturers and suppliers that engage in behavior that is less than supportive of their partners are not unusual. Such behavior, which is known as opportunistic behavior, may include overt behaviors such as lying, cheating and demanding unfair price concessions, as well as more subtle behaviors, such as threatening to withdraw business, establishing the potential for legal action and sharing secrets with competitors.

The existence of opportunistic behavior in a supply chain presents a paradox. On the one hand, as effective supply chain design and management grows in importance in the global economy, the importance of supply chain integration has grown correspondingly (Jap, 1999; Bowersox, Closs & Stank, 1999). There is extensive literature supporting the role that supply chain integration plays in achieving competitive advantage (Bowersox & Morash, 1989; Lee & Billington, 1992; Morris & Calantone, 1991) and enhancing performance (Ahmad & Schroeder, 2001; Frohlich & Westbrook, 2001; Johnson, 1999; Narasimhan & Jayaram, 1998; Stank, Keller & Closs, 2001, Zhao, Nie, Huo, & Yeung, 2006). On the other hand, however, the very steps that a supplier takes to establish supplier integration may set the stage for opportunistic behavior by the manufacturers that it serves. According to transaction cost economics (TCE) theory, investments in transaction-specific assets create a transaction cost imbalance, which will be opportunistically exploited to benefit the partner organization. In a supply chain, this imbalance can be weighted towards either the customer or the supplier. In this chapter, we examine the situation where a supplier has made investments in transaction-specific assets, such as tooling or dedicated human resources, that are specific to

a particular manufacturer. TCE predicts that the manufacturer will capitalize on its knowledge that these investments would be difficult to redeploy to a different manufacturer if the relationship were to end, engaging in opportunistic behavior to benefit itself.

Prior research has examined the effectiveness of contracts and relational norms in safeguarding against opportunistic behavior (e.g., Achrol & Gundlach, 1999; Jap & Ganesan, 2000). An effective contract prescribes appropriate behaviors for supply chain partners, as well as routines for the distribution of outcomes. Relationship norms provide a set of mutual expectations and understandings between supply chain partners, built upon a foundation of trust and the encouragement of long term cooperative behavior. Although such mechanisms are expected to moderate the positive relationship between investments in transaction-specific assets and opportunistic behavior, the previous empirical research on this relationship is quite inconsistent. For example, Achrol and Gundlach (1999) found that contracts did not limit the opportunistic behavior resulting from a partner's investments in transaction-specific assets, while relational norms did. However, Jap and Ganesan (2000)'s study showed that neither contracts nor relational norms had any effect. Thus, there is no clear conclusion about the role that contracts and relational norms play in safeguarding against the opportunistic behavior associated with investments in transaction-specific assets.

Part of the reason for the apparently contradictory results is that transaction-specific assets vary in their tangibility. For example, investment in plant, equipment and tooling dedicated to serve a specific customer is visible, and it is relatively easy to evaluate the value of the investment because the assets are physical and tangible in nature. In contrast, investments in time, the development of human resources to help better understand a supply chain partner's needs and customized processes to meet the customer's needs are much more difficult to value and fully account for (Nielson,

1996; Perks & Easton, 2000) because the assets are intangible in nature. Thus, relationship between investments in transaction-specific assets and opportunistic behavior may be influenced by the tangibility of the transaction-specific asset investments. Because previous research has generally ignored the tangibility dimension, it has neglected the effect of transaction-specific asset tangibility on opportunistic behavior.

To address these challenges, this chapter draws upon transaction cost economics theory to study the effect of a supplier's investments in transaction-specific assets on opportunistic behavior by the manufacturers it serves. It divides transaction-specific investments into investments in tangible and intangible assets, according to the nature of the specific investment, exploring their individual effects on the opportunistic behavior of manufacturers, as well as addressing the moderating effect of contracts and relational norms on these relationships.

BACKGROUND

Transaction-Specific Assets

Transaction cost economics theory (TCE) views the relationship between organizations, such as a manufacturer and a supplier, in terms of the cost of conducting the exchange. Originally developed by Coase (1937) and expanded by Williamson (1975, 1985, 1991), TCE describes how organizations seek efficiency by minimizing the sum of their production and transactions costs (Joshi & Stump, 1999a) through optimal allocation of producing in house versus buying from a trade partner (Heide, 1994). It posits that there are key managerial tendencies that must be considered. Most prominent of these is opportunism; that is, given the opportunity, a manager, and hence his organization, will export any transaction cost imbalance between organizations for his own organization's benefit. Described as "self-seeking

with guile" (Williamson, 1985, p. 47), opportunism can include lying and cheating, as well as more subtle forms of deceit such as violating implicit agreements (Rindfleisch & Heide, 1997). Opportunistic behavior can be initiated by any member of a supply chain, depending on the direction of the transaction cost imbalance. In this chapter, we focus solely on opportunistic behavior by manufacturers toward their suppliers.

According to TCE, the two factors that determine whether there is an imbalance in transactions costs are asset specificity and environmental uncertainty (Joshi & Stump, 1999a). We focus on asset specificity, which is defined as the extent to which asset investments are specific to a transaction. A transaction-specific investment is one which cannot be easily redeployed to a different manufacturer. For example, a supplier to Dell might build a facility within a few miles of a Dell manufacturing plant. A supplier to General Motors might invest in expensive tooling that is specific to the needs of a GM plant. In each case, the supplier has made an investment in transaction-specific assets. These assets are unique to the customer and would be difficult or impossible to redeploy to a different customer if the relationship ended. Investments in transaction-specific assets play an important role in supply chain integration, because they help to achieve effective and efficient flows of products, services, information, money and decisions (Zhao et al 2008), demonstrate partners' intentions of maintaining the supply chain relationship for the long term (Anderson & Weitz, 1992) and have the potential to bring substantial benefits for both supply chain partners (Ghosh & John, 1999; Rokkan, Heide & Wathne, 2003).

However, because investments in transaction-specific assets cannot be easily redeployed to contexts beyond the specific relationship, a supplier which makes such investments becomes vulnerable to opportunistic behavior by manufacturers (Heide & John, 1988; Heide & Stump, 1995; Achrol & Gundlach, 1999; Sheng, Brown, Nicholson & Poppo, 2006; Gundlach, Achrol

& Mentzer, 1995). The presence of transaction-specific assets indicates an imbalance, which TCE predicts will be unscrupulously exported by manufacturers to serve their own self interest (Rindfleisch & Heide, 1997).

The conceptual literature on TCE categorizes transaction-specific assets in several ways. Lohita, Brooks and Krapfel (1994) summarized 76 previous research studies, finding that some focused on transaction-specific human assets, while others identified transaction-specific physical assets. Nielson (1996) concluded that investments in transaction-specific assets are generally divided into two or three categories. Grover and Malhotra (2003) pointed out that much of the operations and supply chain management research focused on transaction-specific human assets and paid little attention to other types of transaction-specific assets, such as physical assets or brand name assets. Figure 1 summarizes the categories used in related studies. The three-category typologies tend to break transaction-specific investments into physical assets, human assets and procedural assets. Physical assets refer to investments in plant and equipment that are geared to a given supply chain partner. In contrast, human assets include investments that are tailored towards learning how to do business with a particular supply chain partner, such as recruitment and training to meet the needs of a specific manufacturer. Procedural assets are processes or services that are specialized to the requirements of a particular partner, embedded in the way the firm performs its day-to-day business functions (Jackson, 1985).

The research which classifies transaction-specific investments into two categories tends to merge procedural and human assets. This is reasonable, since both are more difficult to value than physical assets and because it is human resources that perform procedures. For example, Subramani and Venkatraman (2003) argued that transaction-specific investments are comprised of tangible and intangible assets. Tangible assets include physical assets, such as plant, equipment and tooling, and site specificity, while intangible assets include dedicated human assets, business routines and processes that are specialized for a given supply chain partner. Nielson (1996) divided investments in transaction-specific assets into investments into hard or soft assets. Hard assets are relatively more concrete and tangible investments which are material or physical in nature, such as modification of products, specific equipment and location of a facility. Soft assets are investments in human assets, procedural and temporal assets, such as the time invested in developing a relationship. Brown, Dev and Lee (2000) found that partners made investments in tools, equipment and procedures, as well as training employees to use equipment that is specialized for a given partner. Artz and Brush (2000) noted that transaction-specific investments in OEM-supplier relationships were primarily composed of human, physical and temporal assets. Rokkan, Heide and Wathne (2003) described investments in transaction-specific assets as including physical assets, systems, procedures and human assets.

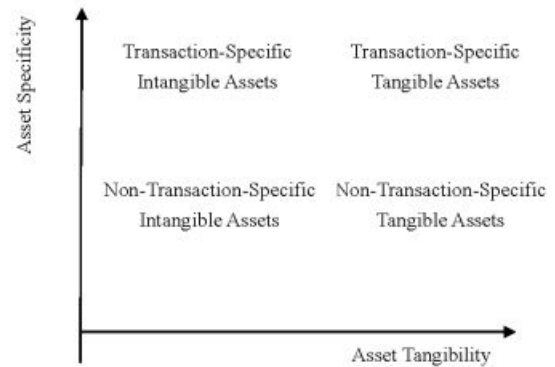
Subramani & Venkatraman (2003)				•					•

Current research suggests the importance of both types of transaction-specific investments to supply chain relationships. For example, Anderson and Weitz (1992) indicated that firms invest in human assets, site specificity and other resources to support supply chain relationships. Based on the literature, we divide transaction-specific investments by suppliers into tangible and intangible asset investments. Tangible assets are defined as physical assets, such as modification of products, special plant and equipment or location, while intangible assets include investments in human assets, procedures and temporal assets.

Figure 2 graphically describes the scope of this chapter. The vertical axis describes the level of asset specificity of a supplier's investments. The higher the level on the vertical axis, the more specific the investment is to the needs of a particular manufacturer and the more difficult it will be to redeploy that investment to a different manufacturer if the relationship is terminated. The horizontal axis represents the degree of tangibility of the investment. Investments which are farther to the right are more physical and tangible, making them easier to value. Investments which are farther to the left are more intangible and focused on knowledge and the development of human resources and procedures. At the lower left of Figure 2 are non-transaction-specific investments in training and procedures, such as investment in TQM and JIT. Such investments would be easy to deploy to a different manufacturer and may, in fact, be a selling point for the suppliers. At the bottom right are non-transaction-specific investments in physical assets, such as the building of a state-of-the-art manufacturing facility, which would be easy to use to meet the needs of a variety of manufacturers. In contrast, investments in the upper right quadrant would be difficult to redeploy, such as investments in expensive tooling which can only be used to make parts for GM and which could not be redeployed if GM were to withdraw its business. Similarly, investments in the upper left quadrant, such as investments in GM-specific

Figure 2. Tangibility and specificity of asset investments


training that would be difficult to redeploy if the relationship with GM were to come to an end.

Although the conceptual literature divides investments in transaction specific assets into several categories, the empirical literature tends to operationalize investments in transaction specific assets as a unidimensional construct, examining only the vertical axis in Figure 2. By ignoring the tangibility dimension, the effects of investments in tangible and intangible assets become commingled, making them difficult to explain. Examination of both asset specificity and asset tangibility may provide an explanation for the inconsistencies in the prior empirical literature.

Opportunistic Behavior

Investment in transaction-specific assets creates an environment where opportunistic behavior will flourish, due to the vulnerability that a supplier creates through its transaction-specific investments, according to TCE. Opportunistic behavior is defined as "self-interest seeking with guile" (Williamson, 1975, p.6), with guile described as "lying, stealing, cheating, and calculated efforts to mislead, distort, disguise, obfuscate, or otherwise confuse" (Williamson, 1985, p.47). What sets opportunistic behavior apart from the standard economic assumption

of self-interest-seeking behavior is that it violates explicit or implicit contracts (Achrol & Gundlach, 1999), reflected in such behaviors as offering proprietary information to competitors, not adhering to promises or reducing efforts in joint tasks (Blumberg, 2001; Provan & Skinner, 1989). These behaviors seek self-interest through the manufacturer's calculated efforts to mislead and confuse its suppliers (Dahlstorm & Nygaard, 1999).

Consider, for example, the case of OneSupp, an organization that worked diligently to be selected as a supplier for Medical Products Company (MPC), a leading manufacturer of implantable medical devices (both disguised names of actual companies). In order to produce the unique parts that MPC demanded, OneSupp invested in expensive tooling that could only be used to make parts for MPC and developed a proprietary material, as well as developing workforce and design engineers who were dedicated to producing MPC's parts. Eventually, it established a small satellite operation that was less than two miles from MPC's factory, so that it could supply parts just-in-time to MPC's assembly line. Thus, OneSupp made investments in both transaction-specific tangible assets (tooling and location of its operation) and intangible assets (selection and training of workforce and engineers). This relationship was quite successful initially. Over time, however, MPC began to extract annual and painful price concessions from OneSupp. In addition, it shared some of OneSupp's proprietary material and process developments with OneSupp's competitors, in hopes of developing alternative suppliers in order to extract further price concessions from One-Supp. Because OneSupp had made substantial investments that were specific to its relationship with MPC, there was little that it could do to combat these moves.

Relationship between Investments in Transaction-Specific *Tangible* Assets and Opportunistic Behavior

Examining the tangibility of asset investments expands upon the foundation provided by TCE, which focuses on the dimension of asset specificity. Transaction-specific investments in tangible assets (the northeast quadrant in Figure 2) are geared to a specific supply chain relationship and cannot be easily redeployed to other relationships (Nielson, 1996; Heide & John, 1988). If the relationship were to be terminated, the value of these assets would be largely lost, and the supplier would suffer greatly. Because the supplier expects to offset the costs of its transaction-specific investments in tangible assets through a long-term relationship with the manufacturer, the supplier's dependence on the manufacturer increases with its transaction-specific investments in tangible assets. As a result, the manufacturer is more likely to shirk its obligations and exploit the supplier, in the absence of appropriate safeguarding mechanisms (Achrol & Gundlach, 1999; Rokkan, et al., 2003), according to TCE. For example, the manufacturer may force contract renegotiation by threatening termination of the relationship, for its own benefit. Thus,

H_{1a}*: Greater supplier tangible asset specificity will be associated with more opportunistic behavior by the manufacturer.*

Relationship between Investments in Transaction-Specific *Intangible* Assets and Opportunistic Behavior

Transaction-specific investments in intangible assets by suppliers (the northwest corner of Figure 2) include investments in dedicated human assets, training, time for developing the relationship, procedures and other difficult to value assets (Nielson, 1996). Although we hypothesized that transaction-specific investments in tangible assets would lead to greater opportunistic behavior by the

manufacturer, we expect the opposite relationship for transaction-specific investments in intangible assets. We propose that the more that a supplier invests in intangible assets that are specific to a supply chain relationship, the less likely the manufacturer will be to engage in opportunistic behavior, for several reasons.

First, the development of transaction-specific intangible assets requires a substantial amount of time (Weiss & Kurland, 1997), for example, the time it takes for the supplier's employees to learn the nuances of dealing with the manufacturer's requirements and modifying its procedures to satisfy these requirements. As they are developed, these procedures become embedded in the supplier's employees and day-to-day routines (Simon, 1996; Zack, 1999), making it difficult for the manufacturer to directly observe and account for their value (Nielson, 1996). Because their value is less obvious, the manufacturer will be less tempted to take advantage of the supplier's investment to engage in opportunistic behavior. Thus, it is more difficult for a manufacturer to exploit transaction-specific intangible asset investments.

Second, in order for the supplier to learn the manufacturer's requirements and modify its own procedures, it must engage in frequent downstream communication with the manufacturer, in order to understand the manufacturer's needs (Subramani & Venkatraman, 2003). Because the supplier has developed an understanding of the manufacturer's behavior and intentions, it has a better basis for monitoring the manufacturer's activities, making it more difficult for the manufacturer to engage in behaviors that take advantage of the supplier. Third, as the supplier works to master the knowledge that is specific to the relationship, the manufacturer becomes better acquainted with the supplier, increasing its upstream communication and interaction with the supplier. As the manufacturer becomes familiar with the supplier's intention to maintain the supply chain relationship, it may relate to the effort that the supplier has made to develop and improve the relationship and develop

a better understanding of the supplier's sincerity and capability, laying the foundation for trust. As the manufacturer's trust in the supplier increases, it becomes more likely to cooperate with the supplier (Nielson, 1996). This reduces the possibility of the manufacturer engaging in behavior which would endanger the relationship.

Fourth, in order to effectively train employees and modify procedures, the supplier needs the manufacturer's help so that it can tailor its investment in intangible assets to best realize both partners' goals. Thus, the manufacturer must also invest some time and resources during this process. If the relationship ends, the manufacturer would need to find another supplier and invest more time into helping it learn the manufacturer's requirements and practices. Thus, there are also transaction costs for the manufacturer associated with terminating the relationship. In other words, the manufacturer makes reciprocal investments into the relationship. Artz (1999) argued that the party making reciprocal investments will make efforts to maintain the exchange relationship. Thus, considering the potential loss from terminating the supply chain relationship, the manufacturer will reduce its opportunistic behavior when the supplier invests intangible assets into the supply chain relationship. Therefore, we put forward the following hypothesis,

H$_{1b}$: *Greater transaction specific intangible asset specificity by a supplier will be associated with less opportunistic behavior by the manufacturer.*

Moderating Effect of Contracts

The literature suggests that the relationship between investments in transaction-specific assets and opportunistic behavior is moderated by mechanisms used to safeguard against opportunistic behavior, such as contracts. Contracts explicitly prescribe roles and obligations, determine the content of the exchange and the division of outcomes, and specify penalties for violation

of contractual specifications (Poppo & Zenger, 2002; Jap & Ganesan, 2000; Dyer, 1997; Cannon, Achrol & Gundlach, 2000). Wuyts and Geyksens (2005) pointed out that "sufficiently elaborate and carefully constructed contracts serve as a form of quasi-integration and establish a vertical inter-firm authority relation that can subsequently guide behavior." Thus, contracts are hypothesized to play a critical role in supply chain relationships (Antia & Frazier, 2001).

However, previous empirical findings on the moderating role of contracts have been mixed. We posit that this is due to the prior empirical operationalization, which focuses only on asset specificity, without also considering asset tangibility. In the case of tangible asset investments, the supplier and manufacturer will have negotiated the supplier's investment at the beginning of supply chain relationship. Thus, before the exchange relationship even begins, the value of the transaction-specific tangible asset investment can be clearly accounted for, and the supplier can forecast its loss if the manufacturer were to engage in opportunistic behavior. Thus, we argue that the supplier can safeguard its investments in transaction-specific tangible assets by writing a detailed contract before the relationship begins. This will mitigate opportunistic behavior by the manufacturer in several ways.

First, an explicit contract prescribes appropriate behavior in the supply chain relationship, as well as each partner's roles and obligations (Achrol & Gundlach, 1999; Poppo & Zenger, 2002), for example, how to invest in and use the transaction-specific tangible assets, such as tooling and equipment. The activities of both partners are restrained, and behavior uncertainties are reduced. In the presence of an explicit contract, the costs to the manufacturer for shirking its responsibilities are known and its obligations increase. Because of this, the manufacturer is less likely to engage in opportunistic behavior.

Second, a good contract not only provides a framework for behavior, but it also determines

the pattern of outcome distribution (Wuyts & Geyskens, 2005). Because the supplier and the manufacturer clearly know how the outcomes created by supplier's investment in tangible assets will be distributed, each is conscious of its own returns from the relationship. Thus, it would be difficult for a manufacturer to exploit its relationship with a supplier through an advantageous position in the supply chain relationship. Third, a well-written contract explicitly states the punishment for violating contractual agreements (Poppo & Zenger, 2002). Because of this, a manufacturer will be able to clearly consider the potential penalties as it considers escaping from its obligations or exploiting the supplier's investments in tangible assets (Jap & Ganesan, 2000). This will reduce the manufacturer's opportunistic behavior related to investment in transaction-specific tangible assets. Thus,

H$_{2a}$: *The more the supplier relies on contracts to govern the supply chain relationship, the weaker the relationship between its tangible asset specificity and opportunistic behavior by the manufacturer.*

In contrast, we postulate that the moderating effect of contracts on the relationship between a supplier's investment in transaction-specific intangible assets and opportunistic behavior by the manufacturer will be more complex. This relationship depends on the level of detail of the contract, as follows.

First, the process of negotiating and drafting a contract will foster a mutual understanding of the exchange activities. The contract between the supplier and manufacturer provides the foundation for their exchange and increases the transparency of the relationship (Lui & Ngo, 2004; Cannon, et al., 2000). With the contract as the guiding framework and the knowledge gained about the manufacturer's needs and requirements through the process of contract negotiation and drafting, the supplier will be able to invest more effectively

in intangible assets that benefit the manufacturer. For example, the supplier will be able to better select and train dedicated personnel to serve the manufacturer and to modify processes and procedures to better meet the manufacturer's needs and requirements. The contract also sets realistic expectations for the manufacturer and allows the manufacturer to understand the benefits of the supplier's investment in intangible assets and of its relationship with the supplier. Consequently, the manufacturer's intention to engage in opportunistic behavior will decrease. Thus, when a contract is more general and not overly relied upon, it mitigates the undesirable (positive) effects and enhances the desirable (negative) effect of investments in transaction-specific intangible asset on the opportunistic behavior of the manufacturer.

However, some contracts move beyond providing a guiding framework to specifying obligations and rights in excruciating detail. When this is the case, the use of a contract can reduce the desirable effect of the supplier's investment in transaction-specific intangible assets on the manufacturer's opportunistic behavior, in terms of decreasing the opportunistic behavior of the manufacturer. Because a very detailed contract may be perceived as intervening in decisions between the partners, it can signal distrust (Cavusgil, Deligonul & Zhang, 2004). The manufacturer may become suspicious about the supplier's motivation and intentions, as the supplier's employees try to learn about the manufacturer's situation and requirements. Furthermore, as the supplier and manufacturer overly rely on a contract, their behaviors are constrained by detailed contractual clauses. As a result, the supplier's transaction-specific intangible investment in understanding the manufacturer's needs, processes or procedures and in customizing the processes or procedures to meet their needs may not bring benefits to the manufacturer, because its potential improvement actions may be constrained or prohibited by contractual clauses. Therefore, over-reliance on very detailed contract will reduce the efficiency and effectiveness of a supplier's

investment in transaction-specific intangible assets. Hence, the manufacturer may perceive the relationship with the supplier as not bringing about sufficient outcomes and become concerned about information requests from the supplier, making it more likely to engage in opportunistic behavior. Thus, we put forward the following hypothesis,

H_{2b}: *The moderating effect of contracts on the relationship between the supplier's transaction-specific intangible asset specificity and manufacturer's opportunistic behavior will be non-linear.*

Moderating Effect of Relational Norms

Some authors (e.g., Barney, 1999; Conner, 1991; Ghoshal & Moran, 1996) have criticized TCE as overemphasizing opportunistic behavior. Indeed, there are many examples of supply chain partnerships with imbalanced investments in transaction-specific assets where there is not opportunistic behavior. This may be due to the development of relational norms between the supply chain partners. Relational norms are defined as "expectations about behavior that are at least partially shared by a group of decision makers" (Heide & John, 1992). They identify a set of mutual expectations and understandings between the partners (Lusch & Brown, 1996), built upon solidarity, flexibility, information exchange, participation and other dimensions (Heide & John, 1992; Jap & Ganesan, 2000; Cannon, et al., 2000). Solidarity is the bilateral expectation that a high value is placed on the relationship and behaviors are directed toward relationship maintenance, while flexibility is the bilateral expectation of willingness to make adaptations as circumstances change. Information exchange refers to the expectation that the parties will freely and actively provide useful information to each other, and participation is the joint expectation that both parties share, make decisions and set goals regarding all aspects of the exchange.

We suggest that the positive relationship between a supplier's investment in transaction-specific tangible assets and opportunistic behavior by the manufacturer will be reduced when the supplier relies more heavily on relational norms to govern the relationship, for several reasons. First, relational norms emphasize a vision of the supplier and the manufacturer as a cohesive whole, and focus on cooperation, rather than adversarial relationships. This guides the supplier and manufacturer toward engaging in behaviors that are beneficial to the relationship and restricting behaviors that seek self-interest (Heide & John, 1992; Achrol & Gundlach, 1999). Thus, when a supplier invests in transaction-specific plant and equipment, relational norms will guide the manufacturer to focus on the total benefits and returns from the relationship, not just on its own interests. Hence, the manufacturer will engage in cooperative behavior (Joshi & Stump, 1999b), lessening the likelihood that it will resort to opportunistic behavior.

Second, relational norms induce partners to maintain a long-term relationship and understand that the long-term returns from investments in transaction-specific tangible assets surpass the short-term returns potentially associated with opportunistic behavior (Wuyts & Geyskens, 2005). The manufacturer will reflect on this as it considers exploiting the supplier's investment in transaction-specific tangible assets. Supporting this perspective, Joshi and Campbell (2003) described relational norms as restricting the partner's opportunistic behavior through emphasizing the "shadow of the future".

Third, relational norms drive the supplier and manufacturer to exchange proprietary information and make operational suggestions. Through improved communication, the supplier knows more about the manufacturer's behaviors and intentions, facilitating its monitoring of the manufacturer's activities. This limits the likelihood of the manufacturer engaging in opportunistic behavior caused by the increase in the supplier's investment in transaction-specific tangible assets. On the other hand, the supplier can influence the manufacturer's decisions by providing suggestions and advice on production and business decisions, helping the manufacturer execute its responsibilities and roles in the supply chain relationship (Jap & Ganesan, 2000). Thus,

H$_{3a}$: *The more the supplier relies on relational norms to govern the supply chain relationship, the weaker the relationship between its transaction-specific tangible asset specificity and opportunistic behavior by the manufacturer.*

Similarly, we argue that the more that the supplier relies on relational norms to govern the supply chain relationship, the stronger the negative relationship between its investment in transaction-specific intangible assets and opportunistic behavior by the manufacturer, for the following reasons. First, relational norms emphasize sharing of values and goals between supply chain partners (Brown, et al., 2000), encouraging them to closely coordinate their activities (Artz & Brush, 2000). When a supplier trains its employees to learn the manufacturer's requirements and modifies its business processes to adapt to the specific context, the manufacturer will realize that these are sincere efforts to realize their shared goals, and it will respond accordingly. Furthermore, the manufacturer will consider it beneficial to maintain the relationship with the supplier, in order to realize its own goals. The manufacturer will be less likely to engage in behaviors that could undermine the relationship. Therefore the increased use of relational norms will enhance the desirable (negative) effects of the supplier's investment in transaction-specific intangible assets on the manufacturer's opportunistic behavior.

Second, relational norms, such as information exchange and participation, establish a platform for communication through which the supplier

and the manufacturer learns about each other's intentions (Madhok, 1995). More frequent information exchange helps the supplier's employees to master and better satisfy the manufacturer's requirements. Frequent interaction aids the supplier in adapting to the manufacturer's organizational processes, enlarging their exchange and improving the outcomes of the relationship. As outcomes improve, the manufacturer is more likely to continue the relationship with the supplier and less likely to engage in opportunistic behaviors that could destroy the relationship. Ultimately, the increased use of relational norms enhances the desirable (negative) effect of supplier's investment in transaction-specific intangible assets on opportunistic behavior by the manufacturer.

Third, relational norms encourage the supplier and manufacturer to resolve problems and conflicts between them (Noordewier, John & Nevin, 1990; Dant & Schul, 1992). When the inevitable conflicts occur as a supplier adjusts its operations procedures and masters the manufacturer's requirements, relational norms encourage each party to think over the differences from other's

perspective and make efforts to accommodate the partner or find a new solution (Gilliland & Bello, 2002). The existence of strong relational norms helps to resolve conflicts quickly, before they deteriorate into major disagreements, which helps to create a lasting relationship. Because the manufacturer intends to maintain the relationship with the supplier, it will make coordinative efforts that are helpful to the development of the relationship, rather than engaging in opportunistic behavior. Thus,

H$_{3b}$: *The more the supplier relies on relational norms to govern the supply chain relationship, the stronger the negative relationship between its transaction-specific intangible asset specificity and opportunistic behavior on the part of the manufacturer.*

Based on the above arguments, we put propose the conceptual model illustrated in Figure 3.

Figure 3. Conceptual model of the relationship between investments and transaction-specific assets and opportunistic behavior
METHOD

Sampling and Data Collection

We chose the Chinese household appliance industry as the population for testing our research hypotheses because it is an industry which has become marketized to a great extent since the 1980's, and it reflects the basic characteristics of supply chain relationships in China. Due to the difficulty of collecting data from suppliers, we solicited the help from a major manufacturer of household appliances, which we will call AP-PCOM. APPCOM has a very broad product line, which includes televisions, air conditioners, water heaters, vacuum cleaners and many other products. There are many firms competing in these markets in China, including Changhong, Chuangwei, Electrolux, Green, Haier, Hisense, Kangjia, Media, Mitsubishi, Philips, LG, Samsung, Sanyo, Sharp, Siemens, Sony, TCL, Toshiba and Zhigao. APPCOM is one of the top five manufacturers of electrical appliances and has a nationwide network of 700 suppliers. These companies serve as suppliers to many manufacturers, in addition to APPCOM, thus they provide a good cross-section of suppliers in the household appliances industry.

We randomly selected 350 suppliers from this list as our sample setting. We contacted the sales manager in each selected firm, described the objectives of the study and invited them to participate. We promised that the information that they provided would not be shared with APPCOM. All of the contacted suppliers agreed to take part in the study. We asked the sales managers to identify the best informant to complete the questionnaire, with respect the most recent main customer (the focal customer), other than APPCOM, that the supplier had dealt with. We intentionally excluded APPCOM to avoid any potential bias related to APPCOM's provision of the contact information for these suppliers. The key informant was the person in charge of the relationship with the focal customer. He/she was asked to complete the

questionnaire, based on the supplier's relationship with the focal customer. Thus, the unit of analysis was the supplier-manufacturer (customer) dyad.

The first wave of questionnaires was sent to the key informants, with a return envelope and guide for completion. Follow-up telephone calls were made to remind and encourage the respondents to complete the questionnaire. After four weeks, we sent a second wave of questionnaires to those companies that had not responded. 249 completed questionnaires were received, with 19 discarded due to invalid or incomplete responses. 230 responses were used in the final analyses, representing a response rate of 65.71%.

We used several approaches to evaluate the qualifications of the key informants. First, each respondent was asked to describe how familiar he/she was with the relationship with the focal customer using a 5- point Likert scale (1=not at all, 5=very familiar). The responses had a mean of 4.29, which indicated that the respondents were knowledgeable about the relationship. Second, the respondents' job titles indicated that 81.9% were sales managers in charge of managing the relationship with the focal customer, and 18.1% were sales employees responsible for dealing with the focal customer. Third, the average length of relationship between the supplier and focal customer was 5.66 years, and the respondents had been involved in the relationship with the focal customer for an average of 3.35 years. Thus, the respondents were familiar with and knowledgeable about the relationship.

To test for non-response bias, we first compared the early and late returned questionnaires on several dimensions, including characteristics of the respondents (work experience, job title and the length of time that the respondent had been involved in the relationship), firm size and the length of relationship with the focal manufacturer. There were no statistically significant differences between early and late respondents. Second, we contacted the 50 non-responding companies by telephone and asked for their response on several

questions about firm size and the length of their relationship with the main manufacturer their firm had dealt with in its most recent selling decision. The respondents were compared with the 50 non-respondents using t-tests (Armstrong & Overton, 1977). The results indicated no significant response bias in these data. Thus, we concluded that the effect of non-response bias on the results was not significant.

Questionnaire

We developed a questionnaire based on prior research on transaction-specific investments, opportunistic behavior and control mechanisms. The items were all borrowed from past research (Sudman & Bradburn, 1982) and adapted to the context of appliance manufacturing in China. The questionnaire was originally drafted in English, then translated into Chinese by three researchers. It was then translated back into English by another two researchers and checked for consistency with the original questionnaire, in order to rule out any

problems arising from idiomatic or colloquial wording (Parameswaran & Yaprak, 1987). The measurement items used for each construct are summarized in Figure 4.

Investments in Transaction-Specific Assets. Tangible asset specificity was operationalized as the extent to which the supplier invested in specialized physical resources. Intangible asset specificity was operationalized as the extent to which the supplier invested in specialized non-physical resources, including transaction-specific human resources and time spent on building the relationship and becoming accustomed to the specialized business process/procedures (Subramani & Venkatraman, 2003).

Opportunistic Behavior. The scale measuring opportunistic behavior was developed based on the study by Rokkan, et al. (2003), which described the extent to which a manufacturer engages in "self-seeking behaviors with guile" (Rokkan, et al., 2003; Wathne & Heide, 2000), such as failing to fulfill its obligations or achieve its promises, distorting information, taking advantage of "holes"

in contracts and using unexpected events to extract concessions from the supplier.

Contracts. This scale was developed based on the studies by Jap and Ganesan (2000) and Cannon, et al. (2000). The items reflect the extent to which the supplier and the manufacturer use explicit and detailed written contracts to coordinate the supply chain relationship.

Relational Norms. Relational norms include information exchange, participation, solidarity and flexibility (Heide & John, 1992; Jap & Ganesan, 2000). In order to measure these constructs, the items reflect the extent to which each partner is willing to provide information to the other partner, provide suggestions and recommendations about the other partner's business, make efforts directed toward preserving the relationship and make good faith adjustments when facing uncertainties.

Control Variables: Because the dependent variables may be affected by factors outside the model, additional variables of less conceptual interest were included, in order to properly specify the equation. Because dependence between supply chain partners is regarded as central to understanding and explaining supply chain partners' behaviors (Adnaleeb, 1996), we included the manufacturer's dependence on the supplier and the supplier's dependence on the manufacturer. Previous studies have argued that the environmental context, such as a gloomy industry forecast, may influence partners' behavior (Joshi & Campbell, 2003; Wuyts & Geyskens, 2005), in particular, opportunistic behavior (Heide, 1994; Wuyts & Geyskens, 2005). In contrast, if the industry is perceived as having a bright future, the supplier and manufacturer may be more likely to engage in cooperative behavior. Thus, perception of both environmental uncertainty and the future of the industry were included as control variables. Exchange history may also affect the behavior of supply chain partners (Dwyer, Schurr & Oh, 1987), and the length of their interaction may influence how they coordinate their exchange (Johnson, 1999), which can further influence the potential for

opportunistic behavior. Thus, relationship length and the length of time that respondents have been involved in the relationship were taken into consideration. Finally, the complexity of the exchange may affect the behavior of supply chain partners (Kim & Hsieh, 2003), thus, coordination and transaction costs were taken into consideration.

There was the potential for common method bias, since the responses measuring all of the constructs were taken from the same questionnaire. If common method bias was a serious problem, we would expect a single factor to emerge from a factor analysis or one general factor to account for most of the covariance in the independent and criterion variables (Podsakoff & Organ, 1986). Thus, we performed factor analysis on items related to the predictor variables and criterion measures. No general factor was apparent in the unrotated factor structure; therefore, no common method variance problem was detected.

Measure Validation

The measurements were subjected to several forms of reliability and validity analysis prior to testing the hypotheses. Content validity was assured by a comprehensive review of the literature and adoption of existing scales, whenever possible. Furthermore, we conducted a pretest and in-depth interviews with ten suppliers randomly chosen from APPCOM's suppliers. We administered the original questionnaire and asked for their evaluation of it, assessing the appropriateness of the terminology used, the clarity of the instructions, the response formats and the relevance of the items to supply chain practice. Based on the pilot study and the respondents' feedback, we modified the wording of scale items, directions and other survey procedures. We then pilot tested the questionnaire with 15 randomly chosen suppliers, and their feedback showed that there were no significant problems with the questionnaire.

Item-to-total correlations and exploratory factor analyses were performed to purify the

measurement items. Items with item-to-total correlations below 0.4 or high cross-loadings were dropped. Reliability estimates were computed using Cronbach's alpha. All values were above 0.7, indicating high internal consistency. The factor unidimensionality of the entire set of items was demonstrated by their high loadings on the intended factor and low loadings on the other factors and assessed using confirmatory factor analysis (CFA). Chi-square values for the model were significant for the data (χ^2=464.83, χ^2/df=2.60, p=0.000), and the other indices likewise showed a good fit (NFI=0.91, NNFI=0.93, CFI=0.94, IFI=0.94, RMSEA=0.078). Convergent validity was also measured by using CFA. The factor loadings were all significant (Bagozzi & Yi, 1988; Fornell & Lacker, 1981) and greater than 0.5, except for one item related to coordination cost, which was a control variable (see Figure 4). The average variance extracted was greater than 40% for each scale, indicating that the measurement items adequately measured the constructs.

Discriminant validity was assessed in several ways. First, we assessed whether the 95% confidence interval of the correlations between all pairs of factors included 1.0. None did, indicating good discriminant validity (Anderson & Gerbing, 1988). Second, we built a constrained CFA model, in which correlations between each of the possible pairs of the constructs were set to one. This was compared with the original unconstrained model, in which the correlations were freely estimated. All the chi-square differences were significant (O'Leary-Kelly & Vokurka, 1998), indicating discriminant validity.

ANALYSIS AND RESULTS

The analysis began with calculation of the mean, standard deviation and correlations among all constructs and variables, presented in Figures 5, 6, and 7. The hypotheses were tested using hierarchical regression, where the dependent variable was op-

portunistic behavior by the manufacturer. In order to mitigate the potential for multicollinearity, the independent variables were mean-centered prior to the regression analysis (Aiken & West, 1991). In the first step, the control variables were entered into the equation. As expected, the regression equation was significant. However, environmental uncertainty, suppliers' and manufacturers' dependence and duration of the relationship were not significant. Next, the main independent variables (investment in transaction-specific tangible and intangible assets) were entered into the equation, and the resulting regression equation was significant. The R^2 value increased significantly from Model 1 to Model 2, indicating significant main effects. In the third step, the moderating variable main effects (contracts, contracts squared and relational norms) were entered into the equation. Although the resulting regression equation was significant, the F-test for the change in R^2 indicated that Model 3 and Model 2 were not significantly different, thus the addition of contracts, contracts squared, and relational norms did not add to the predictive ability of Model 2. In the final step, the interaction terms were entered into the equation, and the overall model was significant. In addition, the R^2 value increased significantly from Model 3 to Model 4, indicating significant interaction effects. These results are summarized in Figure 8.

$H1_a$ and $H1_b$ addressed the relationship between a supplier's investment in transaction-specific tangible and intangible assets and opportunistic behavior by the manufacturer. The empirical findings showed that, without considering the moderating effects of contracts and relational norms, the supplier's investment in transaction-specific *tangible* assets was associated with an increase in opportunistic behavior by the manufacturer. In contrast, the supplier's investment in transaction-specific *intangible* assets was associated with a decrease in opportunistic behavior by the manufacturer. Thus, H_{1a} and H_{1b} were both supported.

H_{2a} and H_{2b} predicted that contracts would moderate the relationship between the supplier's

investment in transaction-specific assets and opportunistic behavior by the manufacturer. A true moderating effect is indicated by a variable whose main effect was insignificant in Model 3, but whose interaction effect was significant in Model 4. Our empirical findings revealed that contracts did not significantly moderate the relationship between investments in *tangible* assets and opportunistic behavior by manufacturers, but did significantly moderate the relationship between investments in *intangible* transaction-specific assets and opportunistic behavior. While there was not a significant linear or nonlinear main effect for contracts in Model 3, the interaction terms for intangible assets and contracts and intangible assets and contracts squared were both statistically significant in Model 4. Thus, the use of contracts moderated opportunistic behavior by the manufacturer in the presence of the supplier's investment in transaction-specific intangible assets in a nonlinear fashion.

This relationship is illustrated in Figure 9, which plots the partial derivative of the manufacturer's opportunistic behavior against transaction-specific intangible assets over contracts. The value dOB/dIA (OB=opportunistic behavior; IA=investment in transaction-specific intangible assets) represents the slope of the linear relationship between opportunistic behavior and investment in transaction-specific intangible assets. Figure 9 shows that this is a U-shaped function. When contract detail is low, the slope is positive, indicating that increased investment in transaction-specific intangible assets increases the manufacturer's opportunistic behavior. As contract detail increases, however, the undesirable (positive) effect of transaction-specific investment in intangible assets on opportunistic behavior decreases. When contract detail is greater than 2.82 (centered score greater than -1.86), the slope becomes negative, which means that an increase in investment in transaction-specific intangible assets is associated with less opportunistic behavior by the manufacturer. However, as contract detail

increases further and reaches 5.58 (centered score greater than +0.90) or above, the slope becomes positive again and greater investment in transaction-specific intangible assets is again associated with greater opportunistic behavior. Figure 9 shows that only when there is a moderate level of contract detail (2.82<contract detail<5.58) will the supplier's investment in transaction specific intangible assets be associated with less opportunistic behavior by the manufacturer, as we hypothesized in H1b. When contract detail is low, the use of a contract can mitigate the undesirable (positive) effect of investments in transaction-specific intangible assets on the opportunistic behavior by the manufacturer because it provides a guiding framework for the relationship and enhances the understanding by the partners, helping them to adjust their expectations about each other. If a contract is too detailed and stringent, it signals distrust and reduces normative relationship commitment, and thus opportunistic behavior in the presence of investments in transaction-specific intangible assets increases. Our empirical results support H_{2b}, but not $H2_a$.

H_{3a} and H_{3b} explored the moderating effect of relational norms on the relationship between the supplier's investment in transaction-specific

Figure 9. Impact of contracts (CO) on the relationship between investments on transaction-specific intangible assets (IA) and opportunistic behavior (OB) by the manufacturer. (Note: The lowest point is 4.20; centered score is -0.48)
tangible and intangible assets and opportunistic behavior by the manufacturer. Our results indicated that relational norms did not have a significant main effect in Model 3; however, the interaction between intangible assets and relational norms was significant in Model 4, indicating a moderating effect. The interaction of tangible assets and relational norms was not statistically significant. As expected, an increase in relational norms enhances the desirable (negative) effect of the supplier's investment in transaction-specific intangible assets on opportunistic behavior by the manufacturer. However, relational norms did not moderate the relationship between the supplier's investment in transaction-specific tangible assets and opportunistic behavior by the manufacturer. Thus, while H_{3a} was not supported, H_{3b} was supported.

DISCUSSION

We studied the relationship between a supplier's transaction-specific investments in tangible versus intangible assets and opportunistic behavior on the part of the manufacturer. We also examined the moderating effects of contracts and relational norms on those relationships. Our empirical findings supported the conceptual model and corresponding hypotheses, for the most part. These findings are important because they shed new light on the relationship between transaction-specific investments and opportunistic behavior.

This research makes several contributions to the literature on supply chain management and TCE. First, it examined the relationship between investment in transaction-specific assets and opportunistic behavior in greater detail than has been done previously, by including asset tangibility. Second, it conceptualized and empirically tested the moderating effect of contracts on the relationship between investments in transaction-specific assets and opportunistic behavior as a complex relationship. Third, it explored relational norms

and their moderating effect on this relationship. These findings open the door to explaining some of the contradictory findings from the previous research on the relationship between investments in transaction-specific assets and opportunistic behavior. Each of these contributions is elaborated upon below.

Transaction-Specific Investments and Opportunistic Behavior

Our findings contribute to the literature by demonstrating that whether or not a partner engages in opportunistic behavior is influenced by the tangibility of the transaction-specific asset investments. TCE's predictions hold true for tangible assets; when a supplier invests in tangible assets, the manufacturer will be tempted to engage in opportunistic behavior. However, when the supplier dedicates intangible assets to a relationship, such investments serve to constrain the manufacturer's opportunistic behavior, with the proper level of contract detail as a safeguard. These findings help to explain the previous conflicting literature and advance the knowledge about the effects of both asset specificity and asset tangibility on opportunistic behavior.

Moderating Effect of Contracts

This research also provides new insights into the role of contracts in moderating this relationship. From a theoretical perspective, much of the previous research has argued that contracts should reduce opportunistic behavior, however, this has been only inconsistently supported by empirical results. For example, Achrol and Gundlach (1999) found no significant moderating effect of contracts on the relationship between transaction-specific investments and opportunistic behavior. Jap and Ganesan (2000) found that contracts and relational norms had no significant moderating effect in the overall sample. However, in the exploration, buildup and decline state of the phases of evolv-

ing relationships, relational norms did have a significant moderating effect. Contracts had a significant moderating effect in the exploration and decline stages.

Our research helps to resolve these inconsistencies by examining the tangibility of transaction-specific asset investments. When a supplier invests in transaction-specific *tangible* assets, the use of contracts is not effective in discouraging opportunistic behavior by the manufacturer. However, when a supplier invests in transaction-specific *intangible* assets, the employment of contracts has a more complex effect. A contract that is too general does not provide an effective framework for what the supply chain should and should not do. In this case, increasing the detail of the contract will help to mitigate the undesirable (positive) effects of intangible transaction-specific investment on opportunistic behavior. When an appropriate detail is specified in a contract, the supplier understands the expectations and requirements of the manufacturer, and the manufacturer will have more realistic expectations about the supplier. Therefore, the use of more detailed contract serves to intensify the inverse relationship between transaction-specific investments in intangible assets and opportunistic behavior. If the contract is too detailed, however, further increases in the level of detail will enhance the undesirable effects of intangible transaction-specific investment on opportunistic behavior. After some point, the use of very detailed contracts counteracts the inverse relationship between transaction-specific investments in intangible assets and opportunistic behavior by the manufacturer. Although the use of contracts has the potential for reducing opportunistic behavior by a manufacturer in the presence of a supplier's investment in transaction-specific intangible assets, if the contract is too stringent, it can have the opposite effect. These findings make an important contribution toward explaining why TCE's predictions have not been supported by previous empirical research.

There are a number of reasons that can potentially explain the behavior of contracts in this research. First, this research was conducted in China, and contracts may function differently in China than they do in Western countries. Historically, contracts have been perceived as being used primarily by foreigners to take advantage of Chinese companies and managers, so contracts may not be trusted. In addition, the Chinese government has historically been unreliable in enforcing contractual specifications (Wong, et al., 2005). In fact, there is evidence that, in the presence of a non-supportive or erratic government, personal relationships emerge as a more important governance mechanism than contracts (Pearce, 2001 a, b; Rao, Pearce & Xin, 2005). Thus, the findings about contracts might not be generalizable outside of China.

Second, it is unclear what the relationship between the level of detail in a contract and the specific situation is. For example, a contract may be extremely stringent because it needs to be, based on past behaviors by the manufacturer. Thus, its decline in effectiveness may be related to the manufacturer's continuing with its opportunistic behavior despite the presence of a contract. Third, contracts exist between two parties. A contract may be written from the perspective of the supplier, from the perspective of the manufacturer, or in a way that benefits both parties. Thus, the mere existence of a contract does not guarantee that it was written in a way that would protect the supplier from opportunistic behavior by the manufacturer. Fourth, our measure did not assess the duration of the contract. Trust may be built through repeated interactions and repeated contracts. Thus, trust may be an intervening variable. Although our findings regarding the use of contracts are somewhat counterintuitive, they raise many questions that provide a foundation for future research.

Moderating Effects of Relational Norms

Our findings help to address the conflicting literature by indicating that the presence of relational norms will intensify the inverse relationship between investments in transaction-specific intangible assets and opportunistic behavior. In other words, relational norms moderate this relationship only when it involves intangible assets, making opportunistic behavior by the manufacturer even more unlikely. These findings imply that relational norms have a differing impact in safeguarding against a manufacturer's opportunistic behavior, dependent on the tangibility of the transaction-specific assets. Although we had hypothesized that relational norms would constrain a manufacturer's predicted opportunistic behavior, based on the supplier's investment in tangible assets, this was not supported. Because tangible assets are visible and physical, investments in them are generally made at the beginning of a supply chain relationship, often in order to secure the relationship. Because the supplier and the manufacturer are less familiar with each other at that point, the relationship is not characterized by solidarity or full information exchange. Thus, relational norms have not been established at the time that the investment is made. It makes sense, then, that the supplier's subsequent development of relational norms will not reduce the manufacturer's opportunistic behavior. Although relational norms are informal control mechanisms, relying on self-control to govern a supply chain relationship (Heide, 1994; Dyer & Singh, 1998), they do not have the power to compel behavior. Knowledge of this allows the manufacturer to engage in opportunistic behavior when relational norms have not been fully formed.

MANAGERIAL IMPLICATIONS

The findings in this chapter provide important guidelines for managers on how to effectively employ contracts and relational norms to safeguard against the potential for opportunistic behavior, in light of their investments in transaction-specific assets. Related research and practice have indicated that transaction-specific investments are a key component in establishing harmony and a successful supply chain relationship (for example, Jap, 1999; Rokkan, et al., 2003). By examining the relationship between investments with different levels of asset specificity and asset tangibility and opportunistic behavior, this research leads to the development of guidelines for suppliers striving to protect against opportunistic behavior by their supply chain partners.

Our findings about the moderating effect of contracts and relational norms on the relationship between transaction-specific investments in tangible assets and opportunistic behavior are particularly enlightening. We found that neither contracts nor relational norms were effective in moderating the relationship between investments in transaction-specific tangible assets and opportunistic behavior. Thus, managers need to consider other safeguarding mechanisms, such as hostage and ownership mechanisms, for moderating this relationship. Hostage, or pledge, mechanisms are actions taken by one party to show good faith and intention to maintain a relationship (Anderson & Weitz, 1992; Jap & Ganesan, 2000). In most cases, hostage mechanisms are operationalized as the other party's (the manufacturer) investment in transaction-specific assets, which Heide and John (1998) termed offsetting investments. Ownership, or vertical integration, is when a firm decides to own its factors of production as a means of forestalling opportunistic behaviors (Brown, Dev & Lee, 2000).

In contrast, because transaction-specific investments in intangible assets reduce the potential for opportunistic behavior with the proper use of contracts, suppliers should consider investing in transaction-specific intangible assets, in their effort to integrate with their customers. They should also carefully consider the appropriate level of

detail and extent of reliance on the contract as the safeguarding mechanism for the relationship. If employed properly, contracts and relational norms will increase the effectiveness of investments in transaction-specific intangible assets in curtailing opportunistic behavior. However, the use of contracts that are too specific should be avoided because they will weaken the effectiveness of the transaction-specific investments in intangible assets in reducing opportunistic behavior.

LIMITATIONS AND FUTURE RESEARCH

Although this chapter contributes to the research on supply chain relationships and provides useful managerial implications, there are nonetheless some limitations which should be addressed in future research. This study lays a foundation for studying investments in transaction-specific assets by suppliers and the resulting potential for opportunistic behavior by manufacturers, however, TCE suggests that the balance of investment in transaction-specific assets may be weighted toward either the supplier or the manufacturer and that opportunistic behavior is associated with the other partner. Future research will benefit from expanding upon the supplier-focused work in this research to study this relationship from the perspective of the manufacturer (opportunistic behavior by the supplier) and more complex reciprocal relationships.

Although we considered the tangibility of transaction-specific investments, opportunistic behavior was considered as a unidimensional construct. Some previous studies have argued that there may be different types of opportunistic behavior. For instance, Wathne and Heide (2000) discussed active and passive types of opportunistic behavior. It is possible that investment in tangible versus intangible transaction-specific assets will be related to active versus passive opportunistic behavior in different ways. Future research should distinguish between types of opportunistic behavior and further investigate the impact of investments in transaction-specific asset tangibility. This will provide a new understanding about the relationship between transaction-specific investments and opportunistic behavior.

In addition, our model considers the moderating effect of contracts and relational norms on the relationship between different types of transaction-specific investments and opportunistic behavior, since they are the most popular governance mechanism in practice (Cannon, et al., 2000). However, we found that these governance mechanisms were not effective in moderating the relationship between investments in transaction-specific tangible assets and opportunistic behavior, although they were effective in moderating the relationship between transaction-specific intangible investments and opportunistic behavior. There may be other governance mechanisms which moderate this relationship, for example, hostage (i.e., transaction-specific investments made by the manufacturer) (Anderson & Weitz, 1992; Jap & Ganesan, 2000) and ownership (i.e., vertical integration) (Brown, et al., 2000) mechanisms. Future research should account for the effect of additional types of control mechanisms in preventing opportunistic behavior due to investment in transaction-specific assets.

The universal significance of the findings may be constrained by the nature of the sample, which is drawn from the household appliances sector in China. For instance, the very rapid growth of China's economy could be a contributing factor in the opportunistic behavior of manufacturers. In addition, national culture may be important in this relationship. China's highly collectivist national culture may help facilitate the development and role of relational norms, reducing opportunistic behavior (Ryu, Han & Frank, 2006). Therefore, it is important that the conceptual model and corresponding hypotheses are tested using data collected from other industries and in other countries.

Future research should also examine this relationship from the perspective of the manufacturer's investment in transaction-specific tangible and intangible assets and the resulting potential for opportunistic behavior by suppliers. Indeed, there are many examples of opportunistic behavior by suppliers, and it will be useful to study the importance of the tangibility distinction on manufacturers' investments in transaction-specific assets.

Section 5
Organizational and Social Implications

This section includes a wide range of research pertaining to the social and behavioral impact of Human Resources Management around the world. Chapters introducing this section critically analyze and discuss trends in Human Resources Management, such as transnational learning, collaboration, action research, and SME success factors. Additional chapters included in this section look at ICT policies and organizational justice. Also investigating a concern within the field of Human Resources Management is research which discusses the effects of trust in Human Resources Management. With 10 chapters, the discussions presented in this section offer research into the integration of global Human Resources Management as well as implementation of ethical and workflow considerations for all organizations.

Chapter 43

Transnational Learning and Collaboration in Delivering MBA Programs in Emerging Markets:
The Challenge of National Culture

Stephanie Jones
Maastricht School of Management, The Netherlands

ABSTRACT

This case focuses on the challenges of delivering Western-style MBA programs in emerging markets, looking at the experience of the Researcher in teaching and assessing courses within management programs (especially in Organizational Behavior and Human Resource Management) and in thesis and dissertation research and writing. The case considers: cultural differences, learning style differences, language differences, economic backgrounds of students, classroom behavior and etiquette, involvement in the learning process, teaching methods, the teacher and the students, group work, examining and evaluating, assignments, projects and reports, theses and major pieces of research-based work, life in the classroom, inter-student behavior, and life out of the classroom. The case focuses on MBA course delivery in China, the Arab World, Africa, Iran, Malaysia and Indonesia, Vietnam, Eastern Europe, former Russian states such as Kazakhstan, and South America, such as Peru and Suriname. Examples of specific MBA teaching and assessment are provided to give in-depth insights into the issues involved.

ORGANIZATION BACKGROUND

The organization under reference in this case is one of the leading Schools of Management in the Netherlands. The school has more than 20 transnational learning collaborations across the developing world. Some of these collaborations have been in operation for over ten years and have produced as many as 1,000 MBA graduates per single academic partnership. Overall, nearly 1,000 graduates emerge from all the collaborations annually.

SETTING THE STAGE

MBA programs from "the West" are now increasingly being delivered in emerging markets, such as in Asia, Africa and Middle East. An MBA from a reputable and accredited international business school or university enables students in these countries to join international companies, become expatriates, earn significantly more money, and gain elite status in society. For the MBA providers, this expansion possibility internationally – together with online and distance courses – can facilitate these business schools and universities to increase revenues and remain competitive. This can be both outbound – the providers go to them – and inbound – they come to the providers. Here, the focus is on the former scenario – transnational learning provided by the School of Management considered here through collaboration with partners (mostly other universities or business schools) in China and the countries of Africa, The Middle East, South-East Asia, South America, Eastern Europe, etc.

CASE DESCRIPTION

The following case study has been based on the experience of the Researcher in four and a half years of teaching around the world, following four years of delivering "Western" style MBAs whilst based in one of the countries of the Middle East.

MBA program delivery outbound to emerging markets can present completely new challenges, especially for faculty. The students behave in completely unexpected ways, and demand unheard of – and sometimes quite unacceptable – new arrangements. These can include issues of academic integrity and other matters relating to academic standards. The students ask for special treatment with more time to finish assignments and examinations, want to attend less than the full hours of study, expect compromising insights into the assessment items, resist individual accountability,

refuse to accept rules about plagiarism, and admire those who can hoodwink or otherwise undermine authority. These issues can be seen as reflecting cultural norms: high power distance, uncertainty avoidance, ascribed leadership, collectivism, synchronism and diffuseness, particularistic behaviors and other national cultural concepts identified in by theorists in the literature.

This case study has aimed to identify the cultural barriers to successful MBA delivery in emerging market contexts and to recommend strategies for maintaining product quality and integrity, through evidence-based research to help decision-making for hands-on faculty members and the initiators of international partnerships, who should take these operational, delivery issues into account when preparing their strategies. This can be seen as a perspective for technology-related issues, which must take the socio-cultural-economic aspects of transnational learning initiatives into account.

In summary, the rationale for this case study stems from the fact that more and more MBA courses are being launched in emerging markets, despite the overall worldwide recession; that this represents an ongoing challenge for teachers of these courses, sometimes ill-prepared for these environments, given the lack of orientation provided to them; and the existence of considerable cross-cultural issues, which are rarely explored in detail. Teachers of executive courses, language teachers, aid workers and all visiting expatriate teachers and consultants focused on emerging market participants will also probably face these and similar issues. How can MBA faculty in particular gain insights to overcome cross-cultural barriers, keep up standards of the course and product, and manage multicultural training groups in the best way they can? Technology can be both an enabler and a barrier here. The standardization of course materials, the ability to electronically send materials in advance, the use of technology in the classroom when delivering the program – all these have benefits and drawbacks. These issues are discussed in detail in the following case.

CURRENT CHALLENGES FACING THE ORGANIZATION

The faculty members of the School of Management considered here spend much of their time teaching MBA (and doctoral-level, DBA) courses to emerging market students in their own locations, at the premises of the partner institution. Through trial and error and some sharing of experiences, the faculty members encounter (and try to cope with) many challenges. In some countries, these challenges include technology-related issues based on intermittent electricity supply, lack of internet connectivity, supply of outdated hardware and software and lack of funds to purchase laptop computers, etc. Other countries have advanced technology but significant language barriers (all the courses are taught in English). Some countries experience students using technology to circumvent accurate assessment (i.e. cheating such as plagiarism). But this mostly tacit knowledge of these challenges and how to deal with them is rarely shared outside the organization – hence this case study.

Most of the research on the challenges of teaching MBA students seems to be focused on the USA and Europe, without much attention to emerging market MBA students, despite impressive statistics, and upward trends in emerging-market student MBA enrollments.

However, there are significant cultural barriers to successfully delivering MBAs to emerging-market students. There are issues in terms of creating sustainable programs which build local capacity, of both faculty and students, including developing the necessary technology. There can be pressure to compromise on academic standards. Many students are unable to successfully complete the programs. Some of these programs are failing and closing, and even this school – which enjoys a strong track record of partnerships – has to pull out of a program occasionally. More practical insights are needed into many aspects of these programs, including the critical issue of cultural challenges in program delivery. The faculty members involved in this delivery process, often finding themselves the bastions of the academic standards of the MBA provider, are trying to prevent "the debasing of the coinage" – yet most MBA deliverers in emerging markets are "reinventing the wheel". They do not often learn from their predecessors (many of whom are unknown to them, are competitors, and as mentioned above, the most vital knowledge is of a tacit nature). There is a particular concern among many faculty with cultural differences and attitudes which can compromise the quality of the product which the provider has developed and on which its reputation depends.

TRANSNATIONAL LEARNING AND COLLABORATION ISSUES

Cultural Differences

In coping with these issues, there is a need to basically understand the theoretical framework to national cultures: power distance, uncertainty avoiding behaviors, individualism and collectivism, sequential and synchronistic behaviors and other dimensions, derived from theorists such as Hofstede (1984, 1991, 1993) and Trompenaars (1997). This basic understanding of cross-cultural management theory can help, but it won't guarantee success – cultural stereotypes can be misleading and all students are different – especially would-be MBAs, always the elite of the local society. It is clearly important for teachers to be culturally sensitive, as there is a heightened risk of exposure of cultural prejudices, which might be tolerated at the home campus. The relevance of the historical, social, political and religious context of each country must be appreciated, as these can impact on students. Technology tends to straddle different cultures, and possession of the latest technological aids is a source of status to consumer-conscious and social-climbing MBA students in emerging markets. They expect teach-

ers coming from the West to understand and use the latest teaching technology. They criticize local teachers for old-fashioned 'chalk-and-talk' methods, and look to visiting foreign professors to use web-based materials, interactive technology, video-clips and other multimedia teaching aids. This is particularly challenging when the teaching environment provided by the local partner lacks a reliable electricity supply and internet connection. The visiting faculty member is then the butt of complaints, most of which are completely outside his or her domain.

Learning Style and Content Differences

This former issue of learning style can have a relationship with culture, in terms of preferences for visual, aural, oral, and written information and learning materials. The ways in which students learn in emerging market environments and the ability to concentrate, and the length of concentration span, often have a cultural dimension. In the latter issue of content differences, for many faculty members, the challenge of arousing interest and creating curiosity in presenting completely new material, which may be unrelated to the experience of the students, is always there. Taking ideas imported from the West, including concepts of employee empowerment and autonomy, and presenting these in command-and-control leadership environments, is often received with incomprehension, doubt or hostility – or all three emotions. The use of technology here can help visually-oriented students and can be used to present course content in a way which can be more attractive and acceptable than in a plain written/printed format. However, there can be a danger of over-simplification of material, the use of distracting transitions and animations obscuring real information, and more interest in the delivery vehicle than the content.

Language Differences

The implications of teaching courses in English when many of the students are not fully conversant in the language; the use of group-based and practical study techniques to allow participants and students to operate in their own language; the challenges of teaching through a translator/interpreter; the assessment of the work of these participants and students, alone and in partnership with local teachers; the teacher's need to understand the classroom discussions, when these need to be translated back; these are all important transnational learning issues. Sometimes the pronunciation of English by some students is more challenging to visiting professors than the students' vocabulary or grammar. Some students, especially from wealthier backgrounds, have been toying with the use of speech-recognition technology to save their time in transcribing interviews, etc. When inadequately edited by the students, this creates challenging reading for the faculty members.

Economic Backgrounds

The socio-economic level of the students and participants, in terms of being hard-working achievers or wealthy aristocrats, is a further issue. Study time can involve a sacrifice of much-needed potential income for some students; others expect to buy qualifications without studying, like buying a new car. There is a further challenge in teaching and assessing members of the country's royal family, who own the university, for example. All of these issues can compromise the fair and meritocratic treatment of students in the teaching process. The more wealthy students have access to a higher level of technology, so it can be seen as important for teachers to create a level playing field for all participants in the program.

Classroom Behavior and Etiquette

This issue includes attendance, punctuality, mobile phone usage; emailing and sending text messages during class-time; side-talking; the constant in-and-out of the classroom behavior of students making and receiving phone calls, and smoking and chatting outside the classroom regardless of official breaks. The tolerance of lax classroom discipline can lead to tolerance of non-completion of assessment items, late submissions and a feeling by students and participants that they can get their MBA Certificate and still get away with whatever they like. Many students in emerging markets are trying to demonstrate their perceived higher status in society, or are showing their attitude of 'buying' their qualifications, and thus disregarding the authority of their teachers. Other cultures show an immediate respect for their teachers, which can be sustained throughout the course or can be lost when the teacher is perceived to be indulgent and easy-going. The use of individual communications technology in the classroom – which many faculty members did not experience when they were students themselves – puts more pressure on teachers to either 'act the policeman' and ban these items – or try to make the class sufficiently interesting to hold the students' attention.

Involvement in the Learning Process

Related to the above points, this issue considers classroom behavior during instruction, including the students making notes or just sitting at the desk; and the presence or absence of learning accessories, such as pen and paper, or just mobile phone and car keys. What is the attitude of students to their classroom experience in terms of expectation of entertainment value, or of the need to work and study? Is there a preference for "interesting" classes, or desire to maximize potential learning by attending all classes, whatever the subject might be? How do the students feel about the sharing of ideas, or do they prefer to keep quiet and wait

for others? Do they expect the teacher to provide all of the learning opportunities, and show scant regard for the contributions of other students, such as side-talking whilst other students are speaking in class? Do the students tend to actively participate in the class or do they think that being an empty vessel into which information should be poured is OK? All these issues can result in variations in student performance which does not necessarily reflect an accurate summary of their academic abilities, and can also be reflected in faculty evaluations. There is always the problem that many students think that if they possess the content materials – without actually reading them – then the information will magically be transmitted into their brains without any effort on their part. The same thinking applies to hard copy books and print-outs as it does to soft copy documents. When asked if they read an article sent by email, some students explain (and perhaps believe) that they downloaded it and saved it to their hard drive, which is 'doing the work' and as much as they are prepared to do!

Teaching Methods

Continuing from the point above, this issue considers the role of lectures and the degree of participation in these, in terms of asking and answering questions; the extent and nature of reading assignments; the use of handouts and textbooks and the requirement to read these; presentations with PowerPoint slides and their effectiveness; the value of cases, examples, guest speakers, videos and films, current events and newspaper clippings, and the overall need for variety in the use of teaching methods and materials. Teachers used to a high level of participation can find it difficult to vary their teaching methods to get more results, and may not give accurate marks because students are unused to their approach (as above). There is a problem with video clips that students watch them in a mindless way and switch off mentally, whereas they might be forced

to concentrate with a more conventional presentation. Business case examples – especially those presented in a visual and practical way – can be attractive to students, but many regard them as entirely academic and not relevant to their own experience. Many excellent guest speakers – with many years of experience behind them – can be interesting to students – but in some cases they are also subjected to the 'technology-test'. If their PowerPoint slides lack sophistication, if their presentation lacks any multimedia content, they can be seen as 'old-fashioned'. This is less of a problem with more mature students, who see through presentation issues and are more interested in content – but these are not necessarily the kind of students encountered in some emerging markets.

The Teacher and the Students

The impact of the personal experiences of the teacher on the learning experience, and that of the students, can be a further issue. The differing appeal of the teacher and the subject can influence the teaching outcome, and this is more the case in some cultures than in others. Some students are most influenced by the teacher, regardless of the subject. The level of dependence of the students on their teacher also varies: can they study independently or do they require a high level of direction? Students from cultures expecting a high level of 'spoon-feeding' who do not receive this can be highly critical of visiting faculty, and the latter may feel that this requirement is beyond their obligations. This can be seen in cultures where students pay their money and expect a high level of service, such as staying in a five star hotel; in other cultures the level of dependence is the same, but stems from huge respect for the teacher and reluctance to challenge his or her views. Such students are anxious to please and, being of a strong uncertainty-avoiding culture, are afraid of 'making mistakes' and 'doing the wrong thing'. Teachers from cultures which accept a high level of ambiguity can become frustrated and irritated

by students insisting on a huge level of detail in every instruction, such as font size, margins and headers in an essay and exact pages of the textbook to be read for revision.

Group Work

The issue of the learning value in the interaction between group members is culturally-loaded, and teachers assuming that group work can lead to positive learning outcomes are not always on the right track. Some students show perceptions of superiority and inferiority in relationships with others, and the mixing of genders in groups can be problematic in some cultures. In Saudi Arabia, for example, there can be a screen in the classroom between male and female students, or even separate classes. Even in some of the more modern cities of the Middle East, seen as open and Western, some students refuse to sit in a mixed gender group for discussion. Experience with group projects and the perception of their value is therefore varied. Equality of contribution between group members can be an issue. There can be differing attitudes towards group-based games and simulations, in terms of taking them seriously. The attitudes towards practical activities, compared with the expectation of chalk-and-talk lecturing, can mean that although students enjoy them – particularly the visually-oriented multimedia-based exercises – they see them as entertaining rather than academically useful. There is clearly a need for careful facilitation and interpretation here. The value of group outings to companies, factories etc. can be questioned. Members of some cultures refuse to board a bus with other students, insist on coming in their own cars, and arrive late or cannot find the destination. Some cultures are much less individualistic than others, and depend on group work to get through the programs; it can be important to offset this with some individual assessments, otherwise the results may not be accurate. Some expatriate students attending classes in the countries of emerging and rich markets find

themselves doing 'all the work' for their group-mates. What you said is completely true but for publication, it can be moderated to avoid any confrontation at the later stage.

Examination and Evaluation

As this is an academic course, there will be a need for written examinations at the end of each MBA program, and this can be a challenging cultural issue. Should these assessments be held in examination conditions or as take-home exams? When operating with open-book exams, even in exam conditions, there can be issues of marking-up the textbook and bringing-in crib-sheets. Cheating and copying others during the exams can be seen as culturally acceptable, and can even be considered as admired behavior in some cultures. MBAs generally are increasingly seen as having a tendency to cheat (Reeves & Knell, 2009). The use of model exam answers is often demanded by students, who want to do everything 'exactly right'. Faculty members from different cultures are concerned with the impact on creativity and originality, especially in more 'soft skill' courses. The announcing of exam per-formance and the giving and receiving of feedback needs to be handled in culturally-sensitive ways, with some cultures suffering 'loss of face' with public exhibitions of their performance. This can be a very difficult issue when one student is in a more senior job and can be the manager of some of the others (see below in the country-specific cases,). Social and cultural pressure on faculty members to mark over-generously is a very dif-ficult issue in several target countries for the MBA program. The formality of examination conditions can vary considerably and this can impact on at-tempts to maintain academic standards. One of the problems here can result from the attitude of partner institutions, where a business school from the West partners with a local university, and the staff of the local university collaborate with the local students to undermine the authority of the

business school from the West. In some cultures, where local administrators support local students against foreign education providers, evidence of leniency in examination and evaluation of performance is common. These clearly cannot be compared with students who are very strictly monitored. This reflects the on-going problem of a lack of supervision and control from a distance.

Assignments, Projects and Reports

Attitudes by students vary here – are assignments better or worse than exams in terms of the effort involved? Are these written projects carried out in their own time easier or harder? The teaching of research and writing skills in different cultural environments can be problematic. Integrity in research and writing are culturally loaded, with varying attitudes to copyright and intellectual property ownership. The challenge of teaching referencing and the avoidance of plagiarism have been compounded by advances in technology. 'Cutting and pasting' from the internet is all too easy for students, but so is the use of plagiarism detection software by teachers. However, some 'talented' students have found a way around it, by saving an old version of their work on the internet in a website, which is then found by the search engine which then searches no further. Also, the saving of whole theses and dissertations as a .jpg file can mean that, as a picture, they cannot be searched! Many faculty members lament that such ingenuity is used for purposes of deception rather than for the pursuit of academic excellence. At-titudes to the acceptability of these practices by students can clearly impact on academic standards.

For students with comparatively weak writ-ten English, there are further issues. Problems can arise with the use of Microsoft tools such as 'SpellCheck' and 'GrammarCheck'. The students see underlining in green and red and then lack judg-ment about correct usage. Many incorrect words are not underlined, because although incorrect in spelling and usage, they are proper words and are

thus not detected. Many students have become lazy, expecting these tools to do their work for them. Also, the use of personal reflections, diaries and log entries is quite strange to some cultures, and can be seen as an invasion of privacy. They sometimes fear compromising organizational secrecy by discussing issues experienced by their companies. Even in an assignment read by only the foreign teacher, who knows none of the background of the company being described, they present a 'whitewashed' view, refusing to tackle contentious issues for fear of reprisals.

Theses and Major Pieces of Research-Based Work

The approach of students to long-term, lengthy and research-based projects can present even greater challenges for faculty to avoid plagiarism and copying. The task of sustaining students over two- and three- month projects, when they find it hard to concentrate for an hour at a time, can be problematic. There is a strong tendency for students to 'sub-contract' such large tasks to fellow students and 'professional' thesis and dissertation-writers. These 'providers' sometimes coach their 'customers' so successfully that it can be very difficult for the examiners to differentiate between authentic students doing their own work and those sub-contracting. In a recent series of thesis defenses in one of the country where the MBA program is running with local collaboration, there were instances of plagiarism and, indeed, were competent pieces of work. But they were not researched and written by the student with his or her name on the cover!

Behaviour in the Classroom

The use of jokes is clearly culturally difficult, and can be pointless and time-wasting if students do not understand them. The jokes told by the students are similarly often incomprehensible to the teachers. Laughing at individual students can be OK

for other students, but not always for the teacher. Much humor is cruel and hurtful, with different cultures taking different attitudes to picking on each other. Acceptable subjects of conversation, during periods of small-talk during break times, can be limited; as in other situations, the weather and tourism are always safe, if boring. Religion and politics are probably to be avoided, unless the students initiate the subjects after a long period of getting to know the teacher. The challenge of remembering the names of students, especially in a big class, can be extreme. It depends on the personal experience of the teacher – some find Arabic names easy; Chinese names less so; and Vietnamese names impossible. However, the effectiveness of this technique, once mastered, can improve the ability of the teacher to manage the class effectively. Dealing with gender issues – of the faculty member and the students – can be more of a problem in some cultures than others. Women faculty can be seen as more sympathetic towards personal issues, and may be taken less seriously in some cultures. The task of failing a student can be more difficult for female teachers in the Middle East. The male student being failed can find his humiliation compounded by the gender of the teacher. The role of life in the classroom is more important to some cultures than others; some cultures find distance-learning programs requiring a level of self-starting ability and discipline beyond their inclination. They need the classroom experience to keep going.

Inter-Student Behavior

They are our friends; or they are the enemy – there can be a "them-and-us" situation between groups of students. Co-operation and competition between students can go different ways. There can be too much collaboration – when sharing the load goes too far and some students do too much work on a project, and others too little. The importance of relationship-driven cultures in inter-student

behavior is culturally-loaded, and there is therefore a need for faculty to appreciate differences here.

Life out of the Classroom

When faculty members hold private meetings with students – how much is acceptable and what is beyond the call of duty? Meetings in the classroom or faculty office can be safer for many reasons. Hospitality is offered in many cultures and a decline to accept can offend. As in the case of corporate ethics, dinner invitations and small gifts are more acceptable for faculty members after the event. This can be at the end of a course or after marking exam papers and assignments. In many cultures, offering bribes is common practice, and most business schools lack clear guidelines on how faculty should deal with these. Relationships outside the classroom with students are universally regarded as probably ill-advised by most academic institutions, but students from some cultures (such as Chinese) use these as a vehicle for self-advancement.

NATIONAL CONTEXTS FOR TRANSNATIONAL LEARNING AND COLLABORATION

The researcher has used her personal teaching experience while delivering the MBA program of this particular School of Management in the different countries of emerging markets. These include: China, Jordan, Kuwait, Dubai, Saudi Arabia, Africa, including Egypt, Cyprus, Iran, Malaysia, Indonesia, Vietnam, Bangladesh, Hungary, Romania, Russia, Kazakhstan, Argentina, Peru, and Suriname.

(In this study, the Researcher has not included USA, Canada, UK, Europe, Australasia, and India as teaching delivery locations – as these countries do not necessarily attract overseas teachers, have enough domestic teaching talent of their own; or are developed markets for education delivery;

similarly, Hong Kong, Singapore and Taiwan are probably not seen as "emerging" any more.)

SPECIFIC COUNTRY-BASED OBSERVATIONS IN TRANSNATIONAL LEARNING AND COLLABORATION

This series of detailed observations, illustrating key points of teaching delivery, experienced by the Researcher as a teacher in the field, have been selected to express concerns, reveal insights, and suggest a discussion of how important issues in MBA teaching have been handled.

Should You Know about Their History and Politics?

I was teaching in one of the countries of Arabian Peninsula, on a Human Resource module in the MBA course, and I wanted to illustrate the varied tasks faced by an HR manager. In particular I wanted to talk about how HR managers help employees to cope in times of crisis and emergency in a company. I found a very good Harvard Business Review case, which I had used successfully before in another country of this area, on the role of HR in a company which lost over a hundred staff in the September 11th incident. Bad idea! The class erupted into a huge anti-American outpouring. Several of their comments were irrational and over-emotional, and did not make sense, but this was no time for argument, I decided. My heart missed a beat as I could suddenly see myself arrested, deported, etc. etc. So I announced that this case was clearly not appropriate, they got the message anyway, let's move on, it's time for a break from class. They all rushed out of the class as students do anyway, and I followed them and spoke to a couple of them I knew well. I apologized for being 'culturally-insensitive'. I went back to the classroom and collected as many copies of the handout as I could and stuffed them in my bag

and later threw them out in the hotel waste bin. Meanwhile the students were distracted by the release of marks from the previous class, which took place in the break, so they forgot all about this offending article. A lucky escape!

Implications

This does mean that it can be impossible to use uniform handouts and materials in teaching in different locations, so there will be more work for faculty preparing extra cases and examples, etc. It also shows a level of diffuse thinking, that political and nationalistic views cannot be easily kept outside of the classroom – the students don't see their different interests and activities as separate, but all mixed up together. This can have implications for maintaining academic standards as the students can accuse foreign teachers of cultural insensitivity and can thereby avoid studying certain topics, take extra time off for religious observances and other ways around the system. Foreign teachers can be intimidated into agreeing to student demands because of a fear of cultural offence – and legal implications, even deportation.

How Can We Arouse their Interest and Create Curiosity?

I was in east-central Africa, in Rwanda, again presenting a module in HRM. All the students were public-sector managers. They were very quiet when I first arrived, for several reasons. I was a stranger, their country is quite isolated, as a nation they are still recovering from a bloody Genocide, they are typically high power-distant, and their English language skills are variable, from weak to hesitant at best. Rwanda was a Belgian colony and French is widely spoken, although many of those escaping the Genocide went to nearby Uganda and Kenya and their English is quite good. But in the first few hours, they weren't saying much. So I asked them about their jobs – which I found very difficult to understand. I could work out what

the Tourism, Utilities, Transport and Education Ministries might be doing, but what about the Genocide Reconciliation Ministry? Then I asked them what they had studied before – theoretical HRM. What were their ambitions? To get promoted, change jobs – but how? Through trial and error I discovered that they wanted to hear about new things no-one knew about in Rwanda, to challenge existing practice, and learn new skills. I reworked the syllabus and every day we learned about new HR practices, policies and initiatives; we discussed what was wrong in their ministries and how it might be fixed; and tried out new HR tools. We practiced basic forms of job evaluation, psychometrics, competency-based interviews, manpower-planning and all manner of exercises, mostly quite new to them. Even though some of these tools were probably impossible to implement in the near future (if at all) the participants were excited, empowered and were curious about what was going to happen next.

Implications

Again, not only do faculty flying in need a range of materials to suit different interests, but also different teaching approaches, such as more group-based work, to accommodate students with language difficulties. There is also the issue here of a high power-distant culture hesitating to discuss problems with this remote figure, the foreign teacher! This can mean that participants will sit in classes hour after hour, day after day, without understanding much of what is going on. Then it can be a big shock for the students when they receive failing grades, especially if they are used to high ones from their own local institutions. There is often a co-existence of high uncertainty avoiding behaviors at the same time in this environment, with students demanding a high level of detail about assessment items, to a much greater extent than they might in the home campus. This can create a discrepancy in standards.

Dealing with Members of the Royal Family

I was teaching at a university in one of the Middle East countries, and one of our students was a son of the then Crown Prince. He was tall, good-looking, popular with the other students but lazy, unpunctual and infrequent in attendance, and expected the others to do the work, which they gladly did. One of the assessment items on the course was a group project. His group made a video of themselves acting out a management problem – 'How to Deal with Difficult People'. It was really good, and funny, and the Royal played a prominent role. They got 19/20 for this, but the remaining 80% of the marks were based on essays and exams. The Royal never appeared again. I called his mobile phone several times, but he never took my calls. I went to see the Dean, who gave me a lecture on the cost and sacrifices involved in doing business in emerging markets. He didn't want to come up with any kind of policy statement or make a decision about my problem. I posted the marks, and the Royal got 19%. Nothing happened, although I was worried at the time. But I'm glad I did this now.

Implications

In many hierarchical societies, there are different rules for different levels of people, and attempts by faculty members to create a meritocratic classroom can be fraught with problems. In particularistic cultures, where relationships can be more important than rules, there's an understanding that rules exist for most people but not for some special people. The foreign teacher can 'pretend' that he or she didn't know these exceptions to rules, and that all students have to be treated the same. The problem is that exceptions can become norms and students with special status can gain more and more favors, undermining the standards which foreign education providers are trying to maintain.

Active Participation or Empty Vessels?

I was teaching in mainland China for the first time, having spent time in Hong Kong, and I started off my topic by asking the students questions. What are some of the greatest management concerns you face in your companies? How is the level of productivity of your staff? What is your organization culture? Is it positive or negative? What is the staff turnover level? They looked at me blankly. Some fidgeted. Some whispered to their neighbors. But no-one answered. So I carried on anyway, presenting my material. In the break one of the students, an elected group representative, came up to me and explained that it is my job to give a lecture, not to ask questions. And their job is to listen. So I carried on with my lectures, and it took a while to get them to participate, as they had to feel comfortable with me first, and I must have put them off a bit at first, by being so demanding and provocative and confrontational.

Implications

This highly neutral, power-distant behavior, where the students are expecting to be recipients of received wisdom rather than being critical, challenging and argumentative, is a difficult one for foreign faculty. It can also potentially compromise learning outcomes where critical reasoning, the balancing of different points of view and creation of arguments is rewarded behavior, as is often the case, especially in MBA programs. It is impossible to change mindsets formed over centuries overnight, but there will be a need for a much fuller explanation of expected learning outcomes of the courses, with many examples for clarity. The larger and more progressive cities in China – such as Shanghai and Beijing – may pose fewer problems than the more remote cities.

Cheating and Copying

One of my colleagues was teaching his last class in the series of an MBA in one of the countries in the Middle East region and the administrative staff member came around with the teaching evaluation forms. As is required, the faculty member left the room. Then one of the students quietly crept up to the computer and stuck in his memory stick. Then he downloaded all the files off the teacher's memory stick onto his own. He was in the middle of doing this (and looking for the exam questions amongst the teacher's files) when the teacher came back. Despite being caught red-handed he denied everything and lied about his intentions. Then he made out that others had put him up to it and it as their fault, really. The incident became huge. But the college administration was reluctant to investigate the students, who were regarded as customers. In the end they all got off the hook. The lesson is, don't make it easy for them. Make it more or less impossible for them to steal any valuable information. OK, they can hack into your computer, but there's not much you can do about this. But you can make sure you always have your memory stick with you – that's why they have a string to hang around your neck!

Implications

Levels of honesty and tolerance of telling untruths clearly varies a great deal between different societies, and the concept of students being 'customers' rather than 'candidates' is also a contrasting feature. We can buy anything we like – we have the money. For people wealthy enough to watch the movie *Casino Royale* and then buy a 50% stake in the Aston Martin car company because they liked the car – 'buying' an MBA seems logical. Taking any other short cuts, such as buying exam questions obtained by others, also follows. This can be highly compromising and means that examination and assessment committees can receive disproportionate numbers of queries (especially

challenges to grades) from these countries. Only by standing firm can the standards be maintained.

Further Short Observations

I was teaching an MBA module wearing Islamic-style clothes and having to fit in with their culture. This is essential to avoid problems with the academic authorities, and to win the students' trust and respect. Then they open-up and share some very personal insights, although there is always a strict Islamic Republic supporter in the class keeping an eye on the foreign teacher and everyone else ...

Implications

It takes time to break down the barriers, lots of political censorship going on, could be cultural insensitivity on the part of foreign faculty, fear and anxiety from the students in case of unacceptable material being presented and how to deal with this

I was teaching an HR module, in one of the major cities in the Middle East, in interviewing skills, and the participants were asked to conduct role plays. Students who regarded themselves as superior in rank to others refused to be "interviewed" by those whom they saw as junior and inferior...,

Implications

Hierarchical societies, high power distance, classroom management issues, group work problems – when part of an assessment, can be difficult

I was teaching a group exercise in a much more cosmopolitan city in the Middle East, in a classroom of around 50, and many of the men would only work in a group with other men, and would not accept female group members. Many of the students arrive late, but must be accommodated, in a group of their choice. If attempts are made to strictly enforce punctuality, it can alienate these students, who will resort to complaining to the university president....

Implications

Students as 'customers' rather than 'candidates', strong role of status and power

I was running a class of Kazakhstan students, of very wealthy individuals (mostly females) who were more interested in shopping, fashion, surfing the internet and going to night clubs. It was very challenging to encourage them to focus on the class…

Implications

Ascribed rather than achieved status issues – they have a position in society because of their wealth, so they can do whatever they want

I was teaching an MBA module in China and warned the students against the consequences of plagiarism. I spent hours explaining the concept, with examples. Nevertheless, when I came to mark their exam papers and assignments, the incidences of plagiarism were almost universal. And several students reused material in their exams and in their assignments, and could not understand why this might not be acceptable, and argued in emails for weeks later…

Implications

Different moral perspectives – 'stealing' of intellectual property, feeling of superiority of own rules

In a class in Kuwait, we had several people from one organization, including their boss. Unfortunately this student was weaker than all the others, but this fact (known to all the teachers) could not be exposed, as then all the students would withdraw from the program en masse, forcing it to close. This was a very delicate situation, reflecting the tendency towards high power distance in this environment…

Implications

Ascribed rather than achieved leadership roles, power distance

In Yemen, I was expected to train two local teachers to teach the course for the next intake after I left. One was quite extravert and a good laugh and we got on well but when he had the class to himself he would not focus on the subject, but talk about anything, as he never did any preparation. The other was very old, traditional, very strict and religious, gained his PhD about 50 years ago, spoke no English, and didn't have a clue about any research in his subject in the last 50 years. He tried hard but I think it was probably too much for him to cope with…

Implications

Different mindsets, different ways of thinking, lack of exposure, need to save face of local teachers but face up to the challenges of the course

I had a mixed group of students on a course in the Netherlands, some Europeans (Belgians, Dutch) who were very outspoken, lively, and talkative and had very good English – and a group of Chinese who remained a mystery. The latter didn't join in much, and were anxious to not be put on the spot, so it was hard to know if they were following the course or not, and if they were getting anything out of it…

Implications

Cultural differences in behaviors within a group, dealing with noisy and quiet participants, need to work with all, even those less attention-seeking

SOLUTIONS AND RECOMMENDATIONS

This case, based on the personal experiences of the Researcher, primarily from insights gained whilst working among the Outreach Programs of the School, considers a wide range of cross-cultural issues in MBA teaching delivery. These issues are important, as they can compromise not just effective delivery and the teaching and assessment of the program, but can threaten the academic standards and reputation of the mother campus. Yet most practitioners of MBA delivery of offshore courses work in isolation and rarely share ideas and experiences. Faculty members newly-exposed to working in the field cannot easily access the insights of their more experienced colleagues. Hence this case, which seeks to consider these challenges, especially in the light of new advances in educational technology. A number of solutions and recommendations are suggested in the discussion of issues and the specific observations, but it is impossible for the current case to a) offer hard-and-fast rules or b) try to replace individual judgment in specific cases. Faculty members develop their own approaches to these issues; this case can only raise awareness of some of the dangers and threats to academic integrity which can be faced by individuals and institutions.

This study focuses on the teaching delivery aspects of transnational collaboration in advanced-level management education; it does not look at the development of collaborations between education providers, and all the technical, administrative and financial aspects involved.

KEY TERMS AND DEFINITIONS

Cross-Cultural Management: The study of cultural differences between nations in management terms, especially relevant for multinational businesses and their executives operating cross-culturally; can also be an issue in trade between nations.

Cultural Barriers: Can be experienced when cultures between two countries or persons are radically different and can prevent effective communications, teaching, doing business, etc.

Cultural Norms: Seen as typical behaviors by persons of specific countries.

Emerging Markets: Defined in various ways but in this study especially China and South East Asia, the Middle East, Africa, Eastern Europe and the former Soviet bloc, and South America. India, Hong Kong, Singapore and Taiwan are not included, as educationally these are no longer viewed as 'emerging'.

Faculty Members: Usually PhD qualified teachers working more-or-less full-time for a university or business school in the West, in this case then travelling to emerging markets to teach, which might comprise all or part of their workloads.

MBA Programs: A series of courses, each with separate modules, which as a whole comprise a master's level qualification. Can be full-time or (usually, in emerging markets) part-time – taught in evening classes and/or over weekends. Different programs can have a broad or specific focus, with concentration courses at the end. Can include a thesis or dissertation.

Plagiarism: The representation of the work of other authors as one's own work, strictly not allowed by most business schools and universities in the West, but culturally-acceptable in some emerging markets. Enabled by internet technology, which can also be used for detection.

Tacit Knowledge: Knowledge accumulated from experience but often not codified or recorded, and may be only informally passed-on, or retained in the consciousness of the person who has gained the knowledge.

Chapter 44
Using Action Research to Assess Student Performance in Traditional vs. E-Learning Formats

Retta Guy
Tennessee State University, USA

Craig Wishart
Fayetteville State University, USA

ABSTRACT

While the popularity and acceptance of online education is undeniable, many are concerned about measurable performance of student learning in Web-based courses. The issue of student performance dates back to the start of correspondence courses as the initial challenge to the traditional classroom (McLaren, 2004). Yet, today, it is not a question of whether we pursue this educational medium, but rather, are students in the Web-based courses performing equal to or better than their counterparts in the classroom-based courses? An action research study was conducted to assess student performance in a traditional versus e-learning format at a historically Black land-grant university located in the southern part of the United States. The population sampled included 293 declared business majors who were self enrolled in either organizational behavior or international business undergraduate courses. Both courses in both formats were conducted over a 3-year period. A chi-square test was run to determine if correlation exist between final grades and delivery method. The results revealed that the delivery method did not impact student performance; hence, concluding that there was not sufficient evidence to assert that a relationship exists between final grades and delivery method.

INTRODUCTION

The growth of the Internet and the World Wide Web are attracting the attention of educational institutions across the nation. Increasingly, the World Wide Web is viewed as an effective and inexpensive means of delivering courses in the educational sector. Professors and instructional designers are being asked to adapt courses for Internet delivery while students are being promised more flexible learning formats.

The move to Web-based delivery of college- and university-level programs and courses is on the rise. This trend is driven by everything from changing enrollments to increasing costs associated with maintaining school facilities. The diversity of today's student population demands that educational institutions adapt the delivery of their programs to accommodate student's concurrent commitments, including work and family.

The Internet and the World Wide Web are significantly impacting all levels of education by changing the nature of the way we teach and learn. These resources open a boundless range of new learning opportunities and experiences for the classroom. The World Wide Web provides new methods for delivering course materials, enabling distance educators to create learning communities of students and teachers that collaborate and explore subjects of interests. It has created a paradigm shift in pedagogical practices, whose potential is largely untapped.

Education via the Internet is essentially online education, which Desmond Keegan (1988) characterizes as:

- the physical disjointing of instructors and students that differentiates it from traditional classroom education;
- the use of computer networks to deliver educational content; and
- the provision of two-way communication between and among instructors and students.

There are many terms for online education, which refer to the use of electronic applications and processes to learn (e.g. e-learning, online learning, web-based learning and virtual learning, to name a few). "E-learning is here defined as interactive learning in which content is available online and provides automatic feedback to the student's learning activities" (Paulsen 2002). The term e-learning is a broader concept which encompasses the use of all available electronic media to deliver educational content, including Internet, intranets, extranets, satellite broadcast, audio/video tape, interactive TV and CD-ROM (Backroad Connections, 2003; ANTA, 2003).

While the popularity and acceptance of online education is undeniable, many are concerned about measurable performance of student learning in Web-based courses. Given the rapid pace of technological innovation, there's a subtle distinction between being on the cutting edge and the bleeding edge of change. Because our students are the one's to suffer from our mistakes, this concern for quality of learning is paramount. The issue of student performance dates back to the start of correspondence courses as the initial challenge to the traditional classroom (McLaren, 2004). Yet, today, it is not a question of whether we pursue this educational medium, but rather, are students in the Web-based courses performing equal to or better than their counterparts in the classroom-based courses. With the hopes of assuring quality instruction, numerous studies have compared the performance of distance learners to that of traditional learners. Johnson and Aragon (2003) argue that student performance is directly impacted by the quality of instructional design and recommend a conceptual framework that represents a holistic perspective when developing online courses. Rungtusanatam and colleagues (2004) suggest that educators and researchers alike should focus on how best to design instruction for diverse populations in widespread locations. Educational institutions across the nation are impacted by many diverse forces motivating

institutions of higher learning to develop and deliver education via the Internet (Rungtusanatam, 2004). This chapter will provide: (1) a summary of the most notable findings from an exhaustive literature review comparing student performance in two distinct formats and (2) a detailed discussion, data analysis, and lessons learned from an action research study conducted to assess student performance in traditional and e-learning formats.

NOTABLE FINDINGS FROM THE REVIEWED LITERATURE

Experts in the field of performance assessment are actively debating whether students in Web-based courses perform equal to or better than students in traditional courses. A review of literature reports on a number of primary research studies that have provided comparable data on student performance between traditional and e-learning environments. A few notable findings (inclusive of non-significant and significant differences) are presented for your perusal.

A number of researchers have compared student performance in traditional versus e-learning courses and have found no significant difference between the two modes of instruction. The following studies add to the literature that states student learning, as measured by performance, does not appear to be different based on course delivery method. The study conducted by McFarland and Hamilton (2005) involved senior-level undergraduate MIS students who were enrolled in an E-Business course during the fall 2003 and fall 2004 semesters. Students self-selected into either the traditional section or the online section. Using Chi-Square analysis, results found no significant difference in the final course grade between the online students and the traditional students. Hoban, Neu, and Castle (2002) conducted a similar study, for two academic semesters, which compared the performance of student teacher candidates seeking state certification through the educational

administration program at National University in both on-ground and online delivery modes. Data collection included student surveys, grades, and a comprehensive exit examination. The results revealed that the students academically performed comparably in on-ground and online courses and that both groups mastered established standards.

Ali and Elfessi (2004) report the findings of a study that examined student performance and attitudes towards the use of information technology in virtual and conventional settings. Participants were 47 pre-service undergraduate students enrolled in an educational media and technology course. The study consisted of two treatment groups, one group completing the course online while the other group completed the course in the conventional setting. Data collection included a survey, a likert-type attitude assessment, and a pre and posttests on student performance. Analysis of covariance (ANCOVA) revealed a non-significant difference in student performance and attitude between the two groups.

Fields and Collins (2005) compared examination scores of students enrolled in 3 self-selected, introductory statistics courses. The study consisted of three treatment groups: a face-to-face course, a hybrid course, and a fully online course. The authors found no evidence of a difference in the students' mastery of statistical concepts. Likewise, studies conducted by Hilton and Christensen (2002), Allredge and Som (2002), Zhange (2002) and Fields and Collins (2004) have consistently found no significant difference in student performance when comparing courses delivered in the traditional setting versus the e-learning format.

Buchanan and colleagues (2000) compared traditional classroom instruction with web-based equivalent courses in a graduate program in library and information science and found no significant difference in student performance. Similarly, Gagne and Shepherd (2001) analyzed the performance of students enrolled in both a face-to-face and web-based section of an introductory graduate level accounting course. A one-way fixed effect

analysis of variance was used in this study and determined that the performance of students in the web-based course was similar to the performance of students in the face-to-face course.

Other notable research findings include the study conducted by Dellana, Collins and West (2000) in which they examined the effectiveness of a virtual classroom for an undergraduate course in management science. The results indicate no significant difference in student's final course score, when comparing the online option and the traditional course settings. Carey (2001) compared the outcome measures of a management information systems course offered at a small, urban, upper-division university in the two delivery modes. Data collection included a pretest/posttest to assess students' understanding of generalized knowledge of the course, final course grade, student evaluations, student satisfaction and their ability to apply course concepts. The results revealed no significant difference between the learning outcomes of students receiving the online-delivery mode and the face-to-face delivery mode. Likewise, McLaren (2004) found no significant difference in performance when comparing 7 online sections and four classroom sections of a business statistics course.

On the other hand, several notable studies have reported findings contrary to the aforesaid authors. Opposing results were reported by Ury (2004) who conducted a study in which he compared performance over time between online and traditional classroom students enrolled in a management information systems courses and an elementary programming course. Performance, as measured by final grades, indicated that the online delivery method was most effective. The results revealed that students enrolled in the online sections showed a significantly lower mean score than students enrolled in the traditional sections.

Connolly, MacArthur, Stansfield, and McLellan (2007) conducted a quasi-experimental study to investigate student performance in 3 masters-level computer courses that were developed

and delivered in online and traditional formats. The study spanned 3 years and included 4,684 participants. Study results show that online students consistently performed better than face-to-face. Identical results were found by Stansfield, McLellan, and Connolly (2004) who examined the results of four modules from the Masters of Science Management of e-Business program with the purpose of comparing the overall performance of students enrolled in the modules online versus those in the face-to-face. Analysis of the results during the period 2000-2002 shows that online students in all four modules, Technologies for Global Commerce, Information Theory and Practice, International Technology Management, and Fundamentals of Database Systems, consistently performed better than the students enrolled in the face-to-face modules.

Studies conducted by Sapp and Simon (2005), Ellis, Goodyear, Prosser, and O'Hara (2006) and Carbonaro, Dawber, and Arav (2006) support the significant difference perspective when comparing student performance in a traditional setting versus the e-learning format.

ACTION RESEARCH STUDY BACKGROUND

Implicit in the term "action research assists educators in assessing needs, documenting the steps of inquiry, analyzing data, and making informed decisions that can lead to desired outcomes" through a process that is undertaken in a school setting (Watts, 1985, p. 118). The idea of using research in a natural setting is traced back to Kurt Lewin, a social psychologist and educator whose work on action research was developed during the 1940s in the United States (McFarland & Stansell, 1993). "Lewin is credited with coining the term 'action research' to describe work that did not separate the investigation from the action needed to solve the problem" (McFarland & Stansell, 1993, p. 14). Action research was introduced to the

field of education by a professor at the Teachers College at Columbia University, Stephen Corey. Corey argued, "that the consequence of our own teaching is more likely to change and improve our practices than is reading about what someone else has discovered of his teaching" (Corey, 1953, p. 70). Educators and researchers alike view the practice of action research viable and of great value in the engagement of educational reform (Noffke & Stevenson, 1995; Best & Kahn, 1998).

The current study was conducted at a historically Black land-grant university located in the southern part of the United States to assess the academic performance of students in both traditional and e-learning formats. The demographics of the population sampled consisted of 73% African Americans, 18% Caucasians, 4% Hispanic, and 5% other races. Additionally, 57% were between the ages of 17-24, while 43% were reported as non-traditional students that were employed, commuting, single parents, adults with families, and/or retired military personnel. The following research question was postulated for this study: Does student performance differ based on delivery method (traditional vs. e-learning format)?

Course Design, Data Analysis and Discussion

Action research methodology was employed to examine student performance in two core senior-level undergraduate business courses that were designed for both the traditional classroom and e-learning instruction. The study included 293 declared business majors, who self selected and enrolled in Organizational Behavior and International Business courses over a 3-year period, beginning in the fall 2004 through the spring 2007. These courses were requisites for all business majors, who were required to maintain at least a 2.5 GPA in all core courses. The same instructor, who holds a Ph.D. in Organizational Behavior and has extensive international research and consulting experience, taught all the courses used

in this study. Prior to developing these courses, the instructor received training in the Blackboard Learning Management System and online course design from the University's Center for Innovation in Teaching and Learning.

The traditional classroom-based sections of both courses met for 2.5 hours per week for a 16-week long semester. The pedagogical practices centered around lecture and discussion in the face-to-face courses. In addition to the chapter readings, the requirements for both courses included a variation of chapter quizzes, case analysis, formative and summative examinations and participation. Class participation was measured by the quantity and quality of oral contributions.

The e-learning courses were developed, delivered and managed with the Blackboard Learning Management System. Utilizing Blackboard's teaching and learning tools, the instructor designed the lecture notes and PowerPoint slides that were used in the Traditional classroom format. The course readings, aside from the textbook, were made available electronically as PDF files. Both the e-learning and traditional sections used Blackboard for the administration of all quizzes, examinations, and submissions of written assignments.

Because there were no face-to-face meetings of the e-learning sections, participation centered upon the discussion board, where both collaborative learning among students and open dialogue with the instructor was encouraged. The threaded discussions about the assigned readings served as a measure of participation, based upon the quantity and quality of the electronic postings of each student.

Year 1 (2004/05)

A student centered approach to teaching and learning was used in the first year in which the responsibility for managing the pace and depth of learning was left to the students. Because the chapter quizzes were primarily intended to be self-study tools, they were posted on Blackboard all

semester for students to take at their own pace. The quizzes were comprised of fifteen multiple-choice and true/false questions randomly selected from a database of 120-150 questions that were timed for completion in fifteen minutes. Importantly, to enable the students to self-assess both their reading comprehension and their level of achievement, the quizzes could be taken repeatedly without limit. In an attempt to avoid the memorization and regurgitation process of examinations, case analyses were required, which served to demonstrate the students' working knowledge of the course concepts and promote analytical thinking and writing skills. Consequently, each of the two (2) case analyses was to be a minimum of ten (10) pages in length and was heavily weighted for the overall grade. The International Management courses also required fourteen (14) one-page summaries of current events in the global marketplace. As a process based strategy, the students were permitted to revise and resubmit their writing assignments repeatedly, until they achieved their desired grade. In contrast to a time centered strategy, where primacy of compliance with time limits for deliverables influences results, this strategy enables students overall effort determine their learning outcomes.

Data analysis for year 1, as represented in Table 1, show that less than twenty percent (18.8%) of the students earned grades below the required level in the traditional format. Additionally, 41.3% earned year-end grades between 91-83, 35% earned between 91-83, and 5% earned between 82-73. In the e-learning format, a significant percentage of students failed below acceptable levels (31.9%), while 29.8% earned between 100-92, 25.5% earned between 91-83, and 12.8% earned between 82-73. Descriptive statistics indicate a larger percentage of year-end grades that averaged between 100 and 73 (81.2%) in the traditional format compared to (68.1%) in the e-learning format.

During the first year, when the instructor placed minimal deadlines upon the students, he discov-

ered that they were not taking the quizzes or responding to the discussion board assignments. Despite numerous appeals that they keep up with the readings and be prepared for class, only a few students kept up with the weekly assignments, while the majority waited until the last month and weeks of the semester to fulfill these course requirements. The students indicated that because of their work and family responsibilities, they had to prioritize the course work for their more instructor-centered classes for which there were severe penalties for failing to meet scheduled deadlines and weekly attendance.

Because the instructor actively coached the students to revise and resubmit the written assignments for evaluation, most students took advantage of the opportunity, which resulted in improved grades. Because the course quizzes and written assignments could be indefinitely revised for improvement, the students' continuous effort largely determined their final grade. In many cases, up to three and four revisions of the writing assignments and up to ten attempts at the quizzes. By the end of the semester, the instructor recognized that the time demands for both the students and he was unreasonable. He discovered that his expectations for writing exceeded most students' abilities, and the quizzes were not assessing their reading comprehension. Rather their success with these assignments reflected their persistence to resubmit papers and re-take quizzes with minimal improvements until they attained their desired results. While the dedicated students were able to achieve A's and B's, numerous students who

Table 1. Year 1 final grade report

Final Grades	Traditional		e-Learning	
	Count	%	Count	%
100 - 92 (A)	33	41.3	14	29.8
91 - 83 (B)	28	35.0	12	25.5
82 – 73 (C)	4	5.0	6	12.8
72 and below	15	18.8	15	31.9

attempted to complete the assignments at the last minute failed the class. A binomial grade curve resulted, in which the average C student either improved their grade or failed the course depending upon their self-discipline and tenacity. The disproportionate failure rate of one-third of the class leads the instructor to perceive the lack of course structure as the cause.

Year 2 (2005/06)

In response to the first year's outcomes, the instructor changed the teaching strategy for year 2, from student-centered to instructor-centered and added formative and summative evaluations. An instructor-centered approach was used to provide more structure and control over the learning process. The instructor provided more conventional guidance, disseminating the information, providing corrective feedback, and establishing timelines. While the courses chapter quizzes were similarly designed and administered, deadlines were imposed to ensure that the students didn't fall behind. These quizzes were due to be completed within two weeks of the assigned chapter readings. Unlimited revisions of the writing assignments were continually accepted, but only until the due date of each assignment. Late submissions of the written and discussion board assignments were not accepted in order to contend with pervasive procrastination. The paper's length requirement was reduced from ten to eight pages, in hopes of improving the quality of writing. And finally, to enhance the assessment of student comprehension, empirical measures were introduced in the form of four multiple-choice exams. The exams were comprised of thirty instructor-selected questions from the test bank and were administered online with a one-hour time limit.

Data analysis in year 2, as displayed in Table 2, shows 21.3% earned final averages between 100-92, 19.1% earned between 91-83, 27.7% earned between 82-73, and 31.9% fell below passing in the traditional format. Comparable percentages

were reported for the e-learning courses with 18.2% earning between 100-92; 29.5% between 91-83, 20.5% between 82-73, and 31.8% with averages falling below 73%. Quite the reverse from year 1, the year-end grade averages of year 2 indicate a minute difference (.01) in the percentage of scores between 100 and 73 (68.2) in the e-learning format compared to (68.1) in the traditional format.

In year 2, the instructor imposed assignment deadlines to create more structure that would control the learning process and reduce the time commitment for evaluation. The quizzes for the assigned readings were due within two weeks, and late submissions of any assignments were not accepted. Unfortunately, many did not complete the quizzes on time. Consequently, the blackboard quizzes were made available one week prior to the exams, in hopes that they would be utilized as reviews and study tools. Upon inquiring why many of the students failed to complete the quizzes in the allocated fifteen minutes, the instructor discovered that they were using the book to look up the answers, defeating the intended purpose for self-assessment of reading comprehension.

Because the students with poor writing skills in the first year were disadvantaged, and the instructor desired to decrease cheating on the quizzes, four multiple-choice exams were introduced and the relative weight and length of the written assignments were reduced. The two writing assignments for the Organizational Behavior courses were limited to 10 pages worth 50% of their grade. Only one case analysis was required in the second year

Table 2. Year 2 final grade report

Final Grades	Traditional		e-Learning	
	Count	%	Count	%
100 - 92 (A)	10	21.3	8	18.2
91 - 83 (B)	9	19.1	13	29.5
82 – 73 (C)	13	27.7	9	20.5
72 and below	15	31.9	14	31.8

of the International Management course, in lieu of the requirement of weekly one-page summaries of current international news. Similarly, the writing assignments were weighted as 50% of the final grade in the International Management course.

Importantly, the results of the multiple-choice exams in all courses reflected the students' performance on the chapter quizzes, suggesting that they served as a reliable measure of performance. These instructor-centered changes resulted in student performance that more closely resembled a normal grading curve, yet nearly one-third of the students failed to complete the course assignments in the second year.

Year 3 (2006/07)

The third year courses incurred greater instructor-centered control over the learning process and student participation. To minimize student's open book cheating, the chapter quizzes' fifteen questions were to be completed in only ten minutes. Additionally, the quizzes had to be completed within one week of the assigned readings and could be attempted only three times. To increase quality of the eight page writing assignments, revisions were subject to one grade reduction. With hopes of improving empirical measures, while assessing analytical thinking, twenty-four review questions were assigned one week prior to the assigned exams, of which eight short answer questions were included in each of the four exams, along with sixteen instructor-selected multiple choice question. Because the required answers were comprehensive, the questions needed to be completed ahead of time. Students who failed to be fully prepared found it difficult to successfully complete the exam within the one hour allotted.

Data analysis in year 3 illustrates a large percentage of students (40.9%) earned year-end averages between 100-92 in the traditional format despite 31.8% earning failing marks. This year also reported 11.4% earning scores between 91-83 and 15.9% earning between 82-73. In the e-learning format, the majority of the students earned grades between 91 and 83 (35.5%), while only 19.4% earned between 100-92, 16.1% earned between 82-73, and 29% earned grades below the acceptable average. The frequency distribution, as depicted in Table 3, show that in year 3 (reminiscent of year 2) a slightly larger percentage of year-end grades averaged between 100 and 73 (71%) in the e-learning format compared to (68.2%) in the traditional format.

In an attempt to address the failure rate, further time restrictions were imposed upon the course assignments in year 3. The chapter quizzes were due within one week of the assigned readings, in hopes that the students would keep current. To more accurately assess reading comprehension and prevent open book cheating, the fifteen question quizzes were timed for only ten minutes. As a result, the quiz scores dropped dramatically. When students who failed the quizzes achieved high scores on the first exam in the Organizational Behavior course, the instructors' investigation revealed that the students were collectively taking the online exam in the University computer lab and sharing answers. Consequently, eight short answer questions were including in all courses remaining exams for the year to more effectively prevent cheating. Due to the changes in examination methods, a disproportionate number of students withdrew or failed the Organizational Behavior courses in the third year.

Table 3. Year 3 final grade report

Final Grades	Traditional		e-Learning	
	Count	%	Count	%
100 - 92 (A)	18	40.9	6	19.4
91 - 83 (B)	5	11.4	11	35.5
82 – 73 (C)	7	15.9	5	16.1
72 and below	14	31.8	9	29.0

FINDINGS

The performance of the 293 students enrolled in both the traditional and e-learning was measured by the final grades achieved. This data was analyzed using a Cross Tabulation to determine any significant differences between the variables, for which Statistical Package for Social Sciences (SPSS) was used with the significance level set at a = 0.05.

Data analysis in this study consisted of two phases. In Phase 1, descriptive statistics such as the mean and standard deviation were calculated (see Table 4) to measure the spread of values in the distribution of final grades. The mean and standard deviation for final grades between 92-100 were 1.31 and .467, respectively; between 83-91 were 1.46 and .502; between 73-82 were 1.45 and .504; and final grades between 72 and below

Table 4. Descriptive statistics for final grades

Final Grades	N	Mean	Std. Deviation
92 – 100	89	1.31	.467
83 – 91	78	1.46	.502
73 – 82	44	1.45	.504
72 and below	82	1.46	.502
Total	293	1.42	.494

were 1.46 and .502. In every instance, the final grades achieved were clustered around the mean.

Additionally, descriptive statistics provided a breakdown of final grades by delivery method. Figure 1 illustrates student performance in the e-learning format with 23% of the study population earning final grades between 92-100; 29.5% earning between 83-91; 16.4% earning between 73-82; and 31.1% earning a final grade of 72 and below.

Figure 2 depicts student performance in the traditional format with 35.7% of the study population earning a final grade between 92-100; 24.6% earning 83-91; 14% earning between 73-82; and 25.7% earning a final grade of 72 and below.

In the second phase of the data analysis, a cross tabulation of category frequencies were computed to determine if correlation exist between final grades and delivery method. A Chi-Square Test was run to obtain a measure of statistical significance with the significance level set at a=0.05. The Chi-Square Test indicates that p>.05 (.141) and cannot be regarded as significant (see Table 5). Accordingly, we conclude that there is not sufficient evidence to assert that a relationship exists between final grades and delivery method.

In summary, this study sought to determine whether student performance differs based on

Figure 1. Student performance in e-learning format
Figure 2. Student performance in traditional format
Table 5. Delivery method chi-square test

	Value	df	Asymp. Sig.
Pearson Chi-Square	5.458[a]	3	.141

Linear-by-Linear Association	3.383	1	.066
N of Valid Cases	293		

a. 0 cells (.0%) have expected count less than 5. The minimum expected count is 18.32.

delivery method (e-learning and traditional formats). The findings revealed that the delivery method did not impact student performance. In likeness to the findings of this study, the reviewed literature reveals a predominance of non-significant differences found between the two modes of delivery.

STUDY LIMITATIONS

As with any research, particularly in the area of online education, there were a number of limitations that may impact this study; accordingly, caution is necessary when interpreting the findings. While this study provides research on a population that is underrepresented in the literature, it also gives

way to the first limitation in focusing solely on participants attending minority-serving institutions with no comparative data from majority-serving institutions. The second limitation pertains to final grades as influenced by institutional standards, which may be at variance with the current study's articulation of final grades as a measure of the extent to which the student successfully complies with the academic requirements set forth by the university's board of regents.

The courses used for this study were business related which addresses the third limitation that frames the assumption not all disciplines have courses that are compatible with the e-learning delivery mode relative to content and subject matter. Lastly, the e-learning courses were created and delivered using Blackboard. To date, there is a significant number of management learning platforms that provide a host of online collaborative tools; therefore, caution should be exercised in generalizing the findings relative to different e-learning platforms.

LESSONS LEARNED

Academicians, researchers, and practitioners across the globe have learned valuable lessons

regarding what works and what does not work for online education. As described in the discussions of this chapter, there were several challenges in the development and design of the online courses. These challenges and lessons learned can be summarized as follows:

- There is an ongoing concern regarding students dropping out of online courses. Researchers have cited poor technology skills, lack of self-discipline and motivation, and minimal interaction between and among students and faculty as reasons for the high attrition rates. As previously stated, a disproportionate number of students either withdrew or did not complete the course assignments in the e-learning format. In view of such, it is important to develop a learning community with meaningful interaction, collaboration and engagement. The use of asynchronous and synchronous communication tools should be employed to provide sufficient levels of interaction.
- A more demanding issue with online education is how to design and offer content. The current study failed to provide content using synchronous tools which promote communication simultaneously; lectures were merely created in PowerPoint and posted online for students to view at their convenience, lessening the online courses to simply threaded discussions and forums. To correct this problem, the use of streaming audio and video coupled with PowerPoint presentations as well as web conferencing is recommended not only to promote interaction simultaneously but also to promote an online environment in likeness of the traditional classroom.
- The instructor-centered approach was used in year 2 and 3 of this study as a means of controlling course activities and student participation and disseminating informa-

tion. Flexibility has been cited as one of the prevailing advantages to taking online courses. In as much, students have the flexibility of completing assignments at their convenience with the option of working ahead. However, to enable students to work leisurely and ahead, all course material should be finalized and posted on the web site at the beginning of the course requiring upfront design and development, not development as the course progresses.
- The instructor repeatedly noted that students were using the book to look up answers to the quizzes. To avoid the problem of cheating, online exams must embrace structured questions or other assessment methods that represent intellectual activity that require students to apply, analyze, synthesize, and/or evaluate the concepts they have learned rather than the regurgitation of simple recall or recognition of facts. (Krathwohl, Bloom & Masia (1973).

CONCLUSION

The current study set out to assess the academic performance of students in both the traditional and e-learning formats. The results, while consistent with the predominance of the current literature reviewed, indicate that the e-learning format offers flexibility with no loss of performance.

The 2003 Sloan Survey of Online Learning polled academic leaders... and asked them to compare the online learning outcomes with those of face-to-face instruction; a majority said they are equal. (Roach, 2003, p. 1).

From the prevailing research, we can conclude that the use of the Internet and the World Wide Web to abet in the development of Web-based courses is a growing trend that cannot go unnoticed (Rungtusamatam et al, 2004; Simonson, 2006;

Fornaciari and Forte, 1999). The data gathered in this study can inform future planning and implementation of online instruction. Although significant differences in performance were not generally reported in the reviewed studies, there are many challenges to overcome if we are to make e-learning a rewarding experience.

Chapter 45

21st Century Learning Opportunities for SME Success:
Maximizing Technology Tools and Lifelong Learning for Innovation and Impact

Kathleen P. King
University of South Florida, USA

John J Foley III
Citigroup, USA

ABSTRACT

This chapter informs SME (small and medium enterprise) owners, developers, consultants, and academics with the reasons, means, and possibilities afforded by 21st century technology in helping SMEs to improve their operational efficiencies and discover more effective marketing strategies for their products and services. With the rapid development and broad-based integration of web-based technologies across domains of communication, marketing, e-Commerce, and training, SMEs can benefit greatly by using these inexpensive tools to their advantage. SMEs typically underutilize opportunities to enhance their efficiencies by using more complex e-Business systems, and in so doing under develop the talents of their workforce for innovation and success. This underutilization is not just because of ignorance of technological capabilities, but also from a lack of exposure to leadership and HR development training. Knowing the need to learn must be a strong foundation before technological development can ensue. This chapter provides a synthesis of research and literature across several related, but seldomly connected fields - including, organizational theory, leadership, adult development and learning, 21st century learning, distance learning and human resource management. In developing this chapter, the authors are attempting to communicate the need for SMEs to both develop leadership and technological program developments to implement the changes needed to compete in a marketplace that reflects rapid change and imperfect information.

INTRODUCTION

With the great proliferation and social adoption of web-based communication tools, e-Commerce platforms, and distance learning, SMEs are in a prime position to broaden their scope of service, increase scalability, cultivate innovation, and add to their profit margin. However, as the literature reveals, most SMEs do not know how to utilize e-Business platforms, nor are they aware of the various forms of education available to become proficient in this media. This chapter defines the current dimensions of what e-Business is, what it offers SMEs, and strategies for evaluation and possible implementation. Moreover, the chapter documents current issues and trends regarding how SMEs are, or are not, using the e-Business potential, and what the obstacles are for learning and implementing these changes. In addition, the discussion includes a review of salient limitations and risks which SMEs may review as they weigh these substantial strategic organizational opportunities. The chapter concludes with an overview of the macro level of the opportunities and recommendations for action.

In addressing options and strategies to encourage SME adoption of e-Business technology, we will build upon the literature of human resource development, business management, organizational theory, leadership, adult development, adult learning, 21st century learning and distance learning. Specifically, the chapter defines a business epistemology for the proper mix of e-knowledge and vision that are relevant for SMEs who are developing an e-Business platform. The chapter focus culminates in proposed solutions to encourage SMEs to embrace e-change, and a call for future directed research in this business challenge. The chapter begins by clarifying e-Business types and their definitions which are essential to the focus of the discussion.

Definitions

In any discussion of such emergent and evolving concepts as e-Business, it is always beneficial to define the terms used. Therefore, this section defines the types of e-Business especially pertinent to this chapter. In reviewing the academic record, uniform nomenclature to describe the various types and platforms of e-Business has not as yet been normalized; however, for our purposes:

E-Business is the umbrella term for all uses of inter-company electronic networks to connect to intra- and inter-company systems, where the use of those networks and software is to organize and transact business activities in cyberspace (Brown & Lockett, 2004, p.1; Wu & Hisa 2009, p. 95).

E-Commerce is the simplest subset of e-Business, and relates to using the internet to order and pay for products or services, plus general e-mail activities (Wu & Hisa 2009, p. 96). Most SMEs (like many individuals) already use these base skills in order to communicate and order supplies. Research on SME adoption of e-Business has shown that SMEs are fine with e-mail/e-Commerce (low to medium technology) applications, but have very little engagement in highly complex applications (Brown & Lockett, 2004, p. 1). Most e-Business definitions exclude e-Commerce from their measurements of adoption of e-Business solutions.

E-Marketplaces, also known as inter-organizational networks (IONs), use the Internet to allow for the development of many e-Business models, which results in SME aggregation via IONs. These IONs form a web of SME exchanges that reflect cooperative and competitive elements, and vary in the form of network autonomy versus dependence, based on the specific needs, trust, and control requirements demanded of each individual network of SMEs. Aggregations in these IONs can range from social networking to formal integration (Brown & Lockett, 2004, p. 2-3).

An example of the first aggregation would be an industry social media which used blogs (web

sites which are easily updated and allow comments to be posted), forums (online discussion areas), wikis (collaborative websites allowing for multiparty editing of documents), etc for members to communicate and share their expertise in nuanced business matters. These aggregations serve two purposes, they make industry expertise available for all SMEs in a particular field, (rather than having expertise residing only with larger competitors), and these forums allow individual SMEs to advertise their knowledge and experience.

An example of formal aggregation sites would be ones in which members can:

- purchase supplies from an industry-aggregated catalog,
- sub-contract out portions of their workload to competitors who currently have excess capacity
- access industry websites that have product lists with price comparisons
- access industry developed back-office tracking systems for billing, payroll, etc.

E-Mobile expands e-Business to mobile computing devices. Wi-Fi networks and Bluetooth® LANs have allowed mobile devices to easily connect to local enterprise networks and the internet. This technology has allowed mobile employees to increase their range of activities and connectivity to allow them to service their customers while they are in transit or out on other business meetings. This extension of connectivity provides employees with flexibility, responsiveness and efficiency when they are not in the office (Sairamech, Goh, Stanoi, Padmanabhan, & Li, 2004, p. 651).

BACKGROUND

Why Do SMEs Need to Maximize 21st Century Learning Opportunities?

In a perfect world where SMEs have the same access to knowledge, financial and human resources, and wield the same marketing acumen as large corporations, the formation of SME aggregations and the advanced usage of e-Business applications would mirror the developments in other corporate practices. ION formation to advance sales efforts and for cost efficiencies would develop linearly. For these SMEs that adopt e-marketplaces, the cause célèbre for forming IONs in e-Business models would be to integrate suppliers, distributors, service providers and clients. These aggregations would ensure better communications with each party, and would enhance business transactions via the internet in order to produce value-added services/efficiencies for themselves and their customers.

Such e-Business networks would not just form in the ether of the internet. Motivated SMEs would link up through general intermediaries and SME targeted networks. These IONs would congeal as individual SMEs connect up to each other within structure provided by these intermediaries. Examples of e-Business intermediary networks are bCentral (Microsoft®), NetBusiness (Netscape™, etc), BizProlink, and Achilles, 2002. These platforms provide host software networks for SMEs, and would also serve as a portal to more complex e-application via consultancy services (Brown & Lockett, 2004, p. 3).

Building upon these foundational definitions of different types of e-Business, the next section describes the current applications of e-Business today. Based on a review of the literature, the practices are analyzed for trends and themes pertinent to SMEs.

The Real World: E-Business Use by SMEs Circa 2010

Based on literature review and analysis, the only SMEs that have fully engaged in highly complex applications are those that are imbedded within a client or supplier chain network, and were required to be compliant with the best practice e-Business applications of these larger companies (Xu, Rohatgi & Duan, 2007, p. 83). In effect, they were forced to adopt because of their captive position in an e-Business vertical chain. Also, the network that was forcing compliance would also have had the expertise to guide these SMEs through the adoption phase.

As e-Business applications become more complex, most independent SMEs are slowing in their adoption of this technology. Academics and policy makers had assumed that as large organizations implemented e-practices, that these would trickle-down down to influence the practices of SMEs. This has not transpired. The high level of application complexity has had a negative impact in SME adoption decisions (Brown & Lockett, 2004, p. 1).

Researchers on this adoption question had speculated that the internal and external critical factors that would effect whether an SME adopted complex e-Business solutions would come down to either barriers to adoption, or enablers to adoption. They speculated that these considerations would fall into 3 categories: specific perceived benefits, organizational readiness/resources, and external pressures to adopt (Levy, Powell & Worrell, 2005 p. 2). However, these generally accepted factors did not include a review of the e-Business application complexity, which appears to have a high correlation on why SMEs lag in adopting complex e-Business applications.

Government sponsors of e-Business initiatives and academia sought a more granular explanation than a simple large to small trickle-down effect, and expanded their considerations. A more nuanced explanation involves the relationship of three barriers to SME adoption of complex e-Business: access to education/information, financial and human resources, and employee training.

One way of depicting and better understanding the relationships among these concepts is illustrated in Figure 1. At the easiest levels of e-Business,

Figure 1. E-application complexity effect on SME adoption

E-application Complexity
Effect on SME Adoption

	E-commerce (Low Complexity)	E-marketplace (High Complexity)
Perceived Benefit by SMEs	Yes	Benefit not commonly known
Organizational Costs:	Low, only need PC	High
Educational awareness	Owners are aware	Owners don't perceive value
Need for additional resources	None	More specialized employees
Need for training	Employees already trained	Significant training
Rate of Adoption by SMEs	High	Low

SME owners and employees are self trained -from their personal experiences with e-mail, online shopping, etc. As complexity increases, SME owners are less aware of the e-benefits, and are more constrained by limited resources (financial and staffing), and are less willing to provide formal training for their employees.

Demands on SMEs

There have been many studies on the issues affecting SME adoption, most point to the limiting effects of the three barriers listed above; the education of SME owners on the benefits and applicability of e-Business solutions for their firms, limitations of funding and available personnel, and ignorance that employees training programs exist for e-Business applications. We have carefully selected six of these studies as representative of the dominant issues reviewed.

The first study examined more obvious, practical aspects of these barriers. Without intellectualizing the factors, Xu, Rohatgi, and Duan (2007) revealed that the development and implementation of e-Business technology by SMEs tends to focus only on short-term benefits (operational savings, etc.) to the detriment of long term strategic planning. This shift away from long-term planning is most likely caused by limited financial resources and employee capacity at most SMEs, which serves to impact the ability to fund and provide training due to limiting constraints. At the more basic levels of e-Business, such as e-mail and the ordering of supplies, employees teach themselves how to use the systems – it is easy. However, the more complex the application, the less likely employees will train themselves, and financial constraints prevent formal management training of these employees. Therefore, advanced applications are ignored (Xu, Rohatgi, & Duan, 2007, pp. 82-85).

In a concurring study, the relatively low rates of SME adoption of e-Business applications relates to a lack of e-Business competency, and a lack in training (Eikebrokk & Olsen, 2009. Lack of time and resources within SMEs and a general ignorance of the training available are seen as the primary barriers to organizational adoption of e-Business (Eikebrokk & Olsen, p. 7). Jeon, Han, and Lee conducted another study in South Korea in 2006 which demonstrated that the most critical determinants of SME adoption of e-Business was the vision and support of the CEO, and the dissemination of information showing business relevance of e-Business applications, as well as access to properly promoted training programs (Jeon, Han, & Lee, 2006, pp.1905-1916)

A Canadian business study, Canadian e-Business Initiative (2003), identified a barrier to SME adoption of e-Business to be a lack of technical expertise in the Canadian marketplace. Universities are producing IT specialist that are trained for the needs of Fortune 1000 companies. Since SMEs need as much business planning as technical development, IT graduates alone are not very useful to them. SMEs need employees or consultants that can design and implement turn-key e-Solution systems (Canadian e-Business Initiative, 2003, pp. 10-11). That requires specialists that can evaluate an SME's existing manual procedures toward redesign, look to identify sales and savings potentials from e-Business platforms, design the technology, train employees and implement the new process. These types of specialists are not being trained at universities currently.

In a follow-up Canadian business-sponsored report, SME adoption of e-Business solutions was found to be stalling (Canadian e-Business Initiative, 2004). While most SMEs have adopted e-Commerce, most have not adopted the more difficult integrated solutions. This report also found that most SMEs do not understand how e-Business can help them, don't have the internal capacity to implement, and that the quality of external consultants to help plan and instruct was uneven. A further concern on that last point was that SME owners felt that there were no coordinated or trusted sources of information and training.

Another study that interviewed the owners of SMEs found that most executives believe that they should pursue e-Business solutions, but that they had concerns over technical and human resource constraints (Ihlstrom & Nisson, 2003). Specifically, there was a lack of knowledge about the topic within their organization, and if anyone did have some e-knowledge, they were too busy on other work responsibilities to be reassigned to program development (Ihlstrom & Nisson, 2003, p. 221).

In Figure 2, the findings of the above studies on issues surrounding the adoption of more complex e-marketplace applications is diagramed from the SME owners' perspective. Education to address these misconceptions is critical if SMEs are to adopt e-Business, and the degree of this education will depend on the SME owners' perception of the usefulness of e-Business to their operations. Once owners' misconceptions are addressed and e-Business plans are devised, technical training can address employee competencies.

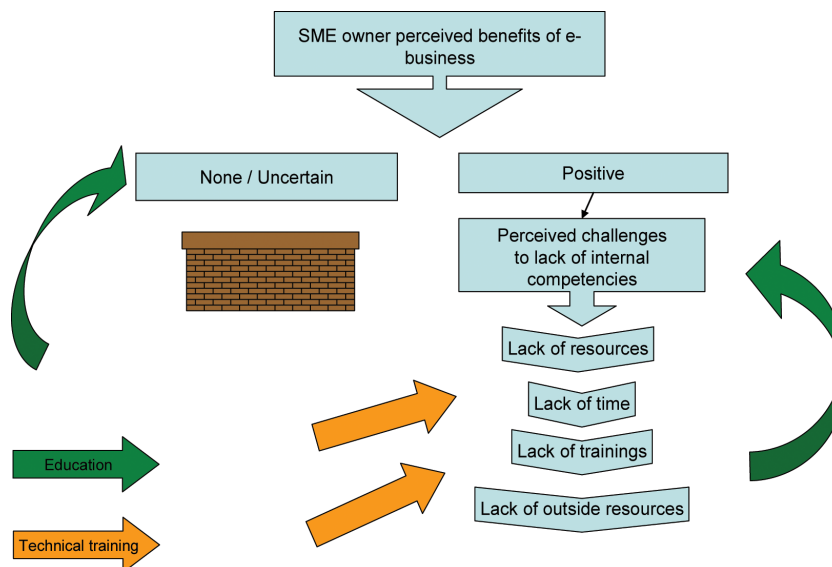
As can be seen in this diagram, SME owners' education of the capabilities of e-marketplace applications starts at a basic level if the owners do not have any perceived value in e-Business solutions. If they do have a positive perception,

then the education process would be focused on their misconceptions of the costs, lack of supports, and savings associated with e-applications. Technical training would proceed once the misconceptions were redressed.

Understanding the current practice, trends and challenges of e-Business today, provides the context for pursuing our discuss ion. However another critical building block is the theoretical framework. The next section describes the theoretical foundation which guides our discussion.

SYNTHESIZED THEORETICAL FOUNDATION

Introducing e-Business to SMEs is not just about an e-Business plan, consultations and training. The process is developed within the framework of a theoretical understanding of leadership skills, management and adult (employee) centered learning. As such, the literature can illuminate salient principles, strategies and models of addressing organizational change, training needs, human performance issues and human resource development needs for our SME e-Business process.

Figure 2. Owners' perceptions of barriers to SME e-marketplace adoption


Leadership and Organizational Theory

Due to the very nature of SMEs, the leadership has a vast impact on the organizational climate and vision. Based on our review of the current literature, it is to be expected that SME leaders will also have vast impact on the choices, comfort level and implementation of e-Business. While leadership theories have varied greatly over the centuries, current trends are that leaders will usually adopt styles which are congruent with their personality style and social adeptness (Kouzes & Posner, 2007). That said leadership has also been encouraged to realize that different missions, situations and constituencies require different strategies and communication approaches. Being able to read the signs of the economic, political and organizational field are high on the list of skills required by successful SME leaders and entrepreneurs in any-sized organizations (Tapscott & Williams, 2006).

Human Resource Development

Concomitantly, organizational theory demonstrates that while organizational structure may be established and organized identically, leader "A" and leader "B" can create entirely differently organizational climates without changing the structure. The blend of organizational climate and structure cannot be ignored because either alone is insufficient to characterize the dynamics and environment of a specific organization. In fact, in SMEs the impact of the leader on the climate is magnified because of smaller numbers of personnel, greater interaction across ranks and cross training needs (Yorks, 2005). When people fulfill several roles in an SME, they work across departments and sectors of organizations that they may never encounter otherwise (Enriquez, 2001). Greater interpersonal communication provides abundant opportunities to influence and craft the climate of SMEs (Caffarella, 2001). Much like a

potter with clay, the CEO may well have direct interaction with large percentages of the employees and able to personally control the delivery of leadership vision, intentions, favor and disfavor, and preferences, thereby molding the climate of his/her SME (Kouzes & Posner, 2007).

Business Management

The literature of business management offers several astute insights which bear on our question and need. Specifically, current practice includes global project management which successfully implements company-wide processes from product and service development, to customer service (Ahoy, 2008; Feigenbaum & Feigenbaum, 2009; Tapscott & Williams, 2001). The fundamental elements comprising this need is found in being able to design and implement data driven decision making, benchmarking, and greater accountability. The emphasis on data driven decision making and bench marking provide a foundation to guide SMEs to document, quantify and evaluate the cost of doing business via non-automated and e-Business platforms. It provides urgency for cost-benefit analysis and return on investment (ROI) in most decision making processes which can guide the CEO and leadership to the degree that they wish this information drive their organization.

In global economies which create more possibilities of fiscal uncertainty (ASTD, 2009), such evaluations become major determinants of making decisions based on real-time data rather than solely projections and expectations (ASTD & Booz Allen Hamilton, 2009). However, in the area of human performance and human resource management, data-driven decision making is imperative and needs to be not only well documented, but also consistent, must demonstrate a lack of prejudice or bias, and closely follow tax, legal and industry requirements (Wang & King, 2009; Yorks, 2005). In times of rapid legal, industry and economic change, SMEs do well to examine the ways the human resource management services

as well as performance can be outsourced to large cooperatives (IONS) or web based for outsourcing (401Ks (retirement plans), payroll, employee handbooks, etc)

Adult Development

The closely related field of adult development reminds SME owners that the increased life span of our workforce means not only an aging workforce, but also a greater number of life transitions, all of which leads to a growing demand for more human resource services (Wang, & King, 2009). Whether it means upgrading credentials in order to satisfy regulations for the same job title, or changing focus of the work of the organizations due to rapid shifts in global markets or technology-driven obsolescence, training is a larger need for today's worker than ever before (ASTD, 2008, 2009). Increased numbers of SMEs cannot afford training departments and sending workers to frequent off-site (or out of town) training, which can be especially expensive and inefficient for SMEs with their smaller staffs (ASTD, 2009). Enter e-Learning, which includes not only learning on demand, but also video conferencing with inexpensive hardware and mobile learning options for staff to take continuing education credits, competency exams or updates via Blackberries®, iPhones®, or iPods®.

The adult development and career literature have indicated for years that adults are changing careers more frequently than even 20 years ago (Bjorklund &Bee, 2007). Add to this consistent trend the national and global economic changes, and businesses will experience even greater personnel turnover and changes. This pattern creates impossible demands for SMEs to handle frequent changes to benefits and industry or government related compliance issues such as, 401K plans, pensions, tax withholdings, staff information, organization wide bonding, individual employee bond compliance, individual employee licensing compliance, etc. Again the cooperative resources

of an e-Source or outsource provider can be most effective in addressing these increased demands and thereby allow SME leadership and to staff focus on the business they are engaged in rather than trying to master increasingly specialized and time consuming personnel services. Electronic solutions allow these services to be integrated into a one company based employee portal (enterprise system), or web-based accounts with major providers.

Adult Learning

One of the most exciting breakthroughs to impact adult learning in the last 8 years is from the field of neuroscience and boldly contradicts of the old saying, "you can't teach an old dog new tricks". Instead, we have learned that children and adults of any age are able to create new brain neuropathways, as long as they are not cognitively impaired by disease or disability (Jensen, 2006; Willis, 2008). Furthermore, the brain remaps areas which no longer function, or functions less than optimally. Much of this development happens through simple practice as adults use their minds in moderately complex mental activity. Such activities include simple number calculations, reading different types of literature, discussions, conducting word or numerical analysis, and visually discerning differences among images or characters.

The research demonstrates that when adults, regardless of age, continue to use their minds actively and challenge them with different types of activities they are able to maintain or increase their mental alertness, and acuity (Begley & Check, 1999-2000; Willis, 2008). The message for SMEs is that all employees can continue to benefit from training, because adults are never too old to develop new skills, improve existing abilities, and master new procedures.

Adult learning theory also confirms that the multiple learning styles identified by Gardner (2006b) apply to adults. Indeed, this is likely in part why people gravitate towards different

careers. While your marketing and development team will likely be highly visual intelligence and learning, bookkeepers, compliance officers, benefits personnel, technical support, and technicians are likely to be inclined towards numerical intelligence.

The current and foundational theoretical literature which has been discussed provides a framework for the discussion of how SMEs may best address the challenges of technology use and training in the 21st century. By bringing together these varied disciplines (leadership and management, business management, adult development and learning) the framing view is one of leveraging and empowering human capabilities rather than solely technological. The two cannot be isolated, and our discussion will illustrate how essential it is to understand the human capabilities in considering SMEs opportunities.

21st Century Learning and Distance Learning to Address the Opportunities

Gardner's book, *Five Minds for the Future* (2006a), is a compelling application of his original premises to current trends and the scope of the business world. This book proposes that there are 5 different types of "minds" which best meet the demands of the current workplace, technology driven society and global marketplace. Consistent with the Partnership for 21st Century Skills (2004) and The Conference Board (2009) reports of global business and workforce needs he identifies critical thinking, problem solving, creativity, and team building major characteristics.

While 21st century skills has been prevalent in k-12 schools for many years, and are now gaining attention by President Obama and Secretary of Education, Duncan's *Race to the Top* educational reform (Duncan, 2009; Obama, 2009; US Department of Education, 2009) and the broader ARRA legislation, the term has been less often applied to the workplace and human performance. However,

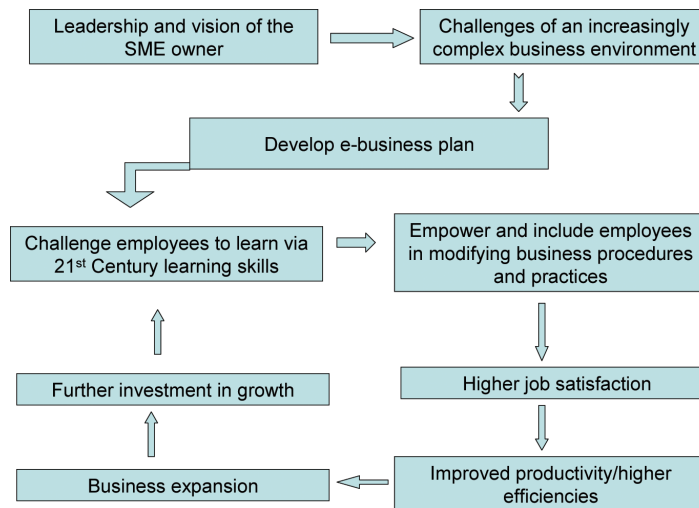
the same skills are identified in major literature from UNESCO education initiatives and higher education reports (2009), and also professional associations such as Society of Human Resource Management (SHRM) and American Society for Training and Development (ASTD) (The Conference Board, 2009). SMEs can act on this unequivocal message by making sure the training they are securing for their leadership and staff includes the emphasis on these same skill sets and the best minds which address them for their specific industry.

Taking these theoretical underpinnings and applying them broadly to e-Business adoption, Figure 3 encapsulates a possible synthesis of best practices for management theory, adult learning, and the development of e-Business solutions.

SME SUCCESS: STRATEGIES FOR 21ST CENTURY LIFELONG LEARNING

Scenario 1: Providing Top Notch Training, For All, And Under Budget!

Up, Up and Away International (UUAI) is a global import export company which has a virtual team of 50 employees spread across three continents. It is an exciting time as they have purchased a new software solution to increase productivity, project management and communication company-wide. However it is no small challenge to roll-out this extensive new platform across multiple sites of varied staff members. Part of the dilemma is a situation where there are several major types of equipment, settings and workflow process for different employees. For instance, just two examples reveal that while the CEO and several of the front line account executives primarily use high-end handheld devices to conduct all their work, most of the home office administrative, payroll and marketing staff are terminal based. Moreover, many of the virtual team are located in

Figure 3. E-business, management, and adult learning


one-person offices worldwide and have entirely different hardware specifications, tasks and needs.

Many SMEs are faced with similar challenges as seen in the UUAI Scenario as they struggle to serve a wide variety of learning needs of their staff effectively, conveniently, and under budget. In smaller organizations you might only have 1 bookkeeper, instead of 5. When new software is acquired or upgraded, do you hire a specialized trainer to train one person?

As indicated in our earlier discussion, the need to support, cultivate and provide ongoing training of SME employees is paramount in sustaining organizational success. In many cases the vast resources available through e-Learning can be combined with face to face and personal instruction so that based on the urgency of the need, e-Learning might provide more immediate and cost effective assistance. In the scenario above, employees in different offices could access software and procedure tutorials on-demand via a web-based interface. In this case the SME might purchase the number of seats they need for their staff with an e-Outsource provider who has a large variety of quality self-paced software tutorials.

Then they can also work with the company to develop simple presentations about company-only policies which would be proprietary to their staff.

High level technical and complex learning may be best facilitated in-person or via interactive synchronous technologies and learning experiences. While in other instances, general introductory instruction for software or hardware might successfully addresses the entire staff's needs, and may be negotiated for a reduced fee, bundled in the cost of the product purchased or in varied formats and time frames as described.

Table 1 provides a detailed chart which enumerates technology options for addressing many of these concerns and needs which are facing this familiar SME dilemma. Software, or web-based solutions, can be selected from open-source, inexpensive and enterprise categories as appropriate. However the focus is in maximizing ROI and cost-benefit results for SMEs. Readers will find this practical and informative chart of resources, benefits and limitations includes integrated e-platform solutions, remote login and tech support systems, IT help desk and dashboard solutions, personnel need solutions such as remote and synchronized travel trackers, and more.

Table 1. Comparison Charts of Resources for Scenario 1: UUAI

Need	Resource	Benefits	Limitations
Integrated e-Business Plat-forms Examples Most have these capabilities included: • CRM • Customer • Supplier • Inventory • Accounting • eCommerce • Banking • Reports Manager • System Manager • Point of Sale **All have these benefits:** - Streamline and coordinate processes because of integration - Potential of increasing customer purchasing, retention and repeat purchases - Better, more comprehensive tracking of vital processes: inventory, client needs, banking, etc	**Interprise Solutions** http://www.interprisesolutions.com	- Fully integrated system across business, product and sales processes - Free online trial available - Extensive product information available - Many available modules, not all have to be purchased.	- Because it is an extensive software, it is not inexpensive - Time for training staff in new software needs to be set aside -Likely new/revised processes to be established and learned
	Oracle e-Business Suite http://www.oracle.com/us/products/applications/ebusiness/index.htm	-Comprehensive business performance management -Extensive integration of knowledge resources and capital - Large tech support staff and extensive product development	- High cost - Long list of included features may not be needed
	Insite Commerce http://www.insite-commerce.com	- Capable of enterprise resource planning (ERP) integration - Integrated system across business, product and sales processes - Free online demo available - Includes content management system - Online shopping cart - Order tracking - Create online product catalog	-Greater focus on eCommerce, maybe less on CRM, accounting, and inventory needs - Only a representative lead demo - Price is not published
IT Dashboard Examples - Immediate download and install - From one computer can gather information on all software and hardware assets, licenses and versions. - Helpdesk ticket system built in- keep track all requests for tech support even in your SME	**Spiceworks** www.spiceworks.com	- Open source - Free online community of users serving as detailed tech support community	- Ads posted except on paid version
	SysAidIT http://www.ilient.com/	• Free version for under 100 computers • Varied price plans available for larger organizations	• Ads posted except on paid version - Other free products including online customer service support www.sysaidcss.com/
Remote Login and Backup Examples Remote desktop control of computers to help user at another location - Remote tech support platform backup -Remote retrieval of files -Screen sharing for demonstrations, training, training	**Logmein.com** www.logmein.com	- Free version has fair number of features - Paid versions range in costs, most affordable -Client sit back and you connect to them once installed	- Requires download of software prior to use
	GoToMeeting www.gotomeeting.com	- Free version has fair number of features - Paid versions range in costs, most affordable - Paid version, setup page and then client put in code to connect	- Requires download of software prior to use

Scenario 2: Going Global, Smarter with Scalable Products and Services

The amazing part of the GnuFone is that this inexpensive device allows people to interact effortlessly with family, friends and colleagues through an ear insert. This is possible because the R&D group at GnuTeam Inc. had discovered how to send video, audio and text via infrared messages to cell phones. The system was able to

741

Table 1. Continued

Need	Resource	Benefits	Limitations
Travel Tracker Examples -Web based -Mobile device compatible (iPhone®, Blackberry®, etc) -Track flights in real time -Travel itinerary -Travel reminders/ alerts - Calendar integration	**Tripit.com** www.tripit.com	-Widget to embed and share schedule in websites, Facebook, LinkedIn and more -Share access to different areas of your schedule with designated people - Integrates with other apps -Very simple to use - Space to track bonus travel points/ miles	-Free and paid versions
	World Mate www.worldmate.com/	-Travel reminders -Travel expense module available -Currency converter -World time converter -Weather reports - Video tutorials as help files -Windows Mobile, Nokia	Free and paid versions - Paid (gold) version enables reserving hotels, cars, flights from smartphone

track what the wearer was looking at, saying and writing without further intervention as it is closely tied to the activity of the brain. More than voice activated software; this device was turning the tech community on end because user-interfaces could become obsolete. The website at GnuFone was constantly crashing because of the huge number of people logged in. It was meant to be a place where aficionados exchanged ways to maximize the use of the device, hack new features, and seek company technical support. Instead it had become the major hotspot for social interaction, file uploads and downloads, dating and collaboration. People were clamoring for additional paraphernalia and products with the GnuTeam and GnuFone brands emblazoned on them. How does a company of 100 people keep pace with global adoption?

At a time when all companies must cope with rapid changing global markets, and provide high quality products and services, while retaining their expert talent, how do SMEs compete? Scenario 2 could be every small enterprise's dream and nightmare simultaneously. Their core product gains mainstream adoption and has a wide base of users-members, but the company is racing to figure out how to increase capacity, scalability and efficiency in service, development and production quickly enough to meet demand.

Fortunately, inexpensive and free technologies provide solutions to many of these needs when used in effective ways to support staff learning, innovation and motivation. Human resources are our most valuable asset and these reports indicate how to maximize their development.

Indeed, a critical element which has been identified in the adult learning and development field is that a vibrant organization cultivates motivation (Wlodkowski, 1998). Often in times of great work-related stress, people will find support and release in discussing their needs among their colleagues with professionals form similar settings. Web based technologies and the e-collaborations provide just such possibilities as even SMEs can enable their staff to participate in group activities, services and programs. Rather than having to start separate programs for each need as it arises in the ramp up mode, instead the community based support- provides a platform for SME on-demand service to their staff. Examples of collections of training, consultative support, even counseling and benefits may be needed to handle the extra stress during this time of rapid expansion. Leaders who

keep a close eye on the quality of life and health of their staff will have the opportunity to recognize early signs of excessive stress and provide access to resources. Sustaining and refreshing your talented staff is more cost efficient and beneficial to the knowledge capital of your company than seeing them burn out and leave, finding yourself forced to replace and retrain a new hire.

Furthermore an organizational climate which values individuals and dialogue provides additional support for change, and refreshment, detection of stress patterns across the organization and insight into needs, and possible recommendations. A climate of acceptance, support and dedication to each other and the organization is valuable in weathering the real struggles of even positive stress. (See Table 2.)

Regarding the technical dimensions of ramping up development, production and service e-Business provides a multitude of solutions which can integrate the diverse work responsibilities of a SME into a desktop application. Integrated dashboards are being used for many purposes across industries. Applications of these include free programs that cost $3000-20,000 just a few years ago. One example is a project management program that could help a team like ours help keep track of rapid changes in their processes, timelines and work assignments. Having a web-based or server-based application enables everyone to login and see the latest information, rather than chasing after files which are outdated. (See Table 2.)

Moreover, the same technologies may have modules which provide users to be able to individually and independently customize their purchasing, and community experience in a membership portal. At this time, such features can be provided by open source software hosted and configured on dedicated server space for $30-60/month. Mammoth corporations no longer have a monopoly on these valuable features. Table 1 provides a chart similar to the one for the prior scenario, but with details for technology solutions to address the specific needs detailed herein.

Connections to Training. As research has pointed out, an essential stage in designing implementation solutions for e-Business is the effort required for training. In order to swiftly and efficiently provide training, SMEs need to first communicate to employees how the new e-Business applications will help improve internal operating efficiencies and sales generation (Kouzes & Posner, 2007). This focus helps develop staff Ownership and motivation as they can see that their time and effort spent learning will have benefits for their success, professionally and fiscally (ASTD, 2009; Wang & King, 2009).

The second essential training focus is to strategize the message and means to develop SME owners' awareness of the vacuum in their training offerings and delivery methodologies (Caffarella, 2001; King, 2003). This goal can be accomplished by trainers demonstrating the application of common marketing success principles. For instance, trainers need to articulate that effectively serving staff needs applies the same principles, but produces more ROI benefits than building satisfied customers by serving *their* needs (ASTD, 2009). Moreover, a simple, specific cost benefit analysis can illustrate the ROI benefit of ideal training. This training serves the staff's and organization's needs and is characterised by being:

- targeted training content,
- delivered for rapid transfer of learning,
- designed and facilitated to address varied learning styles, support, and preferences, and
- prepared to scaffold support needs of the staff.

This synthesis of knowledge and practice regarding training for SMEs provides much needed direction in a changing world. However, without a doubt in coping with rapid changes and much technology integration, there will be limitations. The next section of our chapter explores these issues.

Table 2. Comparison Charts of Resources for Scenario 2

Need	Resource	Benefits	Limitations
Possible Providers for Health, Counseling Personnel Services	Trade Associations Professional Associations Chamber of Commerce	-Group rates are lower than if your company goes in solo. -Feedback from other plan participants.	
Project management software online Usually they include most of these features, and specialize with additional ones -contacts and group manager, -custom workspaces, -file management, -calendars & events, -blogs, -discussions, -chat and instant messaging, -RSS feeds, -web databases, -tasks, -reminders, -charts If your organization uses a paid version, usually these have low monthly fees- no long term contract needed	TimeStamp http://www.syntap.com/	-Simple to use -Track time on task -Set hourly rates -Add additional notes -Append new time to old files -Saved in compatible csv format -Loads quickly to startup	**-Only tracks time on task and hourly rates -No other project management functions**
	Basecamp.com	-Top notch project collaboration service that many top companies utilize. -Includes create and manage projects, private or public to-do lists, milestones, messaging, upload and share files, time tracking, notifications, time reporting. -Rights assignments differentiated - RSS, whiteboards, chat, calendars, assign milestones, - Design templates, activity stream, corporate branding Assign deadlines, commenting, drag and drop interface, and message boards. -Has other extras and 3rd party add-ons that integrate with it for iPhone® applications, billing and invoicing tools, planning tools, desktop widgets, etc.	-Offers a free plan that permits limited access. -Also paid version of their award winning service -30 day free trial of paid version
	Sosius http://sosius.com/	-Many features includes task automation, and access and permissions assignment - Free account has unlimited number of workspaces, unlimited users, but only 200 MB of storage space.	-Varied prices for paid plans
	GroupSwim – www.groupswim.com	-Different array of features - Groups, workspaces, discussion boards, file sharing, wikis, **semantic search, tagging, collective intelligence tools,** notifications, profiles, etc. -Free account includes has unlimited workspaces, up to 3 users, and 500 MB of storage space. - Great opportunity to growth and collaboration	May be too unusual for non-Gen Y people. -Varied prices for paid plans
	LiquidPlanner – http://www.liquidplanner.com/	- Has many features including project scheduling and analysis tools, task management, milestones, collaboration tools, personalized dashboards, resource scheduling, and more. -The free version lets you have up to 3 members, an unlimited number of projects, and 2 GB of storage space.	-Varied prices for paid plans

Table 2. Continued

Need	Resource	Benefits	Limitations
	Huddle http://www.huddle.net/	-Unique in respects - Integrate online collaboration, project management and document sharing using social networking principles. - Free plan will get you up to 3 workspaces, 1 GB of storage, and an unlimited number of users.	-Varied prices for paid plans
Ecommerce Shopping cart – Provides two major components usually the storefront and administrative side of a shopping cart package. Basically a database backbone customized to maintain inventory tracking ad serve it up in web-based purchase catalog or listing. Includes also connection to credit card/paypal or other credit card/online payment provider (some include connection to limited number of merchant accounts) The backbone of being able to actually conduct online transactions/buy/sell.	Mals-e http://www.mals-e.com	-Entirely free Works from their website -No install on server needed	-Very plain -Cannot be customized very much -Limited help resources
	Cartville www.cartville.com	-Works from their website -No install on server needed -Better point-and-click interface for setup -More customize options -Integrated auto responder available (see below)	-Not simple, but somewhat user friendly - Varied price plans based on options needed -30 day free trial available
	Paypal Shopping Cart www.paypal.com/shoppingcart	-Works from their website -No install on server needed -Better point-and-click interface for setup -More customize options	-Not simple, but somewhat user friendly -Varied pricing plans based on size of catalog (number of items in your list)
	Zencart www.zencart.com	-Load on your own site -Widely used by others -Big support group	-Need your own server space -Not simple to install and configure
	OScommerce www.Oscommerce.com	Load on your own site	-Need your own server space -Not simple to install and configure
	Fantastico	Load on your own site OR have it hosted on a site for you -Widely used -Several add-on options -Open source -Usually free from web host	Usually on your won server Not simple to install and configure

Limitations: Issues, and Potential Barriers

Certainly change does not come easily to any organization; however, when people realize it may provide benefit to them personally or collectively, they are more ready to invest the effort, learning, and complications (Kouzes & Posner, 2007; Wlodkowski, 1998; Yorks, 2005). Therefore, the manner in which change is introduced, discussed and experienced has an immense impact on its reception. When leaders and managers mindfully fine tune the message, process, participation in feedback opportunities, and incentives for participation, there are a multitude of benefits.

However, what limitations, issues, and barriers might be confronted also in such instances? Certainly many can arise, but this section identifies 3 areas of concern to evaluate prior to and during the process of incorporating e-Business tools in SMEs: interpersonal, processes, and growth.

Interpersonal. Our opening paragraph for this section illustrates the high stakes value of interpersonal communication skills in SMEs. Guiding an organization through change successfully is on the shoulders of the leader in SMEs

Table 2. Continued

Need	Resource	Benefits	Limitations
Ecommerce Auto-responders - Full strength auto-re-sponders include tracking user forwarding, reading, etc. Watch out because some charge extra for survey capability while for same price it is included in others.	http://www.freeautobot.com/	Use their site and load your info Absolutely FREE	Not as user friendly to configure or use as some others Learning curve
	http://www.listmailpro.com/	-Use their site and load your info -$195 but only **one** time fee -Testimonies of ease of use -Technical support available	Varied pricing tiers Not as user friendly to configure or use as some others
	www.iContact.com	- Per month investment - Discounts when paying multiple months -All versions includes unlimited survey capability - Least expensive of paid versions - Abundant help resources, including videos	Varied pricing tiers
	www.getresponse.com	- Per month investment -Pro version includes unlimited survey capability	Varied pricing tiers
	www.constantcontact.com	- Per month investment - Discounts when paying multiple months	Varied pricing tiers
	http://www.dadamailpro-ject.com/	Load on your own site Free version Pro version only $50 (one time fee)	Need your own server space Not as user friendly to configure or use as some others
	http://www.phplist.com/	- phplist is an open-source newsletter manager - Load on your own site	Need your own server space Pretty technical
	http://www.scripts4web-masters.com/	-Load on your own site -Free, basic, pro free -$99 -No monthly fees- as you buy to own -Inexpensive install service $	Need your own server space Not as user friendly to configure or use
Ecommerce- Integrated shopping cart, autoresponder, follow-up	www.cartville.com	$29, 34, 39, 99 /month Several Integrated options: autores-ponder, affiliate package, digital down-load capability, recurrent billing	Run off their server All features more expensive, but extensive capabilities
	http://www.1shoppingcart.com/	- $29-99/month - $3.95, 30 day trial	Need your own server space Not as user friendly to configure or use

more than ever. However, this process has to be supported by transparency, frequent communication, constructive feedback and positive feedback about communication, and opportunities for staff to participation in decision making at every level of the organization. When staff have a voice, even if small in change processes, when their expertise in doing their work is recognized and called upon to guide the change process, they are much more willing to follow the leader. The power of

cultivating Ownership in the vision can never be overestimated. Build Ownership, and create buy-in, then your organization will work long and hard. Fail to appreciate their efforts, hours of commitment to their work, and concerns, and you will have a much more difficult and uncertain journey ahead.

Process. Another urgent need is focused on processes. In contemplating change, SME leaders must study existing processes, identify where the

problems are, determine how to meet that need, and *plan* prior to implementing change. The emphasis on planning prior to implementing change cannot be overemphasized as history and headlines are replete with examples of catastrophes from lack of planning. Moreover, employees' personal memories of frustration will be unfortunate vivid reminders of the consequences of changes which did not occur smoothly. Instead, work with all levels of staff to understand and plan process transitions before, during, and after change. For example, temporary redundancy, running parallel systems to enable both old and new systems co-exist before the discontinuation of old processes (whether electronic or paper), can head off much of this disaster.

In addition, the strain on technical support during times of change might be excessive. Therefore, in planning for transition, SMEs need to negotiate upfront all technical support from vendors, or other sources, and consider how to scale this support down over time. The transition will be acutely felt at first, but if planned well, it will pass and business will be back to a steady pace, albeit quicker.

Growth. The final area is that SMEs are often caught off-guard with the surge of growth that occurs after making the shift to the integration of ebusiness technologies and platforms. The greater global reach for the marketing of their products and/or services, the expanded ability to serve global customers, may not have been anticipated in specific areas. Such areas may arise in scalability—being able to cope with large numbers of orders, with more sales people, support personnel, production timeline and capacity, and shipping volume, packaging, and costs. They also might not have anticipated how different geographic client bases might have different needs with their products and services either in different features and compatibilities, technical support, hours of availability, etc. Finally, the successful launch may also bring many suggestions for new products, large clients, new collaborations, affiliations, and

partnerships. If the CEO has previously made all top level decisions, he/she might not be able to personally handle them all; instead cultivation of different levels of leadership and succession needs to be considered.

When SMEs use e-Business tools during the change process they have a much greter chance of success. e-Business tools can be effectively applied across there critical areas: interpersonal, processes, and growth. This discussion has laid the groundwork to proactively address change; the next section provides direction for solutions and recommendations within the scope of e-Business.

SOLUTIONS AND RECOMMENDATIONS

Strategy for Encouraging SMEs Adoption of E-Business Solutions

The strategy for SMEs adopting e-Business begins with the education of the SME owners on what e-Business can do for them. After that, specialists and consultants must be available to help design the e-Business plan, and introduce the e-marketplace platform. The last step is employee training.

SME owners must become aware that changes in their business and the technological environment can be first and foremost addressed using e-Business solutions. They must also be aware that these e-Solutions can help them offset these challenges, and in such ways that also improve their competitive edge. Once owners are aware of these possibilities, industry leaders will most likely see SMEs begin to migrate from low complexity e-Commerce to high complex e-Business applications.

The adoption of complex e-Business innovations requires two principal elements, development of internal and external technology, and adoption of new business models. The purpose of an e-Business model is to take advantage of new technologies (hardware and software) through a

flexible market structure that then translates into business value. Business value does not just mean profits; it can mean better communications, responsiveness, cost control, etc. Once implemented, SMEs must continually restructure their resources within an e-Business model to react to ongoing industry changes.

In adopting e-applications, SME owners must be educated to understand that their new e-Business model not only requires the adoption of these new technologies, but must also lead to the destruction of old practices and capabilities. Upon adoption, old ways become obsolete (Wu & Hisa, p.105). All this involves knowledge which few SME have, and the need for continuing refinement in training as new applications develop.

After SME owners understand the potential impact of e-Business on their business, the next educational goal (after the e-specialist has created a new business plan and designed the e-platform) is to train employees in the technology and e-Procedures prior to and during the transition. All the planning and education described is important, but remember, the academic reports show that SMEs do not really implement these procedures. Evidence reveals that there is a trend of SMEs not using training resources which they can afford, are available, and/or have been developed for them. SMEs need assistance in applying the recommendations included in this chapter and further research to determine ways to improve and any barriers to overcome.

FUTURE RESEARCH

Further research is needed in examining the adoption, integration and effectiveness of e-Business in a wide variety of industry areas. Building upon literature for each industry and researching related professional associations may provide substantial leads in comprehending the industry climate, expert and demands. By better understanding the context and organizations, specific studies may be posed and conducted to identify leading trends, and best practice. Just a few questions which might prove informative for efficiency, scalability and sustainability may include

- Are there similar or different ways to introduce ecommerce across SME industries?
- Are there similar or different ways to implement ecommerce across SME industries?
- Are there similar or different ways to introduce ecommerce across SME industries?
- What are trends in each of these areas?
- What are the best practices in each of these areas?
- What are promising practices in each of these areas?
- What are emergent technologies in each of these areas?

Action research (Glanz, 1998) can be a very valuable first level research model for SMEs because it is less intensive, and may be executed by a non-expert who has been sufficiently trained. At the same time action research takes inquiry in SMEs much further than evaluations. Action research allows the staff, leader or researcher to pose a question which they will research (Glanz, 1998; Stringer, 2007). The purpose is to identify how to serve that need. Therefore a proposed solution is established, in this case it would be vetted though the organization, tested in the action research study and data gathered which can provide direction for new or revised product development, marketing approaches, organizational processes, customer service quality, etc. In the context of SMEs, action research can guide and advance data driven decision making to a more proactive level to increase creativity, efficiencies and success.

Trends

Based on our findings, with the continuation of uncertain markets, increasingly global commerce and collaboration, greater e-Business services will

be adopted by successful SMEs. Therefore, how will these organizations respond? What will be the specific details and larger trends in the barriers, challenges, and new opportunities experienced? Continued research will reveal these answers. However, if these questions are pursued on the basis of interpersonal needs, skills, training and organizational change, the SMEs stand to gain much valuable information in readily usable forms. Specific trends which bear watching and tracking for impact on SME specific markets include technologies related to the delivery of more publications, media and entertainment products on-demand, web-based entertainment opportunities, green technologies, and knowledge management.

The e-Book has been the source of debate for decades now, but seems to be coming of age, more recently with Kindle DX®, Sony® Reader and the newer "Cool-er" (Pogue, 2009). Whichever of these or other devices wins the race for global social adoption and market domination; it is clear that people worldwide are ready to use technology to provide reading material. Furthermore, users *seem* to expect to be able to access video, audio, and text all in the same device and retrieve new information on demand. Like a great techno-logical ballet we see features dance in and out of handheld devices over the years: stripped down, one-function-only devices, to the Swiss army knife of smart phones, for instance. The race continues for the next iPod®, iPhone® and Blackberry®.

Younger users' dominate the use of web-based entertainment, social media and networking, but they are also a large consumer market. Fast grow-ing SMEs include those who have identified new and niche web-based entertainment opportunities. Netflix®, Twitter®, Hulu®, and craigslist are examples of sustained and new success in this area (MacMillan, 2009). SMEs are especially ca-pable of making advances in this field due to their smaller size, fewer decision makers, and abilities to respond to new idea markets without having to shift the direction of a behemoth bureaucracy.

Keeping a vigilante watch on emergent trends and evaluating opportunities to maximize your SMEs strengths in this market has been a wise strategy for many.

No other technology application matches the scope of information and constant use as knowl-edge management via the web. SMEs do well to watch the trends happening in this field and deter-mine how their resources, expertise and strengths can be used to develop new products and services which serve the unquenchable hunger of the public for new information, false information, and on-demand information (Tapscott, & Williams, 2006). Moreover, in 2010 and beyond, users are expecting to *use and create* content. We only need to look as far as Google®, Facebook® and LinkedIn® for success stories in this area (McGrit, 2009). Therefore developing platforms, frameworks, communities, portals and spaces in which users, prospective clients or purchasers can find the in-formation they need, manipulate in new ways and share more information there is a prime approach. Fortunately, many open source and inexpensive web-based tools exist which allow SMEs to host such communities, but why not develop your own, or develop entirely new dimensions of knowledge management and creation? The world is hungry for these experiences and you might launch the next profit making subculture, or must-have add-on feature for every SME.

CONCLUSION

What has emerged in this chapter is a clear image that SME owners lag in adopting e-Solutions for various reasons. These concerns include

- A lack of understanding of the solutions' applicability to their enterprises,
- A deep concern over the cost of develop-ment both in actual program dollars, train-ing dollars, and higher personnel costs, and

• A belief that there is no outside help available for assistance should they decide to adopt e-Solutions.

We have also seen that innovative technology initiatives need to be developed within the framework of current theories of effective leadership skills, employee empowerment, and training in new and advanced processes. Moreover, these critical frameworks need to be supported by conclusions that a vibrant work environment motivates higher productivity.

The reality of coordinating successful SME ventures today is that increasing demands of global competition, more complex reporting requirements, and greater demand for human resource management have significantly increased the back-office cost of doing business. Giving even greater hesitation in the commitment of resources and direction is the fact that these expenses do not include the costs of increasing revenue volumes.

The misunderstanding that some SME owners have on the costs of implementing e-Business solutions is not only false, it is *inversely* false. SME owners that question cost often view business expansion in a linear fashion. When sales go up, they add one more person to the payroll. However, investing in future growth can require a high upfront investment in fixed costs – those being costs that are incurred regardless of whether the sales have yet materialized to support them. The benefit of e-Solutions is that proper implementation eats into fixed costs, existing and future, by making these fixed processes much less costly, or making them more like variable costs – that being a direct cost of sales. By joining IONs, the fixed cost nature of many back-office operations can be outsourced to collective systems, making those expenses part of current costs. The most competitive businesses in the world are those that have very low fixed costs.

SME owners must first understand that e-Business solutions will drive down their current fixed costs now. And that they will also make future growth less costly on a per unit of sales basis. By educating owners as to cost savings, the relative inexpensive investment in these platforms, and by improving support scaffolding available while developing e-platforms, more SMEs should be able to move towards adopting e-Solutions as a core component of their operations in the future.

Chapter 46
Cross–Cultural Learning and Intercultural Competence

Pi-Chi Han
University of Missouri-St. Louis, USA

ABSTRACT

Globalization has increased the need to understand the nature of work-related adult learning and development across national boundaries. It is driving the demand for the workforce that possesses knowledge of other countries and cultures and affecting those who are responsible for developing international learning activities. The author of this chapter calls for adult education and Human Resource Development (HRD) professionals to learn how to apply adult learning theories in cross-cultural learning to help individuals with different cultural backgrounds. This would help these professionals acquire intercultural competence and become successful in international assignments.

INTRODUCTION

Globalization demands are transforming the boundaries of the world. This change is leading us into a worldwide global economy where national boundaries become blurred. In reality, the globalization of the workplace and workforce has been a fact of life for many organizations (Roberts, Kossek, & Ozeki, 1998). Workforces around the world have become more diverse, more educated,

and more mobile (Briscoe, Schuler, & Claus, 2009). Therefore, global mobility and global careers have emerged recently as the significant phenomenon for the global workforce (Lin, Pearce, & Wang, 2009). As a consequence, the challenge of developing and managing "global workforce" has received extensive attention (Briscoe et al., 2009; Tarique & Schuler, 2009).

In facing the challenge, international organizations, especially multinational corporations (MNCs) around the world have tried to seek new ways in order to survive in the competitive global

arena. Some succeed, but many do not, and the inability of their managers or expatriates to function successfully in their global assignments has been the primary cause of international business failures (Apud, Lenartowicz, & Johnson, 2003; Lee & Croker, 2006). The need of developing internationally competent workforce becomes increasingly important. In literature, it shows that the degree of one's intercultural competencies to another culture results in the successful international performance (Chuprina, 2001). Learning in a new culture is a prerequisite to obtain intercultural competencies. Ferraro (2002) asserts that the essential competency for success in managing the global organization is also based on learning. There is a great demand worldwide for high quality workforce practitioners and adult educators who can work effectively with cultural diverse adult learners in the workplaces and facilitate the cross-cultural learning (Chang, 2004).

The purposes of this chapter are to review the related literature of cross-cultural learning and intercultural competence; to explore the relationship between adult learning theories, cross-cultural learning, and intercultural competence; to offer feasible solutions and recommendations to the problems; and to discuss the future trends that help adult educators and HRD practitioners to facilitate meaningful cross-cultural learning programs for adult learners to be successful across cultures.

BACKGROUND

Globalization has increased the need to understand the work-related adult education programs across national and cultural boundaries (Chang, 2004). Most importantly, it is crucial to understand how adult learners function and learn across cultural boundaries. The cross-cultural learning and experience of adult learners can occur in many forms. One of the most dominant cross-cultural learning and experiences comes from the expatriation experience, which is the work-related adult learning

(Yamazaki & Kayes, 2004). Without formal training or education in the cross-cultural interactions, the notion of cross-cultural learning has become the key for the expatriates to obtain intercultural competencies (Yamazaki & Kayes, 2004). A growing research enhances the notion that successful expatriate adaptation and cross-cultural learning depend on how well an expatriate can learn from experience in the international assignments (Porter & Tansky, 1999). Many studies have applied and utilized adult learning theories such as experiential learning and transformative learning to be the research theoretical framework to investigate the work-related cross-cultural learning (Chang, 2004; Chang, 2007; Yamazaki & Kayes, 2004). Therefore, it is necessary for adult educators and HRD professionals to understand the nature of work-related adult learning programs in the intercultural settings and the need of developing intercultural competencies (Chang, 2004).

However, scholars, in the different disciplines, throughout the past 30 years have defined intercultural competence in a variety of ways. In the literature, the definitions of "competence" are theoretically and empirically inconsistent. There was no consensus in the definition of cross-cultural competence (Baxter Magolda, 2000; Lusting & Koester, 2003).

Intercultural competence as a concept has been explored and studied under different terms, such as cross-cultural effectiveness (Cui & Van Den Berg, 1991; Han, 1997, 2008), cross-cultural adjustment (Benson, 1978), cross-cultural competence (Ruben 1989), intercultural effectiveness (Cui & Van Den Berg, 1991; Hanningan, 1990), intercultural competence (Dinges, 1983), and intercultural communication competence (Spitzberg, 2000).

In developing cultural competent professionals, Campinha-Bacote (2002) has identified five components: (1) cultural awareness, (2) cultural skill, (3) cultural knowledge, (4) cultural encounter, and (5) culture desire. Similarly, Lister (1999) also has developed taxonomy for the cultural competent professionals. The taxonomy includes:

(1) cultural awareness, (2) cultural knowledge, (3) cultural understanding, (4) cultural sensitivity, and (5) cultural competence. In developing and managing expatriates, Black and Mendenhall (1990) suggest three skills to be successful in a new culture. The first skill is related to the maintenance of self-psychological and physical well-being. Another skill is related to relationship building with host nations through communications skills, interpersonal, and social skills. The final skill is related to cognitive skills that promote a correct perception of the host environment and its social system.

In addition, Han (1997, 2008) has conceptualized intercultural competency as measurable intercultural effectiveness (ICE) competencies, i.e. (1) the ability to handle psychological stress, (2) the ability to effectively communicate, (3) the ability to establish interpersonal relationships, (4) the ability to have cross-cultural awareness, and (5) the ability to have cultural empathy. Han's (1997, 2008) empirical studies have revealed a positive correlation between adult learning and HRD programs and intercultural competencies. Based on the findings, adult learning is crucial to intercultural competencies. Chuprina (2001) asserts that adult learning theories help the individuals learn in the cross-cultural adaptation process.

However, there was limited interdisciplinary research of exploring the relationship between adult learning theories, cross-cultural learning, and intercultural competence, and how adult learning theories help adult learners acquire the intercultural competence desired. Therefore, it is necessary to explore the definitions of the concept of intercultural competence in the first decade of the 21st century. A summary of findings is presented in Table 1.

CROSS-CULTURAL LEARNING/ INTERCULTURAL LEARNING

Cross-cultural learning is the process of adaptation to a new environment and its requirements through obtaining necessary knowledge, skills, and attitudes (Hannigan, 1990). Researchers seem to agree with each other that when there is less cultural dissonance, there is more cross-cultural learning taking place (Bennett, 1995). Methods for facilitating cross-cultural learning skills include assessment of individual commitment and value (Kayes, 2002), emotion and skill development (Mainemelis, Boyatzis, & Kolb, 2002), and immersion in different and challenging cross-cultural interactions (Mintzberg & Gosling, 2002).

In addition, literature has linked intercultural competence to cross-cultural learning. Scholars assert that acquiring intercultural competence is a process of cross-cultural learning (Bartel-Radic, 2006; Hannigan, 1990). The cross-cultural learning only occurs when the individual has passed through the realization of the impact of cultural differences, critical reflections, and practical experiences (Hofstede, 1994). In this chapter, the process is called an intercultural or cross-cultural learning process.

Bartel-Radic (2006) has established a definition for the intercultural learning as "the acquisition or modification of the representations of intercultural situations" (p. 652). Through ideas, concepts, beliefs, knowledge, and desires, an individual represents his/her world. In the assumption of intercultural learning, representations are the learning outcome, while acquisition and modification are the learning process. Intercultural learning does not mean to change one's own culture, but to understand other ways of seeing and finding the world, and that for effective interaction with others, the modification process starts to happen. Therefore, the intercultural learning process has to include how the individual has been modified or changed in knowledge, attitude, and skill in the intercultural situation.

Table 1. Definitions/Perspectives of Intercultural/Cross-Cultural Competence

Authors	Concept	Definition/ Perspective
Leiba-O'Sullivan (1999)	Cross-cultural competency	Knowledge, skills, abilities, other attributes
Cui & Van den Berg (1991)	Intercultural effectiveness	Intercultural success
Adler & Bartholomew (1992)	Global or transnational competency	Specific knowledge, skills, and abilities
Gertsen (1990)	Cross-cultural competence	The ability to function effectively in another culture.
Black & Mendenhall (1990)	Effective cross-cultural interactions	Cross-cultural skills development, adjustment, and performance
Earley (2002)	Cultural intelligence (CQ)	Cultural intelligence as a person's capacity to adapt to new culture based on multiple facets including cognitive, motivational and behavioral features.
Hunter (2004)	Global competence model	Knowledge, skills, attitudes, and experiences are necessary to become global competent.
Cross et al. (1989)	Cultural competence	A set of congruent behavior, attitudes, and policies that come together to work effectively in a cross-cultural situation
Collier (1989); Lusting & Koester (1999)	Intercultural communication competence	Intercultural communication competence "requires that individuals understand the meanings, rules, and codes for interacting appropriately" (Collier, 1989, p. 216).
Spitzberg (2000)	Intercultural communication competence is located in perception rather than behavior.	"competent communication requires attention to the factors of context, locus, and abstraction" (p. 111).
Deardorff (2004)	Intercultural competence	Pyramid model and process model of intercultural competence
Landreman (2003)	Intercultural consciousness	Intercultural consciousness is a more appropriate educational goal than multicultural competence
Bartel-Radic (2006)	Intercultural competence	The ability to adapt one's behavior to these meanings in order to produce effective behavior.
Redmond & Bunyi (1993)	Intercultural communication competence (ICC)	ICC is defined as "a multidimensional concept consisting of communication effectiveness, adaptation, social integration, language competence, and knowledge of the host culture and social decentering" (Redmond & Bunyi, 1993, p. 1).
Thomas (2003)	Intercultural competence	The ability to help/shape the process of intercultural interaction, avoid misunderstandings, and create problem –solving opportunities.

In addition, effective cross-cultural learning does not always come from a positive experience but from effective reflection. The reflection is a cognitive process based on the learner's personal maturity level of cognitive development. Mezirow (1991) views the change or modification from cross-cultural learning as an integrative and transformative process. It is necessary to explore how adult learning theories contribute to the process of cross-cultural learning and the development of intercultural competence. In this chapter, the relationship between cross-cultural learning and experiential learning theory and transformative learning theory are explored.

EXPERIENTIAL LEARNING THEORY

Many scholars have stressed that experience is a crucial element in adult education and learning (Fenwick, 2001, 2003; Kolb, 1984; Kolb & Kolb, 2002). In addition, the international business arena research indicates that cross-cultural learning and experience in cross-cultural settings play a vital role in developing global managers (Bartel-Radic,

2006). Therefore, international experience has been a tradition for cultivating senior management teams in many MNCs (Shen, 2005), as they basically accept the connection between experience, learning, and intercultural competencies.

Experience can be the real life textbook of adult learners. Kolb (1984) asserted that "Learning is a continuous process grounded in experience. Knowledge is continuously derived and tested out in the experience of the learner" (p. 27). Experiential learning focuses on how adult learners apply their direct experiences with the world in order to solve problems, to make the meaning for everyday lives or events, and to create new knowledge. Experiential learning theory is based on a variety of assumptions about the nature of learning. For example, learning is a process that allows an interchange between a person and his/her environment, and results in the creation of new knowledge.

Based on experiential learning theory, we are able to understand the process of knowledge transfer (Kolb & Kolb, 2002). Learning has been considered a vital key to the success of knowledge transfer. Kayes and Yamazaki (2005) have pointed out that cross-cultural knowledge transfer is an issue of cross-cultural learning. "At the heart of any successful cross-cultural knowledge transfer effort lies an individual or group of individuals with the skills to manage a complex ambiguous and often stressful process" (Kayes & Yamazaki, 2005, p. 87). To develop intercultural competence in the workplace, it is important for adult learners to transfer knowledge from one cultural context to another by their work-related practices and experience. Cross-cultural learning helps adult learners to navigate the knowledge transfer process across national borders. They have concluded that the better they understand how adults learn during their experiences in cross-cultural settings, the better they understand the cross-cultural knowledge transfer process.

Globalization has created a growing interest in extending experiential learning to new applica-

tions and new ideas. The quest of globalization and knowledge creation has driven adult learning theories to explore the cross-cultural learning domain. It is clear that learning is the most essential activity that helps global organization to obtain success (Ferraro, 2002). Experiential learning has proven invaluable in developing intercultural competence for individuals across cultural borders. In addition, Kolb has described experiential learning as "a holistic process of adaptation to the world" (Kolb, 1984, p. 31). Kolb's experiential learning theory is one of most influential theories to explain how managers learn from experience across culture (Kayes, 2002).

Kolb (1984) states that learning from experiences requires four different kinds of abilities: (1) concrete experience allowing oneself to be involved in new experience with his/her openness and willingness, (2) reflection and observation allowing oneself to have reflections and observations to view the new experience from a variety of perspectives, (3) abstract conceptualization allowing oneself to analyze from the observation and integrate concepts and ideas, and (4) active experimentation allowing oneself to make the decision and solve the problem by using new ideas and concepts. He also points out that experiential learning is the totality of the learning and knowledge creation process, which experience becomes the foundation of learning.

In a recent study, Fenwick (2003) proposes "reflection on experience" (p. 22) and emphasizes that knowing intertwines with doing and "Learning is rooted in the situation in which the person participates, not in the head of that person as intellectual concepts produced by reflection" (p. 25). Many scholars have argued that Kolb's experiential learning theory needs to take the learner's context (Fenwick, 2001, 2003) and emotional influence into consideration (Dirkx, 2001a, 2001b). Fenwick (2001) has asserted "specific contexts shape an individual's experience in different ways" (p. 11). Therefore, the individual's cultural background, histories, learning methods,

and emotional maturity should all be considered in the learning and knowledge transfer process.

Kayes and Yamazaki (2005) have extended Kolb's (1984) concept to explain how experiential learning theory helps managers to create and transfer knowledge in the global organizations. According to the process of knowledge transfer in the cross-cultural learning, they propose a process of seven competencies of cross-cultural learning. It has answered the quest of how managers learn to be effective in both their home culture and another or host culture as following: (1) valuing different cultures, (2) building relationships, (3) listening and observing, (4) coping with ambiguity, (5) translating complex ideas, (6) taking action, and (7) managing others (Kayes & Yamazaki, 2005).

TRANSFORMATIVE LEARNING THEORY

In literature, transformative or transformational learning is interchangeable. It is about change in the way that adult learners see themselves and the world in which they live. It is defined by Mezirow (1994) as "The social process of constructing and appropriating a new or revised interpretation of the meaning of one's experience as a guide to action" (pp. 222-3).

Transformation is a deep and structural shift in the thoughts, feelings, and actions of a person, which represents and explains the world around oneself. Learning is a process of making meaning and about how adult learners make sense of their own life (Mezirow, 1996). The tranformative learning process begins with an experience of a "disorientating dilemma" for learners. In addition, he asserts that "the process by which we transform our taken-for-granted frames of reference (meaning schemes, habits of mind, and mindsets) to make them more inclusive, discriminating, open, emotionally capable of change, and reflective so that they may generate beliefs and options that

will prove more true or justified to guide action" (Mezirow, 2000, p. 8).

However, not all learning is transformative. According to Mezirow's (1991) work, there are four components in transformative learning: (1) experience, (2) critical reflection, (3) reflective discourse, and (4) action. First, learning begins with the learner's experiences. Second, the self-examined interpretation follows. Third, after testing the new meanings, the learners engage in the discoursing dialogue to obtain a new and empathic understanding and assessment of the interpretation. Last, the learner takes "immediate action, delayed action or reasoned reaffirmation of an existing pattern of action" (Mezirow, 2000, p. 24).

The process of intercultural competence is seen as transformative learning (Kim & Ruben, 1988; Taylor, 1994). In effect, they seem to indicate that intercultural competence is a transformative process where the learner develops adaptation skills that allow the learner to effectively understand the other culture over time. Kim and Ruben (1988) assert that a learning and growth process develops where the learner's old perspectives break down and new beliefs are constructed by the intercultural knowledge, attitudes, and behavioral competencies, are facilitated.

Transformative learning in acquiring intercultural competencies is an on-going process of individual's internal system. Taylor (1994) views intercultural competence as an adaptive capacity that allows individuals to become effective across cultures. Cross, Bazon, Dennis, and Isaacs (1989) also define cultural competence as a set of behaviors and attitudes for enabling professionals to work effectively in cross-cultural situations. In addition, McPhatter and Ganaway (2003) indicate that cultural competence is the ability that allows learners to transform knowledge and awareness. Kim and Ruben (1988) confirm that the process of acquiring intercultural competence is transformational and it is also a learning and growth process allowing individuals to function effectively across cultural and national boundaries.

Taylor (1994) has elaborated Mezirow's (1991) transformative learning theory and pointed out that "the literature seems to indicate that intercultural competence is a transformative process whereby the stranger develops an adaptive capacity, altering his or her perspective to effectively understand and accommodate the demands of the host culture" (p. 155). He states that "the transformation is becoming intercultural competent is anchored within the individual" (Taylor, 1994, p. 157). He has echoed Kim and Ruben's (1988) perspective and viewed the process of intercultural competence as an individual's internal transformative learning. Gaining intercultural competencies is the outcome of the transformative learning, which starts from the need of change. In conclusion, Taylor (1994) has offered a linkage between transformative learning and the process of intercultural competency.

THE ISSUES AND CONTROVERSIES

There are several issues, controversies, and problems that adult learning and HRD professionals should give more attention:

1. Pluralist society in the U.S.: The United States is experiencing a growing immigrant population. In 2005, immigrants comprised over 12 percent of U.S. residents and 15 percent of the workforce (Migration Policy Institute, 2007a, 2007b). The increasing complexity and diversity of U.S. society has enhanced the challenge. The need for multicultural learning and educational services has increased as the new immigrant population has grown and dispersed across the country. Due to the limited English proficiency and distinctive culture, every immigrant has experienced a certain degree of culture shock, stress, and sociocultural disruption. As a result, policy makers, adult learning, and HRD professionals in public, private, and non-profit organizations should pay more attention to applying adult learning theories in fostering intercultural competencies and facilitating cross-cultural learning.

2. Imported talents versus brain drain: There is no doubt that "the single most important skills to acquire in the 21st century is intercultural competence" (Virjee, 2004, p. 35). However, a shortage of international managers is a significant constraint for many MNCs. (Shen, 2005). Richmond (1988) indicates there is a growing demand of importing highly qualified immigrant talents, which is known as "brain drain"- intellectual talents flowing from the less developed to the more technologically advanced countries. A call for professionals in international education, cross-cultural learning, international training and development, international business, and adult education to work together is on the rise.

3. Challenges in higher education: The higher education institutes have faced the challenge of how to prepare their graduates with the intercultural competencies for the global competition. In addition, Lin, Pearce, and Wang (2009) state that there is a great demand of American higher education to import talents such as foreign-born faculty and researchers from other countries. From fluency in multiple languages to an understanding of the culture, the immigrant intellects have encountered many challenges in the host countries just like academic expatriates. These two issues have increased the demand of facilitating cross-cultural learning and developing intercultural competencies in the curriculum development.

4. Lacking of the unified definition: Rathje (2007) has stated that "we see the difficulty in defining intercultural competence as a key to communicative efficiency" (p. 259). Lacking of consensus of definition in intercultural competence and cross-cultural learning has presented a problem. To develop a deeper

understanding in the issues of intercultural competence and cross-cultural learning has become crucial.

5. The quest for adult learning research: Much international business research has been ascribed the high failure of expatriates to a lack of intercultural competence. Although Yamazaki and Kayes (2004) have tried to apply adult learning theory to explain the process of knowledge transfer of intercultural competence as the result of cross-cultural learning, there is still limited literature available regarding how adult learning theories help to develop the global-ready workforce by cross-cultural learning programs.

6. Experiential learning theory: In Kolb's (1984) experiential learning model, the learner's context has been neglected. The learner's context is mainly formed by the learner's culture. Rathje (2007) states that the external conditions and variables affect the intercultural success during the cultural interactions. It is crucial to be aware of the learner's cultural context in the cross-cultural learning.

7. Transformative learning theory: Mezirow (1990) has stated that learners reflect on prior information, knowledge, and experiences to determine how they acquire their beliefs and values and use this information as a basis for greater understanding of their own values as well as the values and perspectives of others. The core of the learning process itself is mediated through a process of critical reflection on one's assumptions and beliefs. However, Mezirow's work has been criticized in two ways, i.e., there is a need to explore how emotional and spiritual dimensions affect adult learning (Taylor, 1997), and different levels of capability in the meaning making, which is the level of maturity of cognition, influence how adult learners experience the transformative learning process (Erickson, 2002; Merriam,

2004). Therefore, it is necessary for adult learning and HRD professionals to consider the holistic situation of learners when they develop, conduct, and deliver cross-cultural learning for adult learners.

SOLUTIONS AND RECOMMENDATIONS

Based on the issues and controversies, the problems, solutions and recommendations are offered as follows:

1. To facilitate knowledge transfer in the process of intercultural competence (Kayes & Yamazaki, 2005). The knowledge transfer process plays a vital role in cross-cultural learning and acquiring intercultural competencies. It is recommended that adult learning and HRD professionals get involved in the process of knowledge transfer of cross-cultural learning in order to develop intercultural competencies proactively. They should also develop the capability to transfer cross-culture knowledge through learning and development programs.

2. To mandate internationalization in higher education. Higher education has been a civic learning organization and played the key role in making a contribution to sustainable human development. Specifically, higher education is now facing the need of directing higher education toward helping humanize globalization and to support lifelong learning (Lin, Pearce, & Wang, 2009; Reimiers, 2009). Higher educational institutions should keep adding more international courses in the curriculum and encourage the international cooperation. More interdisciplinary collaborations in higher education or those outside and in public and private sectors need to integrate adult learning theories into their implementations.

3. To foster global literacy and cultivate a global mindset (Gupta & Govindarajan, 2002). It is necessary to blend cross-cultural learning in the formal and informal education systems. Reimers (2009) recommends that "The avenues are to make the development of global competence a policy priority for mass education systems, to develop a scientific knowledge base that helps discern the success of projects, and to continue developing rigorous curriculum, instructional materials, and opportunities for teachers' education" (p. 27).

4. To develop adult learning and HRD professionals as continuous learners (McLean, 2006). Intercultural competencies assist the organizations in coping with ever-changing international work environments, and understanding international markets. There is also a crucial need to educate a new breed of adult learner and education professional that can develop learners' cross-cultural competencies and keep up the competitive advantage for the organization. In addition, HRD and adult learning professionals should always answer the following four questions: (1) how to develop effective cross-cultural learning programs for adult learners in the organization, (2) how to cultivate a continuous learning organization, (3) how to promote the cross-cultural competent organizational culture, and (4) how to attract, retain, and develop a global talented person in the organization.

5. To include the national culture in developing of the theory of cross-cultural learning. Chang (2004) recommends that adult learning programs should include national cultural differences and adjust programs to accommodate learners' backgrounds. Therefore, to include the learner's context in terms of national cultural background, environmental or situational variables, and the process of personal growth should be examined in the process of developing cross-cultural learning and acquiring intercultural competence.

FUTURE TRENDS

Adult learning and HRD professionals will need to pay more attention to the following trends when they are going to facilitate cross-cultural learning and develop intercultural competencies for adult learners:

1. Professional development for adult education professionals in cross-cultural learning: Developing a framework for quality professional development of adult education programs and practitioners to facilitate adult learners in cross-cultural learning and to help them to acquire intercultural competence becomes crucial (Schaetzel, Peyton, & Burt, 2007). The content of professional development will be focused on the knowledge that adult education practitioners need in order to work effectively with broader adult learners in the programs.

2. Non-western perspectives: One-way assimilation and accommodation of culture and increasing cultural hegemony will no longer suffice. The inclusion of all cultures and their value systems will benefit all concerned (Olaniran & Agnello, 2008). Understanding the different values between West and East will be helpful to manage a multicultural and multinational workplace. A call for an inclusive perspective from different cultural backgrounds is rising.

3. Developing global talent: According to the Conference Board Report (Kramer, 2005), a majority of companies want to accelerate the development of their global talent. The literature reveals that finding talented global managers is getting harder due to the lack of global talent (Bhasin & Cheng, 2001). In the future, the adult learning and HRD profes-

sionals will need to identify what lessons and what technologies will help to develop and train the global talent.

4. Cross-cultural training: Cross-cultural training, one kind of cross-cultural leaning, has long been advocated as a means of facilitating effective cross-cultural interaction and intercultural competence (Han, 1997, 2008; Landis & Brislin, 1983; Mendenhall & Oddou, 1986). In addition, it is important to continue identifying new technologies that assist in the development of successful cross-cultural training and intercultural competence for adult learners.

5. Virtual world and on-line learning: The virtual workforce has become one of most radical transformational issues that challenge adult learning professionals. How cross-cultural learning and intercultural competence issues have impacted the virtual workforce will need to be studied in the field of adult learning and HRD. Currently, the new technology has offered new directions for adult learning and HRD research and practice with this regard (Chapman, 2008).

CONCLUSION

Organizations have been struggling to survive under rapid internationalization. It has made a profound impact on the pattern of global competition and workforce. The request of global managers, leaders, and talents in the organization has been launched by many MNCs or even domestic businesses that are ready and eager to take a leap in the global market. Educating global-ready graduates will help bridge the dramatic shift in the global workforce conditions (Deardorff, 2008). Gupta and Govindarajan (2002) have stated "Heterogeneity across cultures and markets is a pervasive feature of the global economic landscape" (p. 116). They have recommended that cultivating the global mindset for workforce should be the

answer to the response of the quest of global competition. Several mechanisms such as formal education, cross-border teamwork, cross-cultural immersion experience, and multi-year global assignments have been recommended (Gupta & Govindarajan, 2002).

In America, the immigrant labors have long been the underpinning of the country's economic success. However, the dramatic shifts in population have impacted the United States in the past decades. The rapid changes in the population are widely affecting the demographics of the schools, societies, and workplaces. While globalization, global education, and global citizenship have become the new challenges of learning in the 21st century (Olaniran & Agnello, 2008), in facing these challenges, McLean (2006) has offered his personal learning reflections and recommended that adult learning and HRD professionals should improve their understanding of adult learning across cultural boundaries, avoid ethnocentric worldview, and continue to grow and learn.

Finally, tomorrow's leaders must possess a broad understanding of history, of culture, of technology, of human relations, and of cross-cultural learning. Although Hudson (1999) states that the speedy change we face today has brought a global chaos to the adult learning and development world, it seems that there is a light at the end of the tunnel by promoting cross-cultural learning and cooperation. To achieve this goal, adult learning and HRD professionals need to review and explore the relationship between adult learning theories, cross-cultural learning, and intercultural competence in order to facilitate cross-cultural learning and develop intercultural competence for learners. Moreover, they should take the lead to educate global-ready workforce in order to function successfully in the United States and abroad.

KEY TERMS AND DEFINITIONS

Cross-Cultural Learning: It is the process of adaptation to a new environment and its requirements through obtaining necessary knowledge, skills, and attitudes (Hannigan, 1990). Bartel-Radic (2006) has established a definition for the intercultural learning as "the acquisition or modification of the representations of intercultural situations" (p. 652).

Cultural Intelligence (CQ): Cultural intelligence as a person's capacity to adapt to new culture based on multiple facets including cognitive, motivational and behavioral features (Earley, 2002).

Experiential Learning: Kolb (1984) asserted that "Learning is a continuous process grounded in experience. Knowledge is continuously derived and tested out in the experience of the learner" (p. 27).

Intercultural Communication Competence: It is located in perception rather than behavior. "competent communication requires attention to the factors of context, locus, and abstraction" (Spitzberg, 2000, p. 111).

Intercultural Competence: It, as a concept, has been explored and studied under different terms, such as cross-cultural effectiveness, cross-cultural adjustment, cross-cultural competence, intercultural effectiveness, intercultural competence, and intercultural communication competence. In the literature, the definition was theoretically and empirically inconsistent.

Intercultural Effectiveness (ICE) Competencies: It has included five measurable variables as following: (1) the ability to handle psychological stress, (2) the ability to effectively communicate,

(3) the ability to establish interpersonal relationships, (4) the ability to have cross-cultural awareness, and (5) the ability to have cultural empathy (Han, 1997, 2008).

Transformative Learning: In literature, transformative or transformational learning is interchangeable. It is about change in the way that the learners see themselves and the world in which they live. Mezirow (1994) has defined "The social process of constructing and appropriating a new or revised interpretation of the meaning of one's experience as a guide to action" (p. 222-3).

Chapter 47
Analysis of Social Media in Administration:
Epistemological and Practical Considerations

ABSTRACT

This chapter analyzes some case studies about social media in organizations' administration. To do this, social media's epistemological base will be introduced, considering contributions from the subject of organizational behavior. The importance of this discipline is that it brings together social sciences points of view (social psychology, sociology and anthropology). After this, views will be presented regarding the mathematical nature of social media. In this part, the internet's influence on social media will also be discussed, for it has contributed to a new common sense, and it is responsible for social media popularity. Finally, how social media interferes in organizations will be attested to, as well as how it can be managed. In order to help the understanding of such knowledge, a survey will be introduced, with articles related to organizational practices in social media.

INTRODUCTION

Communication through computers has been changing organizations and conversation, allowing for the creation of social media on internet. This media also has been changing how people communicate, work and are entertained. With the coming of the internet in the 1990's, this media basically consisted of small focal groups. Nowadays, social media has become a wide public space where millions of people feel more comfortable in using their real identity online.

However, Silva Junior (2007) has asserted that the term 'media' itself is very broad, referring to relationships among many characters. Some authors approach the subject as organization in networks, organizational networks, networking, bondless organizations, nets, collegial approaches and so forth.

This chapter aims to emphasize how important the use of social media is in the field of administration. But, before analyzing this point, the chapter will show the basis of social media, through the way in which the 'media' concept has been developed in some fields such as philosophy, sociology, anthropology and organizational psychology. After, the focus will be social media on the internet, where this subject has been spreading lately, especially with information and communication technology expansion (ICT).

From here, the theoretical reference will show the diversity of the subject 'social media' in a variety of scientific fields. It can be concluded that the origin of social media is before the internet. Indeed, the internet has contributed to the technological improvement of social media, serving as a disseminator for it to be widely debated.

THEORETICAL REFERENCE

With the literature studied in respect to social media, we can see that it is a subject which permeates many different fields such as philosophy,

sociology, anthropology, organizational psychology, computer science, information science, data processing etc.

In order to approach the main tendencies that have influenced social media in administration, this theoretical reference is divided into two parts: the Social Current and the Technological Current.

SOCIAL CURRENT

In Social Current, the bibliographical review is based in philosophy, sociology, anthropology and organizational psychology fields. Those sciences analyze social media's influence on society before the coming of internet. It means that those sciences go to the essence of what grounds human interactions, and at the same time they analyze technology's impact on an individual's daily life.

Philosophy

In the beginning of civilization, humankind was gathered in clans. These primitive units shared the same interests, values and communication tools, defining specific hierarchical structures. The clans founded the first societies and as they spread, techniques developed.

Rudinger (2007) attests that only in the XVII century did techniques start truly affecting the way of living, cultural life and society's sociability, making the concept of culture strongly connected with the concept of technology, which originated technoculture.

For Subirats (1989), the analysis of modern technoculture must consider the ontological dimension of the technique as the principle present in forms of culture. Thus, the way in which technology affected society found a wide field for discussion in philosophy.

There are basically two lines of thought in philosophy about technique: technologic thought and "technophobia". Technologic thought is divided into Prometheans or technifiles and Faustians.

Both have as a guide the following idea: "whatever is missing in our lives, such a lack will be filled in by a greater access to databases and new technological resources," (Rudinger, 2007, p.14). For technological thought, technology has a huge influence on humankind's faith and its progress does not depend on other factors that interfere with life in a society. In this case, the human beings stand out when greater command of technology is bestowed upon him.

The technophobic view personifies technology by giving it a Machiavellian domination over man. This view believes that technology brings out the main weaknesses of society and to that it suggests ways of sabotaging computer systems so as to save humankind.

Regardless of the views for and against, it is worth saying that technology is just a means and cannot be labeled as good or bad, for it is only a way of knowing developed to fulfill humans' needs.

Thus, technological improvement has contributed to broadening the social media concept, which came to be known as a group of points with mutual communication. In the field of sociology, it came to be used for explaining the phenomena of reciprocal relationships among human beings.

Anthropology

In social anthropology, the notion of social media aims to support the analysis and description of the social processes which involve connections beyond the bond of groups and categories.

When those connections are managed through technology, there is a certain loss. The loss results from the high technological dependence that makes life easier, reducing the complexity of its material needs. However, technologies design it in subjectivism or disorder, from a spiritual point of view.

For McLuhan (1968), such technological dependency will contribute to extending the creative process of knowledge to all of human society

through many means and different related tools. Nowadays this thought is easily seen through ideas that flow freely throughout internet and are also easily accessed.

But McLuhan (1968) warns about those facilities, especially regarding the meaning of technologic progress for everybody. This worry was supported by the written press of that time, which was already pointing out the first hints of forming a poor culture, which makes a person cold, lonely, impersonal and calculating. For Rudinger (2007) telecommunication reveals this fact. For it is essentially audiovisual, capturing especially the immediate senses, telecommunication allows the reconstitution of human collective experiences, which is shared, sentimental and no different from primitive communities. In this observation, the individual is designed in a subjectivism or disorder, spiritually speaking.

Sociology

Castells (2003) says this sociologic understanding of the network concept came to be used and improved upon in social sciences. From the end of the 1980's on, the media conception was reinforced as structured relationship arrangements of transition among members of a social system. According to Mayer (2000), the word *network* means the ascending social relationships with computer communication, showing hints of a new system of relationships among human beings.

Because of that, a sociologic analysis in the context of social networks is valid, given that sociology is a study of social behavior of human organization and interaction.

In Rudinger's view (2007) electronic communications are catalysts of social interactions that reflect a kind of decreasing of society for individuals. According to this idea, social networks together with electronic tools explain the superficiality and changeability of social relationships, which are only important while the contacts make dividends.

Rudinger (2007) emphasizes this perception attesting that social networks express the disintegration of personality, the fragmentation of social relationships and the representation of the world as the Babel of Capital. In this space, the individual, when she does not succumb to some kind of informational bliss, she relinquishes the focal point of her own existence, losing her efficacy and social and historical wealth.

Organizational Psychology

In the organizational environment, the individual attitude is stimulated by group dependence, a fact attested to by a study from Hawthorne in 1924. This study aimed to verify the luminosity effect in employees' productivity. In order to do that, a group of employees had their productivity tested under different light intensities. The result showed that in spite of the light intensity, the group started to work harder. Then it came out that this group worked harder because it was being observed. That the emergence of informal leadership was also verified it was noticed that group influence

determined the individual results rather than the payment.

Since then companies started to care about knowing the groups present in the company, in order to map the leadership and participation profiles. They verified how those groups affect communication, create potential conflicts and define who is nice and who is not and who is good for the job or not.

To obtain this knowledge, a sociometrics technique is used to map the social network or to analyze an organizational network. It also works as an analytic tool for studying group interactions.

Figure 1 represents a sociogram or social graphic where each dot represents the employees of a company and the arrows linking them are the relationships. In this figure it is revealed, specifically, that the changes in this organization happen in a negative way. Social networks in an organizational psychology context are a specific set of links among a certain people set. Those networks are made up of conglomerates, which would be the existing groups inside the social networks, formally and informally.

Figure 1. Information network with employee assessment

Legend
Positive: Black
Negative: Grey
Neutral: Dark grey
Not answer: White
The networks, also known as relationship networks, were not created with a business/organizational objective, but they became important communication means for news, channels, influences and organizational communication.

For this reason, the operation of the networks has automatic mechanisms for changes and historical transformation that do not depend on the will of its components. They are social changes and are not chaotic. The basic idea of a network is simple: a set of actors (or nodes, points or agents) among whom there are links (or relationships) (Martelo, 2004).

For Christakis and Fowler (2010), a group can be defined by a specific attribute or as a specific collection of people. Although a network, like a group, is a set of people, it includes something more: a specific set of connections among people, and those connections are usually more important than the individuals.

Next, Table 1 shows Robbins (2002) variables with the benefits gained when someone joins a group.

Despite the benefits acquired when joining social networks, it is also valid to analyze the motivating factor that encouraged people to seek out those networks more often.

The famous theory about motivating factors is the Needs Theory by Maslow. For him, in each human being there is a hierarchy of five needs: physiological, security, social, esteem and self-achievement. Thus, the first need the individual has to fulfill is physiological such as hunger, thirst, shelter, sex and other corporal needs. Then, there is the need for security and protection against physical and emotional damage. Next, social accomplishment is needed which includes affection, being accepted, friendship and the feeling of being part of a group. After, the person needs self esteem that includes self-respect, accomplishment and autonomy, in addition to external factor of self esteem, like: status, to be recognized and attention. Finally, there is the need of self-accomplishment, when the person achieves everything she wants to be.

What is noticed regarding social networks is the relationship among people or between people and companies that, sometimes, happens when some of those needs are stimulated. Specifically, the item about the influence of social networks in companies shows that the more successful companies in terms of networks are the ones which can show they really care about clients' and potential clients' opinion. Wouldn't this be the same as fulfilling, momentarily, the need for self esteem? Once companies seek to recognize and give some attention to clients and make them feel part of the company, it is like the clients have gained status.

It can be noticed in related literature that there are many theoretical approaches and explanations about the social networks phenomena. Balestrini (2008) says that part of the different definitions and concepts of the term organizational networks found in economics, sociology, administration and political sciences is from the diversity of theoretical approaches in the network study, which should be looked upon as more of a complement than as an excluding factor.

Table1. Group benefits

Variables	Description
Security	The person diminishes the insecurity of feeling lonely and gets more strength, having fewer doubts and becoming more resistant against threats.
Status	The person feels important.
Self esteem	The person feels his own value by showing status, and he is also valued among the other members.
Association	The person satisfies his social needs..
Power	The person reaches goals through group action.
Reaching goals	The person does some task that requires competences.

TECHNOLOGICAL STREAM

Technological Streams will analyze social networks in the network, on internet and in technologic context.

Networks

In Computer Science for instance, the concept of network has been adopted proposing to empower the set of resources available in computers, giving form to strong information networks that refer to the biggest network of all: the *internet*. Castells (1999) defined network as a group of knots connected, like the elements that are part of the media network, the political network and the global financial network. The intense, continuous and expansive flux of immediate information interchanges among varied agents has transformed the planet in a way never seen before. The world watched the birth of a network society (Castells, 1999).

Lazzarini (2008) defines a network as a set of individuals or organizations connected through different kinds of relationships. Recuero (2009, p. 24) says that social networks on internet are defined as "a set of two elements": actors (people, institutions or groups, the knots of the network) and their connections or social bonds".

Internet

The expression "social networks on internet" has been used by the media and by academy meaning sites that offer communication tools and services through the computer. Social Network Sites – SNSes empower interpersonal networks that pre-exist through computer communication (Aguiar, 2007).

According to Recuero (2009 p.102) the Social Networks Sites are spots used for social network expression on the Internet.

Boyd and Ellison (2007) say that the social networks on Internet offer services based on the Web, allowing the individuals to create a public or semi-public profile within a personal page; to have lists to be shared with other contacts in order to have a connection in common; to look over the connection list and see other people on the system. Authors say people, a majority of the time, are seeking communication with groups already known in social networks sites. It has been noticed with the big social network sites that users are not necessarily looking to meet new people; on the contrary, they especially want to communicate with people already in their social network.

Aguiar (2007) says the first SNS were launched in the US in the mid 1990's, having as a reference direct links established among classmates, indirect links among friends of friends. This was based on two academic studies: the experiment on "the small world", from 1967, and about the "strength of weak bonds" (especially in professional contacts). The second generation arose with the launching of Friendster, based on the "Friends Circle" model where users build up a public or partially public profile from data structured in a form and associate it with their friends' profile, friends of friends and acquaintances with which they have a kind of bond in real life. Friendster reached an unexpected audience, but the servers could not support the demand, what allowed the opening of new services like MySpace, Facebook and Orkut (Aguiar, 2007).

Currently there are many sites that offer "social network services", each one seeking a spot in the market related to whatever kind of interest (music, games, sex, etc).

Aguiar (2007) says the entities directly involved with environmental questions and social development problems were the pioneers in using electronic networks for articulating their social networks. There are two perceived articulation "patterns" in these entities' sites: the inter-organizational networks, where all users are only institutional, and the plural social networks, which are divided according to the actions of its interests. Some are formed by different individu-

als and social actors (activists, community leaders, researchers, lawyers, NGO representatives, companies, etc.) and by stakeholders or benefit actors in the processes in which they participate collaboratively (Aguiar, 2007). Recuero (2009, p. 102) says that the basic difference between "social network sites and other forms of communication through the computer is how social networks are visible and social bonds are maintained". For example, Fotologs (flickr), communication tools (Twitter), systems like Orkut and Facebook.

Boyd and Ellison (2007) talk about two important elements of social networks: appropriation (system used to maintain social networks) and the structures (how it is exposed to the actors).

According to Recuero (2009, p. 104), social network sites with appropriation are the social networks sites themselves and the appropriated social network websites. The sites themselves are those that are focused on exposing and making public the actors' social networks. They are systems that allow the publication of profiles and there is a specific place for showing the connections among the users, like Orkut and Facebook. The appropriated sites are the systems that were not intended to be uses as social networks initially, but they were appropriated by the actors for this aim. Those systems do not have places for profiles and connections, for example Twitter and weblogs.

Marteleto and Silva (2004) say the interest in studying social networks is also related to the importance of social capital. Participation in networks is connected to the structural social capital, which makes it relevant to understand the kind of network to be observed (user diversity, institutionalization of decision norms, general or specific goals, size and geographic area, etc). The issue of values constructed in these environments can be realized through the social capital that aids in creating popularity impressions, for instance, the list of followers. These built connections can be maintained by the system and by interactions. The social network sites increase the social groups'

Table 2. Social capital and values

Realized Value	Social capital
Visibility	Relational
Reputation	Cognitive relational
Popularity	Relational
Authority	Cognitive Relational

Source. Recuero (2009 p. 114)

expression opening up space for visibility, reputation, popularity and authority inside the groups.

Recuero (2009) defends that the use of social networks for constructing social capital is efficient in influencing the values directed to the construction and maintenance of the network.

Virtual Communities

According to Recuero (2009) cyberspace is changing human life, broadening the size and power of social interaction. From this point of view, the author says that this perception of change leads to the birth of virtual communities in the form of a social group. Rheingold (1995) cited by Recuero (2009) defines that virtual communities are social aggregates which come from Internet, when a sufficient amount of people move forward public discussions for a period of time, with human feelings, to form relationship networks in cyberspace.

Thus forming elements of virtual communities would be the public discussions and the people who get together and keep in touch through internet. The cited elements could be social network creators, forming the communities (Recuero, 2009).

Lemos (2002) cited by Recuero (2009) defends that the virtual community is an aggregation around common interests, independent of boundaries and the geographically defined place. So, the concept of community is broad. Some authors adopt the same classification that others analyze the virtual communities from the notion of network, such as: communities as Clusters, network communities' topology, emergent com-

munities, association or filiation's community, hybrid community (Recuero, 2009).

Social Network Planning

Social networks exist everywhere around us, at workplaces as well as within families and social groups. They are designed to help us work together over common activities or interests, but unreliable evidence suggests that many SNSs lack such common objectives.

SNSs usually offer the same basic functionalities: a network of friends' listings, private messaging, discussion forums or communities, event management, blogging, commenting, media uploading and so on. With such features, SNSs demonstrate how the Internet continues to better connect people for various social and professional purposes.

Cetina (1997) has argued that social networking sites' longevity is proportional to their object-centered sociality - that is, the degree to which people are connecting via items of interest related to their jobs, workplaces, hobbies, and so on.

Similarly, Jordan and colleagues (Jordan et. al, 2003) advocate augmented social networks, in which citizens form relationships and self-organize into communities around shared interests. One way to develop object-centered sociality on the Web is via people's actions around the content they create together, comment on, link to, or for which they use similar annotations.

Naturally, people across all society and cultural settings naturally and routinely use Web 2.0 tools such as wikis, blogs and social networking services such as Facebook or LinkedIn, for personal purposes. The use of these services for personal and cultural purposes leads to their application in a business or professional application. These personal networking tools, or SNSs (Boyd and Ellison, 2007), are starting to penetrate the workplace.

The major business purpose so far is the use of social networking sites is for marketing purposes as a way to reach customers. But beyond their use as a simple tool for broadcasting a commercial message or interacting with customers, is the promise of productivity improvements in how employees and the enterprise's peers network and communicate. This is the establishment of a communication ecology mediated by technology in the workplace (Hear and Foth, 2007).

So far, Fortino and Nayak (2010) have proposed integrating business processes into the emerging functionality of social networks, such as architecture. Its key elements and some of the major attributes of each, includes:

- Professional Networking:
    - group association;
    - repositories for resume and credential sharing;
    - work spaces for interaction for mentoring;
    - support for career advancement activities; and
    - job search and job matching.
- Professional Communication:
    - instant Messaging;
    - chat;
    - texting;
    - scrapping;
    - book/Message Wall;
    - e-mails;
    - IP Conferencing;
    - discussion forums;
    - file Sharing;
    - video and photos;
    - sharing;
    - blogs;
    - posting polls and reviews; and
    - news.
- Professional Knowledge Base:
    - permanence;
    - easily searchable;
    - easily modifiable;
    - content aggregation;
    - supports different file types (text, images, charts); and

- ◦ ability to be modified/edited by multiple contributors.
- Professional Collaboration:
  - ◦ Threaded discussions;
  - ◦ virtual synchronous work sessions;
  - ◦ shared document site with versioning;
  - ◦ support for multiple document types;
  - ◦ conducting focus groups for feedback on products;
  - ◦ communities of practice for problem solving.

Note that the approach of Fortino and Nayak (2010) analyzes and represents relationships among social interactions, discussion, and communication media and technology of individuals, collectives and networks in a business context.

The applicability of these key elements can yield successful social network creation for effective enterprise uses. The architecture of the social networking space applied to workplace needs consists of categorizing enterprise communication modes based on the distinct characteristics of each communication need.

As with any new enterprise related to intellectual property, there are several issues which have arisen from social and professional networking sites. These include (Lloyd, 2009):

- Privacy: There have been growing concerns about users giving out too much personal information and the threat of others using this information for identity theft, data theft, virus spread, etc. There is also a perceived privacy threat in relation to placing too much personal information in the hands of large corporations or governmental bodies, allowing a profile to be produced on an individual's behavior in which decisions, detrimental to an individual, may be taken;
- Malicious Misuse: The relative freedom afforded by social networking services has caused concern regarding the potential of

its misuse by individual patrons. The misuse of social networking services has led many to cast doubt over whether any information on these services can in fact be regarded as true (the same concern exists for on-line user generated definitions in tools such as Wikipedia). As professional networking sites generally associate the individual with their employer, these sorts of concerns are somewhat diminished.

Currently, social responses to privacy in social networks do not tend to deal with the potential misuse of personal information. This sensitive information is suitable for all kinds of phishing and other similar attacks.

Accordingly to Barnes (2006) there is a conflict between users' security awareness and their actual behavior, the so called privacy paradox. The solution to the paradox is not simple. Awareness is the key to solving the problem. She emphasized that, we as individuals need to be more proactive about educating each other and protecting our privacy on the Internet

Additionally, recent surveys show that problems of social networks are occurring more often, due to openness as one of the key features of these sites. So, it is desirable to raise user awareness of security as well and persuade people to confront their behavior about their belief in such environment.

As the number of social and professional networking sites grows, it is becoming more difficult for individuals to participate and maintain contact on multiple sites. Attempts are now being made to standardize services on networking sites to avoid the need to duplicate entries of friends, interests, profiles etc. There is also a trend to facilitate more interoperability between different networks driven by technologies such as Openid and Open Social. Using these tools a set of social or professional networking sites can form one seamless network.

Different positions of the individuals within a network do influence the resource flows and

enterprise performance. In order to measure the network structure, three main methods have been adopted in past network analysis literature. Network size measures the extent to which resources can be accessed by entrepreneurs. Network centrality measures the ability of actors to control resources through direct and indirect ties at the interpersonal level (Brajkovich, 1994). Network density measures the extent to which actors contact each other (Burt et. al, 2002). The density of a social network is used to measure the degree of relative connection in network members. Bigger social network density increases the degree of information sharing among network members.

Nowadays, we have found out there is coherence between these methods and the criteria used to evaluate online social networking. According to (Toptenreview, 2010) the main features include:

- Profiles: the most popular social network websites put a strong emphasis on the user's profile, making it easy to use yet still reflective of the user's personality;
- Security: all social networks should provide the ability to set up profiles privately in some way or another;
- Networking Features: additional features should include music sections, video uploads, groups and more;
- Search: common search functions include search by name, city, school and email address, and so on;
- Help/Support: most social network sites are self-explanatory;
- Legitimate Friend Focus: the growing trend for social networks is to communicate and keep in touch with people you already know.

Given these characteristics we can find Facebook, MySpace, Bebo, Friendster, hi5 and Orkut leading the ranking of the best social networking websites (Toptenreview, 2010). Websites such as Twitter which target more general social interaction between individuals and groups, and others called professional, such as Xing and LinkedIn which have become widely adopted by people was not considered by this review. So, the success of a social network relies on an individual's background and interest.

So far, the issues of functionality and applicability of social networking services to business purposes are just the beginning of a robust system design.

SOCIAL NETWORKS IN ORGANIZATIONS

Hakansson and Snehota (1995) defined business networks as "a set of relationships among the actors". These relationships make companies part of the network, connected to each other at the same time. It makes the companies influence the network with their relationships, at the same time they are influenced by other relationships with other actors. So, because there are in a network, the organizations are permanently influenced by their suppliers, clients, competitors, suppliers' supplier, clients' clients and other actors, in the same way they are influenced by the organization. Companies are waking up to their actions in social networks and are also realizing that a social network on internet is much more complex than a social network outside the internet. In social networks outside the internet, the messages are processed, fulfilling their goal or not and are filed away until further notice, if they are not lost. On the internet, messages are registered and can be multiplied thousands of times over, creating a complex net, like a social fork. But why would companies have interest in social networks? McCarthy (1960), one of the great names in marketing, says companies must try for four items: product, price, place and promotion. Those items are basic elements of business marketing. The product is what a company makes to be promoted in some place, under a determined price which people are

able to pay for. Such considerations force companies to think about how to expand their market share; it means the companies should go where the client and potential client are. Therefore, the right place to find the customer is on the internet and a tendency is being noticed that internet users are accessing more social networks. Thus, the internet became the world's square and social networks have the role of promoting or harming companies.

According to an Ibope Intelligence poll together with the Worldwide Independent Network of Market Research (WIN), India leads the ranking of countries which have more access to social networks, 100% of Indias' internet users visit social networks sites, followed by Serbia, South Korea, Russia, Spain, China, Turkey, Romania, Italy and Brazil.

In Brazil's case, the Associação Comercial de São Paulo – ACSP did a survey with 500 companies in São Paulo to know the acceptance of social networks (Valle, 2010). It found out that 66% of researched companies work with their own brand website and only 17% accept social networks on internet. It was noticed that 68% of researched companies admitted they do not answer the comments made about them on social networks. Among the researched segments, financial institutions take part with 26% on social networks, the service segment with 21%, wholesaler commerce with 17%, industry with 15% and retailing commerce with 12%.

Another survey done by Robert Half (2009), with 375 executives from Brazil, has revealed that more than 90% of the executives of medium and high management use social media actively, as a work tool and as a tool to contact friends. LinkedIn is the favorite of 36% of people interviewed. Between 23 and 31 years old, Orkut is the most used, with 33% of preferences. Despite the growing importance of social networks for professionals, companies still do not have profiles on those platforms. The research shows that only 20% of the companies where the interviewed ones work have profiles in digital relationship

places. This research also revealed which activities are more developed in those channels by the companies. Thus, the most performed activity is brand monitoring with 20%. Secondly comes divulgation and launching with 14%, followed by a research about rivals with 13% and profile creation so as to interact with customers with 13%. Last, public exams and professional recruitment, both with 11%.

A recent survey from the communication agency Burson Marsteller (2010) reveals that from 100 of the biggest companies in the world, 79 are on social networks. The majority of these companies' interest is to seek improvement of communication with the client. This survey identified which companies stand out. To do this, these companies were analyzed according to some criteria, like answering clients' questions and promoting events and promotions. Since 2008, when Starbuck's business fell off, the company's founder launched a virtual community so that the clients could ask questions and make suggestions. From the 80 thousand ideas, 50 were put into practice in the stores and they helped the franchise grow again. In general, the companies that stand out in social networks follow the same profile, orienting employees about the questions or suggestions in order that interactions are quick enough to not frustrate the customer.

Next, 22 company cases will be introduced that are starting to stand out due to their actions in social networks. To facilitate the analysis, the cases are grouped according to the type of activity they exercise on the networks. They are: customer relations services, creating products, financial mediation, potential client identification, professionals and public service recruitment.

Case 1: Customer Relations Service - Satisfaction and Promotions

In April 2010, a volcano erupted in Iceland, which interrupted air traffic in Europe. Thousands of passengers congested the telephone Center of

air companies for information. The Brazilian operation of **Lufthansa** used Twitter as a means of communicating with the passengers, telling them information in real time (1,800 followers).

JetBlue uses Twitter to answer and suggest attractions at the destinations where it goes. Besides, it offers exclusive rates for people who follow them in Twitter. It is worth pointing out that executives from different areas were assigned to resolve customer questions (1,6 million followers).

Nike uses Twitter for two profiles: runner and soccer fans, for doing market analysis (15,000 followers).

Tecnisa do Brasil Construction has turned to Twitter for making promotions and sales. This company had used Twitter like a tool for composes a Web 2.0 strategy company to promote new releases, blog posts, modifications to the site and innovations. Knowing that their followers were buying and researching, in April 2009 Tecnisa articulated a promotion for users of Twitter, Facebook and LinkedIn creating a page within the site for disclosure and registration of interested users. In this month, the company was able to sell an apartment in Twitter for about 300 thousand dollars (5,200 followers). When someone buys, this person is identified as a potential client.

Nokia gathered about 500 fans (volunteers) of Nokia technology who clear up questions from other customer through Twitter. From these fans, the volunteer who resolves more questions can win anywhere from mobile phones to a visit to the company's technical center in Europe.

The profile of a Twitter user is a person who wants quick answers, so some companies hire teams dedicated to this function, like JetBlue.

Moreover, companies ask for help from their clients and potential clients to develop advertising, as a way of getting clients closer to the company.

Case 2: Creating Products

Nokia, Microsoft and Apple develop products to access social networks.

Nokia became a rival of BlackBerry's manufacturer, RIM, so that its new product would make it easier for Nokia clients to access social networks.

Microsoft created a service that gathers feeds from Facebook, MySpace and Twitter to the opening screen of the system (loop), allowing quick sharing of videos, photos, texts, websites, geographical position and status. Additionally, the service stores data in a "cloud".

Apple created software that uses a social platform for games, called the Game Center. Thus, iPhone and iPod Touch users can play in the multiplayer mode.

Case 3: Financial Mediation

A new challenge of social networks is financial relationships. There is Fairplace**,** a service created in May 2010 to bring together those who need money with those people who are willing to lend. For example, a person needs to make a loan for whatever reason. She puts on the site the amount she needs and explains what she intends to do with the money. Based on risk analysis, Fairplace makes the request public. Those interested in lending can make a proposal with a specific interest rate. If there are more offers, Fairplace calculates the best offer automatically. The advantage to who receives the loan is the lower interest rates. For the investor, the benefit is to build an application with more return than other application. It is worth considering that there is the risk of someone not paying the loan back (5,000 applicants).

In the US, where this is common, there was an interruption after Lehman Brothers went bankrupt, where the default rate was too big. In this case, the Securities and Exchange Commission (SEC), the organization that monitors the capital market, will allow the operation when new regulations are implemented. In the US the Prosper site had a portfolio of 1 billion dollars in loans (960,000 applicants).

A survey done by TerraForum consultancy in 101 financial institutions showed that 60%

of banks and insurance companies are reluctant to put their businesses on social networks, even though they represent a relevant part of companies that take part in social networks (Fogaça, 2010).

Case 4: Potential Client Identification

The Porto Seguros insurance company monitors Twitter to know who bought goods that need insurance.

Case 5: Future and Potential Client Prospection (13 to 17 Years Old)

Among social networks, the one which has captured the interest of teenagers is the Habbo Hotel, a kind of virtual world easier to manage than Second Life.

In Habbo Hotel, the companies share their brands and new products in an interactive way. The companies that are part of Habbo Hotel are Coca-Cola, Procter & Gamble, Kelloggs, Unilever, etc. In Habbo Hotel, the companies have virtual rooms for sharing their brand. The advantage of these companies is that the Habbo Hotel works as a marketing lab (1,200,000 visitors).

Case 6: Professional Recruitment

According to the interview of Serfaty, executive-president of the second biggest website of professional social networks, with Exame magazine (2010), in recession times, people visit social media networks looking for jobs. In this moment, access to networks like LinkedIn and Viadeo is bigger than Facebook. However, the use of social networks is even bigger to promote jobs. Companies like Ambev, Unilever, Vale do Rio Doce and Whirlpool promote jobs in social networks like LinkedIn, Facebook and Twitter. Even in the selection process there are tests that show ability to develop projects with social media.

Case 7: Public Service

In Brazil, public administration uses social networks to monitor citizen behavior, answering questions and launching promotions. Companhia do Metropolitano de São Paulo (Metro), Companhia Paulista de Trens Metropolitanos (CPTM), Polícia Militar (PM) and Companhia de Saneamento Básico do Estado de São Paulo (Sabesp) have designated employees to monitor social media.

Also, the São Paulo state government uses Twitter for promoting projects.

In United Kingdom the Twitter is used for public sector jobs. Wide range of public sector jobs on Twitter:

- Local Government;
- NHS Trust;
- Charity and Non-Profit;
- Armed Forces;
- Education/University;
- Police/Fire & Rescue;
- Housing Jobs;
- Quangos/Non-Government;
- Revenue and Benefits.

CONCLUSION

This chapter emphasized the importance of social media in the field of administration. Firstly, analyzed the basis of social media, through the 'media' concept has been developed in some fields such as philosophy, sociology, anthropology and organizational psychology.

Social networks have been expanding at an alarming rate. Scholars in the field of sociology, anthropology and psychology began to seek answers to this phenomenon. It has been concluded that this communication cannot meet people's deep emotional needs.

After, the social media on the internet was the focus, especially with information and communication technology expansion (ICT). The Internet has

become a meeting point of superficial contacts. The sociologist Robert Weiss wrote in the 70's, there are two types of loneliness: emotional and social. 'Emotional loneliness is a feeling of emptiness and restlessness caused by a lack of deep relationships. Social loneliness is the feeling of boredom and marginalization caused by a lack of friendships or a sense of belonging to a community. "Following this line of thought, it can be seen in the literature on the subject sites to reduce the loneliness of social relationships, but increases the emotional loneliness. It has been observed that the participants of virtual communities on the Internet are always surrounded by people, but cannot rely on any of them for a contact relationship.

The link between social networking and workplace is the architecture of the social networking which consists of categorizing enterprise communication modes based on the distinct characteristics of each communication need. It is emphasized the issues of functionality and applicability of social networking services to business purposes are just the beginning of a robust system design.

Finally, it was shown how social networks are working in the administration of organizations. The chapter selected any social networking cases in administration. They were grouped according to the type of activity they exercise on the networks. Such as: customer relations services, creating products, financial mediation, potential client identification, professionals and public service recruitment.

The cases show that companies use various areas of administration when using social networks. Among the cases reported, all initiatives on social networks were related to strategic planning of organizations. Furthermore, most cases presented as social networking tools for marketing and human resources. A set of special cases use social networks to develop and redefine its business model. One aspect that was slightly mentioned, but of significant importance to the citizen, are social networks in the public sector. Wide range of the public sectors are observed in Twitter and Facebook, if this sector were used appropriately and creatively these social networking probably would be easier to identify emerging issues, citizen satisfaction with public services and to find more efficient solutions to the problems of short and long term through partnership with citizens.

KEY TERMS AND DEFINITIONS

Business Networks: A set of relationships among the actors mediated by a business media.

Network: A set of entities linked to each other that share a common theme.

Social Features: Including profiles, security, networking features, search, help/support, legitimate friend focus.

Social Media: An interaction between people by electronic media.

Social Networks on Internet: Sites that offer communication tools and services through the computer.

Virtual Communities are Social: A group of people who promotes public discussions forward for a period of time.

Chapter 48
Understanding Shared Services:
An Exploration of the IS Literature

ABSTRACT

In a competitive environment, companies continuously innovate to offer superior services at lower costs. 'Shared Services' have been extensively adopted in practice as a means for improving organizational performance. Shared Services are considered most appropriate for support functions and are widely adopted in human resource management, finance and accounting, and more recently employed as an information systems (IS) function. As computer-based corporate information systems have become de facto and the backbone of administrative systems, the technical impediments to sharing have come down dramatically. As this trend continues, CIOs and IT professionals need a deeper understanding of the Shared Services phenomenon. Yet, analysis of IS academic literature reveals that Shared Services, though mentioned in more than 100 articles, has received little in depth attention. This paper investigates the current status of Shared Services in IS literature. The authors present a detailed review of literature from main IS journals and conferences. The paper concludes with a tentative operational definition, a list of perceived main objectives of Shared Services, and an agenda for related future research.

INTRODUCTION AND BACKGROUND

Organizations constantly face challenges to innovate their customer offering, improve the quality of their business processes and operate at lower cost. The current global financial crisis has amplified this need. Managers are looking to 'Shared Services' as one means of improving organizational performance (Wagenaar, 2006). While the notion of Shared Services is still under debate, it is broadly referred to as "*the concentration of company resources performing like activities, typically spread across the organization, in order to service multiple internal partners at lower cost and with higher service levels, with the common goal of delighting external customers and enhancing corporate value*" (Schulman et al., 1999). Shared Services has become increasingly popular within both public and private sector organizations[1] (Bergeron, 2003; Borman, 2008; Janssen & Joha, 2006b; Wagenaar, 2006), where it is mostly deployed in large organizations, with a predominant focus on support processes (Ulbrich, 2006). "*Since the late-1990s, the fast-spreading shared service concept has increasingly become popular as an organizational change approach, focusing on the theoretical potential for extensive improvements in support processes*" (Kagelmann, 2000; Schulman et al., 1999, cited in Ulbrich, 2006, p. 191).

Potential benefits of Shared Services have been extensively discussed in the commercial press e.g., "*promote efficiency, value generation, costs savings and improved service for the internal customers of the parent corporation*" (Bergeron, 2003). Cecil (2000), reports that 16 of the top 20 Fortune 500 companies have Shared Services Centres. Shared Services success stories such as General Electric (Lacity & Fox, 2008), DEC (Lacity & Fox, 2008), Reuters Asia (Lacity & Fox, 2008; Businessintelligence, 2005), Allianz (Lodestone, n. d), and Queensland Government (Queensland-Government, 2008), are many. Leading research firms such as Gartner provide a range of reports that describe the application of Shared Services in different industries, stating that "*Many enterprises are looking to shared services to support efficiency goals and to enhance business integration and agility*" (Gartner, 2008, p. 2).

Shared Services is considered most appropriate for support functions, and is widely adopted in Human Resource Management, Finance and Accounting (Cooke, 2006; King, 1998; McIvor et al., 2002; Peters & Silver, 2005; Webster, 2007). More recently Shared Services is being employed for the Information Systems (IS) function, and although not adopted as widely as by other functions, recent reports (Lacity & Fox, 2008; Peters & Silver, 2005) indicate that IS Shared Services is growing at a fast rate.

IS applications and infrastructure are an important enabler and driver of Shared Services in all functional areas. As computer based corporate information systems have become de facto and the internet pervasive and increasingly the backbone of administrative systems, the technical impediments to sharing have come down dramatically. As this trend continues, CIOs and IT professionals will need a deeper understanding of the Shared Services phenomenon and its implications; "*successful management of IT shared services was recently listed as one of the seven habits of effective CIOs*" (Lacity & Fox, 2008, p. 17).

As a "*discipline that is driven by rigour and relevance*" (Benbasat & Zmud, 1999; Davenport & Markus, 1999; Lee, 1999), IS academia has a vested interest in the growing phenomenon of Shared Services; a domain that warrants research in relation to the IS function, IS applications and IS infrastructure in organizations. In particular, IS as a discipline should be interested in Shared Services because they can drive radical change to the IS infrastructure and architecture (Curley, 2006; Ross & Beath, 2006; Weill & Vitale, 2002); IS can play a major role in identifying opportunities for Shared Services in other functional areas and in preparing the business case, as well as the IS strategy; IS can either internally or through

an external service provider, play a major role in transitioning to, and ongoing operation and evolution of the Shared Services environment. However, until now there has been no systematic study of Shared Services in the IS academic literature.

Therefore, a structured approached was devised and applied to systematically review the status of Shared Services literature in the IS domain. The driving research question being 'How is the notion of Shared Services perceived and reported by IS researchers?' This paper is specifically aims to report on how IS academia have defined the Shared Services notion and what objectives they have reported on. A better understanding of what Shared Services really are and why organizations deploy them, are important for the progression and success of Shared Services in practice and academia. Such results will, for example, help build a better understanding on what drives the interest for Shared Services (Hewlett-Packard, 2006) and form the foundation for deriving performance measures related to Shared Services (Boessenkool et al., 2006). It can also support the design and deployment of shared service structure and governance (Firecone, 2007); and help better understand the nature of Shared Services organizations (Kearny, 2004).

The contributions of this paper are threefold. First, we demonstrate the lack of academic IS literature on Shared Services; that same literature evidencing a need for better understanding Shared Services. Second, drawing from the limited existing IS literature on Shared Services, we provide preliminary definitions and objectives of Shared Services and present a potential research agenda for future research in the domain. Third, we detail a pilot literature analysis approach, developed and tested for the study of Shared Services in IS literature; to be extended to a broader range of academic disciplines, the results of the extended study expected to contribute to a stronger conceptualisation of Shared Services.

The remainder of this paper proceeds as follows. The next section presents the research strategy. Discussion of findings is in the following section. The paper concludes with a summary of the findings and recommendations for future research.

RESEARCH METHOD

This study is specifically devoted to searching and reviewing the literature on the Shared Services concept; predominantly the focus here is on how, the nature of shared service is perceived and reported by other researchers in Information Systems. Following Levy and Ellis (2006), the researchers followed a three staged method to extract, analyse and report the literature based findings. The first stage involved identifying the articles to be included in this review. The second stage comprised of designing and implementing an appropriate classification scheme to match with the study objectives. Finally, the third stage consists of synthesizing the coded details and analysing the literature to respond to the research objectives of this study. The following sections describe each phase in detail.

Extraction of Relevant Papers

In defining the research method for a comprehensive review of the IS literature on Shared Services, two main criteria have to be identified and clarified: (1) the sources, and (2) the search strategy (Cooper, 1998). The sources refer to which outlets are to be targeted, and the search strategy refers to what search terms to utilize during the article extraction process. The aim was to characterize Shared Services from an IS perspective and to review and depict the nature of Shared Services publications in IS. Thus, the primary search was limited to the IS domain.

Journals and academic conferences were considered. It was resolved to canvass the 40 IS journals listed at the 'ISWorld NET' web site[2]. These journals were identified after a comparison

of 9 published papers on IS academic journal rankings (as reported in the 'ISWorld NET' web site). To ensure that the literature reviewed was as current and inclusive as possible, the proceedings from major conferences were also examined. The IS conferences to target were determined based on those that were supported by the Association of Information Systems (AIS)[3]. Thus, the following IS Conferences were included within the scope; the proceedings of International Conference on Information Systems (ICIS), European Conference on Information Systems (ECIS), Pacific Asia Conference on Information Systems (PACIS), Australasian Conference on Information Systems (ACIS), and Americas Conference on Information Systems (AMCIS). Articles published from their inception to present (May 2009) were accessed.

The article extraction was conducted in multiple iterations. In terms of the search strategy, first, the key word 'shared service' was searched for, in the title, abstract, and key words of all papers in the target source list, through a database search. This yielded 4 from the IS journals and 4 from conferences (hereon, we refer to these 8 as the "principal" set of papers).

As this search only yielded very few articles, we extended the study to search for the key word 'shared service' in the body-text field as the next step. Ten selected IS journals[4] (based from those that yielded results in the high-level search, and a selected set from the 'IS world net' journal ranking list - based on topic alignment to Shared Services), and all 5 AIS conferences mentioned earlier were included in this second-staged search. The 10 journals were selected after eliminating those IS journals from the IS world net journal ranking list, that seemed less aligned with the notion of Shared Services (i.e., Artificial Intelligence). These were excluded from this full-text search, to sustain efficiency and feasibility. All papers in these sources were downloaded as full text pdf files. They were systematically indexed (by year and source) using the Adobe Acrobat professional tool. Adobe Acrobat professional's 'advance-search'

facility was used to search the indexed papers. 99 papers (after removing duplications with the principal paper set) were identified through this effort, where they had mentioned Shared Services meaningfully, somewhere in the text of the paper (hereon, we refer to these as the "secondary" set of papers). Thus, the sample paper pool having a total of 107 papers (99 secondary and 8 principal) as we entered the pre-analysis planning phase.

Preparing for the Analysis

Two key aspects are of importance to mention when describing the preparatory phase for the analysis; the a-priori coding scheme and tool(s) used. They go hand- in-hand and are described below.

The goal of this paper was to derive a synthesized definition and identify the most commonly reported goals for Shared Services, based on literature. As mentioned earlier, what is reported herein is a sub-set of a larger study which had broader intensions. NVIVO 8.0 was used as a qualitative data management and analysis tool; to systematically code and analyse the data within one single repository. NVIVO has effectively been applied for analysing prior literature (Bandara, 2006; Gregorio, 2000), and this study adapted the coding and analysis strategies based on these prior studies.

Key areas of interest, in this case; 'Shared Services definitions' and 'objectives of Shared Services' (amongst others) were placed as main tree-level nodes within the NVIVO data-base that was created for this project. A tree-level node is a physical location within the tool, where you store the groups of ideas that would be coded. All the articles extracted were entered and saved within NVIVO as 'documents,' which are simply data that one analysis in the study. The aim was to conduct the analysis in two levels. The goal of the first-level-analysis was to capture the main details that related to each main theme – at a high level. In the second-level-analysis, these extracted

details will be analysed deeper to derive the intended findings. A detailed coding-protocol was devised by the researchers, to confirm the coding plan and scheme. A sample (3) of the papers (from amongst the primary papers) were coded by two of the researchers and the coding protocol was strictly followed, proving to assist in maintaining rigor and inter-coder reliability. The overall research findings and the analytical activities that supported these findings are presented in detail in the next section.

DATA ANALYSIS AND FINDINGS

This section presents the results of the literature-based analysis. First the extent of the academic IS literature on Shared Services is discussed and it is argued that more research is warranted. Next is presented a synthesis of definitions and objectives of Shared Services, as identified from the IS literature. This section concludes with a research agenda.

Need for Academic IS Literature on Shared Services

Our literature study shows that there is a lack of academic IS literature on Shared Services. Shared Services is an interesting area of research because of its impact on the IS function in organizations and the driving and enabling role of IS applications and infrastructure. It is also a very relevant area of research because of its growing importance in practice. We, therefore, argue that more academic IS research and publications are required discussing Shared Services in organizations, in particular in relation to the IS function.

Our literature study showed that only 8 papers are dedicated to Shared Services from a large pool of papers across 45 main IS outlets (this included all outlets as listed in the 'ISWorld NET' journal ranking and all the 5 AIS sponsored IS conferences - after searching them since their inception).

Shared Services literature in IS is still very 'young', where the first main IS papers on Shared Services were those of (Ulbrich); (Veersteeg and Bouwman); and (Janssen and Joha) which appeared in Business Process Modelling Journal, Information Systems Frontier and Americas Conference on Information Systems in year 2006. However about a hundred papers (published since 1995) mention Shared Services in their articles, thus indicating a growing interest in and prevalence of Shared Services in IS, especially in relation to interest areas such as Sourcing (Accenture, 2006a; HRfocus, 2007; Kakabadse & Kakabadse, 2000), ICT Governance (e.g., Goh et al., 2007); E-Government (e.g., Janssen & Joha, 2006b; Janssen & Wagenaar, 2003; Janssen & Wagenaar, 2004); Public and Private Sector (e.g., Janssen & Joha, 2006b; Walsh et al., 2006); and University (e.g., Deloitte, Touche, & Tohmatsu, 2001). Therefore, to advance the academic IS body of knowledge with respect to Shared Services as a research topic and context factor, more academic IS research and publications are required.

The relevance of Shared Services is illustrated by extensive discussion of potential related benefits in the commercial press (e.g., reduce cost, accumulate intellectual and capital assets, provide services with customer and process focus, and deploy new technology) (Casiraya, 2001; Shah, 1998). Despite its apparent benefits, anecdotal evidence (Craike & Singh, 2006; Janssen & Joha, 2006b; Lawson, 2007; Shah, 1998) suggests that many organizations have difficulty understanding the context and details of Shared Services. Thus, evidence from Shared Services initiatives has been mixed, suggesting value from further investigation of the phenomena. While there have been industry-based research reports, these are typically limited to trend analysis (Accenture, 2005; Deloitte, 2007a; Deloitte, 2007b) or narrative description of the journey from Shared Services concept-to-implementation (Accenture, 2006b; Gartner, 2008).

Concluding, as an overall discipline, IS lacks academic research in Shared Services. This is supported by other researchers in the field (Borman, 2008; Craike & Singh, 2006; Ulbrich, 2006). This paper calls for addressing this gap; there is a need for better understanding the phenomena of Shared Services, its relation to the organization of the IS function, and its relation with other IT interests areas such as governance or enterprise systems. The next sections present an analytical review of the definitions and objectives of Shared Services as reported within the limited pool of IS literature. This section concludes with a set of propositions derived for this analysis that is the first formulation of a detailed research agenda for Shared Services in IS.

Defining Shared Services: A Review of IS Literature

This section reviews how IS research defines Shared Services. As mentioned earlier, a separate node was dedicated in the coding scheme of the NVIVO database to capture any 'definitions' introduced or referred to by the papers included in this analysis. Table 1 provides a summary of this analysis. Six papers offer some unique attempt to define Shared Services, at least partially, if not completely. Amongst these, 3 papers refer to the definitions provided by Schulman et al. (1999) and 2 papers refer to Bergeron (2003) which are from the management discipline. This could mean that shared service is a common terms that needs little explanation. However, as the phenomenon is very recent, it cannot be assumed that the broader IS community is that familiar with it. Alternatively, it could mean that while Shared Services are mentioned, it is not considered as important enough. This seems also hardly the case, as there are many direct statements in literature that refer to objectives of Shared Services in relation to the performance and organization of the IS function. Therefore, we argue that there has been a lack of attention and research of what Shared Services

is and how familiar or different it is from other forms of the organization and sourcing of the IS function.

Shared Services can be perceived as a form of sourcing, and thus a clear description of what Shared Services is, and in particular how it differs to other sourcing arrangements should be made in order to define and clearly understand the scope of the notion. *"There is a need to integrate these concepts for a comprehensive view"* (Whitaker et al., 2006, p. 3249). "*Looking to the future, the large-scale changes to the business environment... are likely to tip the balance of factors associated with outsourcing toward... shared services*" (Davenport, 2000, p. 175). Thus, it is important to clearly understand what sourcing model is used and when it is best to change from one form to another. This is especially valid for Shared Services in the IS domain, as one needs to clearly position ICT related Shared Services amongst other ICT outsourcing options when considering Shared Services strategies and adoptions. However, only Ulbrich (2006) made any attempt to compare and contrast Shared Services to other sourcing arrangements. The author states that Shared Services is somewhat similar to outsourcing, and that *"the main difference is where the service provider is located organizationally and that internal resources are used rather than those of a contractual partner"* (Ulbrich, 2006, p. 197). Furthermore, Shared Services can be seen as *"... an enabler that helps to create a platform for business growth, flatten organizational structure, and support of general group strategy. It is often a step towards globalization, an enabler for cultural organizational change, or a step towards external outsourcing"* (Kagelmann, 2000, p. 79-81, cited in Ulbrich, 2006, p. 199).

In an attempt to analyse how IS academia has deemed to define Shared Services in several ways; the key words provided in the few definitions used in the pool of IS literature extracted (as explained earlier) were analysed. Both direct definitions (as presented in Table 1, and indirect

Table 1. Summary of all definitions of shared services found within IS literature

	Paper	Definition made
IS papers specifically defining Shared Services		
1	Lacity and Fox (2008)	*"the consolidation of support functions (such as human resources, finance, information technology, and procurement) from several departments into a standalone organizational entity whose only mission is to provide services as efficiently and effectively as possible."* (Accenture, 2005, cited in Lacity & Fox, 2008, p. 17)
2	Borman (2008)	*"...retains the core concept of concentration while avoiding prescriptive requirements to achieve specific objectives or operate in set ways."* (Longwood & Harris, 2007, cited in Borman, 2008). Other definitions referred by this author are Schulman et al. (1999, p. 9) and Bergeron (2003, p. 3).
3	Sedera and Dey (2007)	*"The concept is simple bring-together functions that are frequently duplicated across divisions, subsidiaries or operating units and offer these services more efficiently and at a lower cost."* (Sedera & Dey, 2007, p. 1). Another definition referred by the authors is Schulman et al. (1999, p. 9).
4	Ulbrich (2006)	*"... shared services gather a selection of common and well-defined services to provide these services to an organization's units, acting independently."* (Ulbrich, 2006, p. 197) Other citations referred by this author are Schulman et al. (1999, p. 9), Bergeron (2003, p. 3), Moller (1997), and Quinn et al. (2000).
5	Whitaker et al. (2006)	*"...consolidating IT and business processes throughout the firm into a single or small number of centers owned and run by the firm."* (Shah, 1999; Ulrich 1995, cited in Whitaker et al., 2006, p. 3249)
6	Gibson and Arnott (2005)	*"A shared service is the standardisation and consolidation of business functions, in order to reduce process duplication and at the same time centralise controls and processes."* (Gibson & Arnott, 2005, p. 9)
Other common definitions cited by IS authors		
Schulman et al. (1999) defines Shared Services as "*The concentration of company resources performing like activities, typically spread across the organization, in order to service multiple internal partners at lower cost and with higher service levels, with the common goal of delighting external customers and enhancing corporate value*" Bergeron (2003) defines Shared Services as "*Shared services is a collaborative strategy in which a subset of existing business functions are concentrated into a new semi-autonomous business unit that has a management structure designed to promoted efficiency, value generation, costs savings and improved service for the internal customers of the parent corporation* " Moller (1997) defines Shared Services as *"... a shared service centre (SSC) is an independent organisational entity which provides well defined services for more than one unit (which may be a division or business unit) within an organisation. The SSC is responsible for managing its costs and the quality and timeliness of the services it provides to its internal customers. It has its own dedicated resources and typically will have informal or formal contractual arrangements, often called service level agreements, with its customers."* Quinn et al. (2000) defines Shared Services as *"... shared services at a simple level refers to the practice of business units, operating companies and organizations deciding to share a common set of services rather than have a series of duplicate staff functions."*		

attempts to describe Shared Services, were used here from the principal and secondary set of papers). Figure 1 depicts these key words, graphed from least to most mentioned themes from 107 papers (indicated by the number of sources that have stated this as a key element when defining Shared Services).

While the data pool is very limited (as only a very few papers define Shared Services), it can be observed that 1) consolidation, 2) support sharing arrangement, 3) new or separate business unit, 4) focused on services and 5) service multiple internal partners are the most common themes used to define Shared Services within the IS literature. Deriving a clear definition for Shared

Services within the IS context is a gap that has to be filled and this analysis provides a starting-point for proceeding with this. Within the context of the currently available academic IS literature, we define Shared Services as the internal provisioning of services by a semi-autonomous organizational unit to multiple organizational units involving the consolidation of business functions supported by a sharing arrangement.

Objectives of Shared Services: A Critical Review of IS Literature

An in-depth understanding of why an organization should consider shared-services is critical

Figure 1. Key themes identified from the shared services definitions provided in IS literature
for its success; "*Make sure you know why you're implementing shared services*" (Gartner, 2008, p.1). Thorough understandings of its objectives are vital for the progression of the field and will be the foundation for its advancement in practice and research. For example, Shared Services objectives form the key input when designing a Shared Services decision-support framework or for benefits-realization and evaluation of Shared Services initiatives. This analysis systematically coded the different objectives of Shared Services as mentioned in the IS literature from 107 papers (8 principal and 99 secondary). Any direct or indirect mention of an objective was captured in the higher level node in the first round of analysis. The content captured in this node was then analysed to build a set of objectives bottom-up from the coded data. Figure 2 depicts the high level summary of the objectives identified through the

literature (based on the number of sources that have stated each).

It can be observed from Figures 2 that the top three objectives of Shared Services that IS literature have reported on are; support consolidation and integration, cost effectiveness and support standardization.

When taking a closer look at the top five objectives, one can argue that there are two relatively more strategic objectives (enhance value and decrease costs), and three organizational objectives. Therefore, within the context of the currently available academic IS literature, the main objectives of Shared Services are enhancing the organization's value and decreasing its costs by supporting consolidation and integration, supporting standardisation, and avoiding duplication.

Figure 2. Shared services objectives as reported by the IS literature
A Potential Research Agenda for Shared Services Identified From a Critical Review of IS Literature

This section is dedicated to deriving a high level research agenda that has been motivated by this study on Shared Services definitions and objectives. The coded data was analysed further to identify potential propositions for future research. NVIVO's query functions were used to identify potential relationships and implied causality amongst the coded objectives. These are presented (with evidence from data) below.

The first observation is that IS academics must make a stronger attempt to define Shared Services, especially for the IS context. Research propositions to pursue are: 'What elements constitutes Shared Services (within the ICT context)?' and

'How does Shared Services in IS, differ in other sourcing arrangements related to ICT?' Of course this also requires addressing the underlying methodological question of 'How can one best derive and validate a Shared Services definition?'

Secondly, while Shared Services is deployed with the expectation of various benefits, a deeper review of what the actual intensions of Shared Services are (especially in relation to IS), is an area requiring further investigation. The data coded in the NVIVO database under 'objectives' was analysed further to identify such potential relations. A set of research questions (inspired by current literature), has been derived as a starting point for future research on Shared Services. Table 2 presents these propositions, together with supporting literature.

Table 2. Potential research to pursue in relation to Shared Services objectives

Research proposition	Motivating evidence from literature

1. Should organizations invest in technology first when deploying Shared Services?
 	
   a. Is technology a key enabler for progressing with Shared Services initiative?
 	
   b. Can organizations gain cost effectiveness through technology investments, when deploying Shared Services initiatives? If so, how?
 	
   c. Is integration capability a key enabler for sharing within Shared Services initiatives? If yes, how can IT support integration capabilities?
	"Reuters found that technology was a critical enabler of its regional shared services"... and *"This is worth investing in before anything else"* (Lacity & Fox, 2008, p. 22)
	"The global ERP system drove process standardization and was the "engine" of the regional shared services." (Lacity & Fox, 2008, p. 22)
	Cost effectiveness can be achieved by the organization through technology investment when deploying Shared Services. *"In 2001, the corporate CFO decided to significantly reduce finance costs by standardizing finance policies for global delivery (BPR), implementing standard, global enterprise resource planning (ERP) and workflow systems (technology enablement),..."* (Lacity & Fox, 2008, p. 19)
	In the literature, one of the goals adopting Shared Services is to deploy new information technology. Integration capabilities have been seen as an enabler for sharing arrangement in the Shared Services initiative. *"The ICTU processes are primarily aimed at creating coordination and integration capabilities to enable the sharing of services among as many agencies as possible in order to gain economies of scale".* (Janssen & Joha, 2006a, p. 2309)

2. Are organizations able to improve customer foci by centralizing all the similar activities or business functions in a Shared Services initiative? a. How/Can Shared Services improve the services to a company's internal customer?	The Shared Services approach has a focus on putting the customer first. *"According to them, business units inevitably become more comparable, when drawing together activities that have been performed similarly in various locations before. Furthermore, work can be handled quicker and more precisely, putting the customer in focus."* (Forst, 2001; Norling, 2001, cited in Ulbrich, 2006, p. 198) Shared services have been designed to improve the customer foci in the organizations. *"... designed to promoted efficiency, value generation, costs savings and improved service for the internal customers of the parent corporation"* (Bergeron, 2003, cited in Borman, 2008, p. 2)

3. How can organizations generate cost effectiveness through Shared Services initiative?
 	
   a. Can organizations generate cost effectiveness by implementing Shared Services arrangement?
 	
   b. What types of Shared Services arrangement can be utilized within the organizations in order to gain cost effectiveness?
 	
   c. Can organizations realize the economies of scales when deploying Shared Services initiative?
 	
4. How can organizations avoid duplication of efforts by implementing Shared Services?
	Reuters found that financial cost can be reduce by *"standardizing finance policies for global delivery (BPR), implementing standard, ..."* (Lacity & Fox, 2008, p. 19)
	"Services are more and more shared among public agencies to gain efficiency benefits." (Janssen & Joha, 2006a, p. 1)
	"Hospitals and physicians are also able to share the use of the systems for ancillary services such as payroll, budgeting, and general accounting. These types of shared services arrangements provide cost efficiencies for both the hospitals and physicians (Guiney, 1994)." (Lockamy III & Smith, 2009, p. 7)
	"Cost reduction is often a primary benefit and driving force for companies to implement shared services (Norling, 2001; Triplett & Scheumann, 2000). Shah (1998) and Triplett and Scheumann (2000) argue that shared services realize economies of scale, and thereby gain efficiencies that are normally reserved to centralized organizations. The main goal is to provide optimal solutions for the lowest possible cost (Funk, 2000; Joachim, 2001)." (Ulbrich, 2006, p. 198)
	Reuters was able to reduce financial costs by *"...moving a significant amount of work from decentralized business units to six new regional services centers (organizational design)".* (Lacity & Fox, 2008, p. 19)
	"Economies of scale through centralisation, the removal of duplication and being better positioned to secure funds to invest in the latest technology were the most common reasons given for establishing SSCs." (Borman, 2008, p. 8)

5. What are the benefits of standardization within Shared Services and how can these be best arranged?	Shared Services benefits can be realize through standardization process. *"Cecil (2000) and Triplett and Scheumann (2000) see benefits in a standardization process. According to them, business units inevitably become more comparable, when drawing together activities that have been performed similarly in various locations before."* (Ulbrich, 2006, p. 198)

CONCLUSION AND OUTLOOK

Many organizations are adopting Shared Services and there has been a significant presence of Shared Services in the recent trade press. Shared Services are promoted in the commercial press as a powerful model for reducing cost, increasing quality and creating new capabilities. The

Table 2. continued

Research proposition	Motivating evidence from literature

6. Are Shared Services able to improve an organization's structure through consolidating processes?
 	
   a. How/Can the consolidating process facilitates the shared service arrangement within the organizations?
 	
   b. Are organizations able to generate cost effectiveness through the consolidation process within Shared Services initiative?
 	
   c. Are organizations able to avoid duplication of efforts through consolidating processes? If so, how?
	"..., many firms have turned to a shared service model, consolidating IT and business processes throughout the firm into a single or small number of centers owned and run by the firm (Shah, 1999; Ulrich, 1995)." (Whitaker et al., 2006, p. 3249)
	"... taking the concept of consolidation and shared services beyond the organization's four walls by sharing applications, hardware or core business processes with other firms to further reduce costs." (Davenport et al., 2004, p. 20)
	"From a business and organizational perspective, the most obvious route to consolidation- related cost savings is the adoption of shared services." (Davenport et al., 2004, p. 20)
	Organizations are able to avoid duplication in efforts when deploying Shared Services. *"By cutting out duplicate support processes and non-strategic activities, and organizing them as so-called shared services."* (Ulbrich, 1996, p. 196) *"... bring-together functions that are frequently duplicated across divisions, subsidiaries or operating units... "* (Sedera & Dey, 2007, p. 1)

7. Are Shared Services able assist organizations build a Centre of Excellence to gain access to organizational resources? a. Should organizations establish a Centre of Excellent to improve organization's control in Shared Services initiative?	Shared Services have several goals, which one of the goal is establishing Centre of Excellence. *"Establishing a centre of expertise is another goal that has been mentioned. Employees are more satisfied and their competencies can be better utilized and anchored in the organization, which contributes to improved knowledge management"* (Kagelmann, 2000, p. 77-8, cited in Ulbrich, 2006, p. 199) *"In this way, experts can be utilized by all business units for a comparable low cost."* (Ulbrich, 2006, p. 198). *""Expertise was scattered around the organizations and the departments were often not able to gain access to the expertise needed and to consolidate experiences." and "The municipalities decided to concentrate their ICT departments within one SSC, as they had similar objectives and ambitions."* (Janssen & Joha, 2006a, p. 2309) A centre of excellence (combination of Shared Services centre and a group of expertise) are able to improve organization's control. *"Since these SAP developments were performed by diverse groups of developers with different knowledge domains and specializations, a shared service center, together with an application management team was created to coordinate and monitor modifications to the SAP system. Through a systematic procedure of authorization and internalized payment for software modifications, the application management team was able to sift out unnecessary changes to the ERP system and reduce the impact of implemented changes across the organization."* (Lim et al., 2005, p. 142)

potential to leverage ICT related benefits through Shared Services has been recognised and more and more IT related Shared Services solutions are predicted to take place, to address calls for efficiency, reduced costs, quality improvement and innovation. While Shared Services in practice has been excelling, it has not gained enough attention and momentum from academia. From an IS academic perspective, our goal should be to: a) do strong, relevant research that informs the practice of Shared Services and related curriculum; and b) anticipate important roles our IS graduates might assume in relation to Shared Services, and insure we are preparing them to be preferred for these roles. Such roles might be in the business areas of Shared Services using organizations, in the IS function of Shared Services using organizations, with software or service providers involved in Shared Services.

This paper is the first attempt to investigate and report on the current status of Shared Services literature in IS academia. It consisted of a very detailed review of IS literature from all main IS outlets – which consisted of the 40 IS journals listed in the 'ISWorld Net' and all the 5 AIS sponsored IS conferences. All sources were searched for, since their inception. The resulting set of papers showed that the current body of knowledge is still very limited while there is a need for a better understanding of Shared Services.

This paper provided a preliminary understanding of definitions and objectives of Shared Services as reported in the academic IS literature, and derived a set of research propositions that can be investigated further.

Within the context of the currently available academic IS literature, we defined Shared Services as the internal provisioning of services by a semi-autonomous organizational unit to multiple organizational units involving the consolidation of business functions supported by a sharing arrangement. We identified as the main objectives of Shared Services; enhancing the organization's value and decreasing its costs by supporting consolidiation and integration, supporting standardisation, and avoiding duplication. Definitions and objectives are critical for the progression of the field, for example; to understand what drives the interest for Shared Services, to form the foundation for deriving performance measures related to Shared Services, to support the design and deployment of Shared Services structure and governance; hence providing a strong foundation for further research in Shared Services.

The content presented here was a segment of a larger study that attempts to characterise Shared Services via published literature. A three-staged systematic approach; for literature extraction, preparing for analysis and conducting detailed literature analysis, utilising the functionality of a range of tools (i.e. Adobe Acrobat professional, NVIVO and EndNote) was devised and applied here. This paper essentially pilot tested the methodology. This approach can be re-used to cover a broader range of academic outlets to derive a detailed characterization of Shared Services beyond the IS domain and to obtain a more in-depth understanding of Shared Services beyond definitions and objectives.

Employees' Perceptions on Organisational Justice, Job Control and Job Demands:
Do Ownership and Human Resource Management Practices Matter?

ABSTRACT

The issue to be addressed in this study is whether ownership and HRM practices are associated with employees' perceptions of organisational justice, job control and job demands. The study focuses on care personnel working in sheltered housing facilities for elderly people. Multi-level linear regression is applied to analyse the data. The results support the argument that an increased similarity between public, not-for-profit and for-profit organisations is emerging in HRM issues. HRM practices were found to associate with positive outcomes in organisational justice and job control. However, to be successful in the implementation of HRM, it is crucial that employees understand the justification for each procedure as well as find it a useful resource in terms of their own job.

INTRODUCTION

The increasing proportion of old people and especially those over 90 has been suggested to result in an increasing demand for the care services and also an increasing need for workforce. The new capacity for the services is often purchased from private sector. Consequently private services providers are increasingly involved in the delivery of the publicly funded health care and social services. Moreover, while employers compete on young skilful employees they also need to sustain the working ability of the ageing workforce. To be successful in both of these quests employers need to understand the importance of appropriate and fair Human Resource Management (HRM) practices.

Public, not-for-profit and for-profit organisations have often been assumed to pursue different societal goals (Haley-Lock & Kruzich, 2008; Schmid & Nirel, 2004). It is, however, not evident whether this has to do with the organisations management practices or the wellbeing of the employees. The question of ownership and for-profit ownership is a highly debated subject. The arguments for and against public or private delivery of public services are, however, rarely based on valid research evidence (Øvretveit, 2003). In this paper we try to put some light on this matter.

The issue to be addressed in this paper is whether ownership and HRM practices are associated with employees' perceptions of organisational justice (Colquitt, 2001), job control and job demand (Karasek & Theorell, 1990). These factors reflect general leadership and management practices as well as psychosocial working conditions in an organisation. These have suggested resulting in positive outcomes for both the employees, but also for the organization (e.g., Laschinger, 2004). The focus of the paper is on the personnel working in sheltered homes for elderly people, which is the most rapidly extending segment in the field of elderly care in Finland. The term "sheltered housing facility" refers to care facilities offering accommodation and a certain set of services (e.g., care, meals, and cleaning) for elderly people. Eligible for sheltered housing are the elderly citizens who are not capable of living on their own and are in need of regular help. Residents pay rent as well as for the services they use. A cross-sectional survey data were used in the study and multi-level modelling was applied as a statistical method.

REVIEW OF LITERATURE AND STUDY HYPOTHESES

Organisational Justice, Job Control and Job Demand

Perceived organisational justice may be seen as a determinant of effective leadership (van Knippenberg & De Cremer, 2008). A perception of fairness of the procedures may be used as a means to evaluate leadership and its legitimacy in general (van Knippenberg et al., 2007; Konovsky, 2000). Furthermore, justice can be seen as one of the basic requirements for the organisation's effective functioning and employee satisfaction (e.g., Colquitt et al., 2001; Greenberg, 1990). It has been claimed that if employees perceive just treatment they will potentially be well disposed to their work, work outcomes, their superiors and the decisions made by the superiors (Barling & Phillips, 1992; Greenberg, 1990; Laschinger, 2004). Moreover, organisational justice has been shown to be associated with employee health and wellbeing (e.g., Elovainio et al., 2005; Elovainio et al., 2002; Kivimäki et al., 2003), productivity (Heponiemi et al., 2007) organisational behaviour (Moorman, 1991), job satisfaction and turnover intensions (Cohe-Charash & Spector, 2001). The perception of organisational justice has also been shown to have an effect also on the quality of care (Pekkarinen, 2007).

To define organisational justice we adopt Colquitt's conceptualization (2001) and divide the perceived organisational justice into four dimensions: distributive, procedural, interpersonal, and informational justice. Procedural justice refers to the perceived justice of the organisation's decision-making procedures. Interpersonal justice is related to the interpersonal treatment that employees receive when decisions are implemented in the organisation. Informational justice refers to the explanations on decisions and other information provided by employers. Distributive justice deals with the rewards the employees receive for their job (Colquitt, 2001; Colquitt et al., 2001).

Perceived job control and job demands describe employees' psychosocial working conditions. These have been suggested relating to sickness leaves, psychological distress, cardiovascular diseases, musculoskeletal disorders (Höckerting & Herenstam, 2006) and the quality of care (Pekkarinen, 2007). In this paper we adopt the Job Demand-Control model (Karasek, 1979; Karasek & Theorell, 1990). The model is based on the assumption that mental strain results from the joint effects of job demands and the freedom of decision-making to meet these demands (Karasek, 1979). Job demands can be defined as the work demands placed on the employee in their work, whereas job control is defined as the authority permitted to an employee to decide how to meet those demands (Karasek, 1979).

Career and skills development, participation in supplementary education (Meyer & Smith, 2000; Paré & Tremblay, 2007; Parry & Kelliher, 2009; Rodwell & Teo, 2007) and developmental performance reviews (Boswell & Boudreau, 2002; Rodwell & Teo, 2007; Tremblay et al., 2010) have been suggested to associate with different dimensions of organisational justice. Thus, perceived organisational justice, but also perceptions on job control and job demands may be seen partly as results of effective leadership (e.g., van Knippenberg & De Cremer, 2008). Thus, we conclude that organisational justice as well as job control, and

job demands, are potentially influenced through HRM practices. Based on this assumption we state our first hypothesis accordingly:

Hypothesis 1: HRM practices, such as receipt of mentoring, participation in supplementary education and participation in the developmental performance review are positively associated with perceived organisational justice and job control as well as negatively associated with perceived job demands.

Ownership Status and Human Resource Management

In the field of health and social care, comparisons between organisations under different ownership have mainly focused on *access* (e.g., Amirkhanyan et al., 2008), *quality of care* (e.g., Comondore et al., 2009; Hillmer et al., 2005; O'Neill at al., 2003), *costs* (e.g., Deveraux et al., 2004) and *performance* (e.g., Rosenau & Linder, 2003). Human resource issues have, in turn, not been addressed to any large extent (see however e.g., Hansen et al., 2009). However, in a more general body of the leadership and management literature a number of public-private comparisons exist (e.g., Boyne, 2002; Budhwar & Boyne, 2004; Nutt, 1999; Perry & Rainey, 1988). The studies present rather controversial results leaving the question of the importance of the ownership open for further research. Moreover, most of these existing studies have focused on comparisons between public and private or between not-for-profit and for-profit organisations (e.g., Amirkhanyan et al., 2008). The studies acknowledging all of the three ownership types suggest that public not-for-profit and for-profit organizations are potentially different in respect to their management and leadership practices (Boyne, 2002; Budhward & Boyne, 2004; Höckerting & Härenstam, 2006; Nutt, 1999; Parry et al., 2005). It has also suggested that ownership has an influence on perceived job demands and

job control (e.g., Höckerting & Härenstam, 2006; Härenstam, 2008).

Public sector is increasingly turning to not-for-profit and for-profit organisations for the delivery of health and social services. It has been suggested that increasing contracting with public sector creates isomorphism between different ownership types making the traditional organisational boundaries blurry and changing (Cunningham, 2008). Public sector organisations have indeed started to increasingly emulate the HRM practices and strategies of for-profit organisations (e.g., Rodwell & Teo, 2007). Not-for-profit organisations, in turn, have been forced to make their operations more transparent and to professionalise their management practices in order to survive in the competition on contracts (Parry & Kelliher, 2009). Moreover, in the field of health and social care factors such as professional culture, education, and strict regulation, are likely to produce similarities and affect the processes taking place in the workplace (DiMaggio & Powell, 1983; Rodwell & Teo, 2007).

Some scholars have even argued that all organisations are public to some extent. Some are just more exposed to public control than others (Bozeman, 1987). This dimensional approach understands the public-private distinction moving along a continuum where pure private or public organisations are rarely found (Goulet & Frank, 2002). Drawing from this, it may be suggested that contracting with public sector increases the private organisations' degree of 'publicness' as they become more dependent on the funding coming from the public pocket. At the same time contracting increases the private nature of the public organisations as part of their operations are moved to the hands of private actors. Moreover, increased market orientation may undermine the special characteristics of not-for-profit organisations, while promoting the culture adopted from the business sector. Based on all the arguments above we state our second hypothesis accordingly:

As to the not-for-profit sector in turn, contracting with public sector has suggested to undermine employees' terms and conditions due to external cost pressures (Cunningham, 2008) as well as to create more unstable environment in which organisations are no longer able to offer secure long-term employment for their employees (Parry & Kelliher, 2009). Furthermore, it has been argued that contracting threatens the possibilities of not-for-profit organisations to maintain their traditional objectives and ideals, which, in turn, further interferes the employees' commitment to the organisation (Cunningham, 2010). Finally, there are scholars suggesting that increasing involvement in provision of public services has required not-for-profit organisations. This, for its part, has potential to develop the organisational culture and organisation of work towards the ones originating from organisation driven by pro-market ideology (Baines, 2004).

Based on the arguments above, we formulate our second hypothesis accordingly:

Hypothesis 2: The perceptions of organisational justice, job demands and job control are not determined by the ownership as such, but mediated through HRM practices.

METHODS AND DATA

Measures

Dependent Variables

The dependent variables describing organisational justice, i.e., procedural, interpersonal, informational and distributional justice, were drawn from the work of Colquitt (2001), while the variables addressing job control and job demand were adopted from the work of Karasek and Theorell (1990) and Karasek (1979). The values of the scale variables were calculated as the means of the values of single items. Responses to these

items were rated on a Likert-scale ranging from 1 ("totally agree") to 5 ("totally disagree"). The justice variable measuring procedural justice consisted of five items (e.g., 'We have influence over the decisions made in the workplace'). The three other justice variables consisted of four items. For interpersonal justice the respondents considered variables such as 'My supervisor treats us with respect'. To measure informational justice the respondents we asked to consider items such as 'My supervisor communicated the decision in a timely manner'. For distributional justice the respondents we asked to express their opinion on variables such as 'My salary and the respect I receive reflect the effort I have put into my work'. The job control variable consisted of nine items, such as 'I have a say in my tasks'. In the job demands variable three items, such as 'My work requires excessive work load' were included. Cronbach's alphas were calculated for each of the dependent variables to indicate consistency of each variable (Table 1).

Explanatory Variables

The detailed information of all the explanatory variables is provided in Table 2. Ownership status was coded into three categories. For-profits were defined as either independent private companies

Table 1. Dependent variables used in the analysis

	Number of items	Cronbach's alpha	Source
Procedural justice	5	0.86	Colquitt 2001
Interpersonal justice	4	0.92	Colquitt 2001
Informational justice	4	0.89	Colquitt 2001
Distributional justice	4	0.96	Colquitt 2001
Job control	9	0.63	Karasek & Theorell 1990
Job demand	3	0.78	Karasek & Theorell 1990

or as part of a larger private corporation. Not-for-profits meant units that were owned by associations or foundations. The public units were those that were run and owned by municipalities. In the analysis for-profit units were used as a reference group as they had the smallest number of respondents.

Perceived organisational justice, but also perceptions on job control and job demands may be seen as results of effective leadership (e.g., van Knippenberg & De Cremer, 2008). Career and skills development, participation in supplementary education and participation in developmental performance reviews have been suggested to associate with different dimensions of organisational justice (Boswell & Boudreau, 2002; Meyer & Smith, 2000; Paré & Tremblay, 2007; Parry & Kelliher, 2009; Rodwell & Teo, 2007;). Thus, participation in supplementary education and participation in the developmental performance review were chosen to describe HRM practices of a unit. As it has been suggested (Brown et al., 2010) that employees' experiences of performance review may play an important role as to employees' attitudes towards their job in general, perceived utility of the review was also included in the performance review variable. Finally also receipt of mentoring was included among the HRM variables, as the practice was considered important for the employees working in health and social services.

Of the individual characteristics, age, education, employment status, employment contract and job tenure were included among the explanatory variables. This choice was based on the literature addressing the determinants of perceived organisational justice, job demands and control (e.g., Ban et al., 2003; Cohen-Charash, 2001; Härestam et al., 2004; Höckerting & Härenstam, 2006; Manville, 2008; Mirvis, 1992; Titrek, 2009). In addition Mirvis (1992) has suggested that the three sectors differ at least as to their employees' level of education as well as to the proportions of part- and full-time workers. The structure and

Table 2. Explanations and coding criteria for the explanatory variables applied in the multilevel linear regression models

UNIT CHARACTERISTICS		
Variable	**Explanation**	**Coding or explanation**
Ownership status	Whether the unit was owned by a private for-profit, a private not-for profit or a public agency	0=public 1=private not-for-profit 2=private for-profit (reference category)
Organizational structure	The size of the parent organization the unit belongs to	0=Small: private single-unit enterprise 1=Medium: 2-5 units in the same region/small municipality 2=Large: more than 5 units/large municipality (reference category)
Staffing level	The number of nursing staff / The number of residents	
In-patient days	The number of inpatient days in a unit / year	
Case-mix	Describes the need for staff time based on care needs of the client	Scale: 1 = average client <1 needs less care than average client >1 needs more care than average client
HRM CHARACTERISTICS		
Variable	**Explanation**	**Coding or explanation**
Developmental performance review	Whether the respondent had participated in a developmental performance review within a year and how they perceived it	1=Yes, useful 2=Yes, neutral 3=Yes, not useful 4=No (reference category)
Supplementary education	Whether the respondent had participated in supplementary education within a year	0=Yes 1=No (reference category)
Mentoring	Whether the respondent had received mentoring within a year	0=Yes 1=No (reference category)
INDIVIDUAL CHARACTERISTICS		
Variable	**Explanation**	**Coding or explanation**
Age	Self-reported age in years	
Job tenure	Years worked in the current position	
Education	The respondent's level of education	1= degree (i.e., polytechnic/university) 2=secondary level (i.e., practical nurse) 3= no education (reference category)
Employment status	Whether the employee worked full-time or part-time	0=full-time 1=part-time (reference category)
Employment contract	Whether the employee had a permanent of fixed-term contract	0=permanent 1=fixed-term (reference category)

size of the overall organisation, as well as the size of the work unit, has been suggested to affect employees' perceptions on their psychosocial working conditions (e.g., Härestam et al., 2004; Höckerting & Härenstam, 2006).

The size of an organisation may indicate the organisations' resources allocated to HRM operations (Ban, Drahnak-Faller, & Towers, 2003; Rodwell & Teo, 2004). Units' inpatient days per year were used to reflect the size of the

work unit. The size of the overall organisation was addressed employing a categorical variable grouping small, medium and large organisations. Staffing level and residents' case-mix were used to describe employee workload, which has also suggested affecting perceptions of psychosocial working conditions (Höckerting & Härenstam, 2006; Pekkarinen, 2007).

Data

This study is a part of a research project exploring whether organisational ownership has an impact on the quality of care, cost of care and employee well-being in the context of elderly care in Finland. As part of the project a cross-sectional postal survey to assess employees' working conditions and job characteristics was conducted in 2008. Questions concerning perceptions of organisational justice, job demand and job control as well as questions on units' HRM practices and employees' socio-demographic status were included in the survey. Data on the units' modified case-mix were based on the RUG (Resource Utilisation Group) classification system for long-term care (Björkgren et al., 1999) and home care (Poss et al., 2009). The case-mix index reflects the relative resources needed to the care for different patient groups. The index is based on measurement of staff time. These data were obtained from the Finnish RAI benchmarking database (Finne-Soveri et al., 2006; Noro, 2005; THL RAI database, 2010). RAI (Resident Assessment Instrument) benchmarking database is a system for benchmarking elderly care in Finland. It aims to improve quality of long-term care for elderly, to integrate services and information flow over care providers, to improve national registers that follow use of health and social services, and to plan and develop financial and payment systems in long-term care (Noro, 2005).

The data were drawn from 128 sheltered home units in Finland, mainly comprising large cities in Southern Finland. The selection of the units was based on the invitation sent to all the sheltered home units that already participated in the RAI - quality-benchmarking project (Finne-Soveri et al., 2006; Noro et al., 2005; THL RAI database, 2010). The invitation was accepted by nearly all of the units, which then delivered the survey to their employees. In addition, for-profit units were recruited from the capital area and from the second largest cities in Finland in order to attain a sufficient number of for-profit units. The units were invited to participate in RAI – quality benchmarking as well as to answer the survey.

Altogether 959 employees completed the survey resulting in a response rate of 66.6%. The response rate did not differ between ownership types. Due to the small number of male respondents (n=25) only female respondents were included in the analysis. Responses with missing values for gender (n=5) were also excluded from the analysis. Finally the units (n=2) with missing values for all unit level factors were excluded. The final sample comprised 929 participants of which 20.5% worked in for-profit units and 36.1% in not-for-profit units. The units belonged to 62 different organizations ranging from large private organizations or large municipalities to small private single-unit enterprises. Of the units, 18% were for-profit and 39.8% not-for-profit. The median number of the respondents per unit was 9 (min=2; max=28). Descriptive statistics are reported in Table 3.

Statistical Analysis

Descriptive statistics (means, standard deviations) were used to describe the data. The relationships between the explanatory variables were tested applying Pearson's correlation. The Pearson correlation coefficients between explanatory variables ranged between -0.01 and 0.64. In the case of missing values for the explanatory variables the method of multiple imputation was used (e.g., Rubin, 1996; SPSS, 2007). The imputations were repeated five times for each individual case. The mean value of the imputations was then used to

replace the missing value for each individual case. For the unit level variables the procedure was implemented at the unit level. As the analysis was done without imputed values the result did not differed statistically from those attained with the imputed data.

Multilevel linear regression was applied in the exploratory analysis, as it was assumed that the employees' responses might depend on both the unit they were working for and their individual characteristics (Colquitt et al., 2002; Leyland & Goldstein, 2001). Multilevel modelling was performed using SAS (Statistical Analysis System) version 9.1. The model was fitted applying the MIXED procedure (Singer, 1998). In all the analyses the level of statistical significance was set at 0.05. Interaction between HRM and ownership was tested but not found statistically significantly associate with any of the dependent variables.

The analysis was built in three parts. In the first model ownership variable was put in the model alone. In the second model ownership and all the variables except for HRM variables were added. In the final model HRM variables were added in the model.

RESULTS

Comprehensive regression statistics are reported in Tables 4 and 5. Participation in performance review was found to be a significant explanatory factor for all the dependent variables except for job demands. The respondents who had participated in the performance review and experienced it useful perceived more organizational justice in general and had a higher perception of job control. They also perceived lower job demands compared to those who had not participated in the performance review, even though the effect was slightly insignificant. By contrast, those who had participated in a performance review but found it not useful perceived lower levels of organisational justice as well as lower job control compared to

those who had not participated at all. In addition, a neutral view on performance review was positively associated with the perception of job control. Participation in supplementary education was positively associated with the perception of interpersonal and informational justice as well as with job control. Receipt of mentoring had a positive effect on procedural and informational justice as well as on job demands. Thus, rather strong support was gained for Hypothesis 1.

Ownership was not statistically significantly associated with procedural, informational and distributional justice. For interpersonal justice, job demands and job control the effect ownership was statistically significant in all models and the effect did not change to any large extent in the models two and three. Employees in not-for-profit and public units perceived more job control compared to the for-profit units. At the same time, however, perceived job demands were also higher compared to for-profit units. Employees in not-for-profit units also perceived more interpersonal justice compared to the employees in for-profit units. Public ownership was positively associated with the perception of interpersonal justice in the first model, but the effect turned out to be insignificant after adding other variables in the model. Thus, Hypothesis 2 was not entirely supported.

Staffing level, case-mix and inpatient days were associated with perceived job demands. The more the residents needed care (i.e., the bigger the value of case-mix), the less there was personnel working in the unit and the bigger the unit was, the more the employees perceived job demands. Staffing level also had a positive effect on the perception of distributional justice, while case-mix was negatively associated also with the perception of informational justice. The level of hierarchy influenced perceived informational justice: employees working in single-unit private enterprises perceived lower levels of organisational justice compared to large organisations.

Age, education, job tenure and employment status were found to be significant explanatory factors for one or more dependent variables. Age was positively associated with job control but also with the perceptions of job demands. Education was positively associated with perceived job control: the higher the education, the more the employee felt control over their jobs. Job tenure, for its part, had a positive effect on job demands: the longer the employees had worked in their current jobs, the more demanding the job was perceived. Employment status also played a role: a permanent employment contract had a negative effect on perceived interpersonal and informational justice.

DISCUSSION

In this study we have tested two hypotheses concerning the importance of HRM practices and ownership as to employees' perceptions of organisational justice, job demands and job control. The results support the hypothesis that HRM practices are positively associated with perceived organisational justice and job control as well as negatively associated with perceived job demands. However, job demands seemed to be the less affected by HRM practices in this study.

The results for ownership confirm the complexity of the issue of ownership reported already by several scholars. The results support Hypothesis 2 to the extent that ownership was associated with interpersonal justice, job demands and job control, but it is not the only determinant behind the perceptions. However, its effect remained significant also after the HRM variables were added in the model. Thus, it may not be said that the effect of ownership is purely mediated by HRM practices applied in this study. It might be important to explore the issue in more detail also with other HRM practice variables as well.

Of HRM practices especially performance review seemed to play a highly significant role in all the dependent variables except for job demands.

However, it appeared that solely introducing a performance review in the unit does not guarantee better outcomes in terms of employee perceptions of the organisation and their own job, but that the quality of the performance review is an important factor. Similar suggestions can be found in the work of Brown and colleagues (2010). As to perceived organisational justice and job control, it seems that participation in the performance review is worthwhile only if the employees find the procedure a useful resource in terms of their own job. If the experience is negative (i.e., not useful) or neutral, the performance review may even have negative implications for the perceptions of the organisation and work in general.

The proportion of those who had not found the performance review useful was highest in the for-profit units, which scored lowest also in most of the response variables examined. We did not find interaction between performance review and ownership in this study and thus, we are not allowed to draw any conclusions about that in this paper. However, it might be interesting to examine the issue in more detail, as the results of our study somewhat contradict non-empirical suppositions of private, for-profit organisations' personnel policies, but also previous research on leadership in private for-profit organisations (e.g., Boyne, 2002; Walsh, 1995).

As to organisational justice, the results quite strongly support the literature suggesting increasing similarity and isomorphism between public, not-for-profit and for-profit organisations as to HRM issues (e.g., Antonsen & Jørgensen, 1997; Cunningham, 2010, 2008; DiMaggio & Powell, 1983; Koning et al., 2007; Rodwell & Teo, 2007). This has potentially to do with current developments of increased public sector contracting and tendering procedures (e.g., Cunningham, 2010, 2008). On the other hand that might have to do with the nature of health care and social service sector in which factors such as professional culture, similar educational background as well as strict regulation are likely to produce similari-

ties and affect the processes taking place in the workplace (DiMaggio & Powell, 1983; Rodwell & Teo, 2007).

Ownership was, however, associated with job control and job demands. Employees in for-profit units perceived lower job demands, which may be explained, among other things, by staffing levels and the case-mix of residents: in the for-profit units the case-mix was rather heavy but also the staffing level was reasonable. As to job control the for-profit units compared lowest. This is somewhat against the preliminary assumptions of better leadership and higher job control in private organisations (Walsh, 1995.) However, it has also been suggested that working with the demand of profit may have a negative effect on perceived control as the valuation of the daily work may be more based on results or work outcomes (Höckerting & Härenstam, 2006).

The highest demands were perceived in the public units in which also the average staffing level was lowest but the number of inpatient days was highest. Perceived job control in public units was similar to the not-for-profit units, in which, however, the staffing level was comparatively higher. This does not allow us to draw any far-reaching conclusions, but it may be possible to assume that employees in public units may perceive more job strain than their counterparts in not-for-profit and possibly also in for-profit units (Karasek & Theorell, 1990).

In this study we have been able to compare public, not-for-profit and for-profit organisations, which has not been that common in the existing body of literature. However, the cross-sectional study design does not offer possibilities to compare stability of the differences or the changes in time. Collecting follow-up data is, however, something that will be done within next years. The organisations participating in the study represent mainly the large cities in Finland. However, the data may be said to present quite well the elderly care service structure in Finland, but also in other western countries with rather similar service

structure (e.g., Nordic Countries, Canada, New Zealand). Public and not-for-profit organisations still play a major role, but for-profit organisations are increasing their proportions of the total volume of the services. Of HRM practices we were able to investigate only three specific activities. To gain more comprehensive knowledge also other HRM activities like career management, rewards and other training activities should be included. Also the perceptions of the usefulness of HRM activities should be included, as it seems to matter as the successful of the activities are considered.

CONCLUSION AND PRACTICAL IMPLICATIONS

This study lends support to an argument about increased similarity between public, not-for-profit and for-profit organisations in HRM issues. Based on the results it may be assumed that it is the organisational procedures that potentially play a significant role as to employees' perceptions towards their work and superiors. This increases the importance of adequate HRM practices, which also in this study were found to associate with positive outcomes in organisational justice and job control. However, to be successful in the implementation of HRM, it is crucial that employees understand the justification for each procedure as well as find it a useful resource in terms of their own job. The results also suggest that for job demands structural factors, such as staffing level and case mix might be more important that HRM practices and thus, it is important to pay attention to these aspects of work as well.

Chapter 50
Communicating in Multicultural Firms:
Boundary Creation, Fragmentation and the Social Use of ICT

Jakob Lauring
Department of Management, Aarhus School of Business, Aarhus University, Denmark

Anders Klitmøller
Department of Management, Aarhus School of Business, Aarhus University, Denmark

ABSTRACT

Based on a qualitative study of 14 knowledge intensive companies, this chapter suggests that multicultural and multilingual firms are faced with certain challenges in the attempt to fruitfully utilize the diverse background of their workforce. Firstly, through informal settings, the employees to create social boundaries within the firm use native languages strategically. Secondly, even though the introduction of English as cooperate language might solve some communication issues, it tends to render the communication less nuanced, thereby reducing the use of human resources within the firm. Thirdly, ICT does not necessarily solve communication problems within a given company. It can even be used as a social 'tool' to uphold social boundaries or social fragmentation. It is suggested that in order to address these challenges, the management should seek to reward not only individual employees, but also expand the notion of performance to include the collectivity of the workplace.

INTRODUCTION

ICT, or Information Communication Technology, has come to play a larger role in contemporary business communities due to the increased inter-

nationalization of companies worldwide (Griffith, 2002; Palmer-Silveira, Ruiz-Garrido, & Fortanet-Gómes, 2006). Much like all other human interaction, communication is at the center of ICT. And communication is what seems to be one of the major managerial tasks that companies working

in globalized markets are faced with. Therefore, managing interaction across national and linguistic boundaries has become a daily issue for a growing number of managers (Maznevski & Chudoba, 2000; Welch, Welch & Marschan-Piekkari, 2001).

In the management of multicultural groups, the varied nature of the group has often been described as a competitive advantage in the creation of information and other human resources (Adler, 1997; Miller, Fields, Kumar, & Ortiz, 2000; Paulus, 2000). Nonetheless, the success of the diverse groups is not given, and managerial challenges should not be taken lightly (Leonard & Swap, 1999). A number of studies indicate that communication management is especially important (Distefano & Maznevski, 2000; Loosemore & Lee, 2002; Maznevski, 1994). And since ICT is the basis of much internal and inter-unit communication in multicultural firms, the relation between diversity management, communication and ICT is an important topic in the understanding of international business.

Communication is central to management since, in one way or another, challenges to communication have an effect on all managerial processes (Cheney, Thøger, Zorn & Ganesh, 2004). Furthermore, communication is the basis of all employee collaboration. In a multinational context, linguistic and cultural differences make communication even more of a concern (Beamer & Varner, 2005; Loosemore et al., 2002). In relation to this, the main managerial challenge of the diverse group is that efficient communication actually occurs (McDonough, Kahn & Barczak, 2001). If group members do not communicate well, cultural and linguistic diversity will most likely become unfavorable (Distefano et al., 2000; Hambrick, Davison, Snell & Snow, 1998). Therefore, the arguments presented in this chapter rely on the fundamental premise that communication is necessary in all coordination and organization of human resources. Accordingly, fostering a rich communication flow within a multicultural

organization is an important source of competitive advantage, thus nurturing social and cultural sustainability within the company and society as a whole.

Language diversity is a theme that has received very little scholarly attention (Henderson, 2005). At the theoretical level, the impact of multilingualism has been examined mainly in relation to language management, which conceives of language as a facilitator providing for the acquisition and transmission of information through social interaction (Dhir & Góké-Paríolá, 2002; Feely & Harzing, 2003; Vaara et al. 2003b). In comparison, empirical studies have focused on the manner in which language differences create a complicated managerial situation, with great implications for the practice of intercultural communication (Marschan-Piekkari, Welch, & Welch, 1999a; Marschan-Piekkari, Welch & Welch, 1999b; Vaara et al. 2003a). With specific reference to culturally diverse groups, Distefano and Maznevski (2000) have found language differences to have a negative impact on relationship building. Furthermore, research by Lagerström and Andersson (2003) indicates that a condition of multilingualism may challenge the socialization of team members. Henderson (2005) proposes an alternative approach to language diversity, by examining possible sources of communication failure within the global workplace. The research relies on a distinction between problems relating to the transmission and reception of messages, and to difficulties in the area of interpersonal perceptions and attitudes, which arise from interlocutors' encounters with the unfamiliar practices of alien speech communities. Thus, Henderson (2005) argues that communication failure should be read as a socio-cultural rather than a purely linguistic phenomenon.

In this Chapter, language use is considered to be the way the linguistic medium is used in communication. To further define the concept, it is the main argument of the chapter that language use

should be understood as a dynamic and dialectical communicative process involving both relationship building and knowledge sharing between different groups and individuals (Cooren 2006, Vaara et al. 2005). In addition, language should be understood as socially and historically constituted in line with other human practices (Bourdieu 1977, Bourdieu 1991). Language, then, is not only a means of understanding and communication, but also an object of action (e.g. Austin 1975, Taylor 2006). The communicative process is then to be understood, in a broader sense, as the transfer of information as well as the organization of social relationships thought patterns and actions (Robichaud 2006, Wittgenstein 1996). The focus of this chapter is on expressed discourses on verbal dialogue as it happens in face-to-face interaction or by the use of ICT.

Cultural diversity is here generally related to variance of national affiliation as it is done by most authors in this field (e.g. Adler 1997, Distefano & Maznevski 2000). However, differences in nationality as such do not create differences between individuals. It is the variety of identifications, behavioral patterns, linguistic skills and bodies of knowledge linked to growing up in different regions that provide the potential for human diversity (Roberson 2006). This chapter attempts to explore discourses on communication processes as individuals describe them in culturally diverse organizations. Furthermore, we wish to direct attention to social processes linked to face-to-face and ICT communication that may affect the utilization of human resources. Finally, it is the aim of the chapter to include the language theme in the discussion as a novel contribution to the understanding of culturally diverse groups, communication and ICT. This will be illustrated by data from 14 multicultural 'knowledge intensive' Danish organizations.

USING THE RESOURCES OF HUMAN DIVERSITY

Human differences are a challenge to the academic community, and for the last fifty years researchers have struggled to develop theories and methods to conceptualize and study those differences (Williams & O'Reilly, 1998). While results have been far from reaching any consistent conclusion (Simons, Pelled & Smith, 1999), the interest in diversity has increased rapidly during recent years (van Knippenberg, De Dreu & Homan, 2004). Three dominating theoretical perspectives are relevant to the understanding of communication processes in organizations that consist of culturally diverse groups.

The Information and Decision Making Perspective

The literature on information and decision-making has a traditional functionalist view on cultural diversity - most often limited to static notions of national cultural differences. In this perspective it is argued that the potential advantage of diverse groups over homogeneous groups lies in the greater pool of distinct task-relevant information to which diverse groups may have access (Hambrick, Cho & Chen, 1996; Harrison & Klein, 2007; Page, 2007). Homogeneity, according to these authors, has been mentioned as being in danger of leading to 'groupthink', in which everyone assumes that since they all believe the same thing, it must be a good idea (Adler, 1997; Miller et al., 2000; Triandis, Hall & Ewen, 1965). As opposed to homogeneity, cultural differences are thus assumed to lead to differences with regard to information and perspectives (McLeod & Lobe, 1992; Watson, Kumar & Michaelsen, 1993). This, according to this research tradition, implies that multicultural groups, if managed correctly, should be more resourceful compared to more homogeneous groups (Distefano et al., 2000). In other words, the different cultural perspectives are believed

to foster innovation and creativity through constructive conflicts of perspectives, heuristics and knowledge (Fiedler, 1966; Millikin & Martins, 1996; Paulus, 2000; Richard & Shelor, 2002; Simons et al., 1999).

While such ideas on information and decision-making are intriguing, diverse groups in organizations, regrettably, often fail to realize the potential (Stewart, 2006). According to Klein and Harrison (2007), the weakness of the theory is related to the fact that the organizational reality of interpersonal and group processes is much more 'messy' than often accounted for in the literature (e.g. Page, 2007). In other words, social barriers may hinder the interaction processes.

The Social Categorization Perspective

Another theoretical perspective relevant to understanding communication in diverse organizations is more concerned with social categorization as a barrier that impedes cooperation and knowledge sharing in diverse groups (Tajfel, 1982; Tajfel & Turner, 1979; Williams et al., 1998). In this line of research, the difference of knowledge or perspective is not always enough to improve decision-making (Homan et al., In print; van Knippenberg et al., 2004). The distinct group member must also be able to win the approval of others with the new solution (Klein et al., 2007). It is argued that individuals tend to communicate mostly with those who are most similar to them (Zenger & Lawrence, 1989). Accordingly, Mor-Barak, Cherin, and Bergman (1998) maintain that dissimilarities are likely to be negatively related to group involvement because distinct individuals are in danger of being excluded from relevant information networks. In this way diversity can disturb communication processes, because the emergence of subgroups may hinder the use of available information (van Knippenberg et al., 2004).

In the literature of social categorization, the negative effects of diversity have often been explained as psychological processes of interpersonal attraction (Webber & Donahue, 2001). The similarity-attraction hypothesis asserts that similarity in attitudes is a major source of attraction between individuals (Byrne, Clore & Worchel, 1966). Consequences of high interpersonal attraction may include frequent communication, high social integration, and a desire to maintain group affiliation (Tsui, Egan, & O'Reilly, 1992).

While the socio-psychological approach to diversity does include the 'messy' reality of group processes, there is a tendency to explain those aspects of diversity only by the psychological needs of the individual. By focusing heavily on the role of the individual in the group, the literature avoids looking into the continuous struggle to obtain resources and recognition among different groups (Bourdieu, 2004; Konrad, 2003; Liff, 1996; Struch & Schwartz, 1989). Consequently, the socio-psychological explanation for the lack of communication is limited to the extent that it does not adequately include inherent power relations between different groups.

The Inequality and Power Perspective

Most of the literature on inequality and power relations in diverse organizations takes a political stance against liberal notions of the management of diversity, as a neutral improvement of information processing and decision-making (e.g. Essed, 1996; Kelly & Dobbin, 1998; Liff & Wajcman, 1996). Litvin (2002) argues that these diversity management initiatives should be perceived as an 'iron cage' that prevents real changes in the power distribution within diverse organizations. Similarly, Foldy (2003) argues that diversity initiatives often ignore the identity formation among employees, thus assuming that useful individual knowledge and perspectives can be applied without interference from group domination. In a

recent publication by Squires (2008) it is argued that diversity management which encourages employers to recognize cultural differences between employees may de-politicize social relations and contain equality objectives within a utilitarian market model. This, according to Squires, may bring only short-term benefits for some minority groups and entrench cultural stereotypes in the process by assuming, for instance, that nationality or ethnicity can be directly associated with certain characteristics. Authors working with organizational inequalities and power relations are concerned that the mainstream literature on diversity issues does little to give voice to or promote the problems of relatively powerless identity groups. They mainly conclude that differential rewards given to various groups form the material bases for group conflicts – which might prevent communication.

However, none of these studies are based on empirical evidence. Accordingly, this exploratory study provides an empirically based discussion of social obstacles to communication in culturally diverse organizations.

RESEARCH DESIGN

In Denmark, managing cultural diversity has become popular, especially after the arrival of a large number of immigrants and refugees during the 1990s (Hagedorn-Rasmussen & Kamp, 2003). These people now account for approximately seven percent of the Danish population. However, for the most part they have not been integrated into the knowledge intensive part of the labor market (e.g. Hedetoft, 2003; Hervik, 1999). As such, Denmark is still trying to create social and cultural sustainability for this group, and even though most of the immigrants and refugees living in Denmark are not integrated in knowledge intensive jobs, the rhetoric on the benefits of diversity management has been very positive, stating that "*the differences between people are*

an overlooked goldmine in Danish companies" (Jacobs, Lûtzen & Plum, 2001: 5) (authors' translation). While the statements concerning the use of human resources through diversity management can be found in all types of organizations, large and small, public and private, the actual practices of using diversity constructively are more or less reserved to companies that employ foreign experts or expatriates from subsidiaries, as well as other individuals with non-Danish backgrounds who are living in Denmark for other reasons.

This chapter is based on data generated in a qualitative study of 14 Danish multicultural companies. The selection of the companies was based on the percentage of employees with a national background other than Danish, and they represent some of the most culturally diverse organizations in Denmark (e.g. Lauring, 2005). The chosen organizations were all internationally knowledge intensive, aiming to achieve an innovative and creative environment by the use of diversity management. All organizations used English as their corporate language.

The study has set out to provide an overall picture of expressed discourses on communication issues in culturally diverse Danish companies, and so, rather than an in-depth study of one or two specific sites, a broad range of organizations have been chosen. This enables the researcher to develop a taxonomy of the challenges faced by managers in the chosen organizations, which adds to the understanding of intercultural communication as a social practice. The limitation is that even though the researcher will gain a broad picture of the informant's conception of intercultural communication, in practice the actual interaction will only be observed to a limited extent.

The data for this study was generated through semi-structured research interviews. In cooperation with organizational gatekeepers, key informants were identified on the basis of their experience with cultural diversity (Bernard, 1995). Out of a total of 82 interviews with managers and employees, 43 of the informants were Danish,

while 39 represented other nationalities. Most non-Danish informants were living in Denmark on a more or less permanent basis. However, only five of them came from countries from which Denmark traditionally accepts refugees or immigrants. About 60 percent of the informants had managerial responsibilities. The interviews were performed in Danish as well as in English. With a single exception, all English interviews were conducted with non-native speakers. The native languages of these informants were Polish, Russian, Rumanian, Italian, Dutch, French, Mandarin, Hindi, and Arabic.

The interviews took the form of a dialogue between the researcher and the informants, in which questions were asked about the effects of cultural diversity on communication and knowledge sharing (see preliminary interview guide[1]). This way the main themes of the investigation were not selected before entering the setting. They slowly developed through the process of interacting with the informants. That also meant that the interview guide changed during the extent of the project. Some questions were added and others deleted (Alvesson, 2003; Fontana & Frey, 1994). At first, communication and language use were only two of a number of themes to be investigated. However, after a while it became apparent that especially language in one way or another seemed to be related to all other intercultural issues put forward by the informants. Initially, language use emerged from the data as a means to boundary creation. But in subsequent analyses and interviews, continuously the social fragmentation became more apparent. The study of ICT was not a part of the original research design. Nonetheless, ICT seemed to be important in the informants' conception of communication processes as they unfolded in the organization. In this way, the research project applied an iterative approach by processing incoming information in a circular fashion, allowing for the continuous integration of new questions in the interview guide (Kvale, 1996; Spradley, 1980). In this case, the perception of language used as

the dominant obstacle to intercultural interaction and the role of ICT could not have been predicted from reviewing the literature on the subject of managing cultural diversity.

RESULTS

This section deals with communication issues linked to the social practices of the multicultural and multilingual organizations. Two kinds of social barriers can be described as formed by 1) boundary creation and 2) social fragmentation. Finally the use of ICT is related to the social practice of communication within the companies.

Boundary Creation

To most informants, the formation of social groups based on the national affiliation of the members constituted a central issue in the organizations. However, the introduction of an international environment and a common corporate language was, in all cases, implemented to counter the problems of communication between the different individuals and groups creating innovative knowledge sharing. Yet, sometimes the common language was not used consistently. As outlined by a French Canadian employee:

I was in a meeting and we were some English, some Canadians, and Swedes, and Danes, and within half an hour the Danes were speaking Danish and the Swedes were speaking Swedish. And after some time I said – I am leaving! And finally people started speaking English. After that, I actually found out that no one had actually understood each other before. The people from Aarhus didn't understand what the Swedes were saying and we didn't understand much of the Danish at all (Employee, North America).

Altogether, foreign informants frequently accused Danes of exercising exclusive behavior

because of their tendency to stay together in a Danish-speaking group and thereby isolate members of other groups:

People get together and speak Danish. If you do not, then you will not be invited. You will not be put in the active discussion. It is the social things that are the problem. It is very hard to become part of it. If you start a conversation in English, people cut you short. (Employee, Southern Europe).

This kind of boundary creation is particularly important in relation to the employees' social integration into the workplace, because employees with limited Danish language skills find themselves unable to participate in social events.

I don't think the technical side is a big problem. But if you don't know the language, you get put in a box. Some of my colleagues are put in a box. If I say no to learning or speaking Danish, the effect would be that I would be isolated. (Employee, Northern Europe).

Exclusion from informal settings is an important problem felt by non-Danish informants. They might find themselves shut out from social interaction when it is carried out in Danish. This may prove damaging to the use of their resources. Sometimes informal gatherings can be important contributions to the innovative capacity, because different viewpoints are shared in an unconventional fashion. A Polish informant describes the situation as follows:

The small talk is always in Danish. And sometimes the small talk gives a lot of information. It gives you an idea of what is really happening. It is something I really miss, to be able to really feel part of the conversation. I don't think my knowledge is used properly because I don't know the small talk (Employee, Eastern Europe).

A Canadian employee describes a similar experience, underlining how a lack of Danish language skills might unintentionally isolate foreign employees from social exchanges with colleagues. Returning one afternoon from an informal gathering, a group of colleagues confronted her to ask why she had not joined them for a beer, and she replied that she had not been invited. '*They said, but we were standing here speaking loudly and clearly about going… but it might not have been the right language*'. She concludes from this that non-Danish speakers risk developing weaker social ties to co-workers, thus limiting their involvement in knowledge sharing:

It is not just personal stuff you miss out on, but business relations too. If something is going on, if nobody directly tells you, you are not going to know. I would say yes, you could work here without speaking any Danish. You can do your job. But all the learning and what is going on around you, you would miss (Employee, North America).

As could be registered from interviews, more or less consciously, the dominating speech community limits the possibility of communication and, subsequently, acting and relating as well. Nonetheless, the Danish community may not be aware of the effect of their communicative practice. Often Danish organizations are represented as being much more tolerant and international than they actually are. This can sometimes lead to the disillusion of non-Danish organizational members:

When I came here I was so disappointed. We always heard talk about the Nordic countries and the expectations were very high. Like this company. I thought it was more international when I first came here. I asked them before – do I have to speak Danish and they said no, no, we are an international company and we speak English. But they cannot say that it is an international company and that English is the company language. It is

just a Danish company with a lot of foreigners (Employee, Southern Europe).

Exclusion from the sharing of ideas due to language differences could be found in many places. Thus, the creation of social boundaries linked to categories that are strengthened by language can be identified as an important obstacle to the use of human resources in culturally diverse organizations. Furthermore, the lack of social commitment noted by several informants points to a second obstacle that impedes the constructive use of cultural diversity. This will be explored further below.

Social Fragmentation

As indicated by some studies, the lack of social coherence can sometimes be the undesired result of cultural diversity (Bassett-Jones, 2005). This may be the effect of individuals who feel more comfortable when associating with others who are similar to themselves, sharing the same beliefs, values, language, and other traits (Miller et al., 2000). Communication in culturally diverse organizations is, then, different from communication among national peers. As one of the Danish managers tells the researcher: '*Communication has to be much more clear than if we were all Danes. We now have to formulate the orders in more plain and precise words*'. In this way, daily communication in a second language has an influence on interaction. As one of the Danish informants mentioned '*then one keeps to oneself the little remarks that would otherwise be more natural - for good or bad''*. In many cases, this resulted in less dialogue and more focus on getting the job done. As outlined by a Danish Manager:

Because of the diversity, you focus more on the professional. You don't think about from where people come, but only whether they contribute their best no matter how they feel among themselves. You don't focus on people's mindset but on the

result. Whether people get on socially or not is unimportant. In that respect, only being together with Danes probably gives you more strings to play (Manager, Denmark).

Another Danish informant describes the situation of a company that has done well in establishing an internationalized environment by mainly using English for everyday communication. This manager has the impression that even though communication is conducted in English, it still results in the disappearance of some interaction:

There are a number of Danes who have actually left the organization because they find it is no longer the same place to work. There is no longer the same consensus. The culture has been shaken. I don't know if this is because of the market or because the company has grown or because of the foreigners. It may have something to do with the joking and the way we communicate (Manager, Denmark).

Other informants observe how foreigners conduct their everyday tasks without any knowledge of the Danish language and thus miss out on '*all the social stuff and all the small-talk across the lunch table*' (Employee, Northern Europe). Non-native employees often characterize their conversations as less detailed or 'deep', which may be due to the disappearance of humor from communication. As a result, communication becomes more formal and task-oriented. However, as a Canadian employee describes it, this does not necessarily improve communication:

One problem, though, is that if people tell you something, you often get a too neat version. You can't really function in this country without speaking and reading some Danish. We had a colleague from Canada who spoke only English, and I could hear that when people talked to her, it always came out in a too neat version (Employee, North America).

The formalization of communication endangers the social coherence and integration of the organization. As one Danish manager observed: *'Much of the informal interaction derives from a strong organizational culture that is valuable to us'*. When speaking to other nationalities, employees find that it becomes more difficult to uphold the same level of communication.

It is most often easier with only Danes. The meetings become more formal when conducted in English rather than Danish. There is less ping-pong across the table - less informal talking. That is a bit negative. It can be good to have the informal talk because it strengthens the group socially (Manager, Denmark).

The introduction of an international environment with a common language might prevent the kind of social categorization described in the previous section. In addition, according to the results of this study, communication tends to be more explicit, thus facilitating the integration of non-native employees in the working routines. Nonetheless, the internationalized environment does not solve all communication problems.

In this exploratory research project, two main obstacles to the use of human resources have been identified. On the one hand, cultural and social boundaries are created, which prevent communication between employees that are categorized as belonging to different groups. On the other hand, a social fragmentation may result in less effective communication with employees abstaining from informal interaction when speaking a second language. These obstacles to communication may have a vital impact on the possibility of using differences in human resources constructively. Furthermore, as will be elaborated in the following, the boundary creation and the social fragmentation that characterized the face-to-face contact of the informants was reinforced through the use of ICT in the companies.

ICT and the Construction of Group Boundaries and Social Fragmentation

As Welch et al. (2001) and Feely and Harzing (2003) propose, it could seem that ICT can minimize the impact of cultural barriers in the international business community, especially due to English as *lingua franca*. Many researchers closely link ICT to the rise of a knowledge based economy and globalization (Roberts, 2000). As such, ICT has enabled data and information to cross great distances, thereby effecting a movement from organizations physically contained single-sited units to multi-sited global networks (Hängst & Sol 2001). This has made researchers argue that ICT, due to stronger cross-national coordination and communication, enhances homogenization (Gabberty & Thomas 2006). Even though this might be the case on an inter-organizational and global level, our research suggests that ICT may have social consequences also on the local organizational level. In this way ICT could enhance the creation of boundaries and social fragmentation in everyday face-to-face communication of the work force.

This, we believe, has to do with the double-sidedness of the globalization process, in which we include ICT. As it has long been promoted by social scientist, the expansion of the capitalist mode of production whereby all economies have been included in the global economy, has led to a homogenization in goods and services. Nonetheless, this process has also led to fragmentation and national boundary creation on the group and individual level (Friedman 1994). That is, what is taken as signs of globalization, such as ICT, is used strategically on the local level as a counter reaction to uphold identity markers such as nationality. In this study what we found was that ICT seemed to be used as a 'social tool' for creating these group boundaries and social fragmentation.

The companies in this research were all heavily dependent on the use of ICT in the everyday

communication of the employees. Especially email seemed to have substituted a great part of what would formerly have been face-to-face interaction. As such, it was more common to send a joke via mail than to tell it face to face. Furthermore, some of the employees only referred to each other by their initials or 'user-names', and not by their real names:

Nobody has a name here, only initials […] sometimes I feel not insulted but uneasy. It is a different style from what I am used to (Employee, Eastern Europe).

Our observations indicate that communication through the use of ICT did not remove existing barriers of communication. Rather, ICT - in this case the use of initials in face-to-face communication - was used strategically to uphold existing group boundaries, excluding the non-native Danes from participating in social interaction, and including the Danes. This way ICT further contributed to the creation of social boundaries in the multicultural companies. In addition, it is interesting to note how ICT affected the face-to-face interaction of the employees. The employment of 'user names' in everyday interaction created a feeling of uneasiness among certain non-Danish employees, which affected their willingness to participate and contribute to personal and professional discussions. As such, the strategic use of ICT by native Danes hindered the flow of information and communication between the culturally diverse groups within the workplace. When asked whether this was a deliberate strategy used to exclude non-Danes from the social group, an informant replied:

I have heard that some of them don't like it, but I really don't think about it. I just do it because I have gotten use to it and it's easier (Employee, Northern Europe).

As such, the study did not indicate that it was a deliberate and conscious strategy from the Danes;

however, it seemed that this group was not willing to change their behavior in order to address the resentment experienced by the non-Danes.

In consequence, the national boundaries were upheld through an unwillingness to change behavior. Whether this led to an overall increase or decrease in communication, through the use of ICT and face-to-face communication, is not within the scope of this project to determine. Rather it should be noted that these perceptions of communication outline group boundaries in which the employees either feel included or excluded, and that these perceptions have an impact on workplace behavior.

ICT seemed also to create an environment in which there was less space to create personal relations and networks. As argued, this form of social fragmentation is especially problematic in knowledge intensive industries, since 'ping–ponging' seems crucial in the development of new ideas. The use of email and phone in the workplace seemed to create a certain perception of what was considered effective working time;

Even if you sit next to someone, you would send them an email. I even do it myself (Employee, Denmark.)

The employees would rather use their computer as the primary tool for communication, especially because sitting at the desk signalized that they were working, and they therefore seemed more effective. One could argue that the use of ICT created a work environment and a form of communication that was more fragmented and individualistic than would otherwise be the case. Such a perception of work might be suitable for traditional industrial firms, but it is less suitable for knowledge intensive corporations in which innovation is a hallmark for survival in a globalized economy. One of the problems with communicating through ICT has to do with knowledge transfer. Robert (2000) agues that communication through ICT favors knowledge, which can be codified and reduced to data. Tacit knowledge, which is crucial in creating

an innovative workplace, might be problematic. Especially where face-to-face interaction is actually possible, since the employees are physically located together.

We found that even though ICT is crucial in multicultural firms, there may also be some problematic consequences. It can be used to uphold existing linguistic and national barriers, thereby reducing communication between these groups. Furthermore, it might individualize the workplace, thus reducing the transfer of tacit knowledge that is crucial to more knowledge intensive industries. In other words, ICT seems to enhance certain elements of social behavior as exercised in multicultural firms.

DISCUSSION

Cultural diversity has often been described as providing an important constructive potential to firms. This potential, however, cannot be activated without the mutual interaction of the different groups and individuals in the organizations. Accordingly, communication across cultural boundaries becomes one of the basic preconditions for the development of a resourceful environment. Unfortunately, communication in multicultural firms is often a complicated matter.

To handle daily collaboration, diverse groups need to have a good flow of communication. When describing obstacles to communication in multinational teams, most studies refer only to differences in language and national culture as leading to misunderstandings and group conflict (e.g. Beamer et al., 2005; Hambrick et al., 1998). However, in this study we suggest that communication practices may be a more complex matter than some studies of culture diversity and communication have indicated. We have argued that certain social elements in communicative behavior have great effect on the use of differences in human resources. And in addition to that, we argue that ICT can enhance some of the observed problems.

This research project has outlined how the perceptions of communication can affect two social processes, which, on the one hand, may create boundary formation, and, on the other hand, social fragmentation. Furthermore, ICT may not solve these problems, but can instead be used as a social 'tool' that reinforces the dominant social categorization and fragmentation within the company, thereby upholding existing structures of social difference.

Three different theoretical perspectives have been mentioned to contribute to the understanding of communication in multicultural firms.

Firstly, the literature applying the information and decision-making perspective puts emphasis on the variety of differences in bodies of knowledge (Distefano & Maznevski, 2000; Page, 2007). However, as our case showed, information does not always flow undisturbed in organizations. Human resources may be embedded in particular social communities. Brown and Duguid (2000) argue that communities of practice enable people to communicate the more implicit elements of knowledge on how to act successfully in the organization. This implies that the membership of these communities can be essential to communication. The notion of communities of practice could provide further inspiration for researchers dealing with communication in multicultural firms from an information and decision-making perspective. This perspective is also highly relevant to understand the social use of ICT that allows communities to span physical settings.

Secondly, researchers operating in the social categorization paradigm put emphasis on boundaries between groups created along lines of similarity attraction. The argument is that similar individuals interact more with each other than with non-similar organization members (Tsui, Egan, & O'Reilly, 1992). However, the case material shows that focus should not only be put on group boundaries, but also on the socially fragmented internationalized environment where individuals have less in common and speak different natural

languages. Turner (1987) argues that if the group membership is unsatisfactory, members will attempt to leave that group. And if that is not physically possible, individuals may engage in other forms of reduced attachment, such as psychologically withdrawing from the community. Such reduced group attachments are difficult to detect if much of the communication takes place by use of ICT. Social fragmentation should therefore be of particular concern for researchers and practitioners working with communication and ICT in multicultural firms.

Thirdly, the literature focusing of inequality and power relations stresses the importance of recognizing that some identity groups tend to dominate others. In our case it was obvious that the Danes were in a dominant position. This also affected communication when applying ICT. Here the dominating Danish styles seemed to exclude members of other nationals groups.

The argument of this chapter is that perceptions of communication and language use is intertwined with other social practices, and that cultural and linguistic diversity increases the complexity of interaction. The results of these processes are difficult to predict, and when ICT is added it becomes even more complicated. Consequently, managing communication in diverse environments by use of ICT should depart from a locally grounded notion of interaction patterns.

While practical implications for multicultural organizations wanting to improve the utilization of diverse human resources by means of improving communication may be somewhat premature due to the exploratory character of the study, some initial guideline can be provided.

To encourage communication in multinational organizations, managers not only need to reward measurable individual performance, they also need to expand the concept of performance to include contributions toward strengthening the collective human resources of the organization. One way of promoting communication is for management to make official the contribution to collective knowledge as dispersed by ICT or other means. Thereby, individuals will start to see communication as valuable and as a valued contribution to the organization's productivity. This has to be backed by unequivocal messages from the management regarding the value of interaction and teamwork. Furthermore, ICT can be used positively if it is not only seen as a simplified solution to the communication issues that are dominant in multi-cultural companies. While the use of ICT provides a different platform for communication compared to face-to-face interaction, this form is not detached from social processes. And some uses of ICT may create problems that can affect the social environment and subsequently the constructive use of differences in human resources. Hence, managers should make a clear statement about which forms of communication are suitable for ICT, and which should be handled on a face-to-face basis.

APPENDIX

Semi-Structured Interview Guide, Diversity Management in Denmark

Subject Time

    1) Work background

Employed by Years of employment

Position

    2) Personal background Prior cross-cultural experience

Language experience

    3) What expectations did you have before entering the organisation?

    4) What does cultural diversity mean to your everyday work assignments?

    5) In which ways have you adapted to the situation?

    6) Is there anything you would like to change?

    7) What formal guideline does your organization have with regard to diversity?

    8) Do other rules or guidelines affect the role of cultural diversity?

    9) What effect does cultural diversity have on the social environment?

    10) What characterizes a valuable employee?

    11) In which ways are human differences employed in the organization?

    12) What problems do human differences lead to in the organization?

    13) How do human differences affect communication?

    14) How do you feel when different languages are spoken in daily work situations/social situations?

Chapter 51

The Human Factor in Quality:
Examining the ISO 9000 and Business Excellence Frameworks in Selected Greek Organizations

Fotis Vouzas
University of Macedonia, Greece

ABSTRACT

The aim of this chapter is to theoretically investigate the implications of ISO 9000:2000 and EQA on HR issues in selected Greek industrial organizations in their road to quality improvement. The study sample consists of two selected industrial organizations that were judged as normal, ordinary, and representative. The data gathering was carried out through extensive and in-depth interviews in the two organizations asking several multiple informants. The study shows that organizations approach to quality is of great influence to effective human resource utilization. There is a tendency to avoid the involvement of HR department on either certification or the EQA and also it is clear that HR department status and role is still very traditional. The small sample does not allow making any generalizations for the majority of Greek organizations in all sectors of the economy. This is the first step towards an understanding of the current context and content of HRM in organizations moving towards total quality management implementing ISO 9000:2000 or EQA model. However, further studies needed to investigate similarities and differences in an international basis. The chapter provides a basis for understanding the present status of HRM implementation under ISO 9000 implementation and EQA model of selected Hellenic organizations and the results can be helpful for academics and practitioners. The author suggests that in order to have a reliable and objective depiction of the effect and influence of ISO 9000:2000 and EQA to the context and content of HRM, a thorough examination and analysis of relevant studies should be conducted which will include all the various approaches, practices and perceptions recorded so far in the literature -some of them based on empirical data and some deriving from rhetoric and "good-stories" or "how things ought to be" perspective.

INTRODUCTION

The word quality in recent year is becoming very popular among organizations and academics and it is widely used in annual reports, in advertisement and even in government initiatives all over the world. However, although the true meaning and the value of quality is gaining ground in all over the world, the figures said a different story. Organizations are facing enormous quality problems in production (defects, scrap), in marketing (customer satisfaction), in logistics (response time, reliability), in finance (quality costs) and in most of their functions, even though the "Quality Revolution" has started according to many authors long time ago.

Having that in mind it is obvious that there is an oxymoron in the quality literature. Some authors argue that quality is about rhetoric and good stories in order for organizations to promote sales and create a "customer-orientation" profile. In United States and in Europe awards were established to promote awareness and provide a basis and a model for TQM implementation. However, the organizations both in US and in Europe were not so enthusiastic about the awards and the numbers are very small in all categories. On the other hand the certification with the new ISO 90000:2000 series of standards is gaining ground and especially in Asia the increase in certified organizations is beyond expectations. But still, many authors state that ISO 9000 is not equal to Total Quality Management but is just a third part quality audit that is not related to final product quality mainly used by organizations as a commercial tool. So what is "right path" to quality improvement and to customer satisfaction? Why quality is so desirable but very few organizations are willing to be involved in the quality journey?

In Greece, according to Dervitsiotis (1999) quality "had been of paramount importance in Greek culture since antiquity often mentioned as "areti (virtue) by Aristotelians and was at the center of all cultural and political activities in the ancient Greek civilization. Over the last twenty years the efforts of Greek industrial organizations for quality improvement were simply focused in the use of statistical methods in the production area and the introduction of quality assurance systems certified by third party (ISO 9000 series). However, the "technical" and "process-oriented" approach seems that does not provide the basis for the establishment of company-wide quality culture that covers all functions of the organization and focus on internal and external customer satisfaction. (IPM, 1993 Blackburn&Rosen, 1992).

On the contrary, moving from a traditional quality assurance system to a new philosophy of continuous improvement in which responsibility for quality is at the hands not of quality professional but all people within the organization is a challenge for Greek Industrial organizations that external and internal conditions will force them to implement.

The new ISO 9000:2000 and the Business Excellence movement through the American and European Quality Awards are the prevailing approaches to quality improvement according to the majority of Quality academics. Both seemed to provide a basis for the implementation of a TQM philosophy, which provides a unique way of improving organizational performance and attaining competitive advantage. The TQM rhetoric calls for a cultural shift, emphasises self-control, autonomy and have a significant effect in the way people are managed. In the context of these awards and the new ISO 9000:2000, new realities and perspectives emerge for the effective utilization of the organization's human resources. In the literature, aligning Quality Improvement programmes and initiatives with human resources effective utilization requires radical changes in the way the organizations perceive their "human capital" and the way the organizations' HR function operate (Hart&Schlesinger, 1991; Blackburn&Rosen, 1993). In the quality literature the importance of the "human or people element" in the quality improvement efforts are often been overlooked

and according to Wilkinson, et.al (1991) organizations are often engaged in a "production-oriented" perspective of Total Quality. Until recently, academics and practitioners seemed to be preoccupied with the study and implementation of the "hard" elements of quality improvement (mainly ISO 9000 certification), and the evidence is on the few books and articles published in the 90's and the following years. Only recently a number of authors suggested that the shift on thinking about quality has major implications for the management of labor and has occurred in parallel to a shift in thinking about Strategic Human Resources Management (Hart&Schlesinger, 1991; Blackburn&Rosen, 1993 Beaumont, at.al, 1994; Baruch, 1997; Vouzas, 2004; Conti, 2002; Soltani, 2003; Soltani, et.al, 1994). It has been argued that TQM cannot be applied in isolation. TQM is a total philosophy involving all organizational members and has high personnel content.

THE NEW ISO 9000:2000 AND BUSINESS EXCELLENCE (QUALITY AWARDS)

Since the introduction of ISO 9000 fifteen years ago there were a series of controversies and doubts over the role and the significance of ISO 9000 series on improving product and service quality, achieving internal and external customer satisfaction, and improving performance (Tsiotras&Gotzamani, 1996; Dick, 2000; Van der Wiele et al., 2000; Withers and Ebrahimpour, 1998; Magd&Curry, 2003; Stevenson and Barnes, 2001;Kartha, 2002.) According to Douglas, et.al (2003) "ISO 9000 is a multi-million-pound industry with many individuals and organizations reliant on it for their livelihood, including quality consultants, lead auditors, internal auditors, supplier auditors, quality representatives/managers and software designers/sellers as well as the numerous training companies and certification bodies and their employees". However, other

authors and among them Kartha (2002) argues that the new standards main purpose is to assist organizations to "identify mistakes, streamline their operations, and be able to guarantee a consistent level of quality".

The new revised standard was launched at the end of 2000 and according to Beckford (2002), is "an attempt to harmonize all the standards and remove the manufacturing bias. Several authors stated that the new ISO9000: 2000 is directed towards performance rather than conformance (Najmi&Kehoe, 2000). Coleman&Douglas (2003) argue that organizations in order to achieve the new ISO 9000:2000 should demonstrate that have quality processes and procedures in place, but they are skeptical about what happens after ISO 9000 certification. Casadesús &Karapetrovic (2005) studying the relationship between the "new" and the "old" ISO found that "the evaluation of the new ISO 9001: 2000 standard is generally positive". Vouzas&Gotzamani (2005) argue that there is no really negative impact but mention that the perceived benefits are less than the previous standard and that the level of reported benefits of ISO 9001/2/3: 1994 decreases with time, evidenced by two empirical studies conducted in 1998 and 2002. Overall argue that there is "an erosion of the perceived usefulness of ISO 9001: 2000 in the future, especially in terms of short-term benefits". Martínez-Lorente & Martínez-Costa (2004) further argue that organizations certified by ISO 9000 "may have gone a part of the way to TQM. However, the authors claim that it is only the "first part of the way, not its end, because there is a large amount of TQM requirements that ISO 9000 does not satisfy". Research on ISO 9000:2000 all over the world is still going on and the perceived benefits and its integration to other quality initiatives is expected to clear the picture and provide a basis for further improvement of the standard (Laszo, 2000; McAdam& Jackson, 2002; Najmi & Kehoe2000,).

According to Vouzas&Gotzamani (2005), "careful analysis of the ISO 9000:1994 standards'

requirements compared to the basic principles of TQM and the requirements of the two most representative business excellence awards, the European Quality Award and the Malcolm Baldrige National Quality Award, reveals several main shortages of the ISO 9000:1994 standards. The authors stated that lack of strategic quality planning, absence of top management commitment; lack of focus on customer satisfaction, lack of systematic training in quality. Furthermore HR competitiveness, benchmarking, and quality cost measurement are absent, as well as issues related to health, safety and the environment in a study in Greek EQA awarded organizations. However, many authors believe that the new revised ISO 9000:2000 series of standards is a significant improvement on the previous version in terms of its conceptual simplification, its process-based vision and its acknowledgement of the importance of customer satisfaction as a key requirement for verifying the effectiveness of the quality system (Conti, 1999). The basic principles on which the new standards' requirements are based (as found in the ISO 9000:2000 document) are much more TQM oriented.

On the other hand, Business Excellence literature is mostly based on rhetoric and "good stories" on EQA and MBNQA awarded organizations in Europe and USA. Bohoris (1995) in a comparative analysis of the two main awards stated that "Quality Awards' assessment procedures seem to be the only comprehensive means available to date by which TQM initiatives can be thoroughly monitored and assessed, providing any business with a competitive internal mechanism necessary to face the imposition of future new barriers to trade in the form of technical or quality standards requirements. However, the criticism over "excellence models and awards" is growing (Dale, et.al, 2000; Laszlo, 1996; van der Wiele, et, al, 2000; McDonald, et.al, 2002; Hewitt, 1997; Steventon, 1994) According to Dale,et.al (2000) the EQA "acted in response to the perceived tarnished image of TQM, whilst the consultancies sought to address the diminishing demand and increasing competition for their services".

QUALITY IMPROVEMENT AND "HUMAN RESOURCES": A LITERATURE REVIEW

As mentioned earlier, only recently quality experts, researchers, academics and practitioners realized that "human resources" issues can be at the core of the quality philosophy and that employee involvement and commitment is essential for the successful introduction and implementation of quality initiatives, programmes or practices and techniques (Blackburn&Rosen, 1993; IPM, 1993; Hart& Schlesinger, 1992;Soltani, et.al, 2004;Soltani, 2003 Boselie & van der Wiele2002). It is widely accepted that Total Quality Management has a high human resource context and that quality movement recognizes the importance of human resources utilization and states a conceptual and well-defined image concerning human behaviour and motivation (Pfeffer, 1994). Wilkinson et al., (1991) state "putting human resources issues in the top management agenda is a prerequisite for the effectiveness of all quality improvement efforts". Research evidence suggest that as TQ improvement efforts proceeds, a change in the corporate culture occurs, resulting in the establishment of a work climate in which participation, trust, responsibility for goal achievement and employee involvement takes place (Lawler, 1994).

ISO 9000 Series Implementation and Human Resources

The literature on Human Resources utilization and quality improvement efforts is rather limited, especially when the focus is on the relationship and the impact of the implementation of the ISO 9000 series. The majority of these studies is descriptive in nature, with many generalizations, and basically put the basis for a better understanding

of the role of the personnel function in quality improvement efforts. TQM is often confused with quality initiatives, short-term projects and ISO 9000 series certification (Soltani,et.al, 2003; Hill&Wilkinson, 1995; Ho, 1994).

The launch and implementation of the new ISO 9000:2000 series of standards increases even more the companies' expectations and the likelihood that the new systems will bring firms one step closer to TQM and Business Excellence Vouzas&Gotzamani (2005). The introduction of the five building blocks and the introduction of the process-based approach are an attempt by ISO to reduce the amount of documentation required. Even more, the new elements that it introduces to the certified companies belong to the "soft elements" of TQM, that have been proved to be the fundamental ones in the TQM system, with a very strong effect in improving company results (Costa & Martinez-Lorente, 2003). However, up to now there is no major research done on the effects and impact of the new ISO 9000:2000 series of standards in Strategic HRM. The relationship between SHRM and ISO 9000 series certification is often seen as part of the HR function involvement in the design, introduction and implementation of a quality assurance system certified by an external evaluator. Wilkinson, et, al (1991) and the IPM (1993) study suggest that HR function actually plays an important role in the design and implementation phase of a quality assurance system. On the other hand, there are cases in which a quality assurance system had been implemented within the HR department.

Furthermore, in the literature, it was found that in many organizations the human resource function plays an important role in the design and implementation of a quality assurance system (Blackburn and Rosen, 1993; Wilkinson et al., 1991). On the other hand there are cases in which a quality assurance system had been implemented within the human resource department. Its integration with human resource management is increasingly recognized as all level managers'

and employees' commitment is a major component of success. Another striking finding is that HR professionals are willing to digest and implement the fundamental principles and practices of quality into their HRM practices. They also strongly believe that quality improvement efforts and the ISO 9000 series certification is one of the major challenges in their job (Lawler, 1994).

Research evidence shows that when quality management evolves from quality control or quality assurance, it tends to focus on the "process" (technical) aspects of quality rather than on the "human" aspects (IPM, 1993; Kufidu&Vouzas, 1998). Thus, organizations being engaged in a quality assurance approach to quality improvement, do not usually allow sufficient room for staff contributions, and training is targeting only towards people involved in the production process. The personnel department usually is a peripheral function with a very traditional role. The IPM study shows that organizations placing emphasis on a ¨process¨ approach to quality tend to exclude human resource department from the design and implementation of quality assurance system such as ISO 9000 series. In most of the cases its role is limited and oriented towards increasing the awareness of the quality standard and handling the administrative aspects of quality efforts (IPM, 1993). Human Resources professionals seem to participate in the various phases of quality initiatives and play a vital role (usually a facilitator role) in these efforts. Overall, the involvement of HR function in quality improvement efforts usually is materialized in three ways a) by participating in the design, introduction and maintenance of various quality initiatives b) by changing traditional personnel practices in order to support a total quality culture and c) by establishing a quality orientation within the function itself. However, we have to consider that the quality stage or level an organization is, instantly influences the embodied organizational changes, which in turn affect the way human resources considerations are formed in relation to strategic quality goals.

The Excellence Movement and the "Human Resources" Element

Hendick&Triplett(1989), suggest that implementing Total Quality initiatives requires continuous adjustments of every facet of work environment and corporate culture and the effective utilizations of organization's human resources through the HR department can play an important role in TQM assessment, planning and implementing process as well as in annual monitoring and review. Furthermore, improving quality, meeting customer's needs according to the literature is part of everybody's job and everybody should feel responsible. Quality efforts should be based on a long-term perspective and be part of the overall business strategy including people-related issues such as education and training, performance appraisal, employee involvement, recognition and improving quality of work life. Absolutely necessary is also a quality policy that is understood and easily applicable by organizational members through a use of a common language.

It is widely suggested that successful TQM implementation changes the dominant values, organizational structures, the way people work together and the way they feel about participation (van Donk&Sanders, 1993). The above support the argument made by many authors stating that quality improvement efforts should become part of everybody's job and everybody should feel responsible. Quality improvements should be based on a long-term perspective and be part of the overall business strategy. In this context people should be considered as assets rather than as additional cost upgrading that way the role of the human resource function. Research in the US shows that in organizations, which were awarded the MBNQA, the human resource function's role was essential, but the overall rating on the HR utilization category was not satisfactory. In these cases the personnel professionals were part of the top management team and fully participated in the design and implementation of the organization's quality strategy. (Blackburn&Rosen, 1993).

There are limited studies concerning the HR element of the European Quality Award and the reason is that in the academic community the EQA framework is not considered synonymous with Total Quality Management but rather such as a business audit approach and a technique within TQM. (McAdam&O'Neill, 1999; Mc Donald, et.al, 2002) A study in Denmark shows that "Danish companies are acting in order to improve the use of human resources in the company and to keep up with competition in the market. The increase in the resource score reflects that companies are also more focused in 1996 on the effective use of non-human resources in such a way that company goals and strategies are supported" Kristensen & Jørn Juhl (1999). Hamzah & Zairi (1996) in a study of British organizations winning the EQA give the following statement concerning people in one of the organizations studied " LL Bean Inc. is about people and respect for people. This is a way of respecting the talents within the organization. A lot of companies see people as the problem. We saw people as part of the solution" Xerox a winner of the European Quality Award uses extensively benchmarking for HR in the areas of "management development, recruiting, compensation and other personnel processes with the world class competitors" (Sherer, 1995). Vouzas & Gotzamani (2005) in a study in Greece found that "EQA seems to provide a new platform for introducing new practices and upgrading the role of the HR function. Management and utilization of people is at the core of the EQA and it seems that the sample organizations are striving to focus on specific issues and measures, covering all HR-related activities.

In some organizations the strategic role of people is still not dynamic. It is considered to be very costly and complex, while respondents realize that there were still high opportunities for improvement in this area. It is obvious that human resources issues were not at the center of the

quality strategy formulation and implementation within the sample companies."

QUALITY IMPROVEMENT AND HUMAN RESOURCES ISSUES IN GREECE: A LITERATURE REVIEW

Quality Improvement Efforts and the Greek Industry

The quality movement in Greece started in the late 80's with the organization of a series of conferences and seminars on quality and followed in the early 90's with the introduction of the first "quality year" from the former Ministry of Development in the year 1993. In modern Greece, quality is still in an infant stage, but there are exceptions and Greek organizations and quality managers are at the top of Europe in terms of quality awards. In the past three years (2001-2003) the European Quality Manager of the year was Greek and one Greek medium-sized, family-owned organization was awarded the European Quality Award. On the other hand, ISO 9000:2000 certification awareness is growing due to government and EU initiatives and quality is at the lips of almost all Greek general managers.

Dervitsiotis paper "Quality in Greece" published in 1999 in the TQM Magazine is the only paper portraying the overall quality picture in Greece. There are of course a number of academic papers on quality but all of them focused on specific industry sectors such as textile (Vlachos, et, al, 2000), construction (Zantanidis &Tsiotras, 1998), food (Efstratiadis, et, al, 2000), and Tsekouras,et,al (2002) on a number of industry and service organizations. Furthermore there are also some "quality specific" papers addressing ISO 9000 series certification (Tsiotras&Gotzamani, 1996; Gotzamani&Tsiotras, 2002; Lipovatz, et, al, 1999), EFQM and ISO (Vouzas& Gotzamani, 2005) leadership and quality (Lipovatz, 1998), financial performance and quality (Dimara, et, al,

2004; Tsekouras,et,al (2004) and human resources and quality (Kufidu&Vouzas,1998; Vouzas2004; Dimitriades,2000,2001)

According to Stavroulakis (1997) "The dominant form of business is the small-sized family enterprise, co-existing with a ubiquitous public sector; both suffer from absence of flexibility, of entrepreneurial spirit and of a long-term perspective". The basic philosophy and principles of quality improvement as well as its significance and its context were almost unknown in the majority of the Greek Industrial organizations up to the 1960's. According to the Stafilidis (1995) although quality was perceived as a major element of each business partnership, no specific techniques or practices were used in order to assure quality of raw material or semi-final products among manufacturers and suppliers. The use of extensive and systematic implementation of quality procedures and use of statistical methods were rarely used.

During that era, organizations' customer orientation was focused in domestic markets, while the customer's demands for quality products and services were not a primary concern of the company. The same period competitive pressures were minimal, and price was the basic criterion for the acquisition of products, and finally the "sense of" householder was the one that determined the appropriateness of product and the "degree of" quality. In the mid 1970's the lack of quality specifications became obvious. Industrial organizations produced products applied Quality Control principles and methods initially with high complexity and high cost. A Karvounopoulos (1994) report that in the early 80's the significance of quality in the Greek industry was closely related with the significance of standardization. The pioneer industries of that era - mainly subsidiaries of foreigner multinational enterprises - saw the challenges and the opportunities of quality improvement and began to adopt specifications in order to ensure final product quality. In 1978 the Greek Organization for Standardization (EL.O.T) was founded, aiming at the development of specifica-

tions, the guarantee of quality of Greek products, and the support of export activities" (Booklet ELOT, 1991). The focus on bigger markets at international level, the sensitivity of consumers on quality issues, and the surge of products from European and other countries forced Greek industrial organizations to come out from their "quality sleep" in which they had fallen. The big foreigner enterprises were the leaders in that effort followed by Greek not-traditional industrial enterprises. Tsiotras&Gotzamani (1996) state that in Greek industry, companies first began to develop quality assurance systems in the 1990s. Most of these companies were subsidiaries of foreign organizations with certified quality assurance systems, and were forced to follow the quality strategy dictated by their mother company. The main reason for this was the inclusion of ISO 9000 certification within the EC procedures for the certification of industrial products, and the demand of already certified companies to their suppliers (domino effect).

On the other hand, Lipovatz et.al (1999) argue that the most important reason for the introduction of quality assurance systems in the Greek enterprises refers to the external, (i.e. the adjustment to the demands of the international and/or domestic market) and not to the internal impact of certification (i.e. the improvement of the organisational structure and the reduction of the production costs). According to Dervitsiotis (1999) "Performance improvement with quality management in the new tradition, using the guidelines of the European Quality Award, has been receiving increasing attention in Greece at the highest levels of government, industrial organizations for most sectors, universities and others". Lipovatz (1998) argues that Greek leadership has generally not embraced the principles of quality so as to be able to drive the process of change towards total quality

Quality and HR Utilization in Greece

It is argued that the majority of the Greek enterprises have neglected the human resources issues (Kufidu&Vouzas, 1998; Papalexandris, 1993; Kanellopoulos, 1990). Only recently SHRM issues have been thoroughly examined by academics. Studies conducted in the 80's and 90's revealed that in Greek industrial organizations, well-organized personnel departments is a recent phenomenon, and consequently personnel managers seemed to be a rare breed, appearing only over the last fifteen years. The investigation of the current level of SHRM implementation in Greek organizations was mainly covered by the Cranfield survey covering several European countries including Greece (Papalexandris, 1993). The survey was conducted three times (1993, 1996 and 1999) and the sample was 150 organizations, which employed more than 200 employees. According to that survey, during the 90's, Greek organizations tried to adopt methods and techniques already successfully applied by multinational. The main emphasis was on the increasing importance of training, the effort to link training to the firm's strategy, the higher involvement and collaboration with line managers. Furthermore, the Cranfield study argues that there is a tendency of Greek organization to adapt their HRM practices to international trends (Papalexandris&Chalikias, 2002).

The literature on the Total Quality Management/ISO 9000 and its relationship to Strategic HRM is rather limited and is focus on commentaries from academics and practitioners and in a few studies. The reasons for such lack of interest can be traced as mentioned above to the small number of certified organizations and the lack of organized HR departments in the majority of the certified organizations. Furthermore quality professionals seemed to ignore or depreciate the "human" elements of the new ISO 9000:2000. The majority of studies shows that the main approach used by the majority of Greek industrial organizations were the adaptation of a quality

assurance system through the ISO 9000 series certification (Lipovatz, 1998; Vouzas, 2005; Vouzas&Gotzamani, 2005;Deligianakis, 2000). Kufidu&Vouzas (1998) in the first attempt to investigate these issues found that "concerning quality improvement efforts, emphasis also seemed to be given to the "system" side of TQM in the majority of the Greek industrial organizations and the reason for that could be traced in the ISO 9000 series certification campaign in Europe and recently in Greece - in many cases reinforced by European Union - and to the fact that most Greek organizations are moving from a quality control phase towards a quality assurance phase.

SURVEY OBJECTIVES AND METHODOLOGY

In this paper, the author suggests that in order to have a reliable and objective depiction of the human resources element in the Business Excellence and ISO 9000:2000 quality improvement frameworks, a thorough examination and analysis should include all the various approaches and perceptions recorded in literature -some of them based on empirical data and some deriving from rhetoric and "good-stories" or "how things ought to be" perspective. The sample consists of two selected industrial organizations (one Greek and one multinational company) that were judged as

normal, ordinary, and representative, one being certified with the new ISO 9000:2000 series and the other took the EQA award of the EFQM. The data gathering was carried out through extensive and in - depth interviews in all two organizations asking several multiple informants i.e. the plant manager, the production manager, the personnel manager, using a semi-structured questionnaire with open - ended questions. The main purpose was to collect data and produce basic information, enabling qualitative observations concerning organizations' Quality and HRM efforts, the role and the status of Quality and HR professionals, and the implementation of various human resource initiatives from people being directly involved. Each site was written up as an integrated case study, with the focus on drawing out the commonalties of meaning and understanding each site. The data analysis provides some ground for generalizations, even though subjective judgments were also made from the analysis of the cases (see Table 1).

FINDINGS

Excellence Company A

The company A is the only Greek organization that had won the European Quality Award in the past five years. Company's A journey to quality started through ISO 9000 and ISO 14000 series

Table 1. Successful Greek organizations in the Categories of the European Quality Award 2004-2005 (Source: EFQM)

European Quality Award Categories	Number of organizations	Sector	Award Year	Size	Ownership
Committed to Excellence	16	Service: 11 (in which 2 public) Manufacturing: 5	2004: (8) 2005: (6)	Large: 7 SME's: 9	Foreign: (1) Greek: (18)
Recognized for Excellence	2	Service Organizations	1 in 2004 1 in 2005	SME's	All Greek
Award Winner	1	Manufacturing	2004	SME	Greek
Prize Winner (same company)	1	Manufacturing	2004	SME	Greek

certification and continued with the EQA (first attempt was on 1997). The main reason for going for the EQA was the organization's effort to establish a very good brand name domestically and abroad and to move a step forward on its quality improvement efforts. The ingredients of success according to quality manager were the high top management commitment and the participative approach used to design, implement and communicate the various elements and requirements of the EQA framework. However, emphasis was also on improving competitiveness and increasing productivity mainly through financial management techniques (cost reductions). The organization is on a spectacular development stage and a very strong export orientation and establishing strategic supplier alliances abroad.

The organization is a champion in providing Equal Employment Opportunities (70% of personnel are expatriates from the former Soviet Republics and there is also a large amount of disabled employees). Some of the organizations best practices concerning HR issues are the continuous encouragement for employee involvement through suggestion and improvement plans, the open and sincere communication between employees and top management in monthly meetings, employee satisfaction surveys on regular basis, competence-based training, zero accidents (SAFE award from the EU) and family working environment. The HR function implements a series of non-financial rewards such as financial support (loans), Sunday trips, and flexible working hours for disabled employees, special awards and happenings and recognition schemes to valuable employees (see Table 2). Based on the above policies and practices the organizations display a spectacular improvement in many areas. According to company data ninety five percent (97%) of employees consider working in a safe and pleasant working environment, the working hours lost in last two years decreased significantly, career opportunities and career development had been more systematic, almost ninety percent (90%)

of employees believe that the products they produce are of highest quality and finally expressed happiness and satisfaction form the training and development programs participated in. The HR function is involved in annual employee attitude surveys aiming at improving working conditions and enhancing employee morale and commitment. However, top management is reluctant to upgrade the HR function and the HR manager role and this is due to the small size of the organization and the predominant role of the owners of the company in all aspects of business activities.

The involvement and the role of the HR function in quality efforts and especially in the European Quality Award was essential for achieving the award and for setting a new standard for improvement in the issues related to management of people. A series of HR practices were re-evaluated, documented and measured such as performance appraisal and rewards and others were better utilized i.e. internal communication methods, recruitment &selection and employee training. The most challenging task for the HR was the to support the organization toward building quality awareness for all functions and changing the existing corporate quality culture by incorporating HR issues to all quality procedures and by creating a climate of trust and commitment.

ISO 9000:2000 Company B

Company B is a multinational organization operating in Greece for many years with a very recognizable brand name and a big market share in its sector. Its main approach to quality improvement is ISO 9000:2000 and is considered very successful in achieving high quality products and increasing productivity. The main reason for ISO 9000:2000 certification was firstly the pressure from the "mother" organization and the increased competition and secondly quality improvement and efficiency in operations. Speaking with the quality manager, the HR manager and the Managing Director it was clear that all considered

Table 2. Profile of sample organizations

	Quality Approach	**HR Philosophy, Goals and Vision**	**HR practices**	**HR dep't Involvement to Quality**
Company A	EQA Winner ISO9001:2000	HR vision and goals part of the corporate strategy embedded in line management	▪ Corporate Social Responsibility ▪ Performance-based pay ▪ EEO ▪ Employee development plans, ▪ employee participation ▪ strong people-driven culture	▪ Education and Training for EQA ▪ Awareness Building ▪ Team design and support ▪ Internal and External communication ▪ HR Processes justification and measurement
Company B	ISO9000:2000	Absence of a written policy and Vision for HR Not quantitative long-term HR goals	▪ Traditional/bureaucratic HR practices ▪ HR function plays peripheral and supportive role	▪ Minimal, training program ▪ Awareness building ▪ HR manager not in quality steering committee

employees to be very valuable resource and that played a key role in achieving strategic quality goals and objectives. This of course is contradictory with the overall picture of the organization's HRM practices, the role of the HR department and the lack of a vision and mission for the personnel.

Formal written HR strategy, policy or quantitative goals regarding the management of human resources were absent and this was due to the focus of the organization to other "strategic" areas such as marketing, operations, and public relations. The involvement of the HR manager to the design and launch of ISO 9000 certification was minimal and covered only the development of training programs for quality and awareness building. The HR manager had no authority to review and adjust HR procedures in order to support ISO 9000:2000, to analyze and re-examine past job descriptions, to evaluate previous performance standards for employees, to suggest training methods and learning activities and ways to increase motivation. The HR manager mentioned that he took part in meetings regarding ISO certification (after certificate granted) and received information regarding quality strategic orientation, but he was not part of the quality steering committee. The quality manager claimed that a written policy or

quantitative goals for personnel is not prerequisite for ISO 9000:2000 certification and considered as unnecessary and costly. A serious obstacle to the involvement of HR department to ISO 9000:2000 certifications was also the existence of serious interdepartmental communication problems as well as internal disputes and conflicts. Having that in mind it was extremely difficult for the HR professional to develop a sound, clear and integrated HR policy that can support the certification process and the establishment of an "ISO culture".

The HR department role in the organization can be characterized as a "peripheral" or "supportive" representing the average small and medium Greek enterprise. The HR department had only two employees, one secretary and one accountant and its most common HRM practices were administrative in nature such as, data filling, employee payroll, employee complaints, disciplinary action, and traditional HR practices (such dismissals, demotions, transfers, working hours and shift patterns). There were no major indexes and matrixes for HR issues (turnover rates, employee satisfaction, evaluation of education and training programs, induction, labor productivity, etc) and core HR practices like performance appraisal system, rewards and recognition schemes were absent for employees at

the shop floor. The above come to support research evidence that when "hard" approach to quality is adopted combined with a weak HR department with no strategic orientation, then "people" issues are often neglected and the quality improvement efforts are partially satisfied. The argument is more realistic since top management commitment in ISO certified organizations is poor and furthermore top level management is probably not aware of the advantages the "new strategic HRM" practices and the effect these practices might have to the organization's overall quality effectiveness and efficiency. Furthermore, in the organization studied the existing organizational HR culture and generally the overall corporate philosophy of human resources utilization seemed to promote quality improvement efforts through ISO 9000 series in a rather bureaucratic manner in which there is no innovation, promotion of new ideas, opportunities to be gained and best practices to be implemented.

CONCLUSION AND FUTURE TRENDS

It is quite obvious from the above analysis that there is an enormous distance between the HR requirements of the awards and those of ISO 9000. The ISO 9000:2000 is no more than an "audit of procedures" with not substantial HR context and content and on the other side the awards are concerned with HR both in relation to people management and satisfaction/results. The ISO 9000:2000 seemed to represent the minimum effort on HR practices and policies an organization should present in order to achieve third party certification but quality award and specifically EQA award requires proof of systematic design and implementation of HR policies and practices. However, many argue that a company cannot win one of the quality awards without first being able to satisfy the requirements of the ISO 9000.

It seems that ISO 9000:2000 certified organizations although are aware of the fundamental principles and tools of continuous quality improvement but still are in the early stages of a company-wide approach to quality improvement. The author believe that one of the most prevailing factors contributing to the delay of the establishment of a "quality-based" culture and a move towards strategic Total Quality Management are the short period of systematic implementation of quality assurance systems and the preoccupation with the so-called "hard" aspects of quality.

The existence of vision and a mission for Human Resources followed by systematic design and implementation of Strategic HRM practices seemed to be the main issues that differentiate ISO 9000:2000 organizations from EQA organizations according to the literature. However, according to other studies EQA organizations problematic area is that of Human Resources (Vouzas&Gotzamani, 2005; McAdam&O'Neill, 1999). The prevailing HR practices absent from the ISO 9000:2000 organization are the communication to employees of the corporate quality mission, designing and implementing programmes for employee empowerment and developing or applying TQM principles, practices and techniques within the HR function.

KEY TERMS AND DEFINITIONS

Business Excellence: The use of quality management principles and tools in business management. It is the systematic improvement

of business performance based on the principles of customer focus, stakeholder value, and process management

Corporate Social Responsibility (CSR): Also known as corporate responsibility, corporate citizenship, responsible business and corporate social opportunity is a form of corporate self-regulation integrated into a business model. Ideally, CSR policy would function as a built-in, self-regulating mechanism whereby business would monitor and ensure their adherence to law, ethical standards, and international norms.

Equal Employment Opportunity (EEO): Some use it as a descriptive term for an approach intended to provide a certain social environment in which people are not excluded from the activities of society, such as education, employment, or health care, on the basis of immutable traits.

European Quality Award: Is now referred to as the EFQM Excellence Award. This distinction is awarded annually by the European Foundation for Quality Management to the organization that is the best proponent in Europe of Total Quality Management.

Human Capital: Refers to the stock of skills and knowledge embodied in the ability to perform labor so as to produce economic value. It is the skills and knowledge gained by a worker through education and experience

Human Resource Management (HRM): Is the strategic and coherent approach to the management of an organization's most valued assets - the people.

Human Resources Strategy: The Human Resources Strategy sets out plans to ensure the recruitment, development and retention of the best quality staff in all staff groups, in order to fulfil the organization's Mission and thereby meet its strategic aims and objectives.

ISO 9000 Certification: A company or organization that has been independently audited and certified to be in conformance with ISO 9001 may publicly state that it is "ISO 9001 certified" or "ISO 9001 registered". Certification to an ISO 9000 standard does not guarantee any quality of end products and services; rather, it certifies that formalized business processes are being applied. Indeed, some companies enter the ISO 9001 certification as a marketing tool.

ISO 9000: Is a family of standards for quality management systems. ISO 9000 is maintained by ISO, the International Organization for Standardization and is administered by accreditation and certification bodies.

Quality Assurance System: A quality assurance system comprises assessment and remediation action in a closed circle

Quality Improvement: There are many methods for quality improvement. These cover product improvement, process improvement and people based improvement. In the following list are methods of quality management and techniques that incorporate and drive quality improvement

Quality: The common element of the business definitions is that the quality of a product or service refers to the perception of the degree to which the product or service meets the customer's expectations. Quality is a perceptual, conditional and somewhat subjective attribute.

Strategic Human Resources Management: Is a general approach to the strategic management of human resources in accordance with the intentions of the organization on the future direction it wants to take. It is concerned with longer-term people issues and macro-concerns about structure, quality

Total Quality Management: (TQM): Is a new management philosophy aimed at embedding awareness of quality in all organizational processes.

Chapter 52

Assessment of Web 2.0 Applications Employed by Human Resource Departments in U.S. Cities

ABSTRACT

This chapter argues cities are not realizing the vast potential of Web 2.0 applications to increase the efficiency and effectiveness of their HR departments.

The chapter reviews the websites of the 50 most populous U.S. cities in terms of Web information available regarding human resources. This review found cities were generally not utilizing Web 2.0 applications. Additionally, the study found Web 2.0 applications, when available were predominately in English only, ignoring Spanish, the largest and fastest growing minority population.

Most local governments employ an intranet within the organization, to assist in human resources. A telephone survey of local government officials (n=17) found these intranet sites employ few Web 2.0 applications. The survey found most cities have plans to increase their use of Web 2.0 applications for human resources management. However, the recent economic recession has adversely impacted these plans. The chapter forwards recommendations to improve local governments' use of Web 2.0 applications while maintaining cost efficiencies.

INTRODUCTION

This chapter fills a significant void in the literature focused on local government Human Resources (HR) practices in the United States. Specifically, to what degree are HR departments in large cities employing Web 2.0 applications to make their practices more efficient, effective, and inclusive. Inclusiveness was measured as a function of the digital divide, to what degree have these cities expanded their content offerings beyond English, to Spanish speakers, the largest and fastest growing non-English speakers in the U.S.

BACKGROUND

Human Resources: A Brief Review

HR is one of the essential organizational functions. Its focus is human capital, one of several types of capital, including for example: finance, equipment, and land. Both private sector and public sector organizations employ capital to maintain themselves and to provide goods and/or services. Since HR deals with humans, it is one of the most complex of organizational functions. Most simply, HR is charged with ensuring an organization has the right people at the right place with the right skills. Specifically, HR links performance standards to rewards, and provides individuals with authority commensurate with their responsibilities (Guy, Klay, & Coursey, 2004; Zeidner, 2008b). The realm of HR is broad and complex, and includes recruitment; retention; skill development (training); morale; rewards (salary, benefits, and others); performance evaluations; communication with current and potential employees; outplacement (retirements and lay-offs); and compliance with federal, state, and local laws and regulations; among other functions. (Bohlander & Snell, 2010)

Human Resource Function in Local Government

The USGAO reports the three enablers of public sector management are: people, process, and technology and of these enablers, Doug Baker (2005) concurs with GAO that people are the most significant organizational asset. (USGAO, n.d.) According to Doris Wong, Vice President of Peoplesoft, appropriate application of technology is an essential contributor to human resource management (Inside View, 2008). A decade ago, choice of technology implied hardware and basic software. Today, key technological decisions surround use of the www and implementation of Web 2.0 applications (Inside View, 2008). Increasingly, HR links two key organizational assets, people and technology.

Expanding upon the above definitional assets, the complexity of HR comes to light:

- **"The right people":** recruitment and retention, and outplacement (lay-off and retirement).
- **"The right place":** geographic, organizational, and temporal location (access).
- **"The right skills":** employee development (i.e. training and career ladders).

These three assets are impacted by innovations associated with Web 2.0, and in turn impact an organization's ability to effectively employ the many potential advantages presented by Web 2.0 applications.

Public Policy and Human Resources

Public policy interests impact HR, possibly more than any organizational function. For example, affirmative action and the Americans with Disabilities Act greatly expanded diversity within the workplace and made hiring and promotion practices more transparent and possibly more complex. The HR function in the public sector

shares many commonalities with the private sector. However, the public sector is clearly different (Bronson, 2009; Harel & Tzafrir, 2001) and overlays additional complexities such as Civil Service, political appointments with implied periodic forced turnover at executive levels, critical employment sectors such as public safety, and access of diverse portions of a community, among other complexities. President Obama on 11 May 2010 sent an unprecedented memo to his Cabinet and other agency heads directing them to "overhaul the way they recruit and hire" the civilian workforce (Grant Thornton, 2010). The President's observation can be applied to almost any unit of government. Grant Thornton, a multibillion dollar accounting and consulting firm with high levels of expertise in HR, forwarded several recommendations to support the President's memo. Their key recommendations centered on applying more technology to the HR system, in short, using Web 2.0 features in governmental HR practices.

Technology and Human Resource Management

When most people think of HR, they seldom consider the linkage between HR and technology. Surprisingly, HR has a close association with technology. In fact HR needs have often been a major pull factor in the development of new technologies. The importance of technology to HR may be reaching higher levels than ever before (Schramm, 2006).

If one doubts the linkage between HR and technology is critical, a few examples should suffice. IBM and other hallmark corporations of the pre-digital age and the early digital age owe much of their existence to the needs of HR. IBM's 80 column card punch, reader, and sorter originally a tool of the U.S. Census, soon found its way into HR management. One of the most vulgar times in the management of human resources is linked to the Nazi use of IBM equipment to identify and monitor individuals, and to deport persons to work

and death camps. (Black, 2001) The IBM 360 and the mainframe revolution received considerable impetus from payroll and benefits management among other organization needs. The IBM PC (and clones) revolution extended the benefits of the mainframe revolution to smaller organizations, introduced real time benefits and salary data to organizations, and enabled job applicants to tailor resumes to a specific position.

Web 1.0 brought a communication revolution. Job announcements were now on-line and applicants submitted credentials *via* e-mail. Web 2.0 offers an even wider array of HR management opportunities. For example, Web 2.0 offers the potential for real time forms, including applications, and enables organizations to search an incredibly wide range of sources for applicant information; how many applicants never hear back from a prospective employer because of some embarrassing picture on *Facebook*? While not the focus of this chapter, it is likely Web 3.0 will further impact the way in which HR does business (Gray, 2009; Rea, 2010).

There have been many successful applications of Web 2.0 in all levels of government: federal, state, and local (Azyan, 2011; Chickowski, 2009; Moore, 2010; Monroe, 2009; Warner, 2007). These case studies, while informative and interesting are largely outside the focus of this chapter. However, experience has demonstrated that for Web 2.0 to be an organizational success, the focus must be first on people and only second on technology (Kreitzberg, 2009).

Web 2.0 and Human Resources

Web 2.0 with its enhanced communication opportunities, is the subject of an expanding literature within the private sector (Towers Watson, 2010c; Ballenstedt, 2010) and a component of many corporate case studies including firms such as Best Buy (Brandel, 2008), Capital One (Zeidner, 2008), IBM (Brandel, 2008) and SAS (Roberts, 2007) to name a few. In short, Web 2.0 applica-

tions have been found to impact organizational culture (Roberts, 2007; Randstan, 2010), communications throughout the organization (Towers Watson, 2010c; Ballenstedt, 2010), and employee relations (Sronce, 2009) as well as cutting edge management practices such as telecommuting (Sronce, 2009; Aon Consulting, 2009). Human resource departments are generally behind the curve with regard to adopting Web 2.0 applications (Zeidner, 2008a), however a rapidly expanding body of literature is focused on how Web 2.0 strengthens specific human resource functions such as recruitment (Sronce, 2009; Roberts, 2007; Schramm, 2007; Overman, 2009; Taylor, 2009), retention (McLean, 2008; Technology aids the human touch, 2010; Giordani, 2009), and training (Christensen & Horn, 2008; In the News, 2008; Baron, 2010; Accenture, 2010; Roberts, 2008a). Web 2.0 offers HR distinct efficiency advantages, for example self-service benefits where employees can take control and manage their own benefits when they want and from a location of their choosing (Franco, 2010; Human Resources 2.0, 2008; Towers Watson, 2009; Towers Watson, 2010b). In addition to improved efficiencies, Web 2.0 applications can support more effective (Corporate Leadership Council Recruiting, 2011; Ingham, 2011; TrendWatcher, 2009) and inclusive (Beaman, 2008; European Commission, 2007; Microsoft, 2010) HR operations. While Web 2.0 has great efficiency, effectiveness, and inclusiveness potential, there is also a substantial literature focused on potential difficulties with expanded use of Web 2.0 applications, namely: Americans with Disabilities Act impacts (Gurchiek, 2008a), bullying (Zeidner, 2008a), privacy (Gross & Acquisti, 2005), security (Wright, 2008), various legal matters (Sronce, 2009; Roberts, 2008b), addiction to pornography (Wright, 2009), and workers communicating negative messages about the organization (Overman, S, 2010).

A well developed portion of the Web 2.0 HR literature is focused on generational differences (i.e. a divide between the expectations of em-

ployees and job applicants and management with regard to technology). The literature shows that Generation Y expresses concern over controlled access to the Internet (Thornburg, 2009; McLean, 2008; Bronson, 2009; Gurchiek, 2008b). The expectations and concerns of younger generations often are not appreciated by management (Wright, 2008; Wright, 2010; It is about…, 2008). These same managers are unlikely to recognize that Generation X and Generation Y often hold differing perspectives of the www and technology (Aon Consulting, 2009).

While Web 2.0 HR success stories abound, it is clear that success is not automatic. Web 2.0 HR return on investment is a function of adapting systems to the local environment, most notably local culture; one size does not fit all (Martin, Reddington & Kneafsey, 2009a; Kreitzberg, 2009). Martin, Redding, & Kneafsey (2009b) provide several case studies that illuminate the benefits and challenges of Web 2.0 in HR.

Human resources, as noted above, has adopted Web applications to support many functions. Almost all local governments, beyond the smallest, support a website, and ordinarily the HR department is one of the main components found on any government website. Each of the 50 largest US cities supports at least one website. The first web based function most HR departments adoapt is job postings, especially internal postings. While a website and job postings are Web 1.0 applications with almost 100 percent market penetration, we felt their inclusion within this study was important to judge the relative penetration of Web 2.0 applications. The selection of which Web 2.0 applications to include in this study was based on our review of literature pertaining to Web 2.0 in HR departments. Since the literature is dominated by private sector experiences, and private sector organizations tend to be ahead of their public sector counterparts, we relied on private sector case studies and broader analyses to select applications for this study. Martin, Reddington, & Kneafsey (2009a) identified blogs, wikis, media

sharing, social networking, blogs, and wiki as key Web 2.0 applications suitable for HR functions. To this list we added micro blogs, like *Twitter,* which was identified as a potentially important HR application (Frauenheim, 2009).[1]

The Public Sector Lags

Relatively little literature is focused on Web 2.0 in the public sector, sometimes referred to as Government 2.0, probably due to broad implementation failures (Baumgarten & Chui, 2009). This is a likely explanation why the public sector lags behind the private sector in adopting Web 2.0 applications (Human Capital Institute, 2010). With governments facing deficits, reductions in expenditures, and hiring freezes, we are not likely to see significant increases in areas perceived to have uncertain payoffs, such as Web 2.0 (Pulliam, 2007). Several of the survey respondents noted that they had plans in place for developing their HR intranet site, but budget crunches have caused the plans to languish, a key difference between public and private sectors (Towers Watson, 2010a). Facing a resource-constrained environment fraught with uncertainty, one might argue, why not simply apply the lessons of the private sector to the public sector. While, undoubtedly there is opportunity to borrow lessons learned, there are significant differences between the two sectors. These differences limit the direct transference of private sector experience however the public sector will eventually find opportunities to borrow from the private sector. Governments will undoubtedly increase their use of Web 2.0 applications as Generation X's cultural impact on HR departments strengthens and as awareness of the efficiency and efficacy of the applications expands. Fully 94 percent of the survey respondents to are planning for greater use of Web 2.0 applications.

RESEARCH DESIGN

With little prior research beyond case and other anecdotal research studies, the present research was necessarily exploratory to identify trends within local governments (Babbie, 1998). We opted for the largest cities under the assumption that with their larger budgets, they would be better able to embrace Web 2.0 in the HR function. A two stage mixed methods research design was employed similar to that discussed by Yin (2003). The first stage was a quantitative review of each city's website similar to that employed by McDonald, Merwin, Merwin, Morris, & Brannen (2011) for their study of county websites. The first (quantitative) stage, conducted in September, 2010, reviewed the external (internet) website for each of the 50 most populous U.S. cities (See Figure 1). The second stage, executed in September – October, 2010, employed a follow-up telephone interview, gathering both quantitative and qualitative data from a smaller sample (n= 17, 33%) of officials, usually webmasters or information technology managers, knowledgeable of their city's internal (intranet) site. A phone survey was employed for two reasons. First, we needed to qualify each survey respondent, to ensure he/she was knowledgeable regarding human resources and web applications. We found that a respondent's position title gave little insight into whether or not they were the right person to respond to our queries. Secondly, telephone surveys tend to provide a higher response rate than on-line surveys (Hamilton, 2009; Kaplowitz, Hadlock, & Levine, 2004; McCarty, House, Harman, & Richards, 2007; Porter & Whitcomb, 2003) Additional data were gathered on each city's technology plans for the future. At both external and internal levels, data were gathered regarding the non-English (i.e. Spanish language accessibility of the site). The brief telephone instrument could be administered in as little as four or five minutes, however, some interviews went as long as 60 minutes as

displayed in Figure 2. Most states (n = 20) have a single city on the list while California has 8 and Texas 7. Other than Arizona (n=3) no state had more than two cities.

Sample

The second stage involved several steps. Each city's external website from stage 1 was searched for contact phone numbers for the Human Resources department. The department was contacted, and the individual answering was asked to identify the individual(s) (along with phone number) most knowledgeable of the city's internal HR site. Sometimes this contact referred us to a more knowledgeable party. This individual was then telephoned. If the individual was reached, the interview was conducted. If the individual was not available, a message was left. We made up to four contacts (with messages). The knowledgeable party (respondent) was found either in HR or more likely in information technology (IT). This often resulted in an internal gulf between those that knew the issues—HR, and those that knew the technology—IT. In all but one case, the contacted individual completed the survey. The authors as a group and individually, have conducted hundreds of telephone interviews; they were surprised by the enthusiasm of the respondents who were, with very few exceptions, delighted to talk about this

respondents volunteered information far beyond that requested by the instrument.

Population

The study employed the 50 largest U.S. cities represent a very diverse group in terms of population, ranging from 8,391,881(New York) to 375,571 (Honolulu) with a median size of approximately 605,000, as displayed in Figure 1. The cities are geographically diverse representing 31 states and each of the nine U.S. Census divisions as

subject. We were also struck by the embarrassment cited by most respondents who felt their organizations were grossly behind in their Web development efforts. They noted that their limited resources have been directed at the external web efforts and the local intranet has languished. Almost every city had plans for substantial development, but these plans were either shelved or were far behind schedule due to budget cuts.

There may well be other impediments to expansion of Web 2.0 in HR. Most significant among these is a cultural divide. There is clearly a generational divide; younger workers get Web 2.0 while many of their older managers and decision makers don't. The value of Web 2.0 might simply escape many managers and decision makers or the technology might even threaten them. One author goes so far as to describe this as a *generational war* (Roa, 2008). We know if a decision maker doesn't understand a new paradigm, and Web 2.0 is a new paradigm, they will resist it. At least two of the cities we studied face a situation in which the decision makers are suspicious of Web 2.0, feeling that greater accessibility to the internet will result in employees wasting time surfing the web, watching movies, and the like.

A response rate of 33% (n=17) was achieved. The sample was, like the population, diverse, with a median of approximately 605,000, and representative of the 50 cities as a whole as displayed in Figure 3.

CITY EXTERNAL WEBSITE REVIEW

Each city was analyzed to see if it exhibited any or all of nine applications as shown in Figure 4. Two of the applications were not Web 2.0, a website and position announcements on-line could be accomplished without Web 2.0, but since they were essential to an on-line human resource presence, no distinction is made herein if these applications are 1.0 or 2.0 in nature. Including these two applications allows comparative as-

sessment of differential penetration between the more fundamental applications, website and position announcements and the seven Web 2.0 applications.

Figure 5 displays the percentage of cities exhibiting each application. As expected, each of the 50 cities had a website and almost all (98%) had position announcements on-line. Approximately one-half had multimedia sharing and on-line forms. At this point the drop off was precipitous, with only 22 percent having social

9	wiki

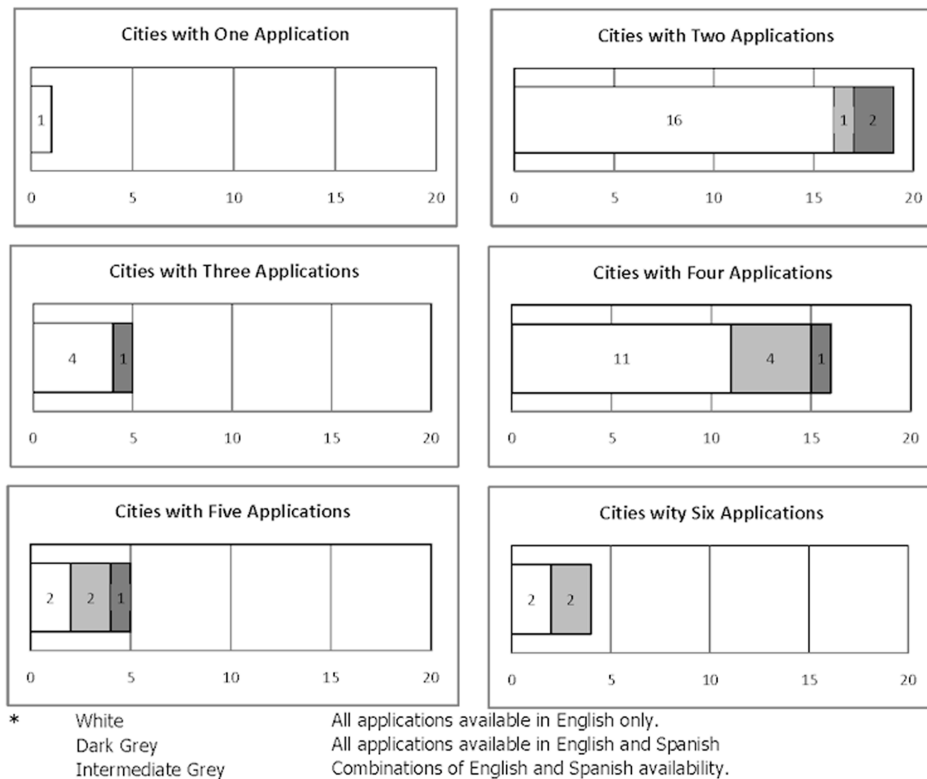
Figure 5. Percentage of cities with Web 2.0 application(s) (n=50)
networking, 6 percent enabling questions/queries, and only 2 percent having one or more blogs. No cities displayed a micro blog or wiki.

The study also sought to measure to what degree cities' on-line offerings were available in Spanish, spoken in approximately 12.2 percent of American households and the fastest growing language in the U.S (McDonald, Merwin, Merwin, Morris, & Brannen, 2011). Figure 6 displays the proportion of each application available in Spanish. For example, of the 50 cities with a website, 26 percent (n=13) have portions of the site available in Spanish, while of the cities enabling questions/queries, 3 of 6, or 50 percent, are available in Spanish. Most sites with content available in Spanish, use Google or another program for translation. While these program translators are free for use, they leave a lot to be desired and generally are of lower quality than translations produced by native or near-native speakers. City

respondents stated Google was preferred, not for its quality, but because it was free.

Figure 7 presents these data from a different perspective, application availability by language. The table displays the general lack of Spanish language services available on city websites.

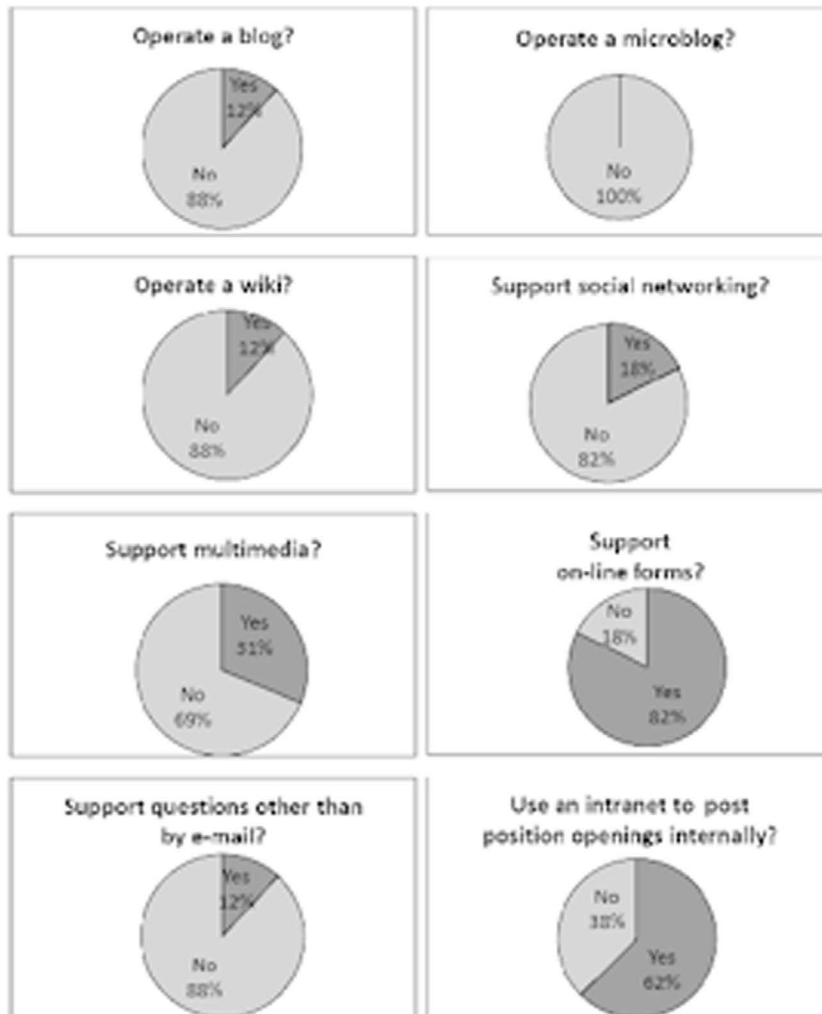
The number of applications available on a particular city's website ranged from a low of one (every city had a website) to six. Three cities out of the fifty most populous U.S. cities had a website and five other applications as shown in Figure 8. The figure displays that almost three in four (72%) of websites contain no Spanish content. For the 14 (28%) other cities, the majority (18%) have one, two, or three applications available in Spanish, with only 10% having four or five applications in Spanish.

Figure 6. Percentage of cities with one or more applications in Spanish (n=50)
Figure 7. Application availability based on language (n=17)
Figure 8. Cities by number of applications and language availability


HUMAN RESOURCES INTERNAL SITES

One-third (17) of the 50 largest cities completed a telephone interview seeking information regarding human resource intranet applications available within the government and not available to the general public. As displayed in Figure 9 approximately 9 in every 10 cities operate an intranet for human resources purposes as displayed in Figure 9. There were no discernable differences between the 14 cities that an intranet and the 2 that did not.

Figure 9. Does the human resources department operate an intranet accessible from inside the government? (n=16)
The interviews queried respondents regarding eight Web applications and the availability of the following: blog, micro blog, wiki, social network, multimedia support, interactive on-line forms, questions and answers by other than e-mail, and position postings. The results are displayed in Figure 10. Only two of the eight applications: on-line forms (82%) and internal position postings (62%) were utilized in more than one-half the cities. Each of the other six applications were utilized in less than one-third of the cities. Clearly, there is considerable potential for expanding the use of Web 2.0 functions in city government.

Figure 10. Internal web applications (n=16)


Growth will take more than fiscal resources. It will also require efforts to convince those who control the budgets that HR Web 2.0 investments have substantial payback for the community. While the private sector has found substantial savings in converting much of HR to Web 2.0 applications, two respondents noted that their city councils would not fund multimedia sharing because they feared employees would spend time watching movies.

We sought to determine if Web 2.0 are widening the digital divide with regard to language. As Figure 11 indicates, relatively few city HR departments (12%) have on-line applications available in Spanish. Clearly, the digital divide remains wide with respect to city HR departments.

Cities have considerable potential for increased use of Web 2.0 applications. Not surprisingly, almost all cities (94%) responded they had plans to expand their usage of Web 2.0, as shown in Figure 12. The majority of respondents who plan to increase Web 2.0 usage, noted the plans are on hold due to the recession and declining revenues. However, as Franzel (2010) states, this may be a false economy since e-Government, and especially Web 2.0 options may in fact save money.

SUMMARY, CONCLUSION, BEST PRACTICES, AND FUTURE RESEARCH

Large city human resource departments are not recognizing the considerable potential of Web 2.0 applications. However, existing Web 2.0 technologies are highly popular among employees and very useful tools for management and HR departments. The two applications employed by the majority of cities, support for on-line forms and internal job posting, are generally dependent on older technologies. And, it is reasonable to assume the 50 city websites reviewed and the 17 (33% of 50) respondents are a best case scenario in U.S. city government. These larger cities are more likely to

have the resources, including professional talent to support Web 2.0 development. Unfortunately like most matters in government, resources are constrained, and when financial resources are constrained, technology budgets tend to suffer. This may be particularly tragic because human capital resources may be the most important of all organizational resources.

What is clear, based on the private sector literature, is that Web 2.0 presents considerable opportunity to make HR departments more efficient and effective, and very possibly to restrain costs. Since government was behind the curve when the recession set in, the principal recommendation is straight-forward; as budgets recover, direct resources to HR departments to realize the potential of Web 2.0. Since we do not know what Web 3.0 holds for human resource departments, HR must be attentive to technology. They may be able to

Figure 11. Are any of the human resources departments' on-line applications available in Spanish? (n=16)
Figure 12. Does the human resources department have plans to increase the use of Web 2.0 applications? (n=16)
Skip Web 2.0, save a generation of resources and investments, and realize the advantages of Web 3.0.

Frustration levels among city HR directors and intranet managers are high. They recognize the opportunities but have diminishing hope to capture the potential offered by Web 2.0 technologies. Leadership is essential to help Web 2.0 gain traction in city government HR departments. While employees and HR professionals often appreciate the advantages of Web 2.0 applications, political leadership remains unconvinced and distrustful. Administrative leadership (e.g. city managers, administrators, and HR directors) will need to educate and change the negative or uninformed predisposition of many decision makers.

Web 2.0 in HR has not shrunk the digital divide. If anything, the divide has expanded as English speakers benefit from the new applications and Spanish speakers are left out.

Since Web 2.0 technology is relatively inexpensive it is clear that budget constraints may not be the most significant factor hindering Web 2.0 in HR. The private sector found leadership was essential to implement Web 2.0, and that leadership needed to be enlightened regarding the potential benefits of Web 2.0. Undoubtedly there is an important role organizations such as the International City and County Managers Association and the National Conference of Mayors can play to highlight success stories and the potential Web 2.0 holds for local governments.

The impact of Web 2.0 on local government HR warrants a good deal more research. Case studies are needed to investigate how particular organizations have grappled with Web 2.0 implementation and the impact of specific applications on HR operations. Additionally, research is needed to better understand the impact of Web 2.0 on other units of local government, for example counties and school systems.

Based on the findings of this study, five best practices are suggested:

1. Public sector HR departments ought to continue to borrow from the private sector since businesses have many years head start using Web 2.0 applications in human resources. The private sector has successfully shown that Web 2.0 can help HR department to expedite some of the clerical functions and free up HR staff to focus on strategic matters.
2. Public sector HR departments need to pursue Web 2.0 with all due haste as resources become available during recovery from the economic recession.
3. The language barriers evident in Web 1.0 seem to expand with Web 2.0. City HR departments must be aware of the expanding digital divide and address this to the best degree reasonable. As private sector organizations have relied on consultants for HR support, cities may find consulting organizations or consortiums with other governments a way to expand language offerings while maintaining cost control.
4. Change agents, must be identified and cultivated. Those individuals with the knowledge, motivation, and courage to lead must be rewarded for efforts that may go against present organizational culture.
5. Finally, HR departments need to keep current with technological advances in Web 2.0 and potentially Web 3.0.

ENDNOTE

[1] A substantial case literature focuses on the implementation and advantages of various Web 2.0 applications. Cases can be readily found at the Society for Human Resource Management (SHRM) (www.shrm.org) and the International City and County Management Association (ICMA) (www.icma.org) sites.

Section 6
Managerial Impact

This section presents contemporary coverage of the social implications of Human Resources Management, more specifically related to the corporate and managerial utilization of information sharing technologies and applications, and how these technologies can be extrapolated to be used in Human Resources Management. Core ideas such as motivation, gender equality, recruiting, and other determinants that affect the intention to adopt technological innovations in Human Resources Management are discussed. Equally as crucial, chapters within this section discuss how leaders can utilize Human Resources Management applications to get the best outcomes from their employees and customers.

Chapter 53
Managing Professions for Knowledge Management

Enrico Scarso
University of Padua, Italy

Ettore Bolisani
University of Padua, Italy

ABSTRACT

In the last years, Knowledge Management (KM) studies have focused on the foundations of this "new managerial discipline". Today, there is an increasing need to transform the theoretical speculations into managerial tools, and to find solutions to practical questions concerning daily KM activity. A key issue that still requires investigation regards the management of human resources devoted to KM. The paper analyzes this topic by means of an in-depth investigation of the relevant experience of some leading companies. In particular it examines the problem of managing new roles and tasks for KM, the issue of developing structured KM units, and the question of evaluating KM activities. A discussion of the possible implications for research and management is carried out in the conclusion.

INTRODUCTION

From its origin, Knowledge Management (KM) has been attracting the interest of the leading US and European companies that have rapidly implemented KM programs (Grossman, 2006). Hence, KM is becoming an essential ingredient of management practices, and it needs to be integrated with the other well established management functions.

One issue that deserves explicit consideration concerns the links between Human Resource Management (HRM) and KM (Edvardsson, 2008; Gloet, 2006). Actually, human resources are involved in KM in many ways, and broadly speaking the relationship between KM and HRM can be seen under two different perspectives. The first one considers employees as the ultimate users of the knowledge an organization possesses (Oltra, 2005). Accordingly, the link between HRM and KM is seen in relation to aspects such as the

organization of training activities, the provision of knowledge-based services, the facilitation of employees' interaction, etc.

The second perspective focuses on the fact that a successful implementation of KM requires personnel specifically employed and trained for managing such initiatives (Burstein et al., 2010; Edvardsson, 2008). This view argues that the adoption of appropriate knowledge-related HRM practices can influence the effectiveness of KM activities (Burstein et al., 2010; Cabrera & Cabrera, 2005), and the practical implementation of KM requires changes in the way people are managed, for instance with the aim of influencing individuals to assume a knowledge-sharing attitude.

This paper especially focuses on this second aspect, which has been relatively less considered in the literature. In particular, it investigates the challenges posed to HRM by the emerging KM-related activities. The recent literature and the empirical evidence are surveyed with the aim to underline important issues, relating to the nature and the contents of the new professions, the staffing policy, the performance appraisal, the rewards system. Based on this analysis, we discuss the main practical aspects of HRM in KM programs, and make some important points for a future research agenda.

THE ROLE OF PEOPLE IN KNOWLEDGE MANAGEMENT

Setting the grounds of KM as a managerial discipline has proven to be a difficult task that is still challenging researchers and practitioners. This is certainly due to the youth of the field and to the fact that several disciplines are contributing to its development (Baskerville & Dulipovici, 2006). In addition, it is the term knowledge itself that can be confusing. In the KM literature, knowledge is often defined in comparison with the notion of information. According to Holsapple (2003) information consists of data that have been organized

for a particular use (i.e. qualities or measures of phenomena or facts, like, for instance, prices, sales, inventories, etc.), while knowledge is a combination of information, ideas, experience and insights that guide actions and decisions. Therefore, although knowledge is based on information, deriving knowledge from information requires human judgment, and is based on context and experience.

According to Holsapple and Joshi (2006), KM can be defined as the deliberate and organized efforts made by individuals or organizations to expand, cultivate and apply available knowledge in ways that can add value to their activity. To put it in a nutshell, KM consists of a set of techniques and tools to make the right knowledge available to the right people in the right moment.

A recent study (Heisig, 2009) aimed at comparing 160 different KM frameworks around the world shows that KM is generally seen as a set of main activities (knowledge creation; knowledge storage; knowledge sharing; and knowledge application) whose effectiveness is based on a proper mix of human, structural, cultural, and managerial factors.

In the past, two main approaches to KM have been followed by companies, one associated to a hard technology-oriented notion, the other to a more human-oriented vision (Lee & Choi, 2003; Newell et al., 2006). The technology-oriented view derives from Information Systems scholars: knowledge is considered to be an object that can be detached from its holder, and can hence be stored and transferred by means of a technological device. Conversely, the human-oriented approach considers knowledge as inseparable from the mind of individuals and as a result of social processes. Thus, although both views ascribe an essential role to computers and ICT systems, while in the technology-oriented approach technologies are the cornerstone of KM and they are seen as a way to automate cognitive tasks, in the human-oriented approach they are considered a set of enabling

tools that may or may not be of use to human beings for facilitating their cognitive activities.

The experience seems to confirm that the effectiveness of KM projects depends on both technical and non-technical elements. The large majority of initiatives carried out by companies resort to a mixed set of solutions, which include both technical tools (e.g. knowledge repositories, knowledge portals, web directories) and organizational arrangements (e.g. teams, communities of practice, meetings). KM can therefore be seen as a socio-technical issue, where both technological and human/organizational aspects must be adequately combined. But while the former have been widely discussed in the literature, the latter still deserves a thorough investigation. Specific issues regard people involved in KM activities. First, there is the need for new competencies and dedicated organizational structures to manage KM initiatives. Secondly, employees can be asked to perform new KM-related tasks, which require capabilities, skills, and attitudes they may not have. Such new activities also need motivation, especially when they are seen as mere distraction from the usual business. Hence, implementing KM programs has an effect on HRM, and it is necessary to investigate how to properly manage people involved in KM in order to obtain their best.

METHODOLOGY

Aims and Scope

As previously said, the issues of HRM in KM require an effort of exploration, systematization, and rationalization. With the purpose to contribute to this effort, we analyzed and compared some relevant case-studies of important companies that developed significant KM programs. The aim of the investigation was to shed light onto how companies manage employees involved in KM staff and what are the related issues. In detail, the main questions addressed were as follows:

- What are the new roles and profiles involved in KM programs? How are they managed? What are their tasks and responsibilities?
- How are KM units organized? What are the relationships with the existing organizational structures?
- How are KM tasks evaluated in companies? What mechanisms of incentive and reward are adopted to improve the effectiveness of KM programs?

Data Collection

Data collection was primarily based on secondary sources. Indeed, considering that there are several case-studies of KM programs reported in the literature, we thought that it would have been easier to examine this literature instead of making new case-studies of the same companies. The literature emphasizes that in some cases the resort to secondary sources can be fruitful (Barbour & Eley, 2007) for doing extensive comparative research, and for exploring specific aspects that were not explicitly analyzed in the original cases. The data collected from secondary sources were integrated with additional information that we could collect directly by mean of case studies that we conducted in a selected number of companies.

The decision to consider multiple case-studies and not just one was justified by the goal to identify common or recurring issues and comparing the adopted solutions within a significant sample of KM programs.

Sample Selection

The selection of the sample was preceded by the identification of a number of cases of relevant KM initiatives that were well documented in the literature. Table 1 clarifies the features of our study. Almost all the surveyed companies are multinationals, whose organization is complex and HRM is complicated as well. In addition,

Table 1. Outline of the cases considered

Company	Industry	KM programs	References – sources

multinational companies have to deal with different cultures. In those corporations, there are well-structured practices and procedures, and HRM absorbs significant resources. Secondly, the cases show a significant range of situations, issues, and approaches to HRM in KM.

The sample includes companies of various sectors. This certainly confirms that KM is recognized as a key activity by leading firms, independently from their business area. In addition, it allows exploring a broad variety of situations. Generally speaking, it is very difficult to classify the various KM programs that companies have been implementing. Here, since we focus on the relationship of KM with HRM, we can roughly identify the KM programs analyzed into two main categories, namely:

- "Soft" programs, i.e. focusing on the key contribution of people. A widely used soft approach is that of Communities of Practice (CoPs), formed to facilitate knowledge sharing between employees facing similar problems or involved in analogous operational activities (Wenger et al., 2002). Computer technologies may be of great help here, but are, generally, not the core question;
- "Hard" programs are chiefly based on the essential support of information technologies, named Knowledge Management Systems (KMS). Several computer technologies are currently used to automate (or, at least, facilitate) knowledge storage, retrieval, transmission, and sharing (e.g.

document systems and repositories, intelligent search engines, interactive communication tools, enterprise portals, web knowledge maps).

In reality, as stated, the soft and the hard approaches are generally mixed to one another. Empirical evidence shows that KM programs are often not just a matter of technology, but rather of people, which means that HRM can be crucial, also when technology plays a significant part.

Data Analysis

The investigation was mainly based on qualitative data, directly drawn from the case-study reports: descriptions of KM programs and management solutions adopted, characteristics of the KM units, profiles of KM staff, etc. In particular, the problems faced by companies, the adopted solutions and the explanations of these choices were analyzed when their descriptions were included in the case-study reports. Qualitative data (when available) were also considered, but especially to understand the dimension of KM programs and explain the consequent problems.

Possible Points of Weakness

Clearly, the reader must be aware that the use of secondary sources has some limitations. Specifically, the connection between the research questions of interest and the data available in the case study may be weak, because the research was designed by others with different purposes. In addition, there may be a temporal misalignment between the data related to the various cases. However, in our specific situation, the use of secondary sources was functional to our research aims that were mainly: drawing an essential picture of the applications of HRM to KM, providing food for thought to researchers and managers, highlighting possible critical points, and exploring the solutions adopted to face them.

The selection of the sample has also some criticalities. The cases investigated are all well documented in the literature, and they are generally considered success stories. Furthermore, the KM programs investigated refer to large corporations: investments in KM are therefore high, and there is a significant commitment of top management. Consequently, the findings of our analysis can be biased. However, since our aim was to identify the core issues of HRM in KM programs, we thought that it was important to analyze the companies that lead the way, whose solutions and problems can provide food for thought.

HRM IN KM PROGRAMS: LESSONS FROM EXPERIENCE

Roles and Responsibilities

This issue is examined in relation to two categories of employees (Maier, 2007): a) employees whose task is the efficient and effective performing of KM activities and processes, and b) personnel that work in other business units but, at the same time, participate in and are affected by KM initiatives.

The presence of KM employees in organizations derives from having realized that the systematic and rational exploitation of knowledge as a corporate asset implies that KM processes have to be managed explicitly and directly. KM jobs are peculiar compared to the more traditional ones. While the first experimental KM programs often engaged few part-time or occasional people, today this is not possible any longer, especially considering the current dimension of many KM initiatives. The creation of structured and dedicated units (namely, teams explicitly devoted to KM activities) is the way generally followed by companies.

This has important implications for HRM. First, several job profiles have been created that have no correspondence to the traditional roles. Many KM profiles and titles tend to be used more

frequently (Maier, 2007; Ruth et al., 2003), but tasks and responsibilities are still unclear. Formal descriptions of KM jobs are still missing, are ambiguous, or can be confused with other activities. Actually, some KM roles are re-alignments or extensions of existing roles, while others are newly created (Burstein et al., 2010). For example, it may happen that KM duties are assigned to IT or HRM people, i.e. to departments whose activity involves organizing people, processes, and information technologies and are expected, by their nature, to entail KM tasks. This especially occurs in companies where KM is seen as a set of hard computer-based programs.

Even the titles used to identify the new roles change from a company to another. For instance, the functioning of CoPs requires two main tasks, i.e.: a) the management of KM tools that underpin knowledge sharing (e.g. IT applications, document management, organization of meetings, contacts keeping), and b) the development of knowledge domains (e.g. identification of relevant knowledge contents, their formalization, developing taxonomies, leading discussions, facilitating the delivery of best practice). In the various companies, such roles may however correspond to different terms and, not rarely, to different task profiles. At Caterpillar *community managers* boost and assist the processes of knowledge sharing among the members of a CoP. But the same roles, in Siemens ShareNet program, are indicated as *facilitators*. These tasks concern KM support rather than knowledge domains. On the contrary, in PricewaterhouseCoopers's (PWC) communities, the leading role is played by *subject matter experts*, that are not full-time KM employees but senior professionals that are experts of particular fields, dedicate just part of their time in managing the community, and put their competence at the service of the others. Their KM task is, consequently, more involved in the development of knowledge domains, while they are assisted by full-time KM personnel in resolving day-by-day practical problems (called generically

knowledge managers). At ENI (Ente Nazionale Idrocarburi) facilitators are often senior experts that act as a sort of primus inter pares among the other members of a community, and are supported by a full-time KM staff, named *enabling team*, led by a *coordinator*.

A popular role is that of *knowledge brokers*. At sd&m, a large German software company, they are responsible (for a limited period) for collecting material and developing reports in specific areas and topics; reports are then delivered to the *technology managers* (term notably used, in that company, as a synonymous of *knowledge manager* – Brössler, 1999). Conversely, at PWC, knowledge brokers are seen as facilitators of knowledge transfer processes. Their activity mainly consists in stimulating the potential users of knowledge to access document repositories, join in CoPs, consult matter experts, etc. Therefore, they are KM support people rather than domain experts. At Siemens, instead, knowledge brokers are at the same time KM people (that help supporting knowledge exchanges within the CoPs) and partly experts of a specific knowledge domain as well. A similar function is played at Hewlett-Packard (HP) by *knowledge advisors*, who are responsible for helping users search for information, making people and community connections, training users in the use of KM tools.

Other ways to name KM roles can be found in other firms. At DuPont (Davis et al., 2005) there are four roles: high level *synthesizers* (experienced R&D managers responsible for monitoring technological developments); *librarians* (whose duty is to gather, assimilate, index and store copious amount of information, and to provide timely assistance and service to other employees); *knowledge engineers* (acting as knowledge interface between R&D, marketing and customers); and *knowledge operators* (typically front-line employees that accumulate and transmit operational knowledge and work very closely with knowledge engineers); and finally *domain experts* (who test the validity of the knowledge assets collected). At

Accenture the knowledge incorporated into their KMS is assessed by *editors* who are responsible for the synthesis, repackaging, organization, and categorization of knowledge.

A key role is that of *Chief Knowledge Officer* – CKO – or similar names. This is probably the most popular KM role, as testified by the literature (Awazu & Desouza, 2004; Maier, 2007; McKeen et al., 2003). According to Wenger et al. (2002), the objectives of a CKO's include: maximizing the firm's knowledge assets, designing and implementing KM strategies, effectively exchanging knowledge assets internally and externally, and promoting the use of KMS.

A clear leadership is considered critical for the success of every KM initiative (Anantamula, 2008), and, for this reason, the CKO should be a senior executive. But this is not the rule, and the situations can be very different. CKOs are not always senior executives or, when they are, they can be just part-time CKOs. At PWC, for instance, the *Global Knowledge Manager* is the director of a business division. He is mainly a sponsor of the program, represents the link with the top management levels, and has budgeting responsibility. More specific aims and implementation strategies are the duty of lower level managers that, however, do not have the same authority in the company chart.

The CKO profiles and their duties also depend on the existence of an independent KM unit. At Accenture, for example, a specific manager, called *Chief Information Officer*, initially headed the KM program. When the unit was incorporated into a wider organizational division, there was a change in roles, tasks, and responsibilities.

The picture is made even more complex by the fact that there are people somewhat involved in KM activities while working in their business units. The issue of *double tasks* and roles derives from the fact that each employee can be considered both a potential source and user of knowledge. This situation is typical of CoPs. For instance, in TechClubs - the CoPs at Daimler – engineers wear two hats: as tech club members, they improve their competence, co-ordinate standardization of practice, and share knowledge with colleagues; however their main affiliation is still at the car plant, and focuses on the design of new models. This double role can cause several problems. At Shell the conflicting priorities of managers reduce their motivation to actively participate in the Turbodude community. At Unilever the most strategically relevant communities proved to be not necessarily the most active ones, primarily because the experts that worked in an area that was of high strategic value were too busy with their local tasks to share their knowledge.

Formal KM Units and Overlapping With Existing Structures

This issue arises once KM programs switch from simple additional activities, performed by existing organizational functions, to highly strategic goals that require structuring, as happened in most firms. Formal KM units are often created to seek efficiency and control over KM activities, which implies specific solutions in terms of setting organizational charts, budgeting, fixing (economic) goals and measuring them, establishing authority and responsibility, planning careers and wages, etc.

The overall picture is, again, very complex. Lara et al. (2002) contrast two opposite situations: strictly formal KM units (e.g. American Management Systems, where the organization of KM activities is aligned with the formal culture of that company) and substantially open environments (for instance, the World Bank KM programs with a certain degree of non formalization). The majority of situations lay in the middle. These intermediate solutions may mean, for instance, that KM units are placed under the responsibility of other divisions, or that KM tasks just represent one part of the staff's current activities. KM initiatives at ENI, even though they involve the entire corporation, are considered part of the Exploration and Production Division that, at the same time, has

several other tasks. At Accenture, KM and learning management have been integrated into the same unit. This reflects the view that the two activities are considered similar and complementary.

Sometimes, this can lead to unclear situations as regards to responsibility and authority. At PWC, a Global Knowledge Manager is in charge for budgeting and general KM strategies, but KM people are subordinate to another director for their daily work. Things can be even more complicated in case of complex multinational KM teams, with the existence of independent but linked KM units. This confusing picture can be seen somewhat typical, given that KM is a substantially new activity that still needs accepting and economically justifying by managers. It is what happened to other management functions (see, for instance, IT departments) that are, now, an established formal part of companies.

However, another important reason has to be mentioned: the nature itself of KM. Since the purpose of KM is to facilitate the sharing and exploitation of knowledge across the entire organization, it requires an active participation by many people that do not necessarily work in the KM unit. A good example is that, again, of CoPs that are generally designed to overcome hierarchical, linguistic, cultural, and geographic barriers that exist in an organization. Since people working at the same project, plant, or market tend to develop idiosyncratic "knowledge islands", CoPs are put as bridges over islands thus enabling companies to exploit the valuable intellectual capital scattered in their dispersed organization. For instance, Siemens Knowledge Community Support was explicitly aimed to network internal knowledge embedded in the distinct parts of the firm. The Shell Turbodude networks were created to facilitate knowledge sharing among colleagues of distinct deepwater exploration teams. At Daimler, engineers working on new models at different plants participate in inter-company TechClubs, where they can share knowledge of specific problems.

This transverseness can cause conflicts with the existing organizational structure. For instance, the development of a new CoP can require the transfer of power from the line management to the community itself. But this may be perceived as an internal element of competition. In ENI's CoPs, experts and facilitators are subordinate to their hierarchical line for usual business operations and to the KM enabling team coordinator for the time they devote to KM activity.

The question of whether and how KM programs can coexist with existing structures is thus critical, especially when they assume a formal configuration and are recognized as a part of the system. In the KM view, knowledge sharing cannot be intended as a mere informal activity that is almost invisible to the formal organization. Structuring and formalization are especially required when KM practices have a directly recognizable business goal. At Unilever, a formal framework has been put in place to help ensure the effective and efficient operation of KM activities and to establish appropriate links to the rest of the organization. At Shell, the conflicting priorities of managers reduce the motivation to actively participate in the community.

In any case, KM structures have peculiar social and organizational functioning, compared with the traditional ones. Especially in the case of CoPs, the involvement of several people, well beyond the boundaries of the KM office, suggests that those programs do not respond well to a usual control. Based on their analysis of Caterpillar, Ardichvili et al. (2006) point that managerial efforts should be devoted to remove barriers and create favorable conditions for individuals' participation. In other words, rigid hierarchies and mechanisms based on authority can prevent the contribution from the other parts of the company, which may be fatal for KM.

When KM programs grow, and their scope extends across departments and multinational sites, the question of local vs. centralized management arises as well. As the Accenture experience shows,

although a central standardized policy may provide common practice and facilitate the flowing of knowledge, locally-managed communities can favor effectiveness and stricter focus on specific issues of interest. Similarly, at Caterpillar and Siemens, differences in culture, values, business approaches, sense of authority, and preferred modes of communication suggest that KM practices should be tailored to the single area of application. On the other hand, the development of distinct environments raises the issue of integration. For instance, when CapGemini merged with Ernst & Young, adapting and integrating KM approaches and structures became a difficult task.

Value of KM

This issue involves two main aspects. Firstly, measuring the economic worth of KM is essential for budgeting resources and for fixing wage schemes. One essential point is that KM should create value for business, and a crucial question here is how costs and benefits can be effectively measured. This is still a puzzling problem in the current practice (Scarso et al., 2011). Due to the intangible nature of KM, proving the absolute validity of the business case, and evaluating costs and contributions to profit are very difficult, and sometimes nearly impossible (see e.g. Glynn on Siemens' KM programs). In addition, the most significant contribution of KM probably arises in a long-term perspective. At Daimler TechClubs, KM communities help to solve day-by-day problems which mean short-term value; but are also deemed to develop expertise of members, which means long-term value. Similarly, Procter&Gamble's KM practices are explicitly declared as a key component of the innovation and technology strategy. Also, McKinsey reports advantages in developing new customer-oriented strategies. All those examples show that the real contribution of KM is seen in terms of strategic value associated to the development of internal knowledge assets.

But this contribution is clearly very difficult to estimate.

Different methods of KM measurement have been adopted in distinct cases. For evaluating the benefits, a frequently used approach is the measurement of tangible elements (i.e. documents delivered, reports written, information packages provided, accesses to knowledge repositories). Such solutions are used frequently, but while they provide information about the *quantity* of knowledge exchanged, they do not indicate its *quality,* which is clearly essential for measuring the business value. Based on that, most companies implemented a system for monitoring the satisfaction of company users, i.e. how much knowledge resources are seen as valuable contribution to everyday work. The solutions are, however, very different, and still based on a trial and error approach. At McKinsey, the measurement of satisfaction of KM efforts was initially left to the single user, while in a second time systematic measures were developed. Both at PWC and Ernst & Young qualitative measures through periodic questionnaires and interviews to users were implemented. All this proves that a standard solution has not been found yet to this key problem.

The second important question is that, to create business value, KM programs need the direct involvement of the entire company. In other words, the more the KM system is used and fed by all the company's employees, the more KM is valuable for business. It is thus important that the entire staff of a company – and not only the KM employees – accepts to contribute to KM, as sources or users of cognitive resources.

Several attempts have been made to promote the participation in KM. One way is to establish economic incentives. For instance, potential sources of valuable knowledge (i.e. experts of some particular field) may be asked to share their knowledge having in return an economic benefit. This approach was adopted by Siemens' ShareNet community: while, initially, knowledge

contributions to KM resources were based on the voluntary efforts of *evangelists* that led the way, then a more formal mechanism of economic incentives was established. Anyway, since knowledge can be considered a precious capital by the experts who possess it (i.e. they are paid based on their capability to solve problems or provide new ideas), in some cases there is an attempt to protect the "copyright" on knowledge contributions. We can mention the interesting example of a large advertising company's website, that collect new ideas from professionals and "put their stamp" on such ideas.

Non-economic incentives can be based on public recognition of the most valuable contributions, thus their sources can be recognized as experts in a particular field. The HP's IT Resource Centre program used a mechanism of credit rating of personal contributions. The experience however shows that while this mechanism is effective in environments where peer reputation is important (e.g. in the software developers community, or among R&D people) it can be less important in other contexts. Non-economic incentives can consist of prizes and bonuses, which represent more tangible forms of reward, but the problem is how to link prizes with real value.

Also, to increase the value added, it is necessary that the KM system is really exploited by the company. Convincing users to utilize the knowledge retrieved or exchanged by means of the KM program is essential for the long-term justification of the program itself. Indeed, the question here is that it may be difficult to convince people to use a system or a method whose utility is not taken for granted, and with which they are not familiar. In Siemens' ShareNet efforts to facilitate the use of KM programs include providing knowledge contents adapted to the specific goals of each individual, and implementing an ergonomic interface with KM repositories. McKinsey adopted a very articulated approach, that includes e.g.: increasing the visibility of experts that share their knowledge (to raise the credibility of the KM ap-

proach); monitoring knowledge contents provided by experts (so that only good contents are provided to users); and establishing incentives to users.

CONCLUSIONS: IMPLICATIONS FOR RESEARCH AND MANAGEMENT

This section summarizes the main lessons that can be drawn from the study in relation to the main issues treated, namely: the development of specific roles and responsibilities in KM; the setting up of formal KM units; the overlapping with existing organizational structures; and the economic value of KM tasks.

New Roles and Profiles

An effort of codification and standardization of KM workers appears to be a vital element for the development of KM initiatives. This can give order to the KM activities of a company by implementing career plans and wage schemes that can be recognized by both KM employees and the rest of the organization. Also, job profiles are an important reference for identifying the competencies that are needed for each task, and arranging adequate training programs. Another indirect (but important) result of standardization can be the creation of a category of professionals, independently from the specific company where they are employed.

It should be remembered that companies have different views of KM, so specific variations can't be eliminated. Nevertheless, a description of KM jobs can at least include some general qualifications that help to understand if a person is eligible for a particular KM position. These qualifications can firstly include the particular KM tasks or processes performed and their relationship with other organizational activities. Also, since KM jobs are strictly intertwined with the rest of the company, the main goals of the KM activity expressed in business terms and the hierarchical

interdependence with other units or offices should be clarified. It may also be important to explain that a job position has or hasn't the responsibility for a specific budget. As regards the required educational background or experience, a special attention should be devoted to ICT skills. This does not mean that a person must always be a recognized expert of sophisticated computer systems. But since ICT applications are basic components of KM programs, an applicant should at least have essential notions of the potential use of these systems in KM. This facilitates the recruitment process, makes the transfer of professionals easier from a firm to another, and creates a more efficient and transparent job market.

Attempts to classify KM roles and profiles have already been made by scholars (Burstein et al., 2010; Maier, 2007; McKeen, 2003; Oltra, 2005; Ruth et al., 2003). This can be a good starting point, but should not remain confined within the academic environments. The diffusion into the business practices is the crucial work that still has to be done, and requires the direct involvement of company managers and trade or professional associations. Also, the competencies needed for KM are still ambiguous, and subject to a continuous change. There is a general shift from the pure IT skills, which denoted the first KM tasks, to broader managerial, organizational and even sociological competencies.

Training and learning programs are increasingly vital for resolving recurring problems like for example:

- Providing the essential background for specific KM tasks; although there is flourishing of courses on KM in business schools and colleges, the tradition of a "KM school" has not been established yet;
- Standardizing concepts, terminology, and approaches to KM, for helping KM employees that come from other areas and don't have specific training in KM (this

appears to be the norm even in the major companies);
- Disseminating general knowledge of the fundamental elements of KM as an ingredient of managerial skills, so that the entire company can understand the KM language; as an example, people should be familiar with terms such as knowledge transfer or community of practice, the same as they are with notions like budget or organizational chart.

Formalization of KM Activities

Building a formal unit for KM requires several actions, such as: clearly defining roles and processes, budgeting and allocating resources, fixing economic goals and monitoring them, establishing authority and responsibility, planning careers and wages, and so on. The question of whether a KM unit should be a formal or informal environment is subject of debate. On the one hand, formalization is required when efficiency is sought. Indeed, as in other activities, KM has a number of tasks that represent procedures and routines, whose systematic organization can be beneficial. On the other hand, too strictly formal rules can hinder the process of knowledge sharing that is still based, at least in part, on flexible participation and voluntary contributions. Also, formalization can help KM employees to gain recognition by the rest of the company (Lara et al., 2002), but can give rise to conflicts with the other well established managerial functions.

As the case studies show, KM units often overlap the existing organization, which raises problems of multiple roles, conflict of authority, etc. Very often, KM roles are part-time tasks: most people, especially in new projects, work in KM activities while doing the usual business practice at the same time. Clearly, this reduces the effectiveness of KM actions and raises conflicts with the other operators. From a HRM perspective, the management of such conflicts is a critical

task that is still largely based on a process of trial and error experimentation.

Evaluation of KM Activities

KM activities have often intangible contents and thus, by nature, are hard to measure. Furthermore, the scope of KM functions extends across the entire organization. This makes the evaluation of costs and benefits of KM for each business unit more difficult. Currently, there is no formal or standard practice for the measurement of KM activities. As shown, firms are now arranging their peculiar methods of auditing, based on a mix of qualitative measures but, at the moment, there is no best practice emerging. What should be noted is that companies are acting based on their specific experience, rather than on systematic or conceptual approaches. Here, fields of study such as Intellectual Capital and Economics of intangible assets might provide good reference for KM practice as well.

A second important issue that our analysis allows to highlight regards the role of incentives and rewards systems. Since the success of KM depends on the active contribution of people scattered in the company, this issue is under the attention of KM practitioners. However, companies are not yet capable of providing measures of the economic benefits of KM in a way that can be accepted and recognized universally. Consequently, the active participation of individuals in KM programs is often based on personal evaluations of their potential benefits. This can be vital at the launching stage, but the further development of a KM program requires other forms of incentives. The survey shows that the various companies have creatively implemented several forms of economic or non-economic incentives, and there is no best practice of reference. A useful contribution of HRM studies can be the systematic analysis and comparison of the reported experience, to help identifying the solutions that have already been experimented, their advantages, and benefits.

Conclusive Remarks

No longer exclusive domain of philosophical speculation, today knowledge is referred to as an essential and concrete element of firm's competitiveness. The current economic climate, with the difficulties it brings, represents an additional motivation to invest resources in the production, management and delivery of knowledge, in the hope that this can help to keep on progressing. This is the reason why KM has now a well-established place in the research community.

In spite of this, there is still a long way to go. As our investigation on HMR issues in KM testifies, managing knowledge in companies not only calls for theoretical concepts and technical solutions, but also requires proper organizational arrangements and managerial capabilities. Like other managerial disciplines, KM would benefit from a converging development of formal notions, applicative models, and organizational practices.

On the one hand, knowledge can't be treated in the business arena as an object of pure speculation. In particular, each company shows peculiar problems and needs, and a direct connection with the day-by-day activity is essential for implementing effective KM programs. On the other hand, a strong conceptual formalization of models and approaches is important for allowing comparisons between KM and other managerial activities, as well as between KM programs of different companies. Budgeting, allocation of resources, and managerial control would become easier. In short, as our study shows, the balance and effective combination of theory and practice represents today's challenge for both scholars and practitioners involved in KM.

ABSTRACT

It is now more than a decade since the acknowledgement of the health human resources crisis that exists in many low-income countries. During that decade much attention has focused on addressing the "pull" factors (e.g. developing voluntary international recruitment guidelines and bilateral agreements between recruiting and source countries) and on scaling up the supply of health professionals. Drawing on research conducted in two sub-Saharan African countries, we argue that a critical element in the human resources crisis is the poor working environments in these countries that not only continue to act as a strong "push" factor, but also impact on the motivation and performance of those who remain in their home countries. Unless attention is focused on improving work environments, the human resources crisis will continue in a vicious cycle leading to further decline in the health systems of low-income countries.

INTRODUCTION

Much has been written in the past decade about the health workforce crisis that is crippling health service delivery in many middle and low-income countries (Hagopian, Thompson, Fordyce, Johnson & Hart, 2004; Ntuli, 2004; McAuliffe

& MacLachlan, 2005; Padarath et al., 2003). High-income countries with high salaries and attractive living conditions are drawing qualified doctors and nurses from these countries to fill gaps in their own health human resources pool. The emigration of skilled labour in search of better returns on knowledge, skills, qualifications and competencies is depleting human capital in many

developing countries (Lowell & Findlay, 2001). The UN Commission for Trade and Development estimated that each migrating African professional represents a loss of US $184,000 to Africa (Oyowe, 1996). While low income countries have limited resources for training healthcare professionals, the migration of those who are trained to conventional international standards has made dependence on such cadres increasingly precarious (McAuliffe & MacLachlan, 2005). It is widely acknowledged that Africa's health workforce is insufficient and will be a major constraint in attaining the Millennium Development Goals (MDGs) for reducing poverty and disease (JLI, 2004). The Joint Learning Initiative (JLI) report (2004) indicated that the low health worker density in some countries has already had a major impact on maternal and child mortality. African countries, especially sub-Saharan Africa, have a very low density health workforce, compounded by poor skill mix and inadequate investment in training and development (Chen et al., 2004).

Beyond the national level shortages, imbalances in geographic distributions, especially between rural and urban areas, exacerbate the health human resources crisis (Dussault & Franceschini, 2006). In the countries that do have enough doctors, geographical mal-distribution is so severe that there may be ratios of 1 physician to 500 patients in the city, while remote districts suffer from a 1:100,000 physician to patient ratio. The migration of health professionals from one geographical region to another, from the public to the private sector, from areas of generalization to areas of specialization, from medical to non-medical fields, and from one country to another affects the capacity of the health system to maintain adequate coverage, access and utilization of services (Awases, Gbary, Nyoni & Chatora, 2004; Padarath et al., 2003).

Health workers' migration is influenced by a combination of factors that either "push" professionals from the source countries or "pull" them to a recipient country. Push and pull factors refer to influences that are felt by professionals within the source country that either create an impetus to leave or an attraction to seek work in a recipient country. A WHO study (1996) suggested that regardless of the pull factors from recipient countries, migration only seems to occur if there are strong push factors from the source country. This chapter draws on research in two sub-Saharan African countries conducted over the past four years and argues that unless attention is focused on addressing the push factors, the human resources crisis will continue in a vicious cycle leading to further decline in the health systems and health service delivery in low-income countries.

IMPROVING THE WORK ENVIRONMENT

Remuneration levels have been identified as potentially the most influential factor in a healthcare worker's decision to migrate either between the public and private sector, or from low-income to higher-income countries (Dovlo, 2002). Efforts to address the workforce crisis include increased remuneration through salary top-ups, locum and rural allowances, and other forms of financial incentives. Such initiatives are based on the premise that the primary reason for migration is to obtain better remuneration. However, there is growing evidence that other factors in the work environment may also be acting as strong push factors. Workload and staff shortages are contributing to burnout, high absenteeism, stress, depression, low morale and de-motivation and are responsible for driving workers out of the public sector (Sanders & Lloyd, 2005). Poor working conditions are reported to seriously undermine health system performance by thwarting staff morale and motivation, and directly contributing to problems in recruitment and retention (Troy, Wyness & McAuliffe, 2007; WHO, 1996).

MANAGING AND MOTIVATING A DIVERSE WORKFORCE

While there is clearly a need to scale up the health workforce in sub-Saharan Africa, the macroeconomic and fiscal reality that the region is facing present a significant challenge. Real Gross Domestic Product in SSA is expected to grow at an average rate of 5.8% per year and real per capita GDP is expected to grow at 3.3% for all Africa in the short term. As a result, increases in recurrent salary expenditures, that will accompany any large scale increase in the health sector workforce, may need to be gradual in order to be sustainable. Domestic resources in many countries may not be sufficient to support scaling up the health workforce to the levels required to address population needs (JLI, 2004). It has therefore been suggested that countries need to move away from the expensive production of clinically oriented health professionals to focus instead on the more pragmatic production of health workers appropriate to their burden of disease, availability of resources, and minimum standards of care (Huddart & Picazo, 2003).

Indeed this strategy has already been adopted by several countries who are increasingly relying on mid-level cadres, such as medical assistants, clinical officers, and enrolled nurses (who have shorter lengths of training than doctors or registered nurses), to provide health care (Buchan & Dal Poz, 2003). Dovlo's study (2004) indicated that Mozambique, Kenya, Tanzania, Malawi, Uganda, and Zambia have various cadres called medical assistants, clinical officers, and nurse aides that are doing essential medical tasks, especially in rural areas. In Malawi, clinical officers are a major resource of the health sector; they give anaesthetics, provide medical care and undertake some surgical procedures. In Tanzania and Mozambique approximately 90% of caesarean sections are performed by mid-level providers. Recent studies provide strong evidence for the clinical efficacy (Chilopora et al., 2007; Pereira et al., 2007) and economic value (Kruk, Pereira, Vaz, Bergstrom, & Galea, 2007) of mid-level cadres, particularly in the provision of emergency obstetric care.

Given such positive indicators, it is important to recruit, retain and support these cadres to build the capacity of health systems in low-income countries. Educational qualifications that are less marketable internationally make it less likely that these staff will migrate, at least in the short term (as high-income countries re-evaluate their health systems' skill-mix this may change). The belief that these cadres are not internationally marketable has given rise to a certain complacency in the management and motivation of such workers. Many countries introduced them as a short-term measure with the anticipation that once the country built up its stock of health workers they would no longer be needed. Because of this there has been little investment in developing their career pathways, something which undoubtedly impacts on their motivation and relationships with other healthcare professionals.

A number of studies have drawn attention to productivity problems arising from the demotivating effects of the work environment. For example, Chaudhury and Hammer (2003) reported the results of unannounced visits to health clinics in Bangladesh that sought to ascertain the proportion of medical practitioners who were present at their assigned post. Nationwide they found a 26% absenteeism rate in rural health centres, with considerable regional variation. In the poorer areas, with single doctor clinics, this rises to 74% absenteeism. Thus, even when health facilities are staffed, the staff may not be present. In Tanzania, time and motion studies found overall productivity in public health facilities to be only 57%, with a mere 37% of staff time spent on patient care (Kurowski, Abdulla, & Mills, 2003). Further, skills among health personnel may be inadequate in terms of making an accurate diagnosis and following through with appropriate treatment; skill levels and skill mix may be inappropriate, while

application within the job can also be quite poor (McPake et al., 1999; World Bank, 2004). Ferrinho and Lerberghe (2003) have argued that poorly paid health service employees have developed a number of "coping strategies" to "compensate" for their under-remuneration, for instance, combining public sector work with "fee for service" private work. Absenteeism, under-the-counter payments for 'free' services, and misappropriating drugs or selling free drugs may be other compensatory coping behaviours. Predatory behaviour, in the form of clinicians using their authority to prescribe treatments for their patients to generate additional income, but in some cases may not be justified (for instance, in the need for a caesarean sections), is another. Public patients may be referred to private practices in return for a referrer's fee and fee splitting where the specialist shares the fee with the referrer are other examples (Ferrinho & Lerberghe, 2003). Whatever the morality of these so-called "coping strategies" they do demonstrate that when equity is thwarted, health workers will find ways to compensate, not just financially but also perhaps in terms of retaining a sense of self-worth.

This complexity of issues influencing motivation, performance, productivity and retention has been the focus of our human resources for health research over the past four years. This chapter utilises our research data from two sub-Saharan African countries to examine health workers' perceptions of their work environment, including their relationships with managers and co-workers. Data from surveys and focus groups with health workers demonstrate the impact of the work environment on burnout levels, de-motivation and retention.

THE RESEARCH CONTEXT

Two sub-Saharan African countries, Malawi and Lesotho, were selected in which to explore these issues. Malawi is one of the poorest countries in the region and has poor health indicators. Life expectancy has fallen in the last decade to 42 years and has been attributed to HIV/AIDS. The maternal mortality rate is 1,800 per 100,000 live births, while the infant mortality rate is 92.1 per 1,000 live births. The Ministry of Health is the main provider, providing 60% of all formal health services. The Christian Health Association of Malawi (CHAM), which operates on a non-profit basis, provides about 37% of all services. Other providers include both private for-profit and private not-for-profit, local government, the military and police health services, and small clinics offering care for company employees and their families (Muula & Maseko, 2006).

Two reports provide a detailed analysis of the health, nutrition and population (HNP) of Malawi. The first report *Human Resources in the Health Sector: Toward a Solution* (Government of Malawi, 2004) analyzes the country's health sector performance in terms of outcomes, household health behavior and knowledge, utilization of services, and the service delivery system. The second report, titled *Human Resources and Financing for Health in Malawi: Issues and Options* (Government of Malawi, 2006) proposes a number of policy options to address the problems in the sector. Significant factors that emerge from these reports are:

- The health status of Malawians continues to be generally poor, and the Millennium Development Goals (MDG) in health will be difficult to achieve at current rates of progress.
- Household knowledge about health and disease prevention is generally high, but utilization remains low for many key health interventions.
- Behavioural and cultural factors continue to impede good health practices and care-seeking.

- Strong performance in some health programs is clouded by faltering performance in others.
- Severe supply constraints for both clinic- and community-based health services have dampened their utilization.
- Service coverage has increased for some interventions, but quality remains variable.
- In an era of global health initiatives, some critical health problems are at risk of being neglected.
- Geographic, socioeconomic, and gender variations in health status and access to services are considerable.
- The private sector is emerging as a significant provider of services and is drawing an increasing number of Malawians, including the poor.

The human resources problem in Malawi is clearly recognised as a crisis situation. The overall vacancy rate has remained static (46%) despite a large increase in the number of filled posts in the past four years (Government of Malawi, 2007). The increase in filled posts is mirrored by an increase of 3,147 established posts in 2005; the attrition rate reached an all time high in 2005 with 491, nearly half (214) being due to death – many of these AIDS-related (Government of Malawi, 2007). There are few fully trained doctors and nurses. Ninety-five percent of medical work in Malawi is done by clinical officers. There are four districts that have no doctors. In some places nurses are doing medical assistants' work and the majority of nursing work is done by enrolled rather than registered nurses (Muula & Maseko, 2006).

The second country selected was Lesotho. Lesotho is a small country covering an area of 30,355 km^2 with a population of 1.8 million, landlocked, and enclosed within South Africa and consisting of three distinct geographical regions. The country is mountainous and more than 80% of the country is 1,800 km above sea level. This presents difficult topography and seasonal severe winters that are a challenge to health service delivery.

Lesotho is a resource poor country with a large percentage of the population (76.2%) residing in the rural areas where poverty is most prevalent. The country depends economically mainly on subsistence farming, manufacturing, and remittances from migrant labour based in South African mines. The level of poverty is high and 50.2% of the population is living on less than $1 a day. HIV/AIDS and tuberculosis (TB) remain the foremost challenges in human and economic development in the country. Lesotho has the third highest HIV prevalence in the world, the fourth highest TB incidence, and a growing problem of multi-drug resistant tuberculosis (MDR-TB) (WHO, 2007).

Public health and social welfare services are administered by the Ministry of Health and Social Welfare (MOHSW). In addition to its own publicly owned health service infrastructure, the Government of Lesotho (GOL) also subsidizes the provision of health services supplied by the Christian Health Association of Lesotho (CHAL) and a limited number of non governmental organizations (NGOs). CHAL provides approximately one third of the health care of the country through a network of eight Health Service Areas (HSA) hospitals and 73 health centres.

A Demographic and Health Survey conducted in 2004 (Government of Lesotho, 2004a) gives health statistics for the country and highlights the continuing problems with improving childhood and maternal health. Childhood mortality is high in Lesotho (double the rates for neighbouring South Africa). One in nine Basotho (the term for a person with Lesotho nationality) children dies before reaching their fifth birthday. Childhood survival has not improved in recent years. For the 10-year period before the 2004 DHS, for every 100,000 live births, 762 women died due to maternal-related causes. HIV prevalence is 23.2% for the country as a whole, with 26% for females and 19% for males. Tuberculosis is also a major public health

problem in the country with an estimated 696 TB patients per 100,000 population (WHO, 2007).

There are approximately 8,600 personnel working in the health sector in Lesotho, excluding traditional healers and traditional birth attendants. Of these personnel, only 44%, or approximately 3,790, are employed in the formal health sector operated by GOL, CHAL, other NGOs, and the private for-profit sector. The remainder, and majority, work in the informal health sector and include an estimated 4,800 community health workers (Government of Lesotho, 2004b).

The personnel census conducted for the Human Resources Needs Assessment reveals that 75% of the enumerated formal health sector employees are employed by the MOHSW, 22% by CHAL, and the remaining 3% by other NGOs and the private for-profit sector (Government of Lesotho, 2004b).

Although over 60% of Lesotho's health care is supplied at the primary care level, less than 20% of the formal sector labour supply works at this level. The largest share of the total health sector labour supply (46%) is engaged at the secondary service level, while a further 24% is employed at the tertiary care level. The remaining 10% are employed in the other support institutions, including the ministry of Health and Social Welfare and educational institutions.

The health human resources crisis in Lesotho is significant. MOHSW health statistics indicate that in 2002 Lesotho had 123 doctors, 623 professional nurses, and 562 nursing assistants. There has been a marked decrease in doctors and professional nurses because of emigration, while there has been a marked increase in the nursing assistant cadre. In 2004 there were 89 doctors countrywide, and 80% of these were foreigners from other African countries, most of whom were awaiting certification in South Africa where they can get higher paying jobs (Schwabe, McGrath & Lerotholi, 2004). Due to the shortage of doctors, other cadres of health workers, especially nurses, are very valuable in the provision of health care in the country. But nurses are also in short sup-

ply: from 1994 to 2004 the number of employed nurses fell by 15%. Only six of 171 health centres in the country have the minimum staffing required (Government of Lesotho, 2007). As of May 2007, 54% of professional nursing posts at health centres were vacant. This left trained nursing assistants, who receive just two years of training, to carry much of the burden of clinical work. At the current burden of disease it is projected that it will be necessary to triple the current supply of medical doctors. The minimum requirement projected is 255 medical officers and 17 specialists. This will ensure that Lesotho's coverage is brought into line with comparable coverage for other sub-Saharan African countries at roughly 12 doctors per 100,000 inhabitants.

The distribution of health sector personnel is also problematic in that the Central region, with more urban areas has much higher staffing ratios than either the Northern or Southern regions. While the Central Region has 2.04 personnel per 1,000 population, the Northern Region only has 1.33 and the Southern Region only 1.13. Further, the South is served by fewer than 25% of the primary care personnel, even though 29% of the population resides there and is the most dependent on primary care services. The health sector is heavily reliant on nursing assistants, particularly so in the CHAL facilities.

Research Methodology

Study Population

Three districts were purposively sampled, one from each of the three administrative regions in Malawi, and a total of 34 health facilities were visited by the research team. In Lesotho two districts from each of the administrative regions of the country were selected giving a total of 6 districts within which 36 health facilities were visited. The sample consists of those who were willing to participate at the time the data collectors visited the facilities. Questionnaires were completed by

153 staff in Malawi and 407 staff in Lesotho. In addition, in conjunction with the hospital management team, representatives of various cadres of health workers were selected to participate in Focus Group Discussions (FGD). Ethical approval for this study was obtained from the College of Medicine Ethics Committee in Malawi and from the Ministry of Health and Social Welfare Ethics Committee in Lesotho.

Data Collection

Participants completed surveys that measured perceptions of the work environment, burnout, job satisfaction, and promotion. The questionnaire was pilot-tested in two districts with 20 health workers of different cadres in each country. Respondents were asked to complete the questionnaire with the researcher present to provide guidance and clarification where necessary.

Instruments

The Healthcare Providers Work Index (HPWI) is an adaptation of the Revised Nursing Work Index (NWI-R) developed by Aiken and her colleagues (Aiken & Patrician, 2000; Aiken, Sochalski & Lake, 1997). The initial NWI-R contained 55 of the original 65 NWI items. Further analysis led to the development of a shorter, 15-item version with items being categorized into three subscales; autonomy, control over the practice setting, and nurse-physician relationships (Kramner & Hafner,1989). These scales have been used almost exclusively to measure the work environment of nursing staff (Aiken et al., 1997). In this study we have adapted the 15-item version for use with all health care providers. Details of the analysis and adaptation of the instrument are published elsewhere (McAuliffe et al., 2009).

The Maslach Burnout Inventory (MBI), comprised of three subscales measuring personal accomplishment, emotional exhaustion, and depersonalisation (an unfeeling and impersonal response towards the recipients of ones' care) was used to measure burnout. Responses are given on a 6-point scale with higher scores on the emotional exhaustion and depersonalisation and lower scores on the personal accomplishment representing greater burnout. The MBI is the gold-standard questionnaire in this area, has been cited in over 1,000 studies, and has previously been used with doctors and nurses in Africa, and in particular in Malawi. Strong reliability coefficients have been reported for each of the sub-scales in Africa (Maslach & Jackson, 1993).

Job satisfaction was explored through several items with scaled responses. None of the job satisfaction scales in the extant literature was entirely relevant and appropriate to the context of this research, as in addition to job satisfaction we also wished to explore intentions to leave and perceived likelihood of obtaining another position. The items were identified from (1) existing questionnaires, (2) a review of the relevant literature, and (3) suggestions from a panel of researchers and policy-makers with expertise in the area. The questions were intended to be descriptive of the particular context of the research, not to be additive.

SCALING UP: NOT JUST NUMBERS

A critical issue for many low-income country health systems is that high-income countries are attracting their most experienced health workers. Yet the focus of research and reporting on the human resources crisis has been largely on the numbers of health workers needed (Hagopian et al., 2004; Padarath et al. 2003; Wyss, Moto, Yemadji & Kurowski, 2002). Equally the country-level response has been focused purely on increasing numbers of doctors and nurses with little regard to where the gaps are occurring in their health systems and what specific types of expertise might be needed to meet demand. Most countries have addressed the shortfall by increasing output from

their training colleges. The impact of this strategy is only now being felt in their health systems as they become overpopulated with new, young graduates with little experience. Figure 1, which gives the age profiles of the 560 respondents to our surveys, bears this out with highest numbers of staff in the 26-30 year age bracket and a gradual decrease in staff numbers in the older age categories,. There is a slight increase in the 51-55 age category that may be accounted for by initiatives in both countries aimed at bringing nurses who have retired or resigned back into the workforce. The dearth of experienced health professionals raises concerns about clinical supervision and, ultimately, the quality of care. The response of one young Malawian medical graduate (on seeing this graph) was: "this frightens me as a newly qualified doctor – who will I turn to for advice when I have complicated cases."

Many of the health workers who took part in our research both in Malawi and Lesotho also raised their concerns about the lack of appropriate supervision and feedback on their performance. One health professional in Lesotho expressed frustration about other duties being prioritised over supervision and the implications of this:

one ends up not doing justice to the people that they are supposed to supervise; they end up doing things because they have to do them and they have to address issues without honestly being guided and supervised. Regarding leadership, you forget as a leader that you play many roles to the people that you are leading; you don't just command them to do 1, 2, 3, but you are supposed to guide and monitor them as well as take care of their personnel issues. When you forget them; that means you are going to lose them because you don't handle them in such a way that they feel that you are part of them; they feel you actually don't appreciate them, and that too de-motivates them.

Another person felt that supervision is something that only happens when you make a mistake.

I think people who are supposed to supervise us do not really have interest in that; you will only see a manager when there is a problem in your department. Under normal circumstances they don't come but once there is a problem they will come and oppress you on why you haven't done this and that.

That supervision was inadequate and in some cases non-existent was a widely held view. This

Figure 1. Age profile of staff surveyed in health facilities
not only results in risk taking and possible reduced quality of care, but also has the effect of de-motivating staff. Staff working in isolation in resource-poor settings who receive no feedback on their performance and have no opportunity for clinical discussion about their cases are particularly vulnerable to becoming de-motivated. One cadre that seems to epitomise this problem are the clinical officers who provide the bulk of medical care in Malawi's health system. They are described as crucial to the running of the health system, yet there is a widespread perception that they have been trained up to a level where they are useful, and then abandoned. They work in a stressful environment, frequently unsupervised and beyond their scope of practice, with no hope of changing either their personal or professional standing (Bradley & McAuliffe, 2009). The current system forces them to either stagnate or leave clinical practice. Clinical officers themselves reported their lack of motivation, and staff who are trapped are unlikely to provide the best service (Martineau, Lehmann, Matwa, Kathyola & Storey, 2006).

Plans to increase outputs from the health professional training colleges in Malawi and Lesotho will surely exacerbate the problem of inadequate capacity and expertise for supervision. Unless this problem is addressed the increased production of health workers is likely to result in these graduates providing poor care and either becoming de-motivated and unproductive and/or leaving their posts within a short period of time.

THE WORK ENVIRONMENT

The role of organisational attributes (such as autonomy of practice, workplace relationships, availability of resources) of the work environment is becoming increasingly important in ensuring that adequate staffing levels can be maintained in high income countries, particularly in times of shortage (Slater & McCormack, 2007). Several studies have shown the link between these organisational attributes and job satisfaction, (Aiken & Fagin, 1997; Gleason-Scott, Sochalski, & Aiken, 1999; Upenieks, 2002) burnout (Aiken & Sloane, 1997), retention and recruitment (Kramner & Hafner, 1989; Slater & McCormack, 2007), decreased mortality and healthier staff (Aiken et al., 1997). Little is known about the predictive value of these same organisational traits in low-income or resource-poor settings. Improving our understanding of the role such attributes play in the satisfaction, motivation and performance of health workers in low-income countries is critical to improving retention strategies in these resource-poor settings.

In order to measure the work environment we used the Healthcare Providers Work Index (HPWI) (McAuliffe et al., 2009), an adaptation of the Revised Nursing Work Index (NWI-R) developed by Aiken and her colleagues (Aiken & Patrician, 2000; Aiken, et al., 1997) from the Nursing Work Index (NWI) (Aiken & Sloane, 1997). McAuliffe et al. (2009) adapted the 15 item NWI-R) scale (previously used only with nurses) for use with a broader range of health professionals and identified four distinct subscales; adequate resources, management support, work relationships, and autonomy/control over practice. This four-point Likert scale ranges from strongly agree (1) to strongly disagree (4); hence higher values indicate more negative perceptions on each of the subscales.

Figure 2 shows the mean scores on each of the four subscales for health workers in Lesotho and Malawi. Inadequate resources and management support were most problematic in the work environments. The means also suggest less than full agreement on the presence of good working relationships and control over practice, but more staff are in agreement that these factors are present than the first two factors. Perceptions of the work environment are significantly more negative in Lesotho. One explanation for this is that the staff who took part in our research in Lesotho included

*Figure 2. Health professionals' mean scores on the work index (HPWI) *Note: Higher scores indicate more negative perceptions*
more staff with higher levels of qualification and therefore they may have had greater expectations of their work environments.

Exploring the perceptions about resourcing in more depth (see Figure 3) show that Basotho (the term used for people with Lesotho nationality) staff are far more likely to disagree that they have adequate staff to (a) get the work done and (b) do a quality job, with more than 80% indicating that these resources are not present in their work environments.

The other aspect of the work environment that differs greatly in the two countries is workplace relationships. Figure 4 shows that between 50 to 60% of Basotho health workers disagree that there

are good working relationships between the different cadres and do not believe that teamwork or collaboration between cadres is a feature of their workplaces. By contrast a much smaller proportion (approximately 20%) of Malawians disagree with these statements. This would suggest that perceptions of work environment on the whole are much more negative in Lesotho. Interestingly, in our earlier studies in Malawi (McAuliffe et al., 2009) we found that the medical cadres had more negative perceptions about their workplace relationships than the nursing cadres. Such negative perceptions about one's work environment are likely to impact on the ability to work to one's best ability.

Figure 3. Health professionals' work index: Availability of resources subscale
Figure 4. Health professionals' work index: workplace relationships subscale
BURNOUT AND DE-MOTIVATION

Inadequately resourced work environments over time can lead to feelings of burnout and de-motivation amongst staff. An important component of our research was assessing the degree to which burnout was a problem for staff in the two countries. Table 1 shows the percentage of staff in each country scoring high, medium, and low on the Maslach Burnout Inventory scale. Both countries have a large portion of the sample scoring high on emotional exhaustion and low on personal accomplishment. Reflective of perceptions about their work environments, Lesotho's health workforce has a significantly greater number of staff scoring high on emotional exhaustion. The unexpectedly low scores on depersonalisation in both countries are difficult to explain, although they may be

indicative of a unique coping strategy amongst health workers in these resource-poor settings.

Pearson correlations (r values) showed that the four subscales in the HPWI are significantly related to feelings of depersonalisation and emotional exhaustion. Those who believe that their work environments are inadequately resourced (r = 0.414) with poor management (r =0.390), lack of good working relationships (r=0.370) and control over practice (r=0.334) are also more likely to be emotionally exhausted (p<0.01). Similarly scores on the depersonalisation scale showed significant positive correlations (p<0.01) with perceptions of inadequately resourced environments (r=0.235), poor management (r=0.207), lack of good working relationships (r=0.255), and control over practice (r=0.264).

Managers whom we interviewed acknowledged that the workload within their facilities is quite high for most cadres of health workers and that staffing numbers are not adequate for the workloads (Manafa et al., 2009). The majority of the health workers, especially nurses, are over-worked. They recognize that this affects their attitudes and retention as illustrated in the following quote from our focus group data:

...but the workload is too much because now most of them are gone. For instance in Ward 6, you have about 60 patients and only 2 nurses – it is not supposed to be like that; it should not be expected

Table 1. Degree of Burnout experienced by Health Workers (expressed as % of staff for each score)

		High	Medium	Low
Emotional Exhaustion	**Lesotho**	42.1%	29.3%	28.6%
	Malawi	31%	35	34%
Depersonalisation	**Lesotho**	14.2%	13.7%	72.1%
	Malawi	5%	18%	77%
Personal Accomplishment	**Lesotho**	28.7%	26.4%	44.9%
	Malawi	27%	28%	45%

that 2 nurses to provide care for 60 patients – that is why I am saying they are overloaded; and end up with negative attitudes probably from burnout; it is not surprising that they leave.

JOB DISSATISFACTION AND ATTRITION

The close relationship between emotional exhaustion and thoughts about leaving the job (evident in the above quote) was borne out by health workers' responses to our questions about job satisfaction and employment intentions. First to get a sense of how health workers perceive their jobs, we asked if they would recommend their job to a friend or family member. In Malawi 30% said they would not recommend their jobs, 48% said yes, but with some reservations, and only 20% said yes without reservation. In Lesotho 44% said they would not recommend their jobs to family or friends, 36% said yes, but with some reservations, and only 20% said yes without reservation.

Job satisfaction was explored through several items with scaled responses. Approximately one third of the Basotho health workers and one quarter of Malawians indicated that they are dissatisfied with their jobs. The higher proportion of staff in Lesotho being dissatisfied is consistent with our other findings and suggests that there is a link between work environment and job dissatisfaction. Indeed, a significant negative correlation arose between poor working relationships (r= -0.261), poor management (r= -0.195), inadequate resources (r= -0.177), control over practice (r= -0.209) and satisfaction with the job (p<0.05). This provides evidence that poor work environments are associated with job dissatisfaction. Whether health professionals recommend their careers to others also seems to be influenced by their perception of their work environment. Not surprisingly, the more dissatisfied they are with their working environment, the less likely they are to recommend their jobs to others.

In order to establish whether such high levels of dissatisfaction were likely to impact on retention we also asked staff whether they had (a) thought about leaving their current employment, and (b) had made any plans to leave. In Lesotho, 44% of respondents said they have seriously thought about leaving the hospital or clinic where they are currently working and more than half of the respondents said they are actively seeking other employment. In Malawi almost a quarter of the sample said they are very likely to leave their job within the next year and 11% said they plan to leave within the next six months. The following quote from a Malawian medical assistant is indicative of the extremes these health professionals are prepared to tolerate, giving up his profession to set up a market stall:

I consider leaving this job on a daily basis especially since after our former DHO (District Health Officer) left. I have even thought of going to sell in the market.

An enrolled nurse and a clinical officer are illustrating their attempts to secure a position in the private sector and articulating the benefits of the private over the public sector, respectively.

Staying here is not by choice but because of circumstances. I have been applying to NGOs (non-governmental organizations) but have not been offered a position by any

Once I finish my internship I will leave the public service to the NGO. My colleagues in the NGO earn 80,000Mk a month while I earn 21,000Mk a month. Though I have better chances to further my education in the public sector, I can still do the same working with the NGO by saving more than half of my salary for 2 years. My colleague did the same and is back in the university while his mates in the public sector are still waiting for their turn to be trained from the MOH.

Health workers who reported poor management, inadequate working relationships, and lack of control over practice are more likely to report job dissatisfaction with current job assignments, have thought about leaving their jobs or are actively seeking other employment.

Implications for the "Brain Drain"

We stated earlier in this chapter that the role of organisational attributes or the work environment is becoming increasingly important in ensuring that adequate staffing levels can be maintained in high income countries, particularly in times of shortage (Slater & McCormick, 2007). Our studies over the past four years in Malawi and Lesotho have shown that these attributes are equally important in low-income countries and could be a key component in stemming the brain drain. Yet they are receiving little attention. Our interviews with health officials and managers in both countries provide evidence that almost all of the initiatives aimed at retaining health workers in those countries involve monetary incentives. These range from salary increases, to allowances for locums, rural postings, housing, transport, or electricity. While we acknowledge that salaries are low and need to be increased, our argument is that better pay *alone* will not stem the brain drain. Indeed, anecdotal evidence from Malawi, where health worker salaries were increased by 50% in early 2005, indicates that this measure has had little effect on the overall vacancy rates there.

Our research has shown that human resources management is insufficiently developed and resourced in many sub-Saharan African countries. It is hardly surprising then that continuing professional development and career planning are at best *ad hoc* and at worst completely absent from the workplace. This is especially true in the case of mid-level cadres, as evidenced by the frustrations voiced in some of the quotes included in this chapter. Poor manpower planning, increasingly complex health needs and an ageing population

in several high-income countries have created the need for additional health workers. Active recruitment of the most experienced workers from low-income countries is creating a critical expertise gap for the health systems of these countries. This critical gap is resulting not only in greater workloads for those who remain in their home country, but also in inadequate supervision and on-the job training for these workers. Understandably, health workers in low-income countries feel vulnerable, overworked and undervalued by their managers. Tensions develop between the more-experienced, but less qualified and the less experienced, but more qualified health workers in the system resulting in poor working relationships. All of this leads to poor working environments that in turn lead to burnout and job dissatisfaction and eventually pushes health workers to seek other employment options. Our research has shown that even those cadres that do not have internationally recognised qualifications are leaving to take up employment in the private sector and some are leaving the health sector to work in other sectors. This vicious cycle cannot be broken by simply increasing the numbers of health professionals being trained in sub-Saharan Africa. Interventions at several levels are necessary. Most urgent is the need to improve the existing work environment in order to retain those workers who are currently providing health services (albeit an inadequate provision to meet the health needs of these populations).

Implications for Policy and Management

Malawi and Lesotho, recognising the crisis in their health systems, have both developed comprehensive human resources strategies in the past few years (Government of Lesotho, 2005; Government of Malawi, 2004; 2006). The emphasis in these strategies is on training and providing incentives to health professionals. Our research gives a clear indication of the inadequacy of adopting a strategy of training and employing health work-

ers in the absence of strategies to strengthen and improve other aspects of the health environment in resource-poor settings.

Strategies and policies are necessary but without the manpower to implement them they will have little impact on the health human resources crisis. If rich countries are allowed to continue poaching the more experienced professionals from these countries, who will do the training? Populating inadequately resourced health facilities with junior staff with no provision for supervision and continuous professional development is an investment that has considerable risks associated with it. It is highly unlikely that these staff will remain in this type of environment, where the push factors are equally as strong as the pull factors from high-income countries.

Implications for Research

Our research over the past four years has uncovered a complex set of interacting variables that serve to continue the brain drain. It provides useful evidence to guide investment in human resources in Malawi and Lesotho. However, many governments and donors are currently investing vast financial resources in initiatives that are based on little or no evidence. The insistence that better remuneration is the solution to the brain-drain is a foolhardy strategy. It is critical that we try to understand the impact of these investments and share the learning across those countries most affected by the brain drain.

Chapter 55
Creating the Environment for High Performing Distributed Teams:
Human Resource Strategies and Practices

Tim Rahschulte
George Fox University, USA

Jim Steele
George Fox University USA

ABSTRACT

The organizational workforce has always been a complex landscape. The varying personalities, demographics, and needs have challenged organizations to be legal, fair, and just, while simultaneously competing for market share and profit margins. Although these conditions are not mutually exclusive, due to the global reach for market share and use of supporting technologies, workforces have grown increasingly diverse over the past three decades. Organizations have looked to their Human Resource (HR) division to support business strategy, growth, and development. While a few have stepped up to accommodate, many HR divisions have struggled to support business needs in perhaps the greatest time of flux in modern day business. This is creating a serious issue for most organizations who recognize the competitive way forward is through effective Human Resource Development (HRD). Business success has always been about the people and it will continue to be so. Therefore, organizations struggling to develop their workforce to perform in complex, highly distributed situations will continue to lag (often far behind) the effective workforces of their competitors. This chapter offers best and next practices from HRD leaders accommodating the needs of their businesses.

"We are at the earliest stages of a significant workplace transformation that will profoundly affect how businesses approach people management and how individuals approach the workplace."

–Towers Watson

INTRODUCTION

Indeed HR is evolving in its attempt to address the needs of businesses and employees. Most HR initiatives, however, have become stymied in more administration and less strategic development. This phenomenon was observed critically by Keith Hammonds (2005) who articulated the reasons 'why we hate HR'. The work of HR practitioners has not gotten easier since then and there is still a faction that hates HR. However, there is also a contingent that (dare we say) loves HR – or at least that does not propose the elimination of that division from their organization due to strategic incompetence. The HR practitioners and others throughout these companies recognize that HR, and more specifically HRD, is the "lever for strategic success" (Marquardt & Engel, 1993, p. xi) especially when engaged in highly distributed work across a global marketplace.

Globalization does make a difference when managing and developing resources. According to Marquardt and Engel (1993), a number of factors differentiate global HRD from domestic HRD. Some of these factors include personnel, culture, administration, learning styles, and language. Each of these differentiating factors is important. Understanding the variances of global HRD as compared to domestic HRD should help ensure appropriate responses to training and development, career development, organizational development, and performance management needs of both the organization and the individual.

While the purpose of this chapter is not to engage in determining the efficiencies of HR administration, the exploration of HR strategies and practices must, of necessity, extend beyond functions that have traditionally been considered the purview of HRD. The related disciplines of HR Management (HRM), HR Development (HRD) and Organizational Development (OD) may have distinct origins and academic identities, however their functions in organizations are deeply interrelated and interdependent (Mankin, 2001). In practice, all of these functions commonly report to a single executive (Ruona & Gibson, 2004; Singh, 2003) within an organization. These and other studies argue that while HRD and HRM may be functionally distinct, it is pragmatically impossible for them to function independently of one another.

The focus of this chapter is HRD. However, the research cases also consider the contributions of related HR functions including recruitment, organizational reputation management (i.e. employer branding) and elements of employee retention that typically fall within the responsibilities of HRM or OD functions (Farndale, Scullion & Sparrow, 2010; Brewster, Sparrow & Harris, 2005; Ruona & Gibson, 2004). Consideration of HRD in the context of these structural interdependencies reflects the type of whole systems approach that must be incorporated into a strategic view of the HR function in an increasingly global and complex environment (Ruona & Gibson, 2004).

The discipline and function of HRD emphasizes major areas of organizational work including training and development and career development (deSimone, Werner, & Harris, 2002). Gilley, Eggland, and Gilley (2002) also noted the HRD concern for performance management. To operationalize the notion of HRD, we rely on Swanson and Holton's (2009) perspective in that HRD is "a process of developing and unleashing expertise for the purpose of improving individual, team, work processes, and other organizational performance" (p. 4). To shorten this to near mantra level, Holton and Yamkovenko (2008) suggested "HRD is to develop and unleash human expertise" (p. 276). This is a distinct and strategic task of optimizing

individual human capital and organizational intellectual capital relative to market needs and other situational conditions.

It is suggested here that effective organizations have clarity in both purpose and execution of their capital and that both purpose and exaction are aligned with organizational strategy. Moreover, there is a marked difference, and an increasing one at that, regarding organizational effectiveness stemming from HRD practices and capital management as compared to those that are ineffective as measured by organizational performance. Those effective at HRD – in which the HR leaders of the firm stepped up and are addressing the strategic needs of human and organizational capital – are proving to be more effective at addressing the challenges of a globally distributed and diverse workforce. This is the focus of the chapter – investigating the value of HRD relative to organizational effectiveness from data yielded from in-depth interviews conducted among some of the most globally savvy, experienced, and effective practitioners in the field.

BACKGROUND

Organizational effectiveness is predicated on the knowledge, skills, and abilities of people. Working effectively in distributed teams across differing timezones and cultures is "challenged by the demand for new knowledge, skills, and abilities among individuals in the workforce" (Milhauser & Rahschulte, 2010, p. 79). Tarique and Schuler (2009) also noted the challenge that organizations face relative to global talent and the general shortage of needed competencies. These challenges have pressured organizations to better manage and develop their workforces and it was Javidan, Dorfman, Sully de Luque and House (2006) who voiced concern that companies, especially multinational companies, have a shortage of managers qualified to assume globally distributed team-based assignments. A summarizing perspective

from a recent Deloitte Research Study regarding this demand-supply gap noted, "Despite millions of unemployed workers, there is an acute shortage of talent" (Athey, 2004, p. 1).

It would stand to reason that these pressures would also fall squarely, or at least to a degree, on the shoulders of academe. However, Milhauser and Rahschulte (2010) concluded that the ability of universities to meet the expectations of hiring managers for the knowledge, skills, and abilities of their graduates was woefully lacking. As organizations attempt to triage the issue and offer their own training and development, they too are falling short. According to IBM (2009), companies are struggling with the accelerated pace of business because "Everything around them seems to be changing faster than they can" (p. 15). This puts even more pressure on HR to not only help attract competent and experienced talent, but importantly recognize high potential and further develop that talent.

Developing talent in an attempt to address global issues is not easy. This effort is difficult as managers on the ground face a host of communication, motivational, and decision-making challenges operating in the cross-cultural context of the global environment (Thomas, 2008). To address the challenges of talent development, leading organizations have implemented HRD programs. Trompenaars (1993) noted that an effective deployment of a global HRD type program helps to establish a competitive advantage, thus creating high performance and increasing organizational effectiveness. To reach this effectiveness, leading companies have recognized the need to be culturally competent (Kersiene & Savaneviciene, 2009) with HRD programs respectful of each local context. To be sure, this simply means that any best practice in one culture may not extend to another culture (Friedman, 2007). Thus, HRD programs need to be organizationally centric yet locally mindful.

Many researchers have studied the skills and competencies needed to effectively lead teams

in the global environment (Malone, 2004; Mohammed & Angell, 2004; Thomas & Bostrom, 2007). While the knowledge, skills, and abilities are good to know, many firms are still struggling to understand strategic modeling for this critical organizational resource. To be sure, there are some models aimed at developing competencies (Stahl, et al., 2007; Caligiuri & Di Santo, 2001). However, as noted by Tarique and Schuler (2009) most of this literature "has a number of theoretical deficiencies" (p. 22). There is little concluding evidence regarding how best to design and deploy a strategic human resource development program.

Due to the existing limitations and the specific call for "more qualitative methodologies" (Tarique & Schuler, 2009, p. 23), theory is still in need of development. Tarique and Schuler further emphasized the need for investigation into the challenges of talent management. Based on these findings, the primary question we aimed to address is, *How does an organization, competing in a dynamic and distributed market, best attract, develop, and retain talent in a way that leads to organizational effectiveness?*

RESEARCH METHOD AND DESIGN

As can perhaps be imagined from the questions, the strategy of inquiry followed a qualitative research method. Addressing this research question and its overall approach took a constructivist knowledge claim position (Creswell, 2003) in that theoretical propositions were the goal and were derived via meta-analysis of existing case studies and new, exploratory, research leveraging case method (Yin, 1994).

Exploratory case study research can lead to hypotheses, or theoretical propositions, for further investigation. This is important especially since the findings from case study research are generalizable only to theory and not population (Yin, 1994). To help mitigate the risk of even theoretical generalizabilty, a multiple case ap-

proach was employed rather than a single case study. The reason for this is that multiple cases strengthen the confidence of critical findings due to replication of data findings and pattern-matching among the research data. It is through this work of replication and pattern-matching that facts are validated (Glaser & Strauss, 1967). Although each individual case is a whole study and they were treated as such throughout the research, multiple cases coupled with a meta-analysis of existing case research further grounds the findings for future work, which is critical due to the aforementioned note of HR's continuing evolution.

To adequately address the research question via case study design, a semi-structured outline was constructed to engage the sample participant(s) of each case. The outline leveraged Tarique and Schuler's (2009) six activities in talent management systems as the basis for probing questions during interviews. The six activities include: developing an HR reputation, attracting individuals with interest in international work, recruiting based on positions, developing global leaders, reducing repatriate turnover, and increasing employee engagement. As mentioned previously, these six functions include elements that traditionally fall within the HR division's responsibility but are not necessarily all associated with the work of HRD. We coupled these probing questions with the aforementioned dimensions of HRD (deSimone, Werner, & Harris, 2002; Gilley, Eggland, & Gilley, 2002). Doing so generated this list of final case study questions:

1. How does an organization, competing in a dynamic and distributed market, *attract* talent in a way that leads to organizational effectiveness?
    a. What are your organization's current challenges to attracting this talent?
    b. How does your organization attract individuals with an interest in international and/or cross-cultural work?

    c.   Can you provide examples of your recruiting process for positions with international responsibility?

    d.   What does your organization do to build reputation?

2.   How does an organization, competing in a dynamic and distributed market, *develop* talent in a way that leads to organizational effectiveness?

    a.   What are your organization's current challenges to developing this talent?

    b.   How does your organization develop individuals into globally competent individual contributors and leaders?

    c.   Can you provide examples of how your organization has developed individuals for global competitiveness?

3.   How does an organization, competing in a dynamic and distributed market, *retain* talent in a way that leads to organizational effectiveness?

    a.   What are your organization's current challenges in retaining globally competent talent?

    b.   Please describe your organization's approach to employee engagement.

    c.   Can you provide examples of how your organization increases retention of globally competent individual contributors and leaders? Please include practices for returning expatriates if your organization utilizes international assignments.

RESEARCH SAMPLING

The effectiveness of case study is found in the richness of the case data, which leads to case findings. Therefore, the sampling was purposeful (Patton, 2002) so as to "select information-rich cases strategically" (p. 243). From its strategic basis, this approach was criteria driven to ensure expert informants provided meaningful and information-rich data that was both practical and relevant. The criteria included (a) experience in the field of HR, (b) at a level of manager or higher, (c) with the role of recruitment and development, and (d) in an organization with internationally distributed operations. The selection of cases is aimed to maximize findings with the understanding limitation of time constraints (Stake, 1995).

A total of six (6) cases were investigated from the same number of companies, all of whom were engaged in complex organizations with significant use of internationally distributed teams. The practitioners engaged in the research of each case are commonly known as expert informants and participants-in-action. Flick (2002) noted that good informants have knowledge and practical experience of the phenomenon in question, are articulate, and have time to participate and contribute to the study. Hassard (1991) noted, "The social world is best understood from the view point of the participant-in-action" (p. 277). As such, these practitioners are experts in their organizations relative to human resource management and development, and sufficient to serve as the research sample.

While the sample case size of six companies is small, it is important to remember that each cases is a whole study and, as important to this research, this sampling did allow for a broad range of perspectives on HRD yielding some pattern-matching for critical findings. The pattern-matching is especially relevant when evaluated against the meta-analysis of existing case study literature. Further, according to Josselson and Lieblich (as cited in Josselson et al., 2003), the sufficiency of any sample "is inversely proportional to the intensiveness of the study" (p. 268). This means that if the inquiry is deep in context and multi-layered, relatively few interviews are needed. Additionally, Patton (2002) noted, "there are no rules for sample size in qualitative inquiry" (p. 244), but rather there must be enough data to represent the richness and diversity of the phenomenon without being overwhelmed (Kvale,

1996). Generally, Josselson and Lieblich advise at least five and no more than thirty interviews are required in qualitative studies. Therefore, again, the sample is recognized as small, but sufficient regarding the phenomenon of study.

DATA ANALYSIS AND RESEARCH FINDINGS

Data were gathered through online survey instruments and semi-structure telephone interviews. Data were then codified electronically and analyzed iteratively based on the three major threads of this research: attracting talent, developing talent, and retaining talent.

Due to the complexity of organizational HRD not all data captured or inductively determined categories need elaboration. With the range of data stemming from case sample observations and commentary and, after significant analysis of the data, categories, and relationships, some findings were simply deemed not applicable to this study and if incorporated here would serve to only congest the findings relative to the aim of deriving theoretical propositions for further study. This approach is supported by Parry (1999), as he noted it is not necessary to detail all the categories that emerged from the study, but rather just those that are pertinent to the subject of the research project. As such, only pertinent findings to this study are detailed hereto.

Attracting Talent

The challenge of attracting quality talent was a consistent theme from the cases. One case spent considerable time noting "We source candidates internationally" and experience great "difficulty in finding [qualified] candidates." Another simply opined, "Talent is rare." Perhaps this challenge is due to the changing landscape of work and the fact that the skills needed for organizational effectiveness ten years ago are no longer the only skills needed for success today. The changing landscape is the distributed nature of work. According to Frauenheim (2006), "Over the next decade, most organizations will face the need to look for people beyond their local environments" (p. S7).

Relative to the need for new skills, the difficulty with attracting qualified talent is, in part, due to the demands organizations are placing on job candidates. One case sample noted that when it comes to attracting managers and executive leaders for their global firm, "It's not enough to be a great strategist or tactician. You need to be able to inspire, guide, engage, and empathize... this is where we find it difficult." Another case noted the need for "industry experience" and "real success track record." That sample went on to explain that once we find talent, "Often they are happy where they are" and it is "difficult to convince them why they should leave."

With this amount of difficulty realized, the question was raised: *So, how does an organization competing in a dynamic and distributed market attract talent in a way that leads to organizational effectiveness?* Three common themes were uncovered immediately including "brand," "reputation," and "referrals."

As one case noted, "There is a balance of including benefits, employee engagement, and a sound business model" to attract talent, but over time "A company gets a good or bad reputation based on the behaviors of managers and leaders. So, we aim to develop managers who are good managers and leaders who are good leaders in an effort to attract top talent." Another case noted, "We brand ourselves as a young, entrepreneurial company with great technology and lots of opportunity." Many comments from most of the cases touted the importance of "employee referrals." Weaker pattern-matching occurred with topics on "professional networking," "working with universities," and promoting "opportunities to work in an international and cross-cultural environment" and "providing ample opportunities to work globally."

HR involvement in organizational reputation management, also known as employer branding, has been noted as an emerging element of global talent management (Farndale, Scullion, & Sparrow, 2010; Martin, Beaumon, Doig & Pate, 2005). Farndale et al. (2010) note that corporate HR divisions are increasingly engaged in reputation management activities including "market-mapping and employer-branding to assist in the attraction and retention of high-performing employees" (p. 163). Employer branding extends the role of HR far beyond the traditional arena of employment advertising, applying the principles of external brand management to attract high caliber employees that can provide a key to competitive advantage (Berthon, Ewing & Hah, 2005). Professional HR associations including the Society for Human Resource Management (SHRM) and the UK-based Chartered Institute of Personnel Development (CIPD) have recognized that "aligning the external, corporate image of organizations with internal employee identity or engagement provides a key opportunity for HR to earn greater voice in business" (Martin, et al., p. 77).

These patterns are interesting especially when compared with cultural and generational specificity. Hansen (2006) addressed the idea of "One World, One Workforce" (p. S2). However, although the world at large may be open for talent sourcing, nations and generations are comprised of individuals seeking not one singular value, but many diverse values from an employer. Take for instance the emerging economies of China, India, and Brazil relative to the mature economies of the U.S., U.K., and Germany. In their 2010 Global Workforce Study, Towers Watson (2010) concluded that "career advancement" was the number one attractor of people to a job. As for the mature economies, "career advancement" was not even in the top three. The number one attractor in the U.S. and U.K. was "competitive salary" and those in Germany noted the need for "challenging work" to be attracted to a job. Brazil followed the maturing economies with the second most

rated attractor for that group being "competitive salary." The number two attractor in China and India is "learning and development opportunities." Relative to the mature economies, "learning and development opportunities" is not in the top three. Number two for the U.K. and Germany is "convenient work location," a category not in the top three for the emerging economies. As for the U.S., the number two attractor of people to jobs is "sufficient vacation," which was noted as number three for those in the U.K. The third for Germany was "flexible work schedule" and for the U.S. it was "competitive health care," neither of which are in the top three for those in emerging markets. Number three for India and Brazil was "challenging work" and as for China, "competitive benefits." If there is a consistency among these six nations, which happen to be similar to the coverage from the six cases of this chapter's study, it is "career advancement" as noted by all three emerging economies, "competitive salary" as noted by the U.S., U.K., and Brazil, and challenging work, as noted by Germany, India, and Brazil. There are, however, far more differences than similarities regarding the attractors of people to work. This is no doubt the reason for an organizational strategy with local culturally competent considerations (Kersiene & Savaneviciene, 2009). Table 1 summarizes these findings.

In addition to geographically and nationally diverse attractors of people to jobs, attracting talent is also moderated by generational identifiers. There are commonly six noted generational identifiers including Veterans (also known as traditionalists), baby boomers, Gen X, Gen Y (also known as Millennials and Net Generation), and Gen Z (also known as Digital Natives). Jackson (2010) has provided a useful synthesis for comparing these generational tendencies. The following is even a shorter synopsis.

- Veterans, those born prior to 1946, were affected by two world wars, are disciplined, respectful of order and consistency, with

Table 1. Top attraction drivers

Career advancement	Career advancement	Career advancement	Competitive salary	Competitive salary	Challenging work
Learning & development opportunities	Learning & development opportunities	Competitive Salary	Sufficient vacation	Convenient work location	Convenient work location
Competitive benefits	Challenging work	Challenging work	Competitive health care	Sufficient vacation	Flexible schedule

Adapted from Towers Watson, 2010, p. 6.

fixed views on gender roles, and roles within a hierarchy and therefore comfortable with direct, command and control management styles.

- Baby Boomers, those born between 1946 and 1964, were once open-minded, rebellious youth but are now a bit more conservative, value job and social status, tend to be optimistic, ambitious, and loyal, and believe that employment is for life.

- Gen X, those born between 1965 and 1979, are known as "latchkey kids," well-educated, resourceful, individualistic, self-reliant, skeptical of authority, and not interested in long-term careers, corporate loyalty or status symbols.

- Gen Y, those born between 1980 and 1995, are technological savvy, comfortable with ethnically diverse groups, optimistic, confident, sociable, and have strong morals and a sense of civic duty.

- Gen Z, those born after 1995, have never known a life without the internet, computers and mobile phones and are used to instant action and satisfaction. The workplace impact of this group is yet unknown, as they have yet to enter the workforce.

Apparent from this synopsis is that what serves to attract one generation may serve to repel another generation. Career advancement opportunities, for example, were identified by Towers Perrin (2008) as the top attraction driver for workers under age 24, but the importance of this factor declined with increasing age, disappearing from the top 5 for workers age 45 and older. Challenging work was ranked #4 by the youngest age group, but its position increased as an attraction driver with age, ranking #2 for all groups age 35 and above (p. 16). Sourcing and recruitment of the right people for the organization is vitally important and is the first critical contribution of the strategic HR function. The importance of attracting the right person has proven vital during the "talent wars" (Hansen, 2006) of a booming global economy, as well as during economic downturns that produce a surplus of labor in the general market.

Regardless of economic conditions, similar to the case findings, Tarique and Schuler (2009) identified organizational brand and reputation as keys to attracting talent. Employee referrals were the third pattern-matching category from the multi-case study. The similarities to existing literature, however, are not the only points of interest from these findings. Specifically, future research should investigate theoretical propositions pertaining to the means best suited to attract talent by geographic or national location and at a generational level of specificity.

- **Theoretical Proposition #1:** Although talent sourcing is a global endeavor for most organizations there is a need to further understand the delineation of people and job attraction. Specifically, there is a need to understand how best to attract skilled individuals by geographic, national, and cultural domains.

- **Theoretical Proposition #2:** Although job searching is a global endeavor for some individuals, it is likely to increase with each passing year. Thus, there is a need to further understand the delineation of generational attitudes relative to job and organizational attraction. Specifically, there is a need to understand how skilled individuals of varying generations are attracted by organizational brand, reputation, and job attributes.

Developing Talent

Milhauser and Rahschulte (2010) noted the need for specific knowledge, skills, and abilities on the part of workers and, importantly, that there is a growing gap between industry demand for skills and the supply of skills being provided by higher education systems. This is consistent with the case sample comments above regarding the difficulty in attracting talent. Finding talent is difficult when it is not readily available. And when it is not readily available, as noted by one case sample, "you source people for fit" and then "develop the talent."

Although there was one case sample noting, "We tend to look more for experience than fit" the common theme was "We source people for fit." This is not mentioned to discount "experience" because as noted in attracting talent, experience is important. Rather, this distinction is made due to the singularity of the former comment and the pattern of "fit."

Some case samples offered depth to discerning "fit." One particular case noted the use of "a personality profile" pertinent for assessing international experience, skills, and aptitude. "This is much more than an experience profile." Another case sample noted the need to "Benchmark jobs and conduct good pre-assessments to help assure good job fits instead of just good skills."

Another common theme was how to initiate a good talent development program within an organization. The first step is, "Identify the talent to retain." Once "high potential" employees are identified, then "individualized plans for each person" can be designed for retention. "We have a Top Talent Program where individualized development plans will incorporate current work, a clear path for advanced opportunities, pay, scope of responsibilities, communication, and inclusiveness." An important component to plans such as these is the need to have each individualized plan "Linked with overall corporate strategy." Employees are responsible for their plan development, but not in isolation because they must "actively take part in the development of [team and organizational] goals and metrics" which in many cases require them to "Seek out, study, customize, and apply best practices." Engaging in this process, which is part of regular reviews (which is a subcomponent to the "communication" note from one case sample), helps to keep employee activity aligned with teamwork and organizational goals. As summarized by one case sample, "We partner [inside and outside the organization] to develop solid plans that are in alignment with [corporate] strategy... linked with the design and delivery of individualized programs... linked to the individual." The use of such plans is supported by Gubbins and Garavan (2005) who noted that in order for HRD to add value to the organization there must be alignment between HRD interventions and the organization's strategic goals and objectives.

With knowledge of the process, the next logical question for the case sample was, *So, how does an organization competing in a dynamic and distributed market develop talent in a way that leads to organizational effectiveness?* In short, noted one case sample, "By creating a visible link between the work they do and the greater good/whole." This seems reasonable since the last paragraph outlined the need for individuals to understand their role relative to the team and the organization at large. This system-view could break down, or at least be challenged, in a highly distributed organization in which 'seeing' the system whole is difficult. To

understand the whole requires participation and engagement, and in a highly distributed team this could be quite expensive due to the need for collaborative technologies and travel. Interestingly, a common theme was the need for "travel" budget. One case sample noted, "Must invest in travel." This is a consistent finding among global leaders as well. Martinelli, Rahschulte, and Waddell (2010) found that "The benefit versus cost of bringing a globally-distributed team together is often debated within businesses. However, *leading* [emphasis added] global companies no longer debate this issue. For them, the act of bringing their globally-distributed teams together on a periodic basis is embedded in their project or program planning and execution practices" (p. 135).

There is evidence that travel is necessary, especially for distributed teams, to develop cohesiveness and help facilitate collaboration. One case sample noted the leveraging activity of "Tying teaching to business travel." This sample further noted, "Within our company there is recognition for those who teach" and "There is an expectation for all senior managers to teach 'x' times throughout the year. We use senior leaders and global partners to develop our learning programs." So, as employees travel, especially executives and program and product leaders, it is part of their role to participate in training, education, and human resource development in the locations they visit.

Moving beyond budgets yet remaining focused on the need for talent development, two additional cases noted in detail the use of "tribes" and "cohorts" to boost learning and development. The challenge is to leverage a cohort model without isolating them from others. "Our strategy is to deliver development programs that are formal trainings yet incorporate experiential learning and coaching." The cohort model is an interesting one that is used in some of the top universities around the world. These are interesting components to corporate HRD. Certainly many organizations use cohort models for new employee orientation and some on-boarding activities, but this is an

emerging theme for HRD among high potential employees and thus leads to the third theoretical proposition of this study.

- **Theoretical Proposition #3:** Is there a measurable value of using cohort models for high potential talent? If so, what is the measure? Additionally, how are cohort risks of alienation and group think mitigated?

Retaining Talent

"One of the most critical issues facing organizations today," according to the Society for Human Resource Management, "is how to retain the employees they want to keep" (Allen, 2008, p. 1). This challenge is made even more daunting by the emergence of a global market for knowledge workers. As the number of opportunities to source talent globally has grown to include information technology, healthcare, accounting and other professional labor pools, the demand for skilled professionals and managers who can effectively cross boundaries has grown significantly (Farndale, et al., 2010), leading to a highly competitive global marketplace for talent. As with attraction, retention factors vary widely by geography, culture and generation – one size does not fit all. The case sample surveyed for this chapter's study, however, yield a single commonality: retention improves in the presence of effective managers and organizational leaders. The findings of Towers Perrin's 2007-2008 workplace study support this sentiment.

Globally, the top 3 drivers for retention were "the organization's reputation as a great place to work," "satisfaction with the organization's people decisions," and "good relationship with supervisor" (Towers Perrin, 2008, p. 17). All of these are consistent with a workplace where effective leadership and management is practiced. The question to be addressed by HRD, therefore, is, what are we doing to ensure a continuous

supply of competent managers and leaders for our organizations? While all employees of an organization have developmental needs, there is a particular strategic need to identify those "high-potential, exceptional performing individuals who will in time move into key strategic roles that will determine the success, or failure, of the firm. (McDonnell, Lamare, Gunnigle & Lavelle, 2010, p. 151).

One case sample noted the importance of effective management, stating, "The most effective retention strategies are those where managers and leaders have, over time, established a reputation for competence and integrity." Another case sample noted, "We retain talent through having strong managers." Similarly, another case sample noted they have found "People join a company and they leave (or stay with) a manager." Another case sample found, "We retain our talent with clear career paths, strong managers, decent compensation, and a good business direction." This commonality was not surprising to one case sample who noted, "We expect high performance and therefore we need strong management." A member of this case also noted a challenge of "building good managers" and that this challenge has impaired their ability to attract and retain top talent.

There were other strategies uncovered to retain talent that are consistent with prior findings for attracting and developing talent. One case sample noted that their organizational approach is "employee engagement through values – the intrinsic side of motivation" and reminded us to "Note that none of this has to do with pay and benefits. The pay/benefits may help to retain people, but not engage them." This approach is confirmed by Towers Watson (2009) who noted, "Top performers are most engaged when they can embrace and be guided by an organization's vision, values, and strategy" (p. 1). Further, Hansen (2006) found that some organizations use intangibles to create differentiation and retain talent" (p. S3). The balance of extrinsic and intrinsic motivators

is important for talent retention and leads to the next theoretical propositions.

- **Theoretical Proposition #4:** Talent retention is a serious endeavor for all organizations. There is a need to further understand the delineation of people and job retention. Specifically, there is a need to understand the organizational attributes, systems and processes that lead to retention of skilled individuals by geographic, national, and cultural domains.
- **Theoretical Proposition #5:** Talent retention is a serious endeavor for all organizations. There is a need to further understand the delineation of people and job retention. Specifically, there is a need to understand how skilled individuals of varying generations are retained and engaged by organizations, and how these may change as generational cohorts progress through the life course.

Summary of Findings

Like never before, organizations face a growing need for continuous improvement and adaptation to organizational and market pressures. Effective management that can engage a diverse workforce of employees and in so doing build a reputation and brand is required for talent acquisition, development, and retention. Managers and their organizations that acquire, develop, and retain employees in an integrated way – aligned with corporate strategy and goals for teams and individuals – can build a distinct market advantage over competitors that employ a reactive HRM/HRD strategy.

One case sample noted the most important aspect of HRM and HRD strategies is "To be clear what HR functions own, so there is no overlap and loss of credibility, authority, or responsibility." The case data also noted that HRM and HRD strategies should entail the full complement of

"workforce planning, recruitment, and selection structures, retention, and succession planning." Those that can maintain alignment of strategy and execution (including the development of talent) have the greatest probability of organizational effectiveness.

FUTURE RESEARCH DIRECTIONS

Consistent with case study design, the findings have yielded areas of future research. Although case study research is generalizable only to theory and not population (Yin, 1994), some of the findings are additionally confirmed from prior case studies and literature. Comparing the findings and existing literature mitigates some internal reliability risk exposure. To summarize the recommended direction of future research, the following five propositions are suggested.

- **Theoretical Proposition #1:** Although talent sourcing is a global endeavor for most organizations there is a need to further understand the delineation of people and job attraction. Specifically, there is a need to understand how best to attract skilled individuals by geographic, national, and cultural domains.
- **Theoretical Proposition #2:** Although job searching is a global endeavor for some individuals, it is likely to increase with each passing year. Thus, there is a need to further understand the delineation of generational attitudes relative to job and organizational attraction. Specifically, there is a need to understand how skilled individuals of varying generations are attracted by organizational brand, reputation, and job attributes.
- **Theoretical Proposition #3:** Is there a measurable value in using cohort models for high potential talent? If so, what is the measure? Additionally, how are co-

hort risks of alienation and group think mitigated?
- **Theoretical Proposition #4:** Talent retention is a serious endeavor for all organizations. There is a need to further understand the delineation of people and job retention. Specifically, there is a need to understand the organizational attributes, systems and processes that lead to retention of skilled individuals by geographic, national, and cultural domains.
- **Theoretical Proposition #5:** Talent retention is a serious endeavor for all organizations. There is a need to further understand the delineation of people and job retention. Specifically, there is a need to understand how skilled individuals of varying generations are retained and engaged by organizations, and how these may change as generational cohorts progress through the life course.

CONCLUSION

Global talent management is a major business concern that has emerged at the end of the twentieth and beginning of the twenty-first centuries (McDonnell, et al., 2010; Scullion & Collings, 2006). The process of attraction, development, and retention can serve as a major advantage for organizations that are effective with this challenge. To be sure, strategic HRD is a challenge. There are a number of trends highlighting this challenge. First, organizations are challenged by their engagement in a highly distributed, global market. Second, within this global market, there is increased diversity as measured by time, geography, age, and importantly knowledge, skills, and abilities. Due to these first two trends, the third can be summarized simply as the constancy of change. Although change is not new, the complexity of the change is and therefore increases the likelihood of failure.

Jackson and Schuler (1995) noted the pressure of globalization alone is a catalyst for interest, concern and research into HRM. Moreover, the three trends pressure the importance of strategic HRD effectiveness. Many HR practitioners aim to be strategic and some, in fact, are. Those that remain mired in tactical issues, barriers, and challenges of administration, will find themselves unprepared to focus on strategies that optimize human capital and development necessary to complete in today's dynamic markets. The HR professionals that transcend traditional organizational and disciplinary boundaries to develop integrated, holistic solutions that advance the greater organization will lead the way.

KEY TERMS AND DEFINITIONS

HRD: The discipline and function of Human Resource Development (HRD) emphasizes major areas of organizational work including training and development and career development (deSimone, Werner, & Harris, 2002). Gilley, Eggland, and Gilley (2002) also noted the HRD concern for performance management. To operationalize the notion of HRD, we rely on Swanson and Holton's (2009) perspective in that HRD is "a process of developing and unleashing expertise for the purpose of improving individual, team, work processes, and other organizational performance" (p. 4). To shorten this to near mantra level, Holton and Yamkovenko (2008) suggested "HRD is to develop and unleash human expertise" (p. 276). This is a distinct and strategic task of optimizing individual human capital and organizational intellectual capital relative to market needs and other situational conditions.

HRM: Used largely as a replacement of personnel management, the focus of Human Resource Management (HRM) is an overarching approach to the managing people within an organizational context.

Theoretical Proposition: A theoretical proposition is a proposed theory. Often identified as part of a qualitative study, propositions theorize collective, patterned, or saturated findings from data. Glaser and Strauss (1967) noted, "Grounded theory can be presented either as a well-codified set of propositions or in a running theoretical discussion, using conceptual categories and their properties" (p. 31). This study used the former as means for reporting findings.

Chapter 56
Effective Virtual Project Management Using Multiple E–Leadership Styles

Margaret R. Lee
Capella University, USA

INTRODUCTION

The field of organizational behavior defines leadership as "the ability to influence a group toward the achievement of goals" (Capella, 2005, p. 294). Leadership styles have been well studied and researched. Early leadership studies were developed using traditional, co-located work arrangements in mind. Later studies expanded to include traditional project team environments. In the current business environment, however, nontraditional virtual work arrangements are becoming more popular. Virtual project teams are increasing in business today and will continue to become more common in the future (Martins, Gilson, & Maynard, 2004).

Managing nontraditional work involving virtual teams is becoming a necessity in the current business environment. The type of leadership e-

managers must demonstrate for successful virtual team management is different from traditional project team management (Konradt & Hoch, 2007). Understanding appropriate leadership styles for virtual project teams and the transition toward new leadership styles is an important part of managing human resources in organizations and successful virtual project management. Emerging e-leadership roles and management concepts for virtual teams include multiple leadership models, and their application is an important part of our evolving virtual organizational behavior.

This paper reviews management concepts for virtual teams that include leadership styles such as control-related models, transformational and transactional leadership styles, leadership that empowers team members to self-manage, and situational and contingency leadership styles. In the virtual project environment, the effective manager

needs to use as many different styles as needed to bring the project to a successful completion.

BACKGROUND

Introductory Definitions

Virtual teams reflect the ever-increasing non-traditional work environments of the 21st century, with members collaborating from geographically distant locations (Lee, 2009). Ariss, Nykodym and Cole-Laramore (2002) define virtual teams as a group of skilled individuals who "communicate via computer, phone, fax and video-conference" (p. 22). Virtual teams involve individuals who are geographically distributed and use technology to communicate and produce results (Duarte & Snyder, 1999).

The term e-leadership describes leadership in today's nontraditional virtual business environment. The need for e-leadership in virtual project teams has become increasingly relevant as businesses move toward more non-traditional work. Virtual project teams are increasing in business today, and understanding e-leadership styles of virtual teams is an important part of e-business. E-leadership styles for virtual project team managers may be different from traditional project team managers, and how they might be different is still an emerging study. E-leadership styles is an expanding topic for developing the knowledge and practices necessary to determine the most effective leadership styles for virtual project managers.

Leadership Styles

Control-Related Leadership

Control-related leadership is defined as leading by tasks and includes motivating, providing role clarity, setting clear goals and priorities, and by giving good directions. Control-related leadership has

been linked to effective virtual team management. Konradt and Hoch (2007) examined leadership roles and showed that the task leadership function was "rated as significantly more important to virtual team effectiveness than people leadership function" (p. 25) and "that managers in virtual teams viewed control-related roles as more appropriate for virtual team success and performance than non-control-related roles" (p. 26).. Similar goal-related concepts can be found in management by objectives (MBO) studies. Previous studies found that control-related leadership strategies were positively related to virtual team success (Hertel, Konradt, & Orlikowski, 2004). Control often has a negative connotation when linked to management behaviors, but leadership involves some degree of responsibility for influencing the behavior of workers (Hersey, Blanchard, & Johnson, 2001, p. 17).

Transformational and Transactional Leadership Styles

Transformational and transactional leadership characteristics are common management styles for virtual teams. Transformational leaders are defined as leaders who inspire followers to work (Capella, 2005). Transactional leaders are defined as leaders who motivate followers to complete goals by clearly identifying roles and setting vision (Capella, 2005). In a study by Hambley, O'Neill and Kline (2007) to determine virtual team leadership behaviors, the results were divided into five major behaviors closely related to transactional leadership characteristics: (1) ability to provide role and expectation clarity and good communications, (2) working along with the team; (3) relationship building skills; (4) effective team meetings; and (5) strong project management. Many of the e-leadership behaviors identified in the Hambley, O'Neill and Kline study (2007) can be linked to the transformational and transactional leadership styles. They found that leaders setting goals for virtual teams reflected the transformational style

motivational skills. Providing role and expectation clarity for virtual teams reflected the contingent reward factor of transactional style leadership.

Leadership Through Empowerment

Effective leadership through empowerment involves self-management within virtual teams. Bell and Kozlowski (2002) report that virtual leaders need to implement a system that will allow virtual project team members to self-manage. Self-managed work teams are defined as teams that "take on many of the responsibilities of their former supervisors" (Capella, 2005, p.234). It is important for virtual team leaders to distribute leadership functions to the team itself, making it self-managing (Bell & Kozlowski, 2002). Bell and Kozlowski suggest that many virtual teams are composed of individuals who already have virtual team experience and expertise in their area of work. Leadership roles can be shared by team members who are not co-located (Pearce & Conger, 2002). Similar to empowerment, the leader-participation theory "provides a set of rules to determine the form and amount of participative decision making in different situations" (Capella, 2005, p. 309) and could be applied to e-leadership. However, a truly empowered leadership style will free the virtual team from organizational constraints and encourage proactive action and accountability (Hersey, Blanchard, & Johnson, 2001).

Situational Leadership Styles

The situational school of leadership models assume that effective leaders can develop and adopt certain styles or behaviors. Tannebaum and Schmidt (1958) presented a framework to help explain an effective leader in their continuum of leadership behavior. Their theory analyzed the different patterns of leadership behavior and how this range of behaviors determined the type of leadership, leadership pattern, and effect on short- and long-range objectives. Blake and Mou-

ton (1964) proposed a behavioral management theory that suggested that many behaviors and motivations affected leadership. They established five key managerial styles: do nothing, country club, task/production, mundane/middle of the road, and team. However, Blake and Mouton's main limitation was that their model assumed that there is one consistently sound style of leadership across all situations. Hersey and Blanchard (1969) contributed to the emerging situational school of leadership, proposing that effective leaders adopt certain styles or behaviors to be successful. Hersey and Blanchard proposed a life-cycle theory of leadership suggesting that leadership could be adjusted to the maturity of the subordinate. They used multiple dimensions - task/production oriented and people-oriented – and the variable "maturity" scaled from most mature to most immature. Building on existing research, they developed a situational style leadership model (telling, selling, participating, delegating) dependent upon workers' maturity.

Contingency School of Leadership

The contingency school of leadership models further developed situational leadership ideas to encourage matching the leadership style to the activity or work. In Fiedler's (1967) seminal book, he identified three major variables – leadership trust, clarity of task, and leadership power/authority – that match the style to the situation. Fiedler identifies two basic styles of leadership – task oriented and relationship-oriented (participative). He suggests that by using a least-preferred coworker scale, workers can be assigned to task oriented or participative leaders to achieve maximum effectiveness. Fiedler re-conceptualized existing leadership studies, theories and research to determine that task oriented leaders perform best in situations that are very favorable or very unfavorable to the leader and that relationship-oriented leaders perform best in situations that are intermediate in favorableness. His significant

contribution to leadership theory was his focus on situational variables as moderating influences.

House (1971) presents a path-goal theory based upon motivation theory. House's leadership effectiveness theory, part of the contingency school, suggests that the leader influences (motivates) the team to find the path to their goals by using an appropriate leadership behavior (directive, supportive, participative and achievement-oriented). The leader adapts leadership behaviors to environmental factors (such as task structure, authority system, and work team) and subordinate factors (locus of control, experience, ability) resulting in more effective and satisfying team performance. House's theory suggests that the leaders diagnose the situation before attempting a leadership intervention. During the 1970s, Hersey and Blanchard (1974) developed a contingency theory that suggested a situational leadership style where the leader is flexible in what type of leadership behavior is used dependent upon the needs of the team.

The common thread for these approaches is that the leader should be flexible and be able to adapt and apply the appropriate leadership style as necessary. Later, Vroom (2003) suggested a contingency theory model that relates leadership style to the task at hand or situation. The Vroom Decision Tree Approach (Vroom, 2000) prescribes leadership styles appropriate for the situation. It uses five leadership styles that are dependent upon the subordinate participation to determine the degrees of being autocratic, consultative, or group oriented when making leadership decisions. Situations shape how leaders behave and influence the consequences of leader behavior (Vroom & Jago, 2007).

Project Management Leadership Research

The seminal contributions of these scholars shaped subsequent research for leadership theory for work teams and project teams. In the body of knowl-

edge for project management leadership, these theories identify leadership styles for traditional project management. Determining whether different leadership styles are appropriate at different stages of the project life cycle and with different team structures has been explored and research conducted in the project management context, with the general conclusion that leadership styles theory can be appropriately applied to project management leadership. Applying these theories and research, then, to virtual project management could be the next step in exploring how leadership styles for virtual project teams are different than traditional leadership styles and traditional project management leadership.

Traditional Project Management Research

Slevin and Pinto (1991) challenged the complexity and often-contradictory research on leadership and the perception that the process of project leadership is confusing. They attempted to describe a cognitive approach to leadership to help project managers consciously select the correct leadership style. They proposed a two-dimensional leadership model (information input and decision authority) on which leadership style can be plotted using percentile scores that it is practical, simple and recognizes three main leadership decision styles (participative, delegation, and pressured). Shenhar's (1998) research also explored a two-dimensional model for management and determined differences in management style based upon a classification system of project type. Results indicated that fit between project leadership style and type of project are important to the success of the project. Turner and Muller's (2006) study attempted to develop guidelines on selecting the appropriate project manager for projects dependent upon leadership style. They found that leadership style was positively correlated with project success and that different combinations

of leadership competencies were positively correlated with project success.

Virtual Project Management Research

Lee-Kelley (2002) suggested in her study of virtual project teams that Fielder's (1967) identification of the key situational variables influence a leader's style, and her study included Fiedler's leadership instrument and least preferred co-worker (LPC) scale. The theory that a manager's ability to control and influence the team or situation impacts his or her management style was confirmed by the study, as was Fiedler's proposal that task-motivated managers perform best when situational control is high as well as in situations where control is low. Konradt & Hoch's (2007) work is important in establishing virtual managers' perceptions of roles. They also questioned if men used more directive leadership styles (indicating a control-related leadership role) than women leaders to manage virtual teams. Hambley, O'Neill and Kline (2007) explored virtual team leadership behaviors in six different experimental conditions and connected virtual team leadership to transformational and transactional leadership styles.

APPLICATION OF THEORETICAL CONCEPTS FOR LEADERSHIP STYLES TO VIRTUAL PROJECT MANAGEMENT

Application of Control-Related Leadership

Konradt and Hoch (2007) research results showed that control-related leadership roles correlated to virtual team success and performance, A field study of two large companies in Germany by Hertel, Konradt, and Orlikowski (2004) showed that effective virtual team management practices included setting clear goals, tasks, and outcome interdependencies. They found that the higher the quality of goal setting processes and task interdependence, the more effective the virtual team. Hertel, Konradt, and Orlikowski suggest that e-leaders focus on high quality goal setting, high task interdependence and use team-based rewards to produce the best results from virtual teams. Hooijberg and Choi (2000) found that the goal achievement role, (attainment of goals, setting clear goals, and coordinating work) had a strong relationship with the perception of leadership effectiveness. Lee-Kelley's (2002) study indicates that the task-motivated leadership style for shorter projects would appear to be effective. Implications for the organization are the need to know the tenure of their projects and ensure that the project leaders' styles are appropriately matched to the term of the projects.

Application of Transformational and Transactional Leadership Styles

Motivation can be enhanced by providing challenges, recognition, and rewarding responsibility and creativity (Project Management Institute, 2001). Communicating the vision can be achieved through a well-developed project charter, developing emotional buy-in and ownership of the vision within the team, and using the vision to guide and direct the work (Kliem, 2004). Inspiring followers to work and motivating followers to complete goals by clearly identifying roles and setting vision are skills that can be learned. Training on transformational and transactional leadership skills and when each style is appropriate can provide an opportunity to apply these skills in real work situations. Hambley, O'Neill and Kline (2007) suggest developing training programs for virtual leaders and virtual project team members to increase team performance. Leaders can be taught skills (Capella, 2005) and learn the leadership techniques that can be most effective in virtual team management.

Application of Leadership Through Empowerment

Bell and Kozlowski (2002) suggest that virtual team leaders need to be proactive in providing clear direction and specific goals to encourage each team member to monitor their own performance and self-regulate their work to be successful. To do this, they suggest the leader develop rules, guidelines and habitual routines for the team. Self-managing teams, usually 10-15 people, usually report higher levels of job satisfaction (Capella, 2005), but the team norms and organizational culture can be influences on the success for teams that self-manage. It is often necessary for a virtual leader to provide motivational incentives, set objectives and mission, and develop an appropriate climate or tone for the virtual team (Bell & Kozlowski, 2002). Day (1999) suggests that empowerment is dependent upon a company cultural attitude that includes education about the organization and what is really happening in the organization, operational consistency, a proven process, loyalty, and trust. Increasing these company cultural behaviors may increase the success of leadership through empowerment. Wickham and Walther (2007) imply that the emergence of more than one leader may be the result of the situation or environment of the virtual team, and project managers must recognize this fact.

Application of Situational and Contingency Leadership Styles

The situational leadership style assumes that effective leaders can develop and adopt certain styles or behaviors dependent upon the needs of the project and team, analogous to the contingency school of leadership that emphasizes matching leadership style to the leadership situation. Tannebaum and Schmidt's (1958) situational leadership theory would provide the opportunity for the project manager to analyze the different patterns of leadership behavior, and how this range of

behaviors could determine the type of leadership needed to affect short- and long-range objectives. Determining the degree of authority used by the project manager and the degree of freedom experienced by the virtual team members, the continuum could help determine the behaviors needed. Hersey and Blanchard's (1969) life-cycle theory of leadership would assist the project manager in adjusting to the maturity of the team member, and become more flexible in what type of leadership behavior is needed dependent upon the needs of the individual. Adopting this model would help control any loss of mature, experienced virtual team members from the team.

The Vroom Decision Tree Approach (Vroom, 2000) could help the project manager understand the team members' level of participation to determine the degree of autocratic, consultative, or group oriented leadership necessary. An overview of this theory would be valuable to the project manager in understanding the relationship between the need for participation and the need for leadership with both the on-site and virtual team members and assist in balancing the team relationships and work. Slevin and Pinto's (1991) model plots four extremes of leadership style with the level of participation by project team members and could be used as a day-to-day working framework for project managers. Turner and Muller (2006) conclude that the project manager's leadership style and competencies contribute to project success and make suggestions for appointment and deployment of project managers based upon their findings.

Moving toward Multiple E-Leadership Styles

Benefits of Multiple Leadership Styles in Virtual Projects

By understanding control-related leadership roles (Konradt & Hoch, 2007), using transformational and transactional leadership styles

Table 1. Effective leadership concepts for virtual teams

Leadership Concept	Description	Application
Control-related	Leads by tasks Motivates Provides role clarity Sets clear goals and priorities Gives good directions	Use a high quality goal setting processes Encourage task inter-dependence Lead by task for shorter projects
Transformational	Inspires followers to work	Clearly identify roles Set the project vision
Transactional	Motivates followers to complete goals Clearly identifies roles Reinforces the vision	Use a well-developed project charter Develop emotional buy-in and ownership of the vision Use the vision to guide and direct the work
Empowerment	Leads self-managed work teams Distributes leadership functions	Develop rules, guidelines and habitual routines Provide motivational incentives Set strong objectives and mission Develop an appropriate climate or tone
Situational	Adopts certain styles or behaviors Adjusts to the maturity of the subordinate	Be skilled in multiple leadership styles Adopt the appropriate style dependent upon the experience and needs of the team member
Contingency	Matches leadership style to the activity/work Assigns workers to task oriented or participative leaders Adapts to environmental factors Leads dependent upon the needs of the team	Be trained on multiple leadership styles Remain flexible Adapt and apply the appropriate leadership style as necessary

(Hambley, O'Neill, & Kline, 2007), empowering virtual project teams to self-manage (Bell & Kozlowski, 2002), and incorporating situational and contingency leadership styles, those managing virtual teams will be able to offer benefits to the organization by providing positive, successful leadership, resulting in better project deliverables (see Table 1).

Virtual project management has become increasingly important and a necessity as the trend in virtual work teams continues. Leadership styles for managing virtual project teams are different from leadership roles for managing traditional, co-located teams. Understanding emerging e-leadership styles for virtual project teams and their application is an important part of our evolving virtual organizational behavior.

FUTURE RESEARCH DIRECTIONS

The literature reviewed may provide scholar-practitioners research topics related to the relationship between leadership orientation and adaptability for virtual project managers. Shenhar (1998) indicates that more research is needed to explore the role of contingencies in project management. Lee-Kelley and Loong (2003) recommend that there needs to be more evidence that the project manager can change leadership styles in response to altered circumstances.

Little research has been done to determine if situational and contingency theories of leadership can be applied to e-leadership of virtual project teams. The goal of future quantitative or qualitative research could be to determine if situational and contingency leadership style theories are applicable and increase the effectiveness of virtual project manager leadership. How leadership functions in virtual project teams evolve throughout the

project and the best way(s) the project manager can adapt to these changes to lead the team to a successful deliverable - on time, in scope, with quality, and on budget – is vital to the future of e-leadership.

CONCLUSION

This paper provides a review that could be used as a starting point for defining successful management styles for virtual project team leaders. For each style, there are leadership skills that managers can use to ensure success. As we move toward virtual organizations, we need to understand more clearly leadership roles in the virtual environment.

The general conclusion, also supported by Turner & Muller (2005), is that multiple leadership styles can be appropriately applied to project management leadership. Applying these theories and research to virtual project management provides an improved approach for managing human resources. The application to human resource management is that this flexibility in leadership style can provide the key to profitable project work, satisfied team members, and continued organizational growth through successful virtual project deliverables.

KEY TERMS AND DEFINITIONS

Contingency Style Leadership: Leading by matching the leadership style to the situation.

Control-related Leadership: Leading motivating, providing role clarity, setting clear goals and priorities, and by giving good directions to complete tasks.

E-Leadership: The term e-leadership describes leadership in today's non-traditional virtual business environment.

Empowerment Leadership: Leading by allowing self-managed work teams to take on the responsibilities of traditional management.

Situational Leadership: Leading by developing and adopting different styles or behaviors as necessary.

Transactional Leadership: Leading by motivating followers to complete goals by clearly identifying roles and setting vision.

Transformational Leadership: Leading by inspiring followers to work.

Virtual Team: Virtual teams are groups of skilled individuals collaborating from geographically distant locations and linked by technology that communicate electronically to achieve the goals of a project or work together on solving problems.

Chapter 57

Analysis of Gender Equality in Higher Management Levels:
A Study Model

Nuria Calvo

University of Santiago de Compostela, Spain

Jacobo Feás
University of Santiago de Compostela, Spain

ABSTRACT

The main goal of this chapter is to undertake a critical analysis of the current situation concerning the equal treatment of female managers in Spain. In this chapter, the authors analysed the dynamics of business behaviour in order to understand why inequality of women managers for gender reasons persists in spite of the anti-discrimination measures recommended by the legislative framework in place. This analysis has allowed proposals for measures to be drawn up to be taken into account in designing human resources strategies, based on systems of management by competencies and assessment of managerial performance.

1. INTRODUCTION

The economic participation of women is essential in shaping the economy of a country, not just for reasons of equity and equality, but also as a strategic question. According to the resources and capability based view (Wernerfelt, 1984; Barney, 1985; Rumelt, 1987; Conner, 1991), the human capital of business organizations, comprised of a combination of people's skills, knowledge, and reasoning and decision-making abilities, constitutes the main competitive value of firms (Grant 1996). Societies that do not use the talent of half the population carry out an allocation of resources that is not efficient, grow less and put their competitiveness at risk.

However, the inequalities between men and women continue in the business world, related

to their access to employment, vertical segregation ("the glass ceiling effect"), (Hymowitz & Schellhardt, 1986; Morrison & Von Glinow, 1990), differences in pay or inequality in working contidions.

In Spain, Law 3/2007 establishes a regulatory framework that obliges organisations to adopt equality of opportunity as an objective to be pursued. Nevertheless, in spite of this initiative, statistics show that the problem persists. Paradoxically, since this law came into force, there are some cases where the percentage of women has stabilised or even diminished. In addition, three new matters for concern emerge:

- According to Amuedo (2007), it is becoming extremely difficult to find women willing to belong to Boards of Directors, for fear of being regarded as "quotas"[1]. This phenomenon could spread to the rest of the organisation, self-exclusion appearing for certain promotions in level, because of identical reservations.

- The confusion between "equality" and "positive discrimination" has popularised the idea that the current context offers opportunities to women *at the cost of* men. In the words of Gómez-Mejía the "*beaten man syndrome*" (Gómez-Mejía et al., 2007). As a consequence of this situation resentment arises, anxiety increases and prejudice grows amongst those who feel threatened. A greater proportion of men perceive these measures in terms of a threat than do women. They believe that currently they are discriminated against by measures favouring women, that they have fewer employment opportunities and that they are paying for the consequences of a situation in which women suffered from discrimination in the past.

In these conditions it seems clear that the Law, even though it may help to correct certain deficiencies, is not as effective as it aims to be. It is necessary, therefore, to understand what the dynamics of business behaviour are that can cause the phenomenon of the "glass ceiling" to appear in promotion to management and, on the basis of this understanding, propose policies for action that allow organisations to exploit all their managerial talent, independently of whether this talent is possessed by men or women.

2. DIAGNOSIS OF THE SITUATION

The inclusion of women in paid employment is one of the great achievements of the 20th century. Nevertheless, the situation in which women have been included on equal conditions is yet to be reached.

A longitudinal analysis shows the progressive inclusion of women into the labour market. In Table 1 it can be seen that the female employment rate has increased by more than 20 percentage points in recent years, in a clear trend towards convergence with the male rate.

Nevertheless, trends and scrutinising data are different things. It is true that, in percentage terms, women have been entering the labour market in an increasing proportion, but it is no less true that their numbers continue to be below those of men (Table 2).

It can be seen from the data in Table 2 that the activity rate as well as the occupation rate is lower in the case of women, while the only figure that is higher is the unemployment rate.

This difference between trend and reality is a common denominator in the analysis of the labour market at the moment. Generally, it can be said that different inequalities persist: (1) at entry level (2) in promotion and (3) in salaries.

1. Inequalities at entry level, or horizontal segregation. Data gathered by the latest survey of the active population warn us of the persistence of this inequality at the

Table 1. Employment rate development (Source: Institute for Women, 2010)
level of access to employment (Table 3). As already remarked upon, in spite of the fact that women constitute approximately half of the labour force in the country, the number who are actually working is noticeably below that of men.

In addition, when analysing this apparent "barrier" to access to employment for women, another piece of data should be taken into account: the *quality* of the employment of those who do

have work. As can be seen from the figures in Table 4, the level of "precarity" or "temporariness" of women is significant.

From among this data, the proportion of women employed on a fixed-term contract basis or, above all, those of a temporary nature in order to substitute a worker, should be noted. In these conditions, and taking the current economic situation into account, it would not be a great risk to suggest that the number of women swelling the

MEN	
Population from 16 to 64 years	15636.2
Activity rate (16-64)	82.72
Unemployment rate (16-64)	13.04
Employment rate (16-64)	71.93
WOMEN	
Population from 16 to 64 years	15265.2
Activity rate (16-64)	65.29
Unemployment rate (16-64)	15.21
Employment rate (16-64)	55.36

unemployment figures in coming months will be significantly higher than that of men.

2. Vertical inequality. In exactly the same way, we can see that women have more difficulty in being promoted to positions of responsibility in organisations. This is a common feature of any statistics we analyse, whatever their sectorial, community, national or international origin.

It seems evident that it is difficult for women to be promoted in enterprises, public as well as private. The following table (Table 5), which is related to the presence of women in managerial positions in public and private enterprises, clearly shows that the proportion of women in these positions is notably below that of men:

The only level on which the numbers seem to be balanced is "management of firms without paid employees", that is to say where women manage because it is their own firm (as in the case of self-employed women, for example) or they are its only employee. This trend is independent of the type of firm, public or private, that is being analysed. In the case of public companies, they do not reach 20% in the best of cases (Table 6).

The situation is not much better in private enterprise. If we look at the situation of firms listed in the IBEX 35, the percentage of of women managers is, on average, lower. (Table 7)

In addition, in this final table, it can be seen that change is slow. It is true that, on average, the percentage of women on boards of directors has practically doubled, but due to the amount of inclu-

sion of women in junior management or middle management positions (board members or below), not in the managerial front line (Table 8)

3. Inequality in salaries. The analysis of salaries received by men and women also throws up great inequalities (Table 9). It must be pointed out that we are talking about inequalities, not discrimination. There is a considerable debate about what the correct terminology is. While some authors (Flabbi, 2005; Hernández and Méndez, 2005; Aláez and Uribarri, 1999) maintain that the majority of salary differences between men and women are explained by discrimination, others maintain there is no such discrimination, but inequality (Oliver, 2005). According to these authors, salary differences can be completely explained by a set of objective factors such as women workers having less experience or seniority; less occupation of positions of responsibility; greater presence in the service sector, holding less skilled positions that are more temporary. Others still (Camarero and Vega, 2000; Moreno et al., 1996) believe that both factors combine.

It can be seen from the Table 9 how the distribution of salaries, on average, is always higher in the case of men. It is true that various reasons can be given, *a prior* objective, for these inequalities: the influence of seniority increments (seniority increments constitute a significant percentage of the salary of workers. Women have recently entered the labour maket, for which reason they probably have less seniority), differing working hours, varying quantities of overtime or productivity bonuses, for example. In fact, researchers disagree when determining what the variables are that have the greatest weight in determining salaries. Aláez and Uribarri (1999) place experience, seniority and level of education first but also concede importance to the type of contract and the sector of activity. For Camarero and Vega (2000) the variables with the greatest influence are seniority (22%), level of education (15%), size of the firm (14%), sex (12%), type of contract (12%), occupation (7%), collective agreement applied (6%), final consumer market (6%) and sector of activity (2%).

From what has been said above it can be deduced that significant inequalities between men and women persist in the labour market. Even considering social pressure in this regard, as well as various political and legal initiatives, these inequalities are maintained through time.

% DIF	32,85%	28,88%	26,33%	21,87%

3. THE PROPOSED OBJECTIVE: A CAUSAL ANALYSIS

In spite of the existence of legislation specifically directed towards achieving equality in the workplace with regard to gender, the statistics show a reality that does not correspond to the objectives set out. Inequality between men and women on a professional level has not been reduced at the speed expected. The interaction of factors of a social, cultural or psychological nature, not considered in the legislative framework, continue to make real equality difficult in business organisations.

Therefore organisational designs and action policies are maintained that, far from favouring access to work and promotion for women, create intangible barriers that are difficult to overcome through legislative rules. Currently, the smaller percentage of women that have entered the executive level in firms and institutions permits the existence of organisational behaviour that is not being taken into account to be detected. In recent years neither governments, nor large corporations, banks, academic or scientific institutions, not even international organisations such as the United Nations, have considered assessing the opportunity cost that not using the managerial talents of many women represents. A more balanced distribution of decision-making power in the levels of the hierarchy could not only allow the value of this talent to be exploited, but also favour equality at work at lower levels of the hierarchy.

Gender discrimination in the workplace is such a broad and complex problem that it is impossible to analyse it from a single perspective. For this reason we have limited our study to the phenomenon known as "Discriminated Elites", as we consider that the formation of the organisational conditions that can favour or impede the promotion of women at work to executive positions could affect their future participation in the managerial processes of business organisations.

The starting point for our analysis is based on an initial set of premises that will determine the development of the approach proposed.

- There are no significant differences in managerial competencies in organisations for reasons of gender. On the contrary, levels of competence will depend on the following factors:
  ◦ Specific knowledge: business management, organisational behaviour and psychology and technical knowledge of the area.
  ◦ Management skills: capacity for social relations, negotiating and communication skills, initiative and leadership.
  ◦ Previous executive experience in management or junior management positions.
  ◦ The existence of a broad social network of contacts key for achieving the strategy of the organisation.
- The existence of a smaller number of promotions of female managers compared to male managers, considering the existence of an equal number of candidates of both sexes, could be related to the following:

- The existence of organisational policies that discourage the promotion of women managers
- Social, cultural and educational factors that influence the assessors when taking decisions about work promotion in their organisations.
- Resistance to change or the "status quo" of the current management bodies of the organisation, which are mostly made up of male managers.

- The percentage of women managers who leave is greater than that of men due to life, emotional, and differential behaviour factors. The difficulties female managers have in maintaining themselves as a minority group in top management bodies are related to the increase in the rate they leave.

The traditional view defines women as a problematic aspect of the labour force. Thanks to political concern to encourage measures that reduce inequalities in the workplace between men and women, superficial remedies in practice have multiplied in recent years that neither deal with the strategic causes of inequality nor integrate women at all levels of the labour force. Policies that facilitate leave of absence to take care of children, encourage part-time work, give preferential access to training courses or fiscal benefits for employing women, even if they are very rewarding acts aimed at improving the image of a government or socially responsible firm, are not clearly of any help in really solving the problem of inequality in the workplace, and less so at the level of management.

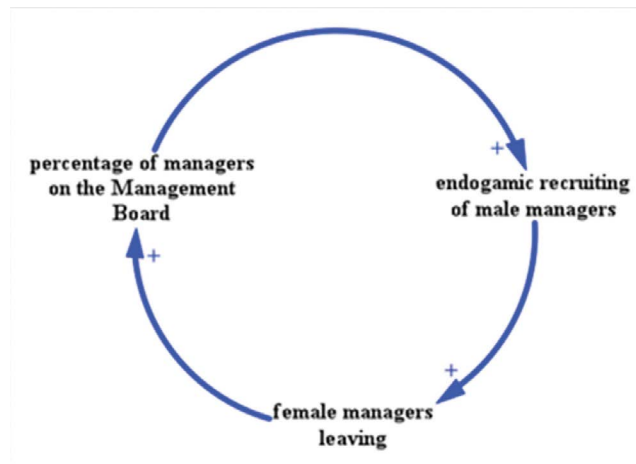
Research on the advancement (or, more correctly, the "non"-advancement) of women in professional careers (Perry et al., 1994; Tharenou et al., 1994), the reconciliation of personal and professional life (Stroh et al., 1996), female managers (Lyness and Thompson, 1997; Bass and Avolio, 1994), leadership (van Knippenberg, 2004; Hunt, Boal and Dodge, 1999) or gender and organisa-

tion (Agars, 2004) indicate that the majority of the "technical" or traditional barriers (access to higher levels of education, a non-discriminatory legal and institutional framework) have been gradually overcome in recent years.

Taking the dynamic role that groups play in determining the form and context of an organisation into account (Ryan and Haslam, 2007; Haslam et al., 2003), we can infer that these barriers are the result of intra-group pressure in the decision-making process, when basically these decisions are taken by men. That is to say that given that the majority of managers in organisations are men, it will be them who have to choose a woman for a management post. Breaking with tradition, prejudices and sexual stereotypes and possible difficulties in ways of dealing with matters because they are different sexes may be some of the reasons that curb male managers from taking this decision. This discrimination could also be interpreted as a way to reduce the status quo and acquired privileges (Schmitt, Ellemers & Branscome, 2003).

From this point of view, because of the internal dynamics of power endogamy (Figure 1), the individuals belonging to a closed group such as a managerial body tend to choose their new members from among those people who are similar to the majority, avoiding the introduction of elements that distort the existing equilibrium and increase the possibility of future conflicts at the heart of the group.

The maintenance of this dynamic through time causes some women members of a management team to leave, because of the isolation created by their minority situation and differences in characteristics from the rest of the group members. The following diagram explains the higher leaving rate that appears amongst women managers compared to their male counterparts. The higher the percentage of men who are at management level, the higher will be the percentage of new male managers recruited. This situation will make the isolated position of the women managers

Figure 1. Endogamous loop (source: made on the premises)


belonging to the same level more acute, which will cause more of them to leave for this reason, which in turn will increase the percentage of male managers with decision-making status.

These dynamics allow the fact that low female representation is maintained at a managerial level in various organisations to be explained. To ameliorate this low representation, a set of policies has been put in place in recent years under the heading "positive discrimination". These are intended to assure a minimum participation of the female minority in managerial bodies. The method advanced by these policies means that if in the selection process there are several equally eligible candidates the selectors will discriminate in favour of the woman. With this method it is intended, in the mid-term, to achieve quantitative equality of both sexes in decision-making bodies. This is a measure that, even though it is obligatory in the Public Sector, is only a recommendation for good governance in the case of private organisations.

From the proposed approach it is not obvious that this type of policy, recently introduced, can achieve the intended objectives. The complexity of the internal reactions of the organisation itself as a group of individuals, not taken into consideration in the practical application of the proposed action, could mean failure in the real objective of this policy.

The following causal diagram (Figure 2) shows the interrelation between various variables that may influence the situation. The increase in policies promoting equality through positive discrimination creates an attitude of disagreement among the men who occupy the majority of managerial positions. This disagreement increases prejudices towards those new female managers favoured in the selection. This attitude is transmitted to the junior managers, making cooperation difficult between male managers and women junior managers. As a result of this situation the productivity of the female junior managers may decrease in comparison to that of their male colleagues. Afterwards, the assessment of the performance of the female junior managers who are candidates will be inferior to that of their male counterparts. As a consequence the previous condition of equal eligibility will not be met during the promotion process, which will make the promotion of new women managers difficult.

Nevertheless, if this diagram allows the maintenance of female managers in a minority in organisations to be explained theoretically, it does not clarify the situation of inequality between sexes that appears at management level in strategic areas in organisations.

Figure 2. Loop of resistance to change and cession in the power structure (source: made on the premises)

The explanation of this phenomenon can be due, from a comprehensive point of view, to the contradiction that appears between the final objective of the policies put in place (that is to achieve global parity between sexes at a managerial level) and the traditional cultural values that exist in the perception of the majority of the male managers whose job it is to implement these policies. In this way the subjective perception of the lack of managerial competence of female junior managers favours the promotion of women into managerial jobs that are not critical for the organisation to function well, placing them in areas of activity with lower budgets or considered "feminine" according to gender stereotypes.

This situation, seen from a dynamic point of view (Figure 3), perpetuates a loop able to keep women managers in a minority despite promotion policies put in place to avoid this.

As a result the promotion of the majority of women managers to areas that are not critical for the global functioning of the organisation, which means occupying posts with less responsibility, budget and margin for manoeuvre, causes their isolation in the important decision-making bodies. This situation reduces the support of their male

Figure 3. Organisational culture loop (source: made on the premises)

colleagues at the same time as it again stirs up prejudices and gender stereotypes, in time provoking a greater leaving rate among women managers in relation to men.

4. PROPOSED MEASURES

Organisations today are aware of change in the competitive environment. Intangible assets, when they are scarce, valuable and lasting, constitute the basis of sustainable competitive advantage (Barney, 1991; Grant, 1996; Drucker, 2005).

Knowing how to manage and develop the managerial competencies of their employees becomes, therefore, a strategic objective for organisations, key to their differentiation. Renouncing this competence because of a gender question can be manifestly unprofitable. Nevertheless, putting women into managerial positions just because they are women, without them having suitable competencies compared to other candidates, may result in the same situation.

It seems necessary, therefore, to identify a strategy that should guide the behaviour of an organisation that intends to select and maintain the managerial talent of its employees as a strategic resource without gender criteria being able to bias decision-making one way or another.

The measures proposed below require close collaboration between the functions of strategic planning, human resources and organisation. Without this coordination, as well as the commitment of management to the objective of equality of opportunity, it will not be possible to change the conduct identified in the above analysis as causing the glass ceiling effect.

4.1. Strategic Planning

A firm's business plan is firmly in the sights of partners, investors, creditors and public organisations involved in its going into operation. The fulfilment of each and every one of the declared objectives adequately and in time allows a firm to gain the necessary credibility to stimulate its growth.

For this reason, the management of a company should embody the distribution of tasks to be carried out in the organisational structure. To do so the following is necessary:

A. *A clear definition of the functional and professional job profile of the management positions.* In order to do so the system of assessment of factors and competencies (Orue-Echevarría, J., 2004; Fernández-Ríos, M., 1995) allows the most relevant functions of each position to be identified, as well as the professional qualities required to carry them out successfully. Only when gender is a relevant aspect to be considered in each of these profiles would it be licit to include it as a criterion in the selection of management.

B. *A distribution of objectives through the organisational structure,* which implies a hierarchical distribution related to the level of responsibility (objectives of the company, the area, individuals), as well as a distribution of functions that is coherent with the basis of groupings in the organisational structure (intra-functional objectives, inter-functional objectives). The weighting of objectives within the process of managing performance allows the degree of commitment of every professional to be assessed at the various levels of objectives. Nevertheless, it is the responsibility of management to define the *goals grid* to be accomplished, that will allow the work of the organisation to be aligned with the fulfillment of the objectives in its Business Plan. Ambiguity in responsibilities combined with a changing situation and an organisational structure that is not well-defined are often features that favour biased and opportunistic behaviour, more concerned with individual interests than the accomplishment of business objectives. It

is in this context that bias can appear in the selection of management for gender reasons, and endogenous behaviour that tends to eject women from the management team just because they are women.

When defining a strategic process of introducing human resources practices, we have considered the starting point to be the classification hierarchy of Wright and Gardner (2003), that differentiates four levels: (1) guiding principles (2) alternative policies (different practices), (3) products (competencies or behaviour that stimulates practice, and (4) processes of putting into practice (effectiveness in the execution of the practices). It is considered that while some practices such as payment for performance, or selection by competence, could be universally effective, this effectiveness does not really come from the practice itself, but from the *fit* between practice and the result obtained (for example, a salary increase for a good performance level or the selection of suitable professionals in relation to a specific strategy).

The description of management profiles and strategic objectives allows a system of management by competencies to be put in action that will serve as a connecting theme for the measures tending to identify and maintain management talent in the organisation.

4.2. Recruitment and Selection Measures

Considering the non-existence of significant differences in management competencies in organisations because of gender, and taking into account that competence in management is related to matters such as knowledge of administration, communication and negotiation abilities, leadership, previous executive experience and a network of contacts, the following are put forward as *selection criteria* for candidates for management posts.

- *A blind review of merits*. This means the consideration of the curriculum value of the candidates without having any information about their gender.
- *The above assessment of competence connected with systems for managing performance*. In order to do this it will be necessary to design tests specifically directed towards assessing, on a predefined scale, the performance of candidates in solving management problems. Strategic problem simulators allow a complete set of parameters of reasoning to be assessed, at the same time avoiding the assessor's bias. This will make it possible to avoid decisions influenced by personal or cultural factors connected with perception of the gender of the candidate.

4.3. Management Coaching System

One of the reasons identified in the above diagnosis as causing the greater leaving rate of female managers was lack of support from the previous management group. To avoid this situation resulting in organisational behaviour in which the group expels the marginal member, or that this member gives up because of lack of support from equals, *a coaching or tutorial system is proposed that encourages managers to stay*, regardless of their gender, as long as the objective assessment of professional performance advises that they remain.

To do this, managers should have a high level of dynamic vision of the organisational scene in which they carry out their work (Table 10).

The perception of self-efficacy is conditioned by expectancy of control over reinforcements (Rotter, 1966). These expectancies reflect belief in one's own responsibility for the consequences of behaviour, and are influenced, one the one hand, by intellectual and social capabilities and resources, under internal control, and on the other by external reinforcement coming from the

Table 10. Adapted from Lewin's Force Field Analysis

Driving forces		Resisting forces
People	→	People
Economic benefits	←	Traditions / previous culture
Situation in the environment	→	Organisational policies
Wants and needs of the management	←	Attitudes of the management team
Availability of technology and tools	?	Costs

perceptions of managerial efficacy that third parties transmit.

The perception of self-efficacy similarly conditions expectancies of results (Bandura, 1986). These refer to the beliefs that, in this case, women managers and junior managers may have about the probability that specific results will be the consequence of controllable behaviour.

Taking these relationships into account, we have identified three behavioural loops which allow in depth analysis of how self-exclusion works as a barrier to the promotion of women managers.

A. *Prior deterrent loop:* The perception of others, biased by gender stereotypes, lessens the effect of the value of the resources and abilities of women hoping to access managerial positions, lowering their expectancies of control over reinforcements. This reduces

their perception of self-efficacy, resulting in abandonment of their promotion to manager, even before this happens.

B. *Positive behavioural loop:* The reduction of the belief in their responsibility for the consequences of their behaviour (expectancies of control over reinforcements) reduces female managers' perception of self-efficacy. This causes a lowering of expectancies of results and reduces those behaviours tending towards achieving managerial success. This situation reinforces the lowering of expectancies of control over reinforcements, creating a dynamic of managerial paralysis (lack of proactive behaviour in the absence of perception of the behaviour-results connection).

C. *Negative behavioural loop:* Reduction of female managers' perception of self-efficacy causes a lowering of expectancies of results which, by contrast, may set in motion be-

Figure 4.Causal diagram of managerial self-exclusion (source: made on the premises)
haviours tending towards failure, motivated by stress, poor assessment of alternatives or those motivated by personal interests. All of this creates a negative dynamic which reinforces the reduction of female managers' perception of self-efficacy and may cause abandonment of the position of responsibility.

The proposed analysis suggests a dynamic which is difficult to change. The majority of measures proposed by the Government focus on providing management training for women and establishing quota systems for female representation in positions of responsibility within organisations. Measures which, whilst they contribute in part to altering the current situation, do not contribute to changing the underlying causes for the psychological and social barriers which prevent the smooth promotion of female talent in organisations.

The coaching measure proposed is directed towards encouraging greater external reinforcement of the work of pre-selected female managers. This support, aligned with their own managerial competencies, may influence expectancies of control over reinforcements, activating successful behaviour and avoiding leaving motivated by a perception of low self-efficacy.

5. CONCLUSION

In recent years we have seen the proliferation of legal regulations -national and international- directed towards introducing equality of opportunity between men and women. Simultaneously, awareness and social pressure have been increasing in this regard. Nevertheless, the situation of women in the labour market continues to be of concern: less activity, higher unemployment rate, imbalances in levels of entry, salary and managers.

In Spain, Organic Law 3/2007, on the effective equality of men and women, attempts to ameliorate

this situation, completely or in part. This law represents a challenge for many organisations. Among the several obligations that the introduction of this law brings with it figures the requirement to draw up an equality plan in firms of more than 250 workers, which will probably before long be extended to the rest of firms.

All together, the greatest challenge that the law creates is the negative collateral effects in the workforce, above all in groups not benefitted by the measures. We have seen that there is a low level of acceptance of positive discrimination measures, above all among men. We also detect that the perception arises among men that their situation is being impinged on to the benefit of women. Conflicts will appear in justice, legitimacy and authority. Women, for their part, may find themselves with problems of self-perception of their capability, getting to the point of excluding themselves from the possibility of benefitting from these measures.

This situation means bad use of managerial talent in the heart of organisations. If in principle business efficiency requires the best use possible to be made of resources, that is to say to always use the "most suitable" resource, applying this to the specific case of human resources implies allocating *the most suitable person* to a post with regard to different attributes (training, work record, productivity, specific knowledge, contribution to results, etc.) that make a person most suitable, independently of their gender.

In this chapter we have analysed the dynamics of business behaviour that allows it to be understood why the situation of inequality of women managers for gender reasons persists in spite of the positive discrimination measures recommended by the legislative framework in force. This analysis has allowed proposals for measures to be drawn up to be taken into account in designing human resources strategies, based on systems of management by competencies and assessment of managerial performance.

From the proposed approach, these measures, adapted to the needs and conditions of each organisation, will allow the orientation of decision-making towards the criterion of efficiency based on exploiting the managerial talent of professionals who work in an organisation, independently of whether this talent is masculine or feminine.

Chapter 58
Listening and Leadership

Javier Pagán Castaño

ABSTRACT

This era is both characterized by continually evolving and changing market conditions and the relevance of knowledge to adapt to the new environment.

In this chapter, the authors will focus on three ideas: the connection between the company results and the leader's listening skills; people as the firm's most valuable resource; and therefore, internal communication as the key for success and full potential of the company. However, the survey concludes that internal communication is scarce and not always effective since one way communication seems to be the most common form of interaction, even though leaders know the importance and value of their human resources.

INTRODUCTION

In the era that we live in, where the market conditions are continually evolving and changing, and organizations are struggling to adapt to the new conditions, leaders must understand that what they really manage in an organization is people. House (2004) defines leadership as "the ability of an individual to influence, motivate and enable others to contribute toward the effectiveness and success of the organizations of which they are members", The DePree´s (1992) idea of leadership, a position of servant hood, compliments with Drunker (1992) observation that the Japanese leader recognizes that rank does not confer privileges but rank entails responsibility. For Nelda Spinks and Barron Wells (1995) to make people feel as though they are accomplishing something and not just "putting time", a leader must work with people and not against them. Leaders must understand that people are the most important components in an organization and that having

an effective communication with them is key to enhance performance. But reality seems to be different since leaders do not put in practice, during their daily interactions, the elements that make good communication possible. Trusting and open environments are the exception in an overall organization's atmosphere characterized by judgment, interruptions, and misunderstanding of people's needs.

LITERATURE REVIEW

The Key Leadership Skill

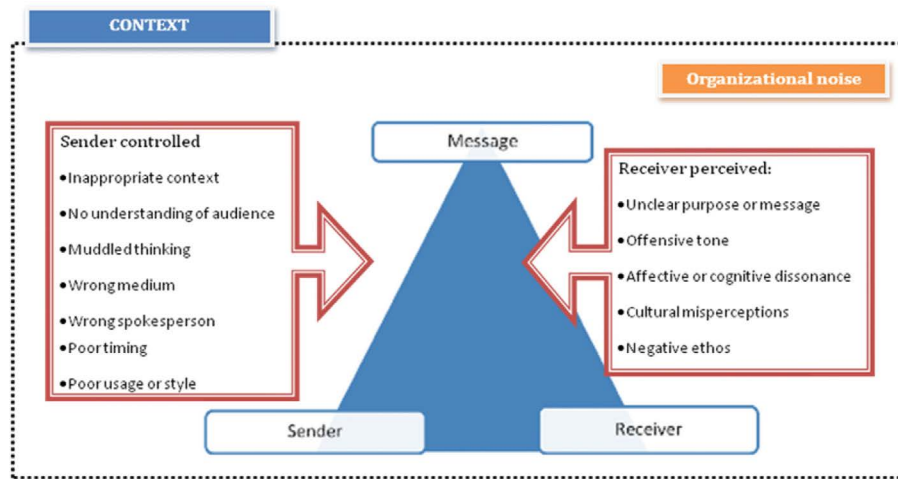
Communication is the most important skill a leader must possess; since it occupies 70 to 90 per cent of his/her time (Mintzberg 1973, Ecles & Nohria, 1991). If that same study were done today including e-mail, cell phones, and text messaging, the percentages yielded would be even higher. The total amount of time managers dedicate to communicate emphasizes the importance of having strong communication skills to advance to leadership positions. Mastering leadership communication should be a priority for managers wanting their organizations to consider them as leaders (Deborah J. Barrett, 2006). Without ef-

fective communication, a manager accomplishes little. Without effective communication a manager is not an effective leader, and through effective communication, a leader leads.

Communication is the transmission of meaning from one person to another or to a group of people, whether verbally or non verbally. Leaders must pay attention to four elements to become effective communicators: the sender, the medium or channel, the receiver and the context (Figure 1).

This triangle shows what would be an ideal and simple communication process without miscommunications or misunderstandings. The person, who sends the message, understands the audience (receiver) and the context, selects the most appropriate medium and sends a clear message. On the other hand, the person who receives it understands the message as the sender intended. But in reality, communication resembles some variations, as in Figure 2 (Barret, 2006).

The complication in communication comes from the interruptions or interferences in that transmission, whether the sender causes them or the receiver. Leadership communication necessitates anticipating all interruptions and interferences through audience analysis and then developing a communication strategy that controls the

Figure 1. Ideal and simple communication process (Source: Own elaboration)
Figure 2. Real and complex communication process (Source: Barret, 2006)


rhetorical situation and facilitates the effective transmission of the message.

The purpose of the sender is to communicate a thought or idea formulated within their mind. Even though he or she clearly sees the idea, factors like the sender's current frame of mind, level of communication skills or familiarity with the receiver influence the communication outcome.

A channel of communication is selected, whichever written or oral. Written communication is exposed to different interpretations of symbols and words, and to poor production. Even though the clarity of the written message, it can be neglected or ignored because of improper spelling/grammar skills, the incorrect format or inappropriate length. In the same way, oral communication is vulnerable to poor listening or distracting voice. To gain effectiveness, the sender must consider the velocity, the tone and the body language used during the communication process. It is mandatory for the messenger to read the receiver's body language to evaluate the degree of understanding. Once the message arrives to the receiver, it is submitted to physical and emotional conditions, predetermined notions and different levels of receptivity.

New Communication Environment

In the past, interactions between individuals used to be face-to-face. Today, an ever-increasing number of encounters are mediated by technology. This new way of interacting involves different types and levels of risk, and they are only possible if users trust each other and the systems they use to communicate. As Checkland (1999) pointed out, any technical system that is brought to an organization can only work efficiently as part of a larger socio-technical system, i.e., the organization and its human actors. Some authors claim that the benefits associated with the implementation of new technology in organizations fail to yield the expected increases in productivity because of its inability to build social capital (Launder, 1996; Resnick 2002). Trust can be formed by informal exchanges, but if new technology contributes to make these exchanges archaic though mechanization, trust could be unavailable when it is required. Interactions that used to be face-to-face and based on long-established personal relationships are now carried out over distance by automated systems, a process called dis-embedding (Giddens, 1990). From this point of view, conducting more interactions using new technology rather than face-to-face

can deprive leaders of opportunities to build trust. To evaluate the potential of new technologies for enabling new forms of interaction without considering these undesirable consequences, trust and the conditions that influence it, can undermine the opportunities for development.

A clear and extreme example of a new form of professional interaction is working at home. The benefits from teleworking programs, understood as any work agreement in which employees can work at any time or place, and can perform their tasks in an effective and efficient way, are not as easy as they might seem. Successful teleworking programs require, according to Chaudron (1995), the "right employee", "the right job" and "the right reasons":

- Employees whose personal traits will be suitable for teleworking.
- Jobs involving individual versus team contributions
- Management teams who do not just view teleworking as a benefit for their employees but also as an opportunity to enhance productivity.

Baruch and Nicholson (1997) research study reveals that ninety four percent of sampled teleworkers declared they wish to continue working at home, but less than ten per cent affirmed a desire to continue on that situation for the rest of their working lives. These results show the inner conflict experienced by the at-home worker. Anxiety, communication gaps, isolation, guilt, negative spillover between family life and work and reduced productivity are some of the feelings they can experience.

Participants at an ACM forum (1995) declared that teleworking does not facilitate the social and professional interaction of the employee, killing his/her most human quality. At-home workers, can feel left out of interactions from office rumors to changes in company procedures, activities or policies. On the other hand, managers and at-home

workers who are part of a program to interact informally, develop interpersonal organizational networks and create synergistic relationships have shown reduced feelings of isolation (Kurland and Cooper, 2002).

Huws (1984) identified in his survey that 60 per cent of respondents felt isolation as the major disadvantage of working at home. This physical separation reduces not only the amount of feedback that teleworkers receive from clients, supervisors or coworkers, but also reduces its quality because the non-visual communication reduces the nonverbal cues (Norman et al., 1995). Hamilton (1987) stated that at-home workers miss the motivation of exchanging experiences and ideas with colleges

As it happens in the in office environment, the out-of-office one also needs good communication between managers and workers to maintain business and personal relationships and to accomplish tasks. But in the out-of-office environment communication channels are mostly electronic, document handling and e-mail being the most commonly used communication methods.

In Weiner and Hill (1995) qualitative study findings, the negative influence that at-home workers had on peer interaction and communication with managers and coworkers contrasts with the view of organizations as social systems whose basic structure is made of relationships among individuals (Fritz, Narasimhan and Rhee, 1998). Employees sharing the same physical location develop alliances, learn through communication and foster creativity through communication with coworkers through casual encounters around the coffee machine and elsewhere (Allen, 1977) Kraut et. Al. (1998) study showed that using e-mail to socialize was positively related to social isolation, depression and loneliness, indicating that e-mail is not as good communication channel as it is face-to-face. Weick (1987) suggests in his research that face-to-face or organic systems involve more managerial information, two way communication and advice rather than instructions, decisions and orders than electronic or mechanical systems. A

leadership style closer to consultation than command (Courtright, Fairhurst and Rogers, 1989).

Communication and Leadership

Geneen (1984) identified in his study that good leadership, which inspires people to excel, contributes as much as 80 – 90 per cent of organization's success. In the opinion of Wells B. (1992) this leadership can only be exercised through quality communication. As DePress (1992) explained, quality communication is the avenue by which leaders clarify their visions and foster participative management within the organization. In this context, Bennis (1989) determined that leaders are people who are able to express themselves fully. They know what they want, why they want it and more important, how to communicate what they want to others to gain co-operation and support. In the words of Tracy Goss (1996) "language is the only leverage for changing the context of the world around you. This is because people apprehend and construct reality through the way they speak and listen". Robert Bolton (1998) expressed, it is how we manage our conversations and have a discipline about conversations that we can achieve change and transformation in organizations and consequently the achievement of breakthrough results.

The fast and efficient exchange of information is undeniably a competitive advantage in business. And for communication to be effective, everyone must be up to date. A balance flow of information reduces the frequency of misunderstandings and limits expensive mistakes. Employees feel a greater sense of connection with their supervisor and co-workers. They are able to adapt to changes more rapidly and they can offer targeted insights, ideas and perspectives. As a result, supervisors and staff work smarter, not just harder. The effect of quality information flows on quality performance (Forza 1995). Management practices are information and people dependent despite all the technological advances of our time.

Organizations are still managed and operated by people and it is their knowledge and skills what determines success (Teresa Brannick et al., 2002). But unfortunately, in the rush to adapt to market needs, many organizations sacrifice effective communication. As priorities shift, executives may impart only the immediate goals and fail to share the rational and strategies behind them (Max Messmer, 2004). Managers must be so focused on results that they neglect to praise and reward their staff. And most of all, they may forget that communication is a two way exchange, one part dialogue, one part listening.

Poor communication is today's number one problem at work, at home and in the work place. People communicate through a set of filters shaped by history, sense of identity, beliefs about what is true, and values about what is right, as well as perceptions and interpretations of what is going on. When someone else communicates with us, we squeeze the message through our own personal filtering system to understand (Shelle, R. Ch., 1995). Every person has a certain number of filters by which they let in certain parts of the real world.

The Role of Listening

Leadership communication uses a full range of communication skills and resources to overcome interferences and to create and deliver messages that guide, direct, motivate or inspire others to action. It is estimated that leaders dedicate as much as 45 per cent of his/her communication time in the form of listening. For Burley Allen (1995) communication breaks down as in Figure 3.

Figure 3. Communication skills and resources (Source: Burley Allen, 1995)
Even though the importance of listening, few individuals are trained in the development of listening skills. Leadership and decision making are as much the art of listening as they are the art of doing (James T. Scarnati (1998). We tend to assume that listening is basically the same as hearing, leading us to believe that effective listening is instinctive. People must seek first to understand, and then to be understood (Covey, 1989).

The word listening comes from the Middle English word *listnen*, which derives from Old English *hlysnan* (Hlud means loud), which simply refers to paying attention to sound. In present literature, listening entails a more refined definition: listening is an in-depth process beyond hearing (Shoho, Woods and Smith, 2006). Webster's dictionary (Agnes 2003) defined listening as to make a conscious decision to hear. For the International Listening Association (ILA) listening is "the process of receiving, constructing meaning from, and responding to spoken and/or nonverbal massages" (Emmert, 1996,p.2) Burley – Allen (1995) and Bakhtin (1993) consider listening as a process that entails a sophisticated mental model that requires discipline and energy. Bakhtin (1993) considered that every word in a conversation replies to another word. Spears (1995) described listening as the active recognition and acceptance of employees´ ideas, opinions and suggestions. Bass and Avolio (1994) described it as the leader's motivation to entertain even the most eccentric ideas from followers, noting that this behaviour enhances follower's commitment. Bechler and Johnson (1995) came across with the relationship between leadership effectiveness and listening skills and with the strong positive connection between leadership emergency and listening skills (Johnson and Bechler, 1998). Kramer (1997) tested interpersonal skills and discovered a link between transformational leadership effectiveness and listening.

But it was not until the work of Ralph Nichols that listening was considered a study focus as an element of verbal communication. Lewis and Nichols published in 1954 a guide to effective verbal communication emphasizing the relevance of listening in becoming an effective speaker. In 1957, Nichols co-authored the book *Are You Listening?* The first book dedicated to listening. Shortly, business people and scholars became interested in Nichols´ work as the significance of communication between subordinates and supervisors became more apparent (Orick, 2002).

After Nichols´ work various factors have been linked to the concept of listening. Brandt, Emmert and Emmert (1992) discussed in their work six specific elements of listening, as shown in Figure 4.

And adopted these variables to develop the Listening Practices Feedback Report (LPFR). In their work, 860 people representing 22 firms in a variety of industries and business participated in the study. The survey asked them to make a list with the names of three colleges they considered to be good listeners and another list with the names of three people they considered to be poor listeners. The participants were also asked to write five habits or qualities they will use to identify an effective listener and five more to describe a poor one. Even though there was not a major difference between the group of good listeners and the group

Figure 4. Six specific elements of listening (Emmert and Emmert, 1992)

of poor ones, the attained results were used to group specific characteristics into general concepts (open mind, empathy, memory, attention, respect, and response) to develop the LPFR.

Open mind refers, according to Brandt Management Group (1999), to be free from personal biases. It is considering logic and content and it is not being critical of appearance, vocabulary, delivery, etc.; it is about not becoming defensive or emotional when confronting a difficult situation, keeping an proper balance between listening and talking; and staying away from emotion-packed clichés, phrases or words (Brandt Management Group, 1999).

Attention describes the use of the listener's body, eyes and face to show the speaker that he or she is the most important thing occurring at that specific moment (McEwan, 2003). It entails the listener's non verbal communication as well as the degree the listener creates a private listening environment (McKewan, 2003).

Empathy refers, according to Covey (1989), to a person desiring to understand what the other person feels and thinks. It is the person's willingness to understand the paradigms of the other person although it is different from his or hers. It involves seeing the word from the other person's ayes and willingly being in the other person's shoes. Covey (1989) believed that empathy was key to find a common ground and to create a productive relationship. For the Brandt Management Group (1999) a person demonstrates empathy by summarizing, paraphrasing, or repeating the comments of the other person in order to ensure understanding by the listener, by giving confidence to others to give their views on subjects under discussion as well as reflecting on the subject under discussion before responding, and by putting oneself in the speaker's situation and understanding their feelings and concerns.

Memory is related to the result of listening. Good listening produces an outcome aligned and consistent with the guidelines or instructions agreed ahead, the precisely remembered comments and the notes taken when appropriate (Brandt Management Group, 1999).

Respect can be measured in numerous ways. It can be seen as the ability to be confident and listen honestly without just going through the actions. Respect can be articulated by having patience during a conversation and recognizing others´ ideas and words in spite of economic, business or social status (Brandt Management Group, 1999)

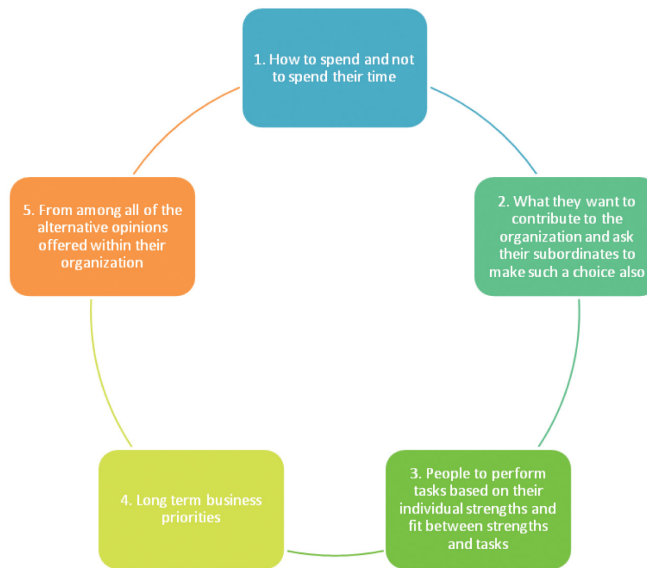
Response is related to the listener's reaction. A good response happens when the listeners ask relevant questions for clarification of points that are misunderstood or technical. Response also refers to the appropriateness of verbal and non verbal replies, such as facial expressions or nodding (Brandt Management Group, 1999).

The question that can arise at this moment is "Why should leaders listen to their people?" Osterman (1993) indicated that Covey (1989) could have answered this question when he settled that "the greatest need of a human being is psychological survival-to be understood, to be affirmed, to be validated and to be appreciated" (p.241) Listening carefully to another person gives "psychological air" to him/her. And it is only when this need is satisfied when the leader can focus his/her attention on problem solving or influencing.

Bennis (1997) talked about the four characteristics that people look for in their leaders:

- Sense of trust,
- Sense of purpose,
- Optimism and
- The capacity to achieve results

"One of the best ways to build trust is by listening. It is the most powerful dynamic of human interaction when people feel that they are being heard. Listening does not mean agreeing, but it does mean having the empathetic reach to understand one another" (p. 75).

Figure 5. Listening effectiveness model (Source: Peter Druker 2002)


In Peter Druker's effectiveness model (2002) executives must carefully choose (as illustrated in Figure 5).

The model relies on the listening abilities of the leaders, especially steps one, two and five. Listening is required during step one to understand the employees´ plans and improvements to avoid control of everything, therefore annulling step one. Druker's conviction that organization effectiveness depends on subordinate's contribution is emphasized in step two. It is only when subordinates and managers express their contributions that everyone feels ownership and a role in the organization effectiveness. The importance of searching for views and questioning about the basis for these opinions to make decisions and put plans into action is emphasized in step five as opposed to the alternative of centring the evolution on pre-arranged ideas. It requires listening with genuine curiosity to persuade others to voice and sustain their opinions, instead of just setting forth proposals hoping form a general agreement.

For Kouzes and Posner (1987) pioneer leaders feel comfortable jumping into the unknown. They identified five common practices to successful leaders, shown in Figure 6.

They emphasize, in these five leadership practices, the power of encouragement, and noted that encouragement is achieved through listening and recognition.

On the other hand, Burley Allen (1995) mentioned the consequences of not developing listening skills:

- Individuals create unnecessary problems for themselves.
- Misunderstandings.
- Hurt feelings.
- Confused instructions.
- Loss of important information.
- Embarrassment
- Frustration

Listening is a potent force for reducing stress and tension, since true listening builds (Burley Allen, 1995):

- Team work
- Trust
- A sense of belonging to a group

Figure 6. Five leadership practices (Kouzes and Posner, 1987)

When people know they are talking to a listener instead of someone who sits in judgement, they openly suggest ideas and share thoughts. The listener has an opportunity to respond to the person's concerns and needs that otherwise might have gone unnoticed. Factors such as the information not sounding good, not making sense or not ringing true act as filters because they are the result of values and past experiences. These filters result in a closed mind. Listeners with closed minds focus on (Burley Allen, 1995):

*   Disagreeing.
*   What is not right
*   What is wrong

This negative process can be discouraging for the talker. A listening barrier exists when someone hears what he wants to hear, not what is really communicated. The James T. Scarnati (1998) formula: open your mind, your ears, your eyes, and your heart while closing your mouth is a winning combination for listening.

Many people are poor listeners, because listening is difficult and because it is usually more satisfying to be on the offensive. Listening in fact is often more tiring than talking. It demands intellect effort. The average person speaks at rate of 150 words per minute, whereas humans have the capacity to listen at the rate of over 1.000 words per minute (Robins 1989). This leaves a mental deficit equivalent to a "distraction zone" of about 850 words per minute. Be a productive listener takes a great deal of mental effort. Successful leader will have not the loudest voice but the reediest ear (Bennis 1993).

Active Listening

Active listening provides a climate for decision making that can best impact strategic change. Nothing will kill genuine dialogue and the motivation to pursue new initiatives faster than a senior manager who is unwilling to listen and who demonstrates little patience or respect for what people have learned and the knowledge they want to transfer. Active listening by top management is a catalyst for change because It overcomes some of the distance created by the authority they hold (Kenneth J. Hatten and Stephen R. Rosenthal 2000). Leaders who practice active listening sign a genuinely open door, and demonstrate care and respect for those doing the talking.

In mastering the role of leadership, leaders must discern between behaviour modification and attitude modification. Behaviour modification implies that people change their outward action, while their attitudes, beliefs, feelings and opinions remain the same. On the other hand, attitude modification implies that followers change their

inward thinking hence, their attitudes, feelings, and opinions are brought into line with those of the leader. In opinion of Wells B. (1992) attitude modification is more important.

Another element to take into consideration is the managers´ general assumption that all they are supposed to do is to issue directives and to make decisions. As Sayles (1979) points out, managers often do not know how to react when they encounter a situation that requires endurance, patience, spontaneous compromises continuous interactions and negotiation. Just because executives know their aspirations does not mean that they know how to attain them. Managers have, within themselves, the ideas, capacity and vision to become more effective and to accomplish their goals. However, because most directors need the support and assistance of other people to accomplish their objectives, they need to learn what to do in order to motivate others to perform relentless tasks. In this context, the charismatic and transformational approaches are ideal for innovating, initiating, or energizing others´ behaviour, but fail for directing and maintaining their behaviours.

Leaders responsible for maintaining performance on a day-to-day basis have to pay attention to how they interact with their followers. Letting people occasionally know what they liked or disliked about their jobs and frequently communicating, in a casual way, their impressions about their performance through the day make followers aware of how leaders perceive and value their performance and understand different ways to improve it. The managers´ agreements and disagreements resulting from their observation of the followers' performance can be called performance consequences. These consequences provoke a manager's response that is succeeded by a follower reaction:

- *Positive contingent consequences:* The manager compliments followers for an outstanding job.

- *Positive non-contingent consequences:* The manager praises followers when they did poorly and well.
- *Negative contingent consequences:* The manager reprimands followers when their performance was bellow the standard.
- *Negative non-contingent consequences:* The manager makes followers accountable for things over which they had no control.

Collaborators were more satisfied with their managers when they felt that contingent consequences were delivered by their supervisors. The majority of the problems are not based on peoples´ insincerity, but because they seem to be insincere. So, in some cases, it is not a question of content, but a question of style; and in others, it is about a manager who does not have or know the information on which to support a sound judgement, even a positive one.

Another important aspect is the frequency of managers' acquisition and communication of information.

To avoid non-contingent consequences, managers must pay attention to the quantity and quality of their information gathering efforts. Frequently monitoring performance provides natural opportunities to provide consequences on a daily basis. Landy, Barness and Murphy (1978) found, after surveying employees of a large manufacturing organization, three aspects connected to the employees´ attitudes about the accuracy and equity of their evaluations:

- The supervisor's frequency of appraisals
- The supervisor's communication of the goals that the employee should try to attain in order to eliminate weaknesses
- The superior's knowledge of employee's level of performance and job duties.

Monitoring and consequences are two important elements to improve and sustain performance. Effective managers collect information about how

their workers were doing and, who, based on this monitoring, present consequence that shows that bosses know what is going on. This back and forth information exchange must be an interactive process performed together by managers and workers in a sort of communication symphony. Even though their melody does not always sound pretty and peaceful, it is "in tune" in the sense that participants listen to each other.

FINDINGS

Communication is the most important skill in life since the ability to communicate well is critical for effectiveness. Having a clear vision and good communication skills are critical to becoming a successful leader since they are the only tools available to interact with the team members in order to understand their personal needs, values, objectives and intentions, to align them with the vision of the firm and to create a powerful team spirit.

Poor communication is today's number one problem. 59 per cent of the people participating in the study claim that communication in their work place is tense, disorganised, non-directional, and insufficient. When asked what they understand by communication, 42 per cent of them consider it as a one way process used to transfer information from one person to another. Since two monologues do not make a dialogue, perceiving communication as alternating monologues is a big problem. Communication suffers when the parties involved focus their attention on what to say, how to say it and how to communicate it better, because the speaker focuses his/her attention to achieve his/her conversation goals and forgets the other end of the message. For communication to exist, the receiver has to interpret and to understand the sender's message in the same way the sender intended it.

Leaders must understand that when communicating, people see things not as they are but as they perceive them to be. The communication process is complex and it is vital to have a clear understanding of it if a person wants to succeed.

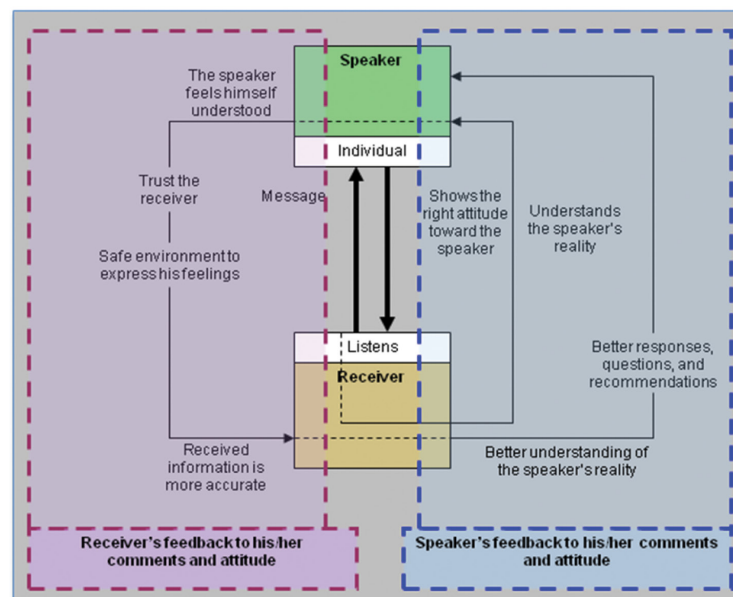
For communication to be completed the receiver must understand the message and the sender must be sure that it happens. It seems it is an exception since more than 40 per cent of respondents described communication in their work place as a one way process. The Neuro-Linguistic Programming (NLP) presupposition of communication is that the meaning of communication is the response one gets. The response a person gets gives him/her valuable points about what to do next. People know if their message has been properly received by two way communication or feedback. It is surprising that more than 60 per cent of survey respondents understand feedback as something to be given not as something that is part of the communication process. The purpose of feedback is to understand the impact that the message causes on the other person in order to change or adapt it so the new message is better understood and communication can succeed. Communication is an exchange, not just an emission. All parties must participate to complete the information exchange.

People in business organisations must communicate clearly if they want to reach their basic purpose, to make a profit. Successful communication is based on the ability of practicing the act of listening. This "simple" act of listening to each other opens the door to connection, understanding and transformation and improves the individual's conversation capabilities. When two people are truly listening to each other they are not only present but also they are present to something beyond their individual selves. It is what James E. Sullivan defines as the "*dying the self*" and describes as the giving up, at least temporarily, of the individual point of view. This exercise requires putting individual perceptions aside for a moment in order to be present in the world of the other. It is to see what the other person sees,

and to feel what the other person feels. It is this type of conversation that can transform a firm.

The reality shown in the survey indicates that people are constantly interrupting each other in order to make a point or convince someone to do something, since more than 60 percent of respondents did not feel respected or understood during the communication process. When speaking, people hear what they already know but when they listen they may learn something new. For a conversation to be effective participants can disagree among themselves but they must be able to see, respect and understand the other person's point of view. When listening to somebody it is essential to fully understand the other person's perspective. The listening process has to start with an attitude that presumes that the other part has sound reasons for why they are saying what they are saying. From the understanding of the topic it could be possible to reflect the importance of active listening in the Figure 7.

For communication to exist, someone, the speaker, must be willing to communicate something to someone, the receiver. In order for this process to be effective, the listener must be receptive to what is going to be communicated by showing some respect towards the speaker. The survey reveals that more than 80 per cent of respondents have regular bad communication experiences when communicating with their superiors, a circumstance that sure influence their approach in future conversations and that sure contribute to destroy the ground for a good communication process. On the other hand, a positive attitude, allows the listener to better understand not only the message but also the feelings involved in the message. The speaker's perception of this positive attitude of the receiver will make him/her feel comfortable and safe and will make him/her willing to go deeper into his/her thoughts and feelings. This circumstance will provide the receiver more and better information about the message formerly presented. The result of this circular process is not only a better understanding of the idea and feelings expressed by the speaker and a better recommendation given by the receiver but also the start of a long term trusting relationship. It is remarkable that 44 of the sur-

Figure 7. Importance of active listening (Source: Own elaboration)


veyed people felt interrupted, not listened, inferior and not comfortable when speaking with their superiors. The result of that is a low quality relationship and trust between them. The employees´ level of commitment and motivation decreases, dissatisfaction appears and staff turnover rises. The end result will be a company with a personnel working as individuals not as a team.

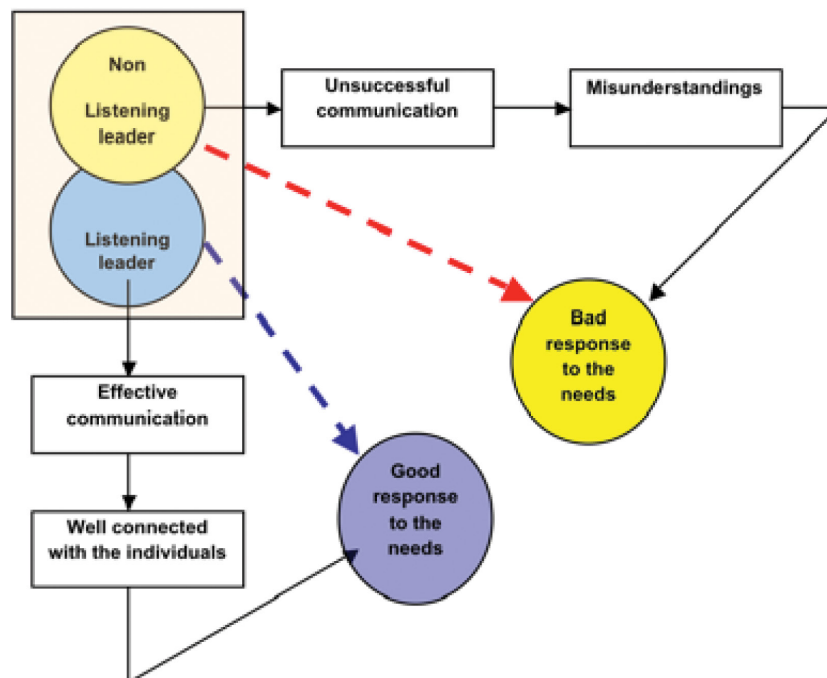
From the findings it is possible to graphically describe the result of a leader interaction depending on his/her listening skills as in Figure 8.

Having good listening skills is connected with having good interpersonal communication which facilitates professional growth. The better understanding derived from good listening skills avoids misunderstandings, hurt feelings, confused instructions, loss of important information, embarrassment and frustration, and facilitates career satisfaction. When people realise that they are in front of someone who listens instead of someone who judges, they openly share thoughts and suggest ideas. Listening leaders have the opportu-

nity to respond to the follower's needs and concerns that otherwise might have gone unnoticed. The principle behind this is "the better the understanding, the better the response". But this principle is far from being present in the surveyed firms since more than 40 per cent of respondents claim that the communication with their superiors is a one way process.

The survey gives the idea that managers are inclined to show power by demonstrating that they know everything. They believe listening is not needed and they share the thought that if they are not talking they are not leading. The consequence of this behaviour is managers blocking openness to new ideas and concepts. Since new perspectives and ideas are not needed, why listening? Richard de Vos, chairman of the Orlando Magic NBA franchise, gives a good answer to this question:

"Listening provides the foundation of productive human reaction without which society cannot function. If we do not listen to each other, we cannot

Figure 8. Leader interaction depending on listening skills (Source: Own elaboration)


learn from each other. Listening is a vital skill. It is specially important in view of the enormous amount of information and misinformation that is exchanged in today's world"

Information is power. Effective listeners are able to concentrate and find the most valid information in whatever they hear. Effective listeners are powerful people.

A listening barrier exists when someone hears what he wants to hear not what is really communicated. From the survey results it can be possible to draw the map to represent the listening barriers shown in Figure 9.

The purpose of listening, building a relationship, is specially challenging in the case of managers because they have a dual function. On one

Figure 9. Listening barriers (Source: Own elaboration)

hand, they must show trust in their people allowing them to explore, make decisions and become increasingly independent, but on the other hand, they must also provide the boundaries, the safety lessons, the directions, the values and the beliefs that the employee needs to become self sufficient.

The required balance between these two responsibilities can be achieved creating an excellent communication environment, which will be possible thanks to the adoption of an active listening attitude.

The process of creating this ideal communication environment is not easy since there are inherent blocks to making real emphatic listening connections work. The human relations involved in the process are challenging because of the different goals of the people involved. Bosses and employees often have difficulties hearing each other when their interests are in apparent conflict.

During the employees´ development stage managers can judge rather than listen. The employee's inexperience at this stage will keep the manager/leader from listening because of his/her perception of the situation as a period of threat and will react projecting his/her experience onto the employee to guarantee success.

An analogy can be drawn between employees and children, the former learn from their leaders as children learn from their parents. They all absorb the values their mentors represent and there are no shortcuts in values education. "*Do what I say not what I do*" is a doomed message. Despite signs to the contrary, employees are always watching their leaders.

CONCLUSION

There is a connection between the company results and the leader's listening skills. Even though leaders understand the inefficiency of directive models to manage people they keep using a variant of it since listening seems not to be a priority on their day to day activities. Internal communication is

scarce and not always effective since the one way communication seems to be the most common way of interaction among the interviewed people.

Internal communication is the key for success. Without it the survival of the firm is at risk or its developmental capabilities are not being used at its full potential. It could be reflected the importance of a leader's listening skills in relationship to achieving organizational performance as shown in Figure 10.

The objective of most firms is to make a profit in order to survive and the objective of the leader is to manage the company's resources in order to make the firm's objective possible.

In the knowledge era in which we live, 'people' is the firm's most valuable resource. So how the leader manages it makes the difference between success and failure.

To succeed, the leader's main responsibility is to create an open and trusting environment where everyone feels safe to express feelings without the threat or fear of being judged and to use this information to build a team whose members are included and involved. It becomes clear the role of communication in the leaders understanding of people's needs.

If the group of people decides to work a team, individuals working for the team instead of for themselves, the possibilities for the firm and the leader to succeed increase exponentially.

From the information collected in the survey it is possible to end up with the impression that leaders know the importance and value of their human resources but apparently they do not act accordingly. They continually blame failure on their employees' behaviour and seem not to know what to do differently to overcome the situation. But paradoxically when employees are asked about how to improve their present situation at work they demand more time and empathy from their managers. If they listen they understand the situation and the alternatives.

KEY TERMS AND DEFINITIONS

Active Listening: Provides a climate for decision making, genuine dialogue and motivation to pursue new initiatives.

Communication: The transmission of meaning from one person to another or to a group of people, whether verbally or non verbally. It's a crucial skill since the ability to communicate well is critical for effectiveness.

Leader: Person who make people feel as though they are accomplishing something and not just "putting time"; a leader must work with people and not against them. Leaders are able to express themselves fully.

Leadership: The ability of an individual to influence, motivate and enable others to contribute toward the effectiveness and success of the organizations of which they are members.

Listening Barriers: Exist when someone hears what he wants to hear not what is really communicated.

Quality Communication: The avenue by which leaders clarify their visions and foster participative management within the organization.

Chapter 59
Strategic and Organizational Considerations Related to an E-Learning Model:
A Case of Study

ABSTRACT

The aim of this chapter is to assess the impact of different organizational factors on the success of e-learning programs, in terms of both self-reported satisfaction and the level of learning. Hence, this study adds to the analysis of the efficacy of e-learning models from an organizational perspective by providing some useful insights, which may help to improve decision-making related to employee's continuing education and satisfaction. This simulation, using a bivariate ordered probit model, shows that economic and indirect economic incentives play a key role in augmenting the level of both satisfaction and learning. This analysis also considers how efficacy of learning programs may thus improve by linking the human resources development policy with results obtained in e-learning courses.

1. INTRODUCTION

The application of latest advancements in Information Technology to business education has contributed to fulfill most wishes of education managers. The demand for continuing education programs with top specialists, the costs of mobility, the fragmentation of learning time due to inopportune meetings, among other difficulties, seem to have come upon a solution with the

so called e-learning model (Box, 1999; Kirby, 1999;Bose, 2003).

Technological improvement and the design of high-capacity networks for sharing data have allowed for solving most of the limitations of the traditional learning methodology, by facilitating both access to information and the adaptation of programs to individual needs. However, earlier applications of e-learning have shown that those technological tools do not automatically guarantee high levels of learning (Snyder et al., 2000; Ettinger et al., 2006, Fernández Díez de Lastra, R., 2001). Moreover, Ettinger et al. (2006) demonstrate that the mere act of uploading materials of traditional courses to a software platform may reduce motivation and, thus, learning outcomes. Discussion about these problems has generated a second wave of development of e-learning models (Servage, 2005). Due to the different approach to learning under the new model, it has been argued that e-learning needs a different pedagogical system (Roy, 2006). As a consequence, a number of firms, focused on the management of educational contents for e-learning, have born during the last decade. Those firms offer teams of experts in pedagogy, scriptwriters and technicians, who work for creating personalized educational paths and taking advantage of all possibilities of software platforms for enhancing learning. In addition, the development of e-learning educational materials has actually generated an increasing demand for standard rules to facilitate the compatibility of contents and software platforms (Singh and reed, 2002; Orbea, 2008).

Previous research about factors influencing learner satisfaction reveal that learner computer anxiety, instructor attitude toward e-learning, e-learning course flexibility or quality, perceived usefulness, and diversity in assessments are critical factors affecting learners´ perceived satisfaction (Sun, P.; Tsai, R.J.; Chen, Y. & Yeh, D., 2008). Perceived self-efficacy has been also considered as key factor that influences e-learning satisfaction (Liaw, S., 2008). According to existing literature,

disposing of both advanced technological instruments and adapted learning programs does not guarantee the optimal management of e-learning within firms (Ettinger et al., 2006; Galagan, 2002; Netteland et al., 2007). In fact, it is necessary to consider where, when and how learning programs take place, to identify the possible difficulties and how the firm should manage learning through a software platform (Zhand and Jasimuddin, 2008; Rahmandad et al., 2009). Learning by using the new training model requires self-motivation and self-management, and it demands both cultural and organizational changes (Redmon and Salopek, 2000; Tynjäla and Häkkinen, 2005; McPherson et al., 2005; Ettinger et al., 2005; Davis and Wong, 2007). Hence, organizations must strategically define what the main objective of e-learning is, and what they should do in order to achieve their goals.

The rest of the paper is organized as follows. Section 2 describes the main objective and the methodology used in the analysis. Section 3 presents data, descriptive statistics, and the model that will be estimated. Section 4 discussed main results, and the last section summarizes conclusions.

2. MAIN GOAL AND METHODOLOGY

The aim of this paper is to assess the impact of different organizational factors on the success of e-learning programs, in terms of both self-reported satisfaction and the level of learning. Hence, this study adds to the analysis of the efficacy of e-learning models from an organizational perspective by providing some useful insights, which may help to improve decision-making related to employee's continuing education and satisfaction. To this end, the case of EVERIS, one of the first firms that introduced e-learning as the standard methodology for its employees, has been studied. From a methodological point of view, the analysis can be divided into two parts. Firstly, both directors and users of e-learning programs at

EVERIS have been surveyed. The survey included questions about personal satisfaction, level of learning, and relevant organizational factors such as the existence of incentives, the preference for e-learning compared to the traditional system, and users' capacity to use the technological platform (variables are fully described in the next section).

In order to assess the impact of the explicative variables on satisfaction and learning, we estimated a bivariate ordered probit model, which is specified by seemingly unrelated equations. The main reason for using this methodology is the potential existence of an indirect relationship between satisfaction and learning, which might cause biased results when two different ordered probit models are considered, one for satisfaction and the other for the level of learning. There is a growing empirical literature which makes use of bivariate probit models. Greene and Hanser (2009) cite more than 20 different papers applying this methodology from 1997 to 2007, though first applications are due to Calhoun (1989, 1991, 1994), and more recently, Dawson and Dobson (2010). The methodology used here is the same used in these papers and, explicitly, we have followed Sajaia (2008) for its implementation in Stata©.

3. DEVELOPMENT OF THE ANALYSIS

As starting point of the framework, we analyzed both strategic and organizational factors that have driven a firm such as EVERIS to choose an e-learning model. To this end, we discussed the reasons for the implementation of e-learning with directors of EVERIS, who helped them to better understand relevant variables. As a multinational consulting firm, EVERIS offers solutions for business strategy, development and maintenance of technological appliances. The growth of the number of employees (from 3300 persons in 2004 to 7400 in 2009), as well as the increased volume of projects and its differentiation, justified in 2006

the strategic decision of adopting e-learning for continuing education at EVERIS. On evaluating this choice, the board of directors analyzed the need for aligning with new tendencies of professional education, and they also underlined both the possibility of offering a larger number of courses, and the opportunity for cost-reduction.

In particular, two main goals emerged as reasons for change toward an e-learning model: enlarging the offer of educational programs, and innovating through alternative models of learning. Provided that one value of EVERIS is the building of a learning software platform for continuing education for its employees, these goals were perfectly aligned with their business strategy. In order to carry out the implementation, departments of Marketing, People and Human Resources worked together and, under the direction of their Corporate University, they evaluated open-source applications for collaborative learning. The adoption of e-learning was thus an internal process of the organization, and it took about six months.

Employees at EVERIS are characterized by a higher qualified and technical skills than other professionals, which allowed the firm for not investing in their capacity to use the learning platform. It should be noted, in fact, that this is one of the main investment limitations in other organizations. The management of the e-learning model in this firm involves the development of a supply of courses, which reflects the professional needs of employees and makes use, to this end, of specific personal mapping for professional development. Each personal map consists of mandatory courses, recommended programs, and other optional courses depending on both personal preferences and job skills. This educational system aims to achieve the goal of 40 hours of education per employee and year, by investing about 10 millions of euros yearly.

At present, the learning model of this company takes the form of "blended-learning", combining lectures and online courses available at EVER-CAMPUS. Though the firm did not design an

explicit incentive scheme, the monetary value of grades achieved by EVERCAMPUS is published and communicated to employees, thus underlining their direct value in terms of employability or market value of professionals.

3.1 Data and Descriptive Statistics

Data have been collected by a survey to 84 employees of EVERIS Madrid, who were attending e-learning courses between march and may 2010, and voluntarily answered our online questionnaire. It should be noted that the questionnaire is independent from both the attendance of any particular course and results obtained (though data about dropout rates for each course is not available, the average at EVERCAMPUS is about 28% of all participants). In addition, given our objective, we have decided to survey employees independently from the specific course they attended, and we focused on specific organizational measures such as incentives, time and space availability for learning, and the skills that permitted to use the learning platform in a profitable way.

Figure 1 presents the functional distribution of the sample of employees surveyed. Although this analysis did not focused on studying satisfaction with a specific e-learning course, most of the contents assessed were related with technical knowledge (programming languages, technical certifications) and management skills.

As it can be observed, about 50% of respondent work in the department of Technology Systems, a characteristic that is likely to affect results. In fact, we expect those employees to be able to handle the learning platform with ease.

Table 1 presents the definitions of variables being analyzed, along with descriptive statistics. Dependent variables, self-assessed satisfaction and self-assessed learning, are categorical variables, which take value from 1 to five.

On considering the impact of organizational factors on Self-Assessed Satisfaction (SAS, hereafter) and Self-Assessed Learning (SAL, herafter), it is important to control for both basic characteristics of the course, such as quality of contents, for example, and the ability of attendants to use the e-learning platform. This is in fact the standard object of study in existing literature, and taking into account these variables allows for a comparison of main results. Figure 2 represents the distribution of SAS when subgroups of respondents that value positively specific aspects of the e-learning course attended are considered. As it can be observed, and as expected, the distribution of SAS suffer a significant change when people have a positive perception of both course material and contents. In other words, satisfaction and the quality of contents are highly correlated, and we will thus take into account this factor in the rest of the analysis. In addition, the quality of contents positively affects learning, as Figure 3 points out.

Figure 1. Functional distribution of the sample
Table 1. Variables and descriptive statistics

Variable	Description	Mean (sd)
SAS	Self-assessed satisfaction, it takes discrete values from 1 (not at all satisfied) to 5 (very satisfied)	4.06 (0.848)
SAL	Self-assessed learning, it takes discrete values from 1 (very low) to 5 (very high)	3.454 (0.851)
TECNO	1: Learning technology is perceived as excellent 0: Otherwise	0.523 (0.502)
INC	1: If there is incentive related to learning (both real and perceived) 0: Otherwise	0.333 (0.474)
TIME	1: Specific time for learning available 0: Otherwise	0.13 (0.339)
EASY	1: If the use of the learning platform is perceived as very easy 0: Otherwise	0.19 (0.395)
MODEL	1: If respondent prefers traditional learning methodology 0: Otherwise	0.623 (0.487)
TECHSUP	1: If respondent works in technical support department 0: Otherwise	0.511 (0.502)
CONTENTS	1: If course contents were perceived as very good 0: Otherwise	0.357 (0.482)
PLACE	1: E-learning course attended out of the workplace 0: Otherwise	0.619 (0.488)

Figure 2. Distribution of SAS when all respondents are considered (top left), for the subgroup of people who value postively the contents of the course (top right), for the subgroups that value positively the e-learning platform (bottom right), and for the subgroup of people who value positively the tutoring system (bottom left)
Figure 3. Distribution of SAL when CONTENTS: 0 (left), and when CONTENTS: 1 (right)
This last point underlines an important feature, which affects our analysis and the specification of the model being proposed: the same set of variables may have an impact on both satisfaction and learning. Figure 4, in fact, demonstrates that SAL and SAS are highly correlated. The rest of this section develops the model being estimated, in which the correlation between SAL and SAS is considered.

3.2 Model Description

The objective of this paper is to assess the impact of different key organizational factors on the levels of both satisfaction and learning related to the e-learning model. This study makes use of categorical dependent variables, which constraint the possibility of specification of the model (see Table 1). It is assumed here that the same set of variables might have an effect on both satisfaction and learning, as in

Figure 4. Distribution of SAS when SAL: 2 (top left), SAL: 3 (top right), SAL: 4 (bottom left), SAL: 5 (bottom right)
$$SAL_i = f(x_i) \tag{1}$$

$$SAS_i = g(x_i) \tag{2}$$

Neither the level of learning nor the level of satisfaction are directly observable from answers to survey questions; hence, following Greene and Hensher (2008), we assume that latent variables SAL_i^* and SAS_i^* depend on:

$$SAL_i^* = x_1'^2{}_1 + \mu_{Ai} \tag{3}$$

$$SAS_i^* = x_1'^2{}_2 + \mu_{Si} \tag{4}$$

where β_1 and β_2 are vectors of unknown parameters, ε_A and ε_S are error terms, and x_1 is the vector of explicative variables. Explicative variables are, by assumption, exogenous; that is, $E[x_1' \varepsilon_{Ai}]=0$, $E[x_1' \varepsilon_{Si}]=0$.

Provided that the specification proposed in (3) and (4), which represent seemingly unrelated equations, does not imply any identification problem, we can use the same set of explicative variables. In fact, there are not any theoretical reasons to exclude some variable from one particular equation. We can observe in our database the values of the categorical variables SAL_i and SAS_i such that:

$$SAL_1 = \begin{cases} 1 & si SAL_1^* \leq c_{A1} \\ 2 & si c_{A1} < SAL_1^* \leq c_{A2} \\ 3 & si c_{A2} < SAL_1^* \leq c_{A3} \\ 4 & si c_{A3} < SAL_1^* \leq c_{A4} \\ 5 & si c_{A4} < SAL_1^* \end{cases}$$

$$SAS_1 = \begin{cases} 1 & si SAS_1^* \leq c_{S1} \\ 2 & si c_{S1} < SAS_1^* \leq c_{S2} \\ 3 & si c_{S2} < SAS_1^* \leq c_{S3} \\ 4 & si c_{S3} < SAS_1^* \leq c_{S4} \\ 5 & si c_{S4} < SAS_1^* \end{cases} \tag{5}$$

where $c_{j1} < c_{j1} < c_{j1} < c_{j1} < c_{j1} < c_{j1}$, $j = SAL, SAS$. The probability of being $SAL_i = k$ and $SAS_i = 1$ is:

$$\begin{aligned}
&\Pr\left(SAL_i = k,\ SAS_i = 1\right) \\
&= \Pr\left(c_{Ak-1} < SAL_i^* \leq c_{Ak},\ c_{Sl-1} < SAS_i^* \leq c_{Sl}\right) \\
&= \Pr\left(SAL_i^* \leq c_{Ak}, SAS_i^* \leq c_{Sl}\right) \\
&\quad - \Pr\left(SAL_i^* \leq c_{Ak-1}, SAS_i^* \leq c_{Sl}\right) \\
&\quad - \Pr\left(SAL_i^* \leq c_{Ak}, SAS_i^* \leq c_{Sl-1}\right) \\
&\quad + \Pr\left(SAL_i^* \leq c_{Ak-1}, SAS_i^* \leq c_{Sl-1}\right)
\end{aligned} \tag{6}$$

When error terms are distributed as normal bivariant with correlation ρ, their contribution to the likelihood function can be expressed as:

$$\begin{aligned}
&\Pr\left(SAL_i = k,\ SAS_i = 1\right) \\
&= \mathellipsis\left(c_{Ak} - x_{1i}'^2{}_1,\ c_{Sl} - x_{1i}'^2{}_2, \acute{A}\right) \\
&\quad - \mathellipsis\left(c_{Ak-1} - x_{1i}'^2{}_1,\ c_{Sl} - x_{1i}'^2{}_2, \acute{A}\right) \\
&\quad - \mathellipsis\left(c_{Ak} - x_{1i}'^2{}_1,\ c_{Sl-1} - x_{1i}'^2{}_2, \acute{A}\right) \\
&\quad + \mathellipsis\left(c_{Ak-1} - \mathbf{x}_{1i}'^2{}_1,\ c_{Sl-1} - x_{1i}'^2{}_2, \acute{A}\right)
\end{aligned} \tag{7}$$

The logarithmic likelihood function for observation I is, thus:

$$\begin{aligned}
\ln L_i &= \sum_{k=1}^{5}\sum_{l=1}^{5} I\left(SAL_i = k,\ SAS_i = 1\right) \\
&\quad \ln \Pr(SAL_i = k,\ SAS_i = 1)
\end{aligned} \tag{8}$$

By adding (8) for each of the N observation we obtain:

$$\begin{aligned}
\ln \mathcal{L} &= \sum_{i=1}^{N}\sum_{k=1}^{5}\sum_{l=1}^{5} I\left(SAL_i = k,\ SAS_i = 1\right) \\
&\quad \ln \Pr(SAL_i = k,\ SES_i = 1)
\end{aligned} \tag{9}$$

Using (9), we can estimate model (3)-(4) by the procedure described in Sajaia (2008). It could

be argued that model (3)-(4) takes the form of a seemingly unrelated specification, though both dependent variables might have a direct impact on each other. Hence, either Equation (3) or (4), or both of them, should include as explicative variable the dependent variable used in the other equation. Though this might be true in principle, we have estimated the model with a simultaneous bivariate ordered probit specification, and tests carried out permit to exclude a direct effect of either satisfaction or learning on the other variable. Accordingly, the seemingly unrelated specification has been adopted here.

4. RESULTS

We have estimated model (3)-(4) by both a bivariate ordered probit model and two separated ordered probit models for each dependent variable. Table 2 shows results of the bivariate model (column 1) and the two ordered probit models (columns 2 and 3). Firstly, regarding the interdependency between Equations (3) and (4), it can be observed that the correlation between error terms is posi-

tive and significantly different from zero: the null hypothesis of independency of the two equations does not hold true. In other words, the two ordered probit models produce biased estimations, which may be adjusted by the bivariate model. We will thus consider results of column 1 only. The first relevant result is the positive impact of incentives on both satisfaction and self-assessed learning. INC, in fact, is the variable with the largest effect on both SAL and SAS. In addition, incentives (either monetary incentives or the possibility of advancements in the professional career) have a greater effect on satisfaction compared to learning. The ability to handle the technological platform (variable EASY), in contrast, has not a significant effect on both learning and personal satisfaction. However, a good assessment of the technological aspect of the platform (TECNO) generates an increase in the probability of both being satisfied and awarding a positive evaluation to the level of learning. In other words, results underline that the quality of the learning platform has a significant impact on both learning and satisfaction, independently from the basic ability to handle it.

Table 2. Results of estimations

	(1)		(2)	(3)
	SAL	**SAS**	**SAL**	**SAS**

  Note. ** = confidence level 95%; * = confidence level 90%. Robust standard errors in parenthesis.

Assigning a specific amount of time to learning during the working day has interesting consequences. In fact, having time for education boosts the level of learning, whereas its impact on satisfaction is not significant. This variable thus appears to be especially relevant to the goal of optimizing investments in education. On considering the professional group, being a computer technician has a significant impact on both SAS and SAL. Possibly, due to their higher "sensibility" to technological aspects of the e-learning platform, computer technicians report a significantly lower level of satisfaction; in should be observed, in addition, that the impact is much larger for SAS then for SAL.

Preference for an e-learning model compared to classic methodology, based on the meeting of trainer and trainee in a common space and time, is another interesting variable being analyzed. Estimations suggest that people preferring the classic methodology are both less satisfied with e-learning and report to have achieved a lower level of learning. As for TECNO, however, the effect on SAS is larger: people who do not prefer e-learning declare to be unsatisfied, where their level of learning is affected to a considerable lower extent. This might be due to the functional distribution of respondents, as pointed out in section 3 (Figure 1).

Finally, it can be observed in Table 2 that flexibility (in terms of the possibility of attending the e-learning program out of the workplace), improves both satisfaction and learning.

Estimations carried out allows for predicting the effect of explicative variables on the probability of reporting at the same time both a high level of satisfaction (SAS = 5) and a high level of learning (SAL = 5), when incentive schemes are introduced. This is a relevant prediction, provided that it explains the impact of a (costly) organizational measure with potential benefits. Under this scenario, the model predicts that adopting an incentive scheme, when no incentives are initially implemented, causes an increase of about 121.5%

in the probability of declaring both SAL = 5 and SAS = 5. Explicitly, the probability of reporting a high level of satisfaction would grow about 112.6%, whereas the increase in the probability of reporting a high level of learning would be equal to 79.5%. In other words, incentive schemes affect the level of satisfaction most. Another interesting result is obtained when analyzing a scenario in which people are not assigned any amount of time for studying. In fact, the model predicts that when specific time for study is assigned to people, the probability of reporting a high level of learning increases of about 80%.

5. CONCLUSION

E-learning does not automatically imply learning. In fact, it might actually reduce the level of learning, motivation and satisfaction of users, when it consists of just uploading course materials initially designed for use with classic methods. Organizational factors as e-learning course flexibility (Sun, P.; Tsai, R.J.; Chen, Y. & Yeh, D., 2008) or perceived self-efficacy (Liaw, S., 2008) were considered in previous research as key issues that influence e-learning satisfaction. As a consequence, a complete pedagogical system has been developing through recent years, which is aimed at establishing the educational process in the new technological environment. At the same time, companies are conscious that some organizational features may facilitate learning within the new model and thus, they could contribute to improve both its efficacy and efficiency.

Following this approach, this paper has considered the impact of a number of organizational features on satisfaction and learning of users. It is shown, firstly, that incentives schemes play a key role in augmenting the level of both satisfaction and learning. It should be noted, moreover, that by incentive we mean either monetary rewards, which are almost absent in our sample, or the expectation of advancements in the professional

career within the firm. This circumstance may also help to a better understanding of the greater impact of incentives on satisfaction respect to learning, which we found out in our analysis. In other words, the organizational value of learning programs for employees, independently from the level of learning, not only causes their greater acceptance, but also it may also positively affect behaviors in such a way that favor learning. Efficacy of learning programs may thus improve by linking the human resources development policy with results obtained in e-learning courses.

Another interesting conclusion we obtained in the analysis is the importance of assigning a specific amount of time for attending e-learning courses. Explicitly, it is shown here that time available for learning has a positive and significant impact on learning, whereas it does not affect satisfaction. This implies a relevant question. In fact, one of the main advantages of e-learning is its temporal flexibility, which permit to work and study during the same period of time. Model predictions about the positive effects of a fixed amount of time available for learning are thus in apparent contrast with flexibility. On the other hand, it seems logical that focusing on study during a certain amount of time, without disturbance or interruption due to working activity, facilitates concentration and therefore, learning, and results about the importance of spatial flexibility support this conclusion. One possible solution we propose is to assign an amount of time to each student, who is then responsible to use it whenever he or she wants, thus obtaining some degree of flexibility together with reducing interruptions when studying.

On considering the limitations of our analysis, it should be noted that our sample includes users of e-learning programs within a single firm. The aim of this paper is the study of a particular case, and the generalization of results is beyond our scope. Results are in line with previous research mentioned in the introduction; we have considered how organizational factors, which are normally excluded from the analysis, have affected the implementation of e-learning at EVERIS. Moreover, we considered e-learning users independently from the program attended. In other words, an implicit hypothesis of this piece of research is that courses have homogeneous and comparable characteristics regarding their internal structure and therefore, users' opinion is assumed to be referred to the e-learning model rather than one particular program. This limitation suggests one step forward in the same line of research. It would be interesting, if data were available, to divide the sample and study the impact of organizational measures depending on both the type of course and the professional category of the student. In addition, comparing results with other firms that adopted the e-learning model would permit to analyze additional policies aimed at improving efficiency.

Chapter 60

Talent Management:
A New Perspective in Human Resource Management

Roberto Luna-Arocas
University of Valencia, Spain

ABSTRACT

Talent management is a new concept in the scientific literature, but not in the practitioner arena. In this sense, this chapter underlines the powerful perspective of talent management integrating practices from organizations and providing a scientific approach. Some previous results from different research are expressed in relation to strategy and organizational performance. Talent Management is clearly a concept close to high performance work system, with the difference of a more strategic approach. More than practices are goals for the organization to achieve excellence at work. So Talent Management is clearly linked with a strategic approach to the organization in order to attract, develop, evaluate, and retain professionals with high capacities.

INTRODUCTION

Today's businesses have to cope with hard competition and continuous change (Hamel & Prahalad, 1994) and Human Resources Management (HRM) and Talent Management (TM) is clearly affected by this turbulent environment. As Farndale et al. (2009) confirm, competition between employers has shifted from the country level to the regional and global levels (Ashton & Morton, 2005). Indeed, as Ulrich (1997, p.304) emphasises "under environment conditions of low change, attention to HR practices had little impact on business results, but under environmental conditions of high change, executive attention to HR practices had a large impact on business results". Moreover, Lawler (2005) defend that HR "can and should add more value to corporations. The best way to do this is by being a business partner- by directly improving the performance of the business. This

can be accomplished by effective talent management" (p. 165).

In response to this situation, it is argued that organizations are flattening, relying on self-managed teams, becoming highly matrixed, and reconfiguring the structure of work (Shippman et al., 2000). Lepak and Snell (2002) argue that given pressures for both efficiency and flexibility firms are exploring the use of differentiated employment modes to engage workers and allocate work. Indeed, HRM "is under pressure to reduce costs, to improve its services, to increase its impact, and to provide a more satisfying work experience for its own employees" (Kochanski & Ruse, 1996, p. 19). Also, Calvo and Garcia (2010) in the analysis of talent management in professional services firm observed that a lack of flexibility within the organization tended to lead to a reduction in potential intellectual capital, and increased excess workload, together with a decline in the company's competitiveness within the marketplace, as seen in a drop in its level of corporate attractiveness.

In this sense, Farndale et al. (2009) according with Bhatnagar (2007) argue that "while companies are facing significant talent management challenges in several regions of the world, such as Europe and North America, the challenges are most acute for young professionals and new managers in the emerging markets such as the BRIC economies of Brazil, Russia, India, China and the economies of Central and Eastern Europe" (p.161). Indeed, there is a shortage of leadership talent (Farndale et al., 2009) and assuming talent management as a source of competitive advantage has been key in HRM (Frank & Taylor, 2004; Lewis & Heckman, 2006).

In spite of the great deal of research on HRM in the last decades, there is still a significant gap between what happens in theory and practice (Pfeffer & Sutton, 1999). This is especially the case in the area of "talent management" (TM). There is much talk about 'talent' and 'talent management', driven largely by the belief that

while traditional approaches to HRM have served MNCs well in the 20th century, the contemporary business environment requires new and innovative approaches in the development and deployment of human resources (Caligiuri, 2006; Lengnick-Hall & Andrade, 2008). However, while much is claimed for it, much confusion also surrounds it. A cursory trawl of the literature will reveal several variations on the meaning of TM: informal individually-focused talent management (Tansley, Turner & Foster, 2007); TM as a relabeling of human resource planning (Lewis & Heckman, 2006); TM as succession management (Hirsch, 2000) and strategic TM (Cappelli, 2008; Zuboff, 1998; Boudreau & Ramstad, 2005).

Talent management comes up as a new perspective from strategic human resource management (SHRM) linked more than ever with business strategy. Therefore, TM offers SHRM goals covered with different HRM practices in a configurational way. This systemic perspective have attracted practitioners more than other scientific HRM approaches.

Regardless of how it is conceived, of critical importance in this regard is the debate on TM and firm performance. If a focused talent strategy is capable of delivering a return of investment of up to twenty two points over other firms in the same sector, why it is not widespread in firms? Indeed, practices should warranty the use of talents in the organizations and this can be done not only with practices but also "cultures and systems in which these great people can actually use their talents, and even better, management practices that produce extraordinary results from almost every-body" (O´Reilly & Pfeffer, 2000, p. 63).

MAIN PURPOSE

HRM is growing as a discipline that takes information from many other fields. This multidisciplinary approach makes more complex but also richer the research in the next future. In this sense, HRM

and High Performance Work System (HPWS) literature has concentrated during the last years to analyse configurations in organizations to fit strategy and environmental factors. Our main purpose in this chapter is to analise the theoretical construction of TM in the line of HPWS perspective as a system. Also we present different results obtained and the evolution of HRM during the last few years from this perspective. Finally, we present the results in the research of TM in its relationship with organizational satisfaction and job performance.

Wright and McMahan (1992) indicated the need for the creation of a horizontal fit among HR practices, so that they complement each other rather than compete against one another. This horizontal fit has been called internal alignment (Becker & Gerhart, 1996; Huselid, 1995) and it is completely coherent with a talent management systemic perspective.

TALENT MANAGEMENT AND STRATEGIC COMPETENCIES FOR COMPETITIVENESS

HRM needs to advance scientifically and professionally in order to assume a proactive role in these new sceneries. One new perspective is assuming organizations as a bank of talents, that is, focusing on TM. A talent strategy may be conceived as the attraction, the development and retention of people with excellent competencies appropriate to the work context. Generally, TM is associated with Competency Based Management (CBM) where competencies are aligned to organizational values and goals (Hayton & McEvoy, 2006; Kochanski & Ruse, 1996; Sharma & Bhatnagar, 2009; Ulrich, 1998; Ulrich et al., 1995). Also competencies activate actual performance and employee potential. Indeed, competencies refer to "an individual´s demonstrated knowledge, skills or abilities" (Ulrich et al., 1995, p. 474). Also Ulrich (1998) defined intellectual capital as the function

of competence by commitment. Therefore, firms with high competence, but low commitment, will have talented but unengaged employees. Conversely, in the context of having high commitment with low competence, the organisations talent pool is more limited, but commitment is high. Intellectual capital requires both aspects. And this equation can be analysed at different levels: firm, units or individual. Arguably there are at least two ways to increase competence in a firm: aligning competencies with business strategy and generating competences through more than one mechanism (buy, build, borrow, bounce and bind). Similarly, commitment can be generated thorough different ways: (a) reducing demands, (b) increasing resources so employee can find new resources to accomplish work and (c) turning demand into resources. But most importantly, by way of consequence, the intellectual capital index will be positively associated with productivity.

There is a clear consensus about the importance of employee behaviours more than the HRM practices in the value creation of an organization (e.g. MacDuffie, 1995; Schuler & Jackson, 1987; Wright & Snell, 1998; Colvin & Boswell, 2007). Discretionary employee behaviours that are difficult to specify in advance are particularly valuable to organizations because, unlike routine job performance, they are difficult for competitors to imitate or replicate and thus may provide a source of sustainable competitive advantage (Colvin & Boswell, 2007). TM offers a strategic perspective where behaviours are aligned with performance goals in the organization. Therefore, micro and macro perspectives are connected in a configurational model of HPWS.

This focus in HRM research has involved a shift in the outcomes of interest from individual level impacts to outcomes at the level of the organization (Becker & Gerhart, 1996; Delery & Shaw, 2001). However, the shift has not simply been towards using organizational performance measures as the dependent variables of interest, but also a growing interest in how employees relate to the organization

and how human resources contribute to the business strategy of the organization. Driving much of this interest is the underlying idea that HRM can play a more central role in organizational success by enhancing the contribution of employees to organizational value creation (Wright & McMahan, 1992) thorough TM.

Thus, competencies are dealt with as values that must be developed and are interpreted as provoking benefits both for employees and organization (Van der Heijde & Van der heijden, 2006). In this sense, CBM is the base for a more integrated model dedicated to further addressing how organisations which are suffering a shortage of talent might respond to the challenge (Chiavenato, 2002; Michaels et al., 2003; Peters, 2005; Schlemenson, 2003). Thus, all efforts are concentrated on TM (Casado, 2011; Cubeiro, 2004; Chiavenato, 2002; Gubman, 2000; Jerico, 2000; Michaels et al., 2001; Peters, 2005; Schlemenson, 2003). And TM is based on strategies of talent banks trying to focus on four main actions: (1) staffing and atraction of talents, (2) detecting and identifying talent in the organization, (3) developing talents and (4) retention and loyalty of talents. These SHRM goals guide HPWS in the organization.

TM, through HPWS literature, has been linked with positive results including higher efficiency, less turnover and higher commitment, and a growth in what Sternberg (1999) has termed organisational intelligence. Also, TM as a HPWS have been linked with improvements in the market value of organizations and a higher ROA. Indeed since the last recession, the TM proposition is more strategic now than ever.

One of the streams of research that seems to hold "the promise of creating a truly strategic approach to talent management" (Lewis & Heckman, 2006, p. 145) is the Resource-Based View (RBV) perspective. The HR arquitecture is a value-creating system that raises the question of the appropriate locus of strategic value creation (Becker & Huselid, 2006). These authors follow "going forward, however, we need more

theoretical work on the "black box" between the HR architecture and firm performance, and less emphasis on the "black box" within the HR architecture (p. 900). Following Lee and Miller (1999), a dedicated and talented workforce may serve as a valuable, scarce, non-imitable resource that can help firms execute an appropriate positioning strategy. Indeed, competences are one category of possible resources that enable firms to achieve performance and (sustained) competitiveness. A prerequisite for sustained competitive advantage consists of a unique combination of acquiring and retaining competent workers, and adequate HR policies and practices which promote the importance of investing in them. In the RBV literature, terms like resources and capabilities "are used interchangeably and refer to the tangible and intangible assets firms use to develop and implement their strategies" (Ray et al., 2004, p. 24). Strategy experts argue that an organization´s internal resources-including the capabilities of its workforce- could give rise to competitive advantage (Barney, 1991; Wernerfelt, 1984). Competencies benefit firms when they provide customer value, resist imitation, and enable a firm to create new business through product and service-extensions and through innovation (Hagan et al., 2006). Therefore, RBV literature offers clearly a theoretical approach to TM and HPWS literature.

DEVELOPING A TALENT MANAGEMENT MINDSET

A growing number of organizations see competence as the key to enduring performance and to making HR most effective (Kochanski & Ruse, 1996, p.19). Prahalad and Hamel (1990) argue that key employees are the ones who have unique and very valuable competencies that developed in a right organizational context generate key organizational competencies for sustained competitive advantage. Ulrich et al. (1995), have situated the

competencies in a framework referred to as the HR Value Proposition "an integrated blueprint for the future of HR" (Ulrich & Brockbank, 2005, ix).

Against the backdrop of this value proposition, a question that arises is how can we develop TM as a talent strategy in firms? Michaels, Handfield-Jones and Axelrod (2001) argue that talent mindset is the key concept, something which they refer to as a passionate belief that to achieve excellence in business we need talents and these have to be underscored by the company values and goals. This cannot be done by the HRM Department, it cannot depend on HR processes, but rather demands a unique and different mental predisposition. Michaels et al., (2001) in their treatise on the future of HRM point to the existence of a shortage of talent which they suggested would result in a "war of talent". This war is predicated on the necessity to increase the skill level of up to 60% of the workforce in order to compete in the age of the smart economy. The firms surveyed by these authors were all considered High Performance Companies and results demonstrated that only 20% considered that they have enough leaders with talent and only one out four establish talent banks as a priority. But results also indicated that 48% of leaders were likely to leave the organization in the next two years. Therefore, "we are seeing a shortage of skilled management talents" (Gubman, 1996, p. 34).

But is there a shortage of talent? Results of several studies indicate that talent mindset is not often present in firms. Right Management Consultants (Philadelphia, a subsidiary of Manpower; Credit Union Management, 2004) found that four out of ten managers and executives are considered excellent leaders, exhibiting management talents their employers value most. Moreover, from a practitioner perspective, TM is predicted to be the highest challenge for Human Resources up to 2015. Indeed, a study with 1350 managers in 27 countries done by The Boston Consulting Group (BCG) and the European Association of Personnel Management (EAPM) identified five main challenges for the future, TM being the number one challenge. Also, HR Focus, a prestige practitioner journal found that 75% organisations they surveyed were worried about retaining and developing key employees into the future.

Gupta (2001, p. 2), noted that "If I am puzzled as you are with the crisis of TM, I encourage you to engage in some serious study of this issue. We need to learn more before it´s too late". More recently Boudreau and Ramstad (2005) in an article published in *Human Resource Management* indicate that a talent science is needed given its incremental importance to stimulate talent decisions, while Tolich (2005) in *Administrative Science Quarterly* notes the dearth of TM and the consequences of our inability to deliver on the promise and potential of the knowledge economy. In 2007 the *Harvard Business Review* gives a special emphasis on TM (HBR Spotlight, *How to manage the most talented*) with two articles: (1) "Leading clever people" (Goffee & Jones, 2007) and (2) "Crisis at the Summit" (Parsons & Pascale, 2007). And finally, The Economist published in 2006 an article entitled *The battle for brainpower* claiming that organizations are much concerned about TM.

But what composes a talent mindset? Some research in Benchmarking has been done from the *American Productivity and Quality Centre* and *the Centre for Creative Leadership* (McCauley & Wakefield, 2006) in order to analyse TM. They include eight main practices, several of them focused on organizational culture (integration, involvement, key employees), others linked with the measurement from the competency model, and others associated with the organisational context.

HPWS TO ENHANCE TALENT MANAGEMENT AND PERFORMANCE

Hiltrop (1999) also supported the importance of HPWS for strategies that strive to attract and retain

talented personnel, arguing that high performance organizations beat their competitors in a number of HR factors such as team work, healthy relationship between collaborators, training and the development of opportunities that are offered to workers.

Luna-Arocas and Camps (2008) mention that in short, scholars conceptualize HPWSs as a set of distinct but interrelated HR practices that, taken together, select, develop, retain, and motivate a workforce (Becker & Huselid, 1998; Guthrie, 2001; Huselid, 1995). However, Becker and Gerhart (1996) have suggested that among empirical studies which have examined the link between HR practices and firm performance, there is little consistency in regards to the individual HR practices that have been included within these studies. Similarly, Way (2002) analyzed six exemplary empirical studies (Arthur, 1994; Huselid, 1995; MacDuffie, 1995; Ichniowski et al., 1997; Becker & Huselid, 1998; Guthrie, 2001).

The differences in the practices used by researchers come from the variety of perspectives in HR (Becker and Gerhart, 1996). Three main traditional approaches have been distinguished (Delery and Doty, 1996): universalistic, contingency and configurational. The universalistic approach assumes a direct relationship between HPWS and organizational performance. The contingent approach contemplates the value of strategy, among other aspects of the organization, as moderating the relationship between HPWS and organizational performance. And finally, the configurational approach considers that some variables in HPWS can act jointly showing consistent patterns related to organizational performance. In general terms, as is defined by Becker and Gerhart (1996, p. 786) "there may be a best HR system architecture, but whatever the bundles or configurations of policies implemented in a particular firm, the individual practices must be aligned with one another and be consistent with the HR architecture if they are ultimately to have an effect on firm performance. In this sense, the best practice and contingency hypotheses are

not necessarily in conflict-they simply operate at different levels of an HR system". Also, some authors have contemplated universalistic and configurational perspectives together to explain HPWS impact over organizational performance (e.g., Shih, Chiang and Hsu, 2006).

The main trend in research on the HRM-firm performance linkage comes from a systems view of HRM by considering the overall configuration of HR management practices (Ferris et al., 1998). Moreover, some practices are argued to support better organizational performances (Jackson and Schuler, 1995; Huselid, 1995) and these HRM practices, as a system, can contribute to firm performance helping the organization to achieve strategic goals (Bowen and Ostroff, 2004). Following these two authors, we can distinguish two features of an HRMS: content (based on the HRM practices needed to achieve organizational goals) and process (how the HRM system can be designed and administered).

In this sense, HRM research has focused on the practices, as a system, directly related with organizational performance. This is called HPWS and is concerned as a means to maximize firms´ competitive advantage (e.g., Guthrie, 2001; Huselid, 1995; Sun, Aryee and Law, 2007; Takeuchi et al., 2007) and a way to improve firm performance (Arthur, 1994; Combs, Liu, Hall, and Ketchen, 2006; Datta, Guthrie, and Wright, 2005; Guthrie, 2001). Indeed, HPWS understand HR management as a system concerning the management practices that provide employees with skills, information, motivation and attitude that results in a work force that becomes a source of competitive advantage (Huselid, 1995; Collins and Smith, 2006). Thus, HPWS refer to a group of separate but interconnected HR management practices designed to enhance employee and firm performance outcomes through improving workforce competence, attitudes, and motivation (Huselid, 1995). TM goes beyond putting practices together to achieve strategic goals. Therefore, dif-

ferent organizations can use different practices to achieve the same organizational goals.

Also, a main premise of this research stream is that a system of internally coherent HR practices aligned with an organizational strategy, rather than individual HR practices used in isolation, may enhance organizational performance (Lepak, et al., 2006). Literature has much empirical evidence in support of these HPWS or systems of HR practices (Lepak, et al., 2006). It is the combination of practices in a bundle, rather than individual practices, that shapes the pattern of interactions between and among managers and employees (Cutcher-Gershenfeld 1991). Thus, research that focuses on the impact of individual HR practices on performance may produce misleading results, with a single practice capturing the effect of the entire HR system (Ichniowski, Shaw, and Prennushi 1993).

Folllowing MacDuffie (1995), implicit in the notion of a "bundle" is the idea that practices within bundles are interrelated and internally consistent, and that "more is better" with respect to the impact on performance, because of the overlapping and mutually reinforcing effect of multiple practices.

From the HRM literature, the concept of HPWS has emerged as a core construct encompassing the extent to which firms invest in the attraction, selection, management, and retention of the best possible human capital (Huselid, 1995; Lepak et al., 2006; Lepak & Snell, 2002) linking HPWS with the new TM approach. That is, HPWS are indicative of the value firms place on their human capital as a source for competitive advantage, with higher HPWS levels indicative of greater value firms place in their human capital.

Summing up, from the literature about TM, we distinguish five main components: alignment with the organization, that is, the adequacy of value that involves commitment and loyalty; managers that manage with talent, that is, a model about how employees can use and relate with others concerning talent; talent effectiveness, that is, the way people can use their talents; the

freedom and autonomy to use their talents, that is, a basic characteristic of empowerment; and last, the development of talent, that is, the update of feedback about competencies and the development of potential in organizations. Therefore we propose a model of TM to analyse its relationship with other organizational variables.

EMPIRICAL EVIDENCE

In this chapter we present two main empirical results. First, the role of strategy and organizational structure with HPWS on firm performance. Second, the role of job satisfaction as a mediator variable in the impact of TM over individual performance. Results from the first study of Camps and Luna-Arocas (2009) showed that the originality of this work lies in conveying the fact that in order for these companies competing in quality to implement HR commitment practices it is important that they have a strong company culture based on shared values. Once the image one has of the company is perceived homogenously, making important investments and efforts in achieving optimized paying systems, training workers or selecting them properly becomes more coherent (See Figure 1, Figure 2).

TM is associated with a high performance system in organizations. But from a behavioural perspective, one of the main indicators of a high performer employee is their own perception of the work and effort they do (Bailey, 1993; Kuvaas, 2008; Peccei & Rosenthal, 2001; Tam et al., 2002). In this sense, the main model proposed postulates that the application of a TM strategy will have a direct effect on individual performance. Although this is quite useful for building a model of TM as was expressed by Lewis & Heckman (2006), as earlier literature has indicated, other variables related with involvement/commitment and satisfaction are also important in explaining the effectiveness and impact of a TM strategy. In this sense the literature review supports the idea of a

Figure 1. Structural model results. Standard regression weights

mediating role of job satisfaction in the TM→ Individual performance relationship.

Studies suggest that HR practices affect organizational outcomes by shaping employee behaviors and attitudes (Huselid, 1995). More specifically, HPWS increase organizational effectiveness by creating conditions where employees become highly involved in the organization and work hard to accomplish its goals, in other words, by increasing their employees' commitment to the organization and job satisfaction (Eisenberger et al., 1997). When Varma et al. (1999) carried out research into 39 organizations in order to evaluate the effectiveness of HPWS initiatives, they discovered that organizations that concentrated their changes on the internal work-culture of the company as well as on their HR practices as part of HPWS design achieved important improvements in operational and financial performance.

Several studies have linked HR practices with individual work performance (Kuvaas, 2008; Edgard & Geare, 2005). The basic assumption is that the HR practices from the best practices perspective improve motivation, skills, attitudes and behaviours of their employees (Kuvaas, 2008). Although there are some controversial results Wright and Boswell (2002) indicate that HR practices impact on individuals constitute an opportunity to research in the future. Lee and Bruvold (2003) argue that investment in employee development facilitate more obligation by employees toward the organizations, and this elicitate employees´ motivation to effort and work hard supporting organizational effectiveness. Also MacDuffie

(1995) noted that to get a high performance organization linked to HR practices employees should be motivated to apply their skills and knowledge through discretionary effort. In this sense, TM is analysed as HPWS encompassing all the literature that links these practices with organizational performance. The added value from our perspective is a new model of HPWS called TM focused on a different general HR strategy. Also, the relationship between empowerment (development, one of the dimensions in TM) and performance has been contemplated in the literature (Logan & Ganster, 2007; Peccei & Rosenthal, 2001) (See Figure 3, Figure 4).

These results (Figure 3) reflect on the study that was presented at the International Human Resource Management Conference in Birminghan (Luna and Morley, 2010). Moreover, some new interesting research has been done by these authors relating also TM with Organizational Performance (growth and return of investment, perceived ROI) with the innovation strategy as mediator variable (Luna and Morley, 2011). Promising research is growing in the literature that sure will consolidate the talent management strategy concept and its powerful implications in the relation between micro and macro perspectives.

DISCUSSION OF RESULTS

Concerning the first research results from Camps and Luna (2009), the mediator role of organizational structure between organizational strategy and HR practices (in the sense used by Ferris et al., 1999 and Bowen & Ostroff, 2004) needs to be clarified in an empirical way. Much work has to be done in that direction. The intention in this first study is to advance in this effort by selecting an organizational strategy (differentiation), a construct of HR practices configuring a HPWS, and a component of the organizational structure (control mechanisms), and by trying to show the mediator role of these control mechanisms between the other two constructs.

Results obtained in this first study provide support for most of the hypothesized relationships presented in the model. First, this research

Model 6 TPs → POP mediated by Job Satisfaction	89,159 (32)	0,052	0,095	0,916	0,894	0,928

provides empirical evidence that differentiation strategy enhances HPWS. The causal link between differentiation strategy and HPWS has been not completely validated in the literature. To date the evidence in favour of this connexion has been mixed at best (Becker & Gerhart, 1996; Delery & Doty, 1996; Huselid, 1995). This first study supports, in line with much of this literature, the positive direct relationship between these two constructs.

Also, the mediator role of control mechanisms between differentiation strategy and HPWS has been partially supported. This study supports the literature that established the negative relationship between centralization and differentiation strategy, and between centralization and HPWS (Govindarajan & Fisher, 1990; Ashmos et al., 1990; Wooldridge & Floyd, 1990). Therefore, centralization mediates, in a negative way, the relationship between differentiation strategy and HPWS implementation. Moreover, the results of this study support the causal positive relationship between differentiation strategy and formalization. In this sense, the results of the study support the causal positive relationship between differentiation strategy and formalization, in contradiction with other studies (Govindarajan y Fisher, 1990). However, the hypothetic relationship between formalization and HPWS is not significant. Therefore, we can conclude that formalization level in an organization which follows a differentiation strategy does not affect the implementation of HPWS in a significant way. Also in this study a strong organizational culture clearly mediates the relationship between differentiation strategy and HPWS.

Finally, in the same line that some works such as Ostroff (2000) and Lee and Miller (1999), this study found a positive direct relationship between organizational strategy and firm performance.

These findings can be interpreted as an indication that within the differentiation strategy context, HPWS implementation is easier when strong values and low levels of centralization are found in the organization. An eminently current HR literature is therefore corroborated, which favours the intensification of a "humanizing" work practice, especially if the aim is to achieve a correct implementation of competitive strategies which require the workers' implication in the process.

Nowadays, there is general agreement that human capital can be a source of competitive advantage, and that HR practices have a direct influence on the human capital of a firm (Delery & Shaw, 2001).

The results of the second study (Luna and Morley, 2010) are especially in line with extent contributions to the literature that focus on how a HPWS, in this case TM, influences individual perceptions of the psychological contract (e.g. Rousseau & Greller, 1994), in this case Job Performance. Therefore, we conclude that strategies centred on TM affect directly Job Performance, but thorough Job Satisfaction and this can be done if we attract people close to the values of the organization (Alignment). Moreover, this staff should be measured and developed (Developing TM) in competencies, and empowered (Empowerment) as much as the position can extend. But mainly, employees should have the talent mindset, that is, the competence of TM (Talent Competence). This Talent Model indicates the importance of job

satisfaction (JS) as a source of positive perceptions in organizations and points to how perceptions in this regard can influence the perceived individual performance of employees. The model does not postulate that we have to pursue JS as a main key to job performances (JP). On the contrary, it suggests that if we develop and institutionalise a comprehensive system of TM, this can affect both JS (directly) and JP (indirectly). Only in this sense we can understand both dependent variables.

More research should be done in order to integrate HPWS and TM literature. This will bring about practical implications in HRM. Also, recent studies are linking TM strategies with organizational performance. In this sense, TM literature has to demonstrate its contribution to the competitive advantage of organizations.

KEY TERMS AND DEFINITIONS

Competency Based Management (CBM): Individual´s demonstrated knowledge, skills or abilities (competencies) aligned to organizational values and goals.

High Performance Work System (HPWS): Practices, as a system, directly related with organizational performance.

Human Resources System: Perspective of HR that considers all practices interrelated and influencing each other.

Talent Management (TM): Strategies developed in the firm to get the most for each employee in coherence with managerial goals.

Talent Mindset: Employee´s mentality focused on quality and excellence performance.

Chapter 61

Research and Output Management in Digital Era:
Emerging Challenges at UB

M. B. M. Sekhwela
University of Botswana, Botswana

ABSTRACT

The institutional commitment to research that was hitherto left to individual researchers and few research centres came with the University Strategy, 'Shape Our Future'. The Strategy, with clear mission and vision of research excellence, provided support for the development of a policy framework, subsequent research, output management infrastructure, and associated processes. This paper has reviewed these developments and emerging challenges posed by resource intensive paper based processes that need to be addressed inline with increasing aspirations for digital scholarship. Efforts to address these challenges are largely to reduce intensity of resource use inline with digital scholarship aspirations that embrace information and communication technology (ICT). However, the dynamism of developments and innovations in ICTs are characterized by high frequency of system obsolesce that could be costly to emerging resource poor Universities, particularly proprietary systems. This leads to the need of embracing the use of open source ware by investing in human resource development for capacity building and sustenance of digital scholarship.

INTRODUCTION

The turn of the century witnessed the development of commitment to research by the University of Botswana with the setting up of the Office of Research and Development (ORD). The office was charged

with the responsibility of foremost formulating and implementing research policy that provided for research capacity and quality development and management through funding and training, as well as celebrating success in research. The impetus to this commitment was further boosted by the University's overall strategy 'Shaping

Our Future' that identified research excellence as pone of its strategic goals that have now been clearly articulated in the Research Strategy (UB 2002, 2008). In line with the vision and mission of the University, the specific functions that have emerged from the initial policy and subsequent policies to support the development of research excellence include:

- Developing and coordinating a strategic research plan of the University.
- Facilitating the development of Departmental research plans.
- Facilitating the alignment of the internal research funding with research activities that support departmental research plans.
- Designing and implementing an effective funding system which sources research funds from internal and external sources.
- Assisting Departments to align their teaching and research activities so as to achieve research – led teaching.
- Increase research activity through various means including the creation of Centres of Study, post doctoral programmes, and collaboration with external partners.
- Establishment and implementation of a management system that provide for continuous rise in research quality.

Other functions focus on the outputs of research that include the dissemination of the findings by encouraging staff to publish research through peer reviewed channels that include well established external and internal University owned journals.. The effort is in support of the publication drive aimed at enhancing the University research visibility locally and internationally. The ORD also produces and publishes a comprehensive Annual Research Report which markets UB by serving as a tool for raising awareness locally and internationally about its research capabilities, and enabling it to attract consultancies for the mutual benefit of the University and its clients. This will also support the drive towards commercialization of research outputs, which is also the responsibility of the ORD.

Given this broad functions, the ORD has since been developing and articulating the necessary infrastructure that should support processes of delivering on the functions. This paper highlights some of the infrastructure components that include policy frameworks, institutional provisions and processes. Challenges that have surfaced are highlighted together with efforts put in place to address them by embracing technological developments that are continual supporting the digitization of research and information. While the paper shows the potential of digitization to enhance the management of research, it concludes by identifying challenges in the area of technology development that continue to experience rapid dynamism that may require high resource endowment to keep up with the global developments.

Research Policy Framework

As noted above, a policy framework that continues to improve with the strategic development of research and its support, signifying the University commitment, backs the ORD functions. The policies that are currently being implemented include: Research Policy; Policy on Ethics; Intellectual Property Policy; Policy on Centres of Study (UB 2002 and 2004). In addition, the recently approved Research Strategy provides an overall framework of which the implementation will be supported by these policies.

- *Research Policy:* This overall research policy was approved by UB Council in 2002, and it sets out the University position on research. It provides a framework for developing consistency, quality management, accountability and strategic direction for research activities. The Policy provides for the University Research Advisory Committee (URAC) to advise

the ORD, and has already been set up and operational.

- ***Policy on Ethics and Ethical Conduct in Research:*** The University Council approved this Policy in November 2004, and it defines the codes of practice that the University will adhere to in its research activities, and to make these binding to all staff. It takes due note of international and national expectations and customs, and provides clear guidance on the conduct and behaviour of staff. It also sets up mechanisms to ensure that the standards are met, through appropriate procedures and regulations that would ensure compliance. Efforts are currently on to set up necessary policy implementation structures that include Institutional Review Board(s) (IRBs).

The implementation of this policy will parallel the current Government of Botswana research permit system that is tantamount to some kind of research clearance. The UB based ethical clearance of research proposals will also have similar effect to the Government permit system. Streamlining the two processes would ensure minimum delays to the start of research activities. This initiative would be paramount to quality improvement.

- ***Intellectual Property Policy:*** The aim of this policy is to provide a mechanism for enabling discoveries and ideas created within the University community to be developed into products available for the benefit of society, and for any resulting income or rewards to be shared fairly between the stakeholders. It was approved by University Council in November 2004 to effect immediately.
- ***Policy on Centres of Study:*** The policy was also approved by the University Council in November 2004. It provides a framework and criteria that will enable new Centres of Study to be established and to be developed as a means of encouraging interdisciplinary research, teaching, outreach and scholarship, in harmony with the Vision, Mission and Values of the University

The implementation of the policies has led to the emergence of processes that underpin the activities that are necessary to implement the policies fully. The main flow in these processes is information that is currently mediated by paper which is increasingly becoming a challenge in its management.

- ***Processes:*** The research policies as highlighted above provide for activities in various areas identified as pertinent for the development of research culture. The overall policy identified research funding and quality management, research outputs reporting and management and also the need for ethical conduct in research that was later strengthened by a specific policy for it as areas for immediate attention. The processes of addressing the areas identified by the policies were mainly through the initiation of activities to improve on the situation as outlined subsequently.

Research Funding

The initiation of research funds management revealed a situation of uncoordinated research and a funding system that was not easily accountable centrally. It also emerged that the University research is funded internally and externally through donors and collaborative research. Further situational analysis showed that internal funds were given to Faculties without a management process that has clear accountability in terms of expenditure and research outputs. Externally funding was largely a matter between the researcher and funders/collaborators.

In order to improve on the situation, the Office of Research centralized the allocation of internal funds by setting up a system that has funding calls (funding rounds) for research proposals that are reviewed for quality and funded competitively. The proposals are submitted to ORD where they are recorded and photocopied for distribution to Faculties where the quality reviews by peers take place under the auspices of the Faculty Research and Publication Committee (FRPC). The potential winners in each Faculty are ranked and send back to the ORD which oversees the final assessment of the reviewed and ranked proposals for funding by the chair persons of the FRPCs.

The Faculties are also allocated part of the internal funds directly based on their research performance to support research proposals that are submitted to their FRPCs. This affords the Faculties the opportunities to strengthen their research performance by boosting certain areas of their research plans. The management of these funds has not yet been fully aligned to the ORD system to allow for coordinated and full reporting on the use of internal research funds.

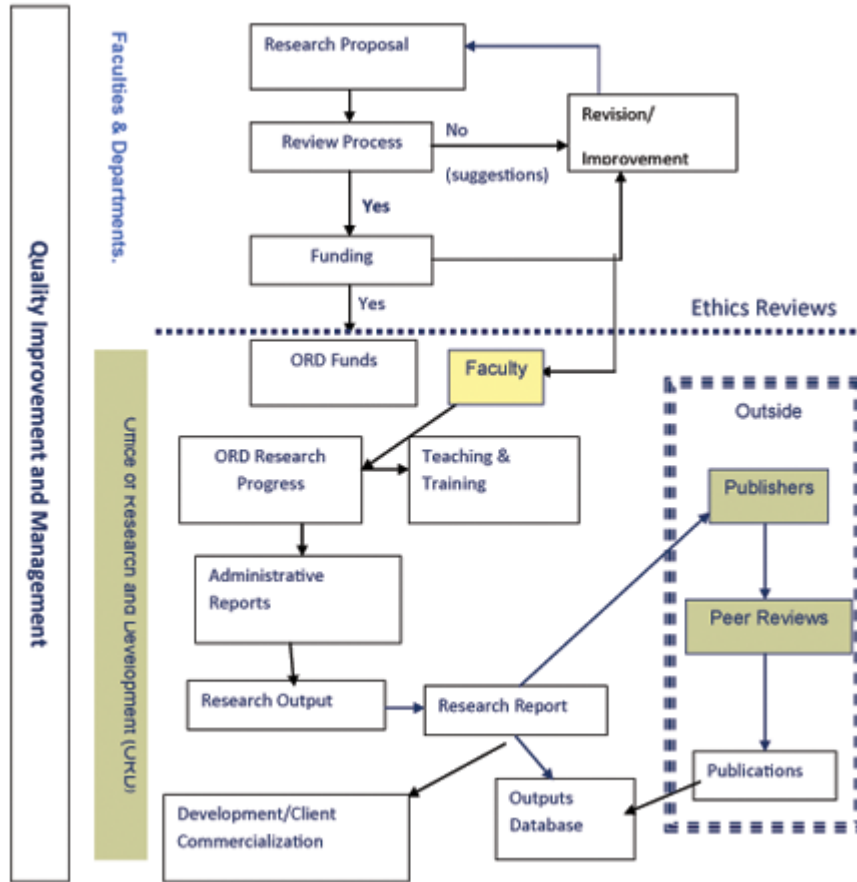
Similarly, externally funded research is not as yet fully integrated in the management of research funding such that the ORD is central to the processes as it does with the internal funding. It is envisaged that research proposals should receive comparable quality assurance irrespective of the funding sources as they all support the University institutional goal of research excellence. Hence the ongoing efforts of quality assurance through development and management of research quality as elaborated in the subsequent section.

Research Quality Management

The University of Botswana adopted 'fit for purpose' as a working definition of quality that can be interpreted to mean that all products of the teaching and learning and research processes must fit the purpose of which they are meant for. With regard to research which is the focus of this paper, a broader definition of quality has been adopted to include the whole processes as the product depends on it. The various stages of a research process are recognized, and quality assurance is intended for every stage once the quality framework has been finalized and an appropriate supporting infrastructure is in place. Currently this is done for proposals that are subject to academic quality and ethics reviews, and research progress monitoring that emphasizes timely reporting and completion of projects. Research papers emanating from the research are assumed quality assured by peer review mechanisms through publishing process (Figure 1).

- *Academic Quality Reviews of Proposals:* The review of proposals for quality focuses on theoretical rigor and scientific soundness based on the views of peers and experienced researchers in the discipline and area of the proposed research (Figure 1). The purpose of the reviews is to select the best proposals for funding and ranked according to level of quality on a scale of poor to excellent. Constructive feedback is given to unsuccessful proposals to build the skills of the researchers and improve quality of research at the University.

- *Ethics/Safety Reviews (internal):* As part of ensuring ethical and safe conduct of research, the ORD has started the implementation of the Ethics Policy alongside awareness raising through seminars on responsible conduct of research (RCR), and also developing guidelines on identifying misconduct in research. The implementation of the policy has required the setting up of the overall Research Risk Committee (RRC) responsible for insuring ethical conduct in research including conflict of interest that also covers financial matters. The committee operates through three subcommittees: Institutional Review Board (IRB) responsible for human subjects; Animal

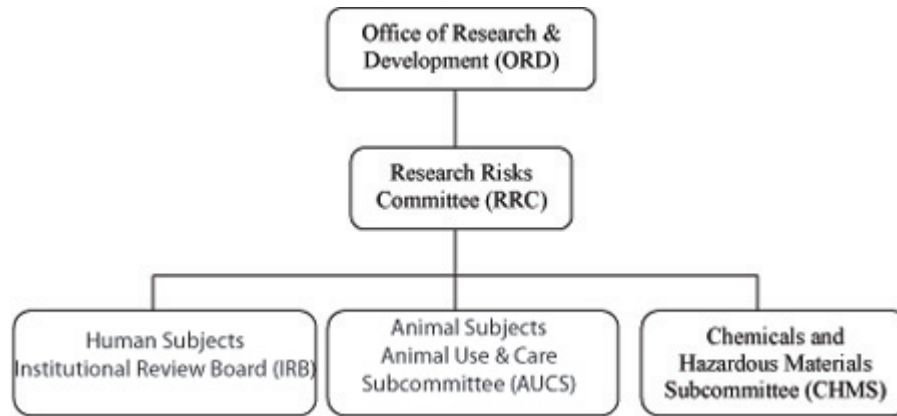
Figure 1. Flow chart of management of internally funded research and quality assurance at University of Botswana (adapted from Sekhwela, 2006)


Use and Care Subcommittee (AUCS) responsible for research involving animals, and Chemicals and Hazardous Materials Subcommittee (CHMS) responsible for safe use and disposal of hazardous materials (chemicals and others) (Figure 2).

In addition to University based ethics reviews, Government Ministries have also been given mandate to review research proposals in their respect areas of responsibility and issue research permit which is mandatory for all researches carried out in Botswana (Government of Botswana 2003). The ORD funded research projects have to obtain research permit and comply with the

obligatory repository condition of the permit. All University of Botswana projects funded internally or externally have to be permitted and comply with all conditions of the permit as required by law.

- *Research Project Monitoring:* Projects that have been permitted are monitored for progress 6 monthly and annually with reports required highlighting areas of progress in the project work plan. Researchers are also encouraged to disclose any problems or difficulties encountered in carrying out the project in order for the ORD to assist in improving the conditions of project

Figure 2. Ethics committees at University of Botswana


implementation. Prior to project implementation, researchers are work-shopped on project management that include the preparation of workplans with clearly outlined project milestones, budget and expenditure tracking, and reporting of both technical progress and financial accounting. Timely completion of research projects is regarded as paramount and part of research quality. It is also expected that all research findings are disseminated through reports, conference presentations and preferably peer reviewed journal publications.

- **Research Support:** The highlighted processes of research management are part of the developing support for high quality research at UB. In addition to training to develop the necessary skills, efforts are devoted to making information required by researchers easily accessible to empower them to act responsibly and be part of quality growth and assurance. Information availability on research governance, policies, procedures, guidelines, funding, research news, research outputs and expertise database has improved with a website created for the sole purpose of managing this information and making it easily accessible to the research community. The website provides such information for researchers carrying out or wishing to carry out research in the University; http/www.ub.bw/ORD/.

Emerging Challenges

While the ORD has made tremendous progress in developing research management and support systems, there are emerging and increasing challenges. The culture of individualized and 'self accountable' research that posed an initial challenge, is now revealing the fundamental problem of lack of research planning and supervision at Departmental and Faculty levels. Consequently all other processes of research planning, management and accountability as insisted upon by the ORD are not yet fully supported at these levels. This creates a gap for ORD that has no responsibility over researchers as they fall under Head of Departments and Deans of Faculties. The situation precipitates other challenges in the following highlighted areas:

- **Research Proposition, Approval and Supervision:** The lack of institutional research goals with prioritized research areas until the development and approval of the Research Strategy resulted in research

proposals that are not aligned to any desired long term planned research programme and competence building in given areas currently. While the strategy is still to be implemented, approval of proposals is largely on the basis of academic quality without any elaborate strategic criteria linked to long term desired achievements. This has undermined research supervision and the development of its leadership at Department and Faculty levels.

- *Research Reporting:* The reporting of research is not yet a priority or incentivised enough among researchers, and it is exacerbated by the highlighted lack of research planning and supervision. Currently internally funded researchers submit progress and final reports to the ORD directly and not accountable formally to their HoDs on their research as they do with their teaching and learning responsibilities. Similarly, externally funded research is largely the responsibility of individual researchers in terms of execution and reporting without the involvement of the HoDs or immediate supervisors, and the ORD has not been involved either. These gaps have increasingly made the collective reporting of research at UB very difficult as both the HoDs and Deans are not fully aware of all the researches being carried out in their Faculties and Departments as their researchers have not been eager to report on their research work. This is becoming a challenge as the University has started assessing its research performance, and the gap needs to be closed.

- *Research Performance Assessment:* The University has been putting in place processes of evaluating its achievements in pursuance of its strategic goal of research excellence. This depends on the availability of outputs for assessment, and the gaps highlighted above have been making this

difficult because of incomplete research reporting. The adoption and implementation of the Performance Management System (PMS) for staff, has resulted in a research performance evaluation that will hopefully encourage research reporting as only one mandatory source of research outputs in the form of a database or institutional repository (IR) is under development (University of Botswana, 2008).

- *Institutional Repository:* The challenge posed by the development and operation of the institutional repository is the quality assurance of non published research outputs that are important in reflecting an overall University research activity. As a mandatory source of research information, all research activity of staff for annual assessment will need to be uploaded and quality assured. Hence the need for quality reviews at Departmental level where the upload will occur as the IR provides for Departmental collections.

- *Research Quality Management:* The achievement of the research excellence goals require the development and maintenance of research quality with internationally recognized benchmarking. While the PMS evaluation of research includes quality criteria and indicators, there are no appropriate structures at Department and Faculty level to support quality assurance.

The international recognition desired by the University in the area of research will require appropriate benchmarking as there are several research performance and quality indicators used that may not yet be applicable to emerging Universities such as UB, and these include:

- Total research expenditure.
- Total publications.
- Competitive central government funds.
- National science academy membership.

- External funding.
- Postgraduates (PhD) awards.
- Postdoctoral appointment.
- Citation indices of faculty.
- Patents, etc.
- ***Paper Based Processes***: The biggest challenge has been the resource use intensity of all the above highlighted processes that are largely paper based. The photocopying of proposals for the necessary quality and ethics review processes, and then disposal thereafter has been very costly. Similarly the reporting of progress of research projects is requiring more and more paper and filing that needs storage, and the situation is worsening with increasing research activity.

There is also need to reflect the reality of challenges nationally and Africa as a whole, and embark on appropriate responses.

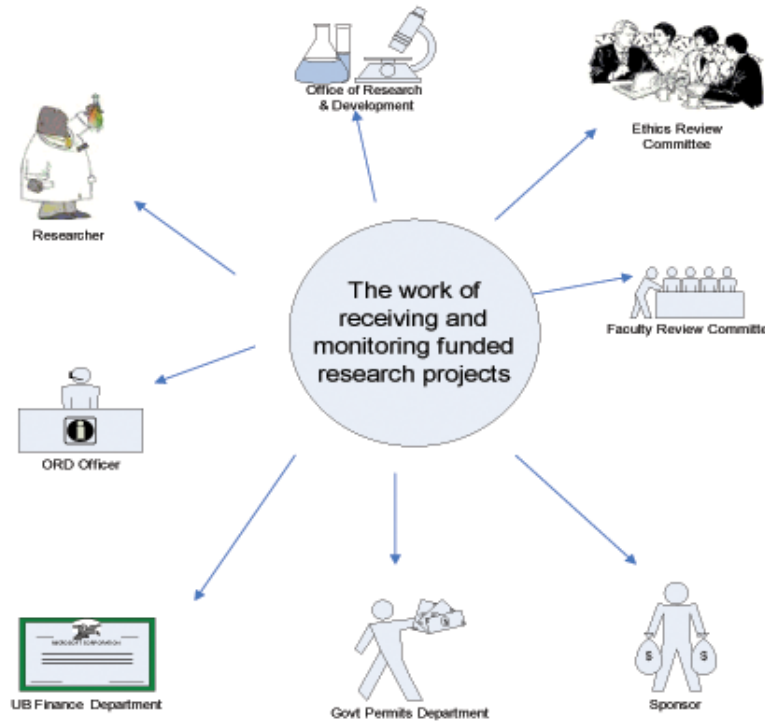
Responding to Challenges

In order to address the highlighted challenges, efforts are being made in various fronts starting with coordinated strategic research planning lead by the ORD to provide for research planning, management and leadership at both Department and Faculty levels. This would provide a framework for quality reviews and assurance of proposals and research processes. In order to address the high paper and other demands of these processes as highlighted above, the ORD has embarked on developments that would addresses these challenges as outlined in the subsequent sections.

- ***Research Management System (RMS):*** The management of the proposal submissions, reviews (academic quality and ethics), approval, monitoring of research progress and other processes that are currently paper based and taking up lot of resources, are earmarked for computeriza-

tion with the development of a Research Management System. The system is expected to manage the whole workflow from the time a proposal is submitted for funding through all subsequent processes till the project is completed if the research is funded (Figure 3). As a web-based system, authorized persons will have accesses at the various stages to perform whatever tasks necessary, as well as researchers for information about their research proposals or decisions on their research work The system is expected to be linked to the financial and human resources systems, as well as the staff performance management system and the Institutional Repository for research outputs when these are in place.

- ***Research Output Database/Repository:*** The research policy and subsequently the University Strategic Plan highlighted the need for research performance assessment and evaluation that were not easily done because of lack of collected research output. A modest web-based research output database developed in 2003 has since demonstrated the potential of digital information, and this is now being further developed to fully benefit from the versatility of this type of resources. The limitations of the facility that included few data entry points based on compiled data and lack of data manipulation and analysis for reporting purposes, are now being addressed to allow multiple data entry that include self up-loading by researchers and data analysis. This will be enable by the currently ongoing development of a web-based institutional repository (IR) through which self up-loading will be carried out, with necessary workflow management put in place together with quality assurance. Necessary links or interfaces will be developed for data harvesting or analysis for reporting purposes and other uses such output verification for

Figure 3. Examples of some the components of the research management system that is being develop for the ORD (Adapted from Mogwai, 2007)


staff research performance assessment for rewards and reviews for promotion.

The University through its Library, is one of the designated national legal research repositories in the Government of Botswana research permit system, and these collections are mostly in hard-copy and not easily accessible to researchers outside the University and the country. The IR as web-based information resources will allow access to all such collections and the University research outputs and ongoing work generally, increasing its visibility and thereby attract potential collaborators as well as customers for its demonstrated capabilities as reflected in its work (Figure 4).

• ***Draft Publishing Policy:*** One of the increasing challenges facing the University implied in the preceding section is the lack of national and international visibility of

its research work. This has come to the fore nationally during the development of the Botswana National Research, Science and Technology Plan that pitied the University against other national research providers. While its voluminous research output was comparable to none, the lack of its impact or visibility in the national innovation systems was a far cry in the light of it being supported by public funds (Government of Botswana, 2005). At the same time, the report could not find any respectable presence of the University in the international research landscape assessed using indicators of research strengths as reflected by peers, e.g., citation indices. Hence the University is now responding to this challenge through the development of the IR above as part of its publication drive and a publishing policy to support these efforts.

Figure 4. The University of Botswana Institutional Repository (IR) Prototype Page

The overall aim of the Policy will be to create a context in which the scholarly communications and publications of the University of Botswana can be enhanced at all levels, national, regional and international. While recognizing various channels of research dissemination, the University has its own journals that the policy is providing for their further development that will include digital formatting and online accessed. It is also envisaged that submission of manuscripts, reviews and other publishing processes in respect of the journals will eventually go online as part of embracing digital scholarship that has already a task group working on (Figure 5).

- *Quality Management:* The imperatives of encouraging and developing quality in research to inspire public confidence in the research findings and assurance that funds are invested in the highest quality investigations are no longer a matter of choice. While the research strategic planning offers a framework for research management, the research management system

highlighted above needs practical arrangements on the ground that are guided by certain expectations as part of quality management. Hence the development of a framework that provides for research quality assurance through the structures that will manage the workflow in the system.

The framework seeks to encourage the development and sustenance of high quality research by promoting and insuring the following as critical cornerstones:

- Research leadership and management.
- Clear allocation of responsibilities and research supervision.
- Transparent decision-making processes.
- Development and adherence to set quality criteria and standards.
- Clearly laid out quality reviews and procedures.
- Clearly laid out monitoring and evaluation arrangements.

Figure 5. Examples of University of Botswana journals being considered for digital formatting as part of further development in digital information management

- Measurement and reward for research success.
- Research support that include adequate allocation of resources.

It is expected that the structures that are set up will ensure the above cornerstones, and play a major role in the RMS when it is finally put in place. The quality framework is supported by the University of Botswana Quality Strategy, research and other policies as well as national and international laws that provide for healthy and safe conduct of ethical research.

Yet Biggest Challenges

While digitization of research and output management processes will address various challenges highlighted above, there are still further challenges posed by the digital environment and supporting technologies that are under constant evolution. The potential and benefits provided by the digitization can be realized if capabilities are developed to continual address the following:

- *Interfaces:* The highlighted research project management systems under development or being resourced will need interfacing the personnel and financial systems for automatic updates of project expenditure and staff employment status. Similar interfaces will be required for linking with the institutional repository to update research outputs at the completion of the projects and the PMS online performance agreements for verification of the reported research outputs for rewards.
- *Lifetimes and migrations of databases:* The lifetimes and migration of information databases created with digitized systems will remain a constant challenge as technology changes, and require 'in-house' capability and capacity to adjust and develop as necessary.
- *Speed of resourcing technological changes:* The dynamism of technology development may render newly and costly acquired technology/systems absolute before fully benefit has been derived and needing further and speedy development for con-

tinued use. This may be costly to lowly resourced institutions/organizations such as UB, and this need to be considered in the development and fully embracing digital scholarship.

- *Platforms ± Applications ± Open sources?* The question of what platforms and applications for use in digital information technologies is increasingly arising as more choices are made available. The cost implication of proprietary systems and software applications have led to more efforts devoted to open sources that allow for cheaper application of technology. This however, require self supporting in further development and customization to enable use as needed, hence the need to invest in appropriate human resources. The highlighted dynamism of technological innovations are further challenged by development in digital scholarship that increasingly support open access to scholarly information, at the same time assuring the protection of intellectual propriety that is also being commercialized. Once again emphasizing the need for adequate human resources.

- *Human Resources:* The major challenge in technological development remains the human component that drives both the innovation and application of the same. The development aspects tended to be highly competitive with systems becoming absolute quickly and increasingly expensive for low resourced suppliers who close shop, leading to the dominance of bigger companies producing proprietary systems/ware. However, alternatives that have emerged in the form of open source systems for continual 'cooperative' and shared development require input from users. Hence the need to have adequately developed human resources to drive both the development and application of the necessary innova-

tions for the digital scholarship from open sources. Therefore emerging Universities such as UB should aim to maximum the potential of open sources by emphasizing human resources development in the area of ICT so that its aspiration of digital scholarship could be fulfilled.

CONCLUSION

The aspirations of research excellence have resulted in the development of institutional strategic research goals and supportive policy framework inline with the mission and vision of the University of Botswana. The implementation of the strategies and policies led to the development of research and output management infrastructure, and associated processes that have exposed challenges that need to be addressed in order to promote digital scholarship. Much of the challenges are related to high resource use by paper based processes which appear to be a draw back in the digital era, and efforts are under way to address them. However, the high diversity of systems and dynamism in technological innovations pose further challenges for resource poor emerging Universities such as UB, and it is proposed that the solution could be found in open source wares coupled with adequate human resource development for self sustenance in ICT. The need for in house capacity is also supported by the challenges posed by the increasing move towards open access to scholarly information, and the need to protect intellectual property that is also being commercialized.

Chapter 62
Recruiting, Selecting and Motivating Human Resources:
Methodological Analysis and Case Studies Applications

Konstantinos C. Zapounidis

Aristotle University of Thessaloniki, Greece

ABSTRACT

This paper's aim is to analyse practices adapted by different enterprises regarding personnel motivation and human resources approaches to increase their productivity and profitability while examining the methodology of human resources recruitment and selection used by different kinds of enterprises, which cannot exist without human manpower. The objective of this paper is to analyse methods and tools used by several enterprises in motivation and in human resources recruitment and selection. Regarding motivation, the basic aim of the process adapted was to define whether each enterprise was closer to the participating or to directive management model. Especially in the recruiting and selecting process IT could add important value since adapted IT processes could lead to quicker and more successful transparent results. IT professionals could organise these processes for every enterprise in order to become standard, formulated, and even more accredited procedures which would lead to successful recruiting and selecting results.

INTRODUCTION

The environment in which enterprises are operating is extremely competitive and in order to survive, they have to react to the new circumstances, including globalisation, new technologies, innovation and collapse of economic barriers. Moreover, low productivity is a common problem faced by an increasing number of organisations world-wide. When in an enterprise the productivity is not managing to keep up pace with the increasing work cost, then effectiveness, but also the existence of the enterprise, is under important threat.

Requirement for each enterprise is competitiveness, productivity, quality and finally efficiency. The objective of this paper is to analyse methods and tools used by several enterprises in human resources recruitment and selection, taking into consideration the aforementioned requirements (Vaxevanidou, 2008; Chitiris, 2001) and, moreover, to examine motivation methods used by them.

For this scope important is the role that the human resources recruited provides. The human resources, in the field of organisations and enterprises or the human capital, in the field of society in general, are considered as basic pivot of development and whilst up to now they were defined inductively, a tense is presented to be assessed in knowledge (new and dissemination of existing) and skills (education and training).

Human resources are the only factor that could activate and develop all the production elements, in order an enterprise to operate and successfully accomplish all its objectives. Great and successful enterprises are formed by human capital, whilst enterprises fail or are low efficient, as employers could not or are not willing to participate in the objectives' accomplishment.

Machinery, computers, installations and the rest factors of production, do not think, learn, try and of course do not set objectives in order to decide what and how to perform. Furthermore they are not motivated, they do not act collectively and they do not have expectations and needs to de

fulfilled. All these characterise the human nature and action (Chitiris, 2001).

The quality of Human Resources is characterized, without any doubt, first priority for a "competitive economy" and for balanced social development. This recognition is depicted in operational level, through the quest and adaptation of methods used for investment's value assessment and for education and training of production mechanisms.

Regarding motivation, the question that derives is what the reasons of low productivity are. A number of executives are pointing as reason for low productivity the decrease of personal motives and the minimisation of "will to work". Moreover, the decline of devotion to the organisation in correlation with weakening of their commitment to the ethical laws for work is another important factor. The aforementioned explanation has been challenged repetitively by experts on human resources management, based on an important number of results. According to these results, it is proved that, as a rule, an individual human being "wants" to work, "wants" to be productive and to contribute to the organisation's development. Supporters of the so called "motivation school" support that if the productivity of employees is inadequate, management has not succeeded to apply in a right way the conclusions of the modern science related to work environment attitudes. Rivals as the aforementioned lead to the conclusion that it is difficult to define what the "real" answer for low productivity is. To succeed a common accepted answer, a number of parameters should be taken into account as the possibility that motivation experts and academics could be wrong and the option that individuals are not willing to work or are obliged to work and for this reason do not perform in an efficient way.

It is easily perceptible how important Human Resources Management is when it is applied in the right way, in order an enterprise to acquire, preserve and develop capable employers, who will execute their role efficiently and success-

fully. Indicatively actions that Human Resources Management includes are (Chitiris,2001):

- Planning of Human Resources
- Job analysis
- Recruitment and selection of capable human resources
- Education and Training
- Employers' efficiency evaluation
- Employers; wages
- Employers' protection
- Negotiation of working relations

The aforementioned actions are interrelated and inter-depending in such a degree that the successful or not execution of one influences the rest. It is obvious that the on time and rational planning of human resources influences the efficiency of actions of recruitment, selection and education, whilst the inefficiency of the system influences human resources planning.

In order to highlight the interrelation of human resources actions, it is deliberate to consider them as subsystems of the human resources management system. Each transformation of one of the aforementioned sub-systems (or of their elements) influences the operation and efficiency of the whole system. Human Resources Management, considered as an open system, accepts inputs (human resources) and is being influenced by factors and limitations of the external business environment. Adapting the appropriate processes seeks the accomplishment of specific outputs-objectives, as the qualitative and quantitative performance of the employers, the positive working conditions, high motivation level (Werther, 1996).

As it can be conclude, Human Resources Management is a tough project, multi-sectoral, requiring knowledge and art by all involved individuals (Human Resources Managers or not) (Chitiris, 2001).

Basic factors for the successful and effective function of an enterprise or organisation constitute the recruitment and the selection of ideal executives and workers for any level of hierarchy. The basic aim therefore is that all stages can be comprehensible for an objective and effective selection of the particular candidate for the particular vacancy should be accomplished.

It is vital, that the qualifications and the experience which an enterprise requires to be precisely determined, before the enterprise commences to search for the suitable candidate for the job vacancy. This can be achieved with the meticulous job-description and the thorough definition of the candidate specification (Chitiris, 2001; Hindle, 2001). The job-description is useful as a map and as a compass on the direction that each employee is obliged to have for the implementation of the work. It describes in every detail all the content and the breadth of work that it should be executed by the holder of the position (Vaxevanidou, 2008). The candidate specification, or personnel specification, as it is frequently called summary of the knowledge, skills and personal characteristics required of the job to carry out the job to an acceptable standard of performance (Cole, 1999).

The next step is the attraction/seeking of human manpower, as it is called the process of inviting of suitable individuals with regard to their knowledge, experience and skills, so that they can correspond to the job required (Leigh, 2001). There are two basic methods of seeking ideal candidates for covering the vacancies: 1) the Internal Attracting/Seeking with the exploitation and upgrade of the existing personnel, and 2) the External Attracting/Seeking via the external environment of the company. Both sources of attracting/Seeking have advantages and disadvantages; thus their combination helps the enterprises to remain competitive in a rapidly altered environment.

The observation of an electronic database with the characteristics of the employees, the notification of the vacancy via the company's table of statements or the company's publications, the internal system of promotion, the workers' references and finally the recruitment of former workers of former candidates constitute the in-

ternal seeking process. The external sources of attracting are various and differ in terms of cost and effectiveness. The most usual are the following: the contact with the Offices of Interconnection of the Universities and Polytechnic Colleges of the country, the contact with technical and professional faculties of specialisation, the communication with the Organisms of Employment of Workforce and the local unemployment agencies, the interaction with the private agencies, the collaboration with companies of benefit of services and selection of executives, the communication with relevant enterprises of the branch that proceed in redundancies, the transcription of executives from corresponding competitive enterprises of the branch (Vaxevanidou, 2008; Chitiris, 2001; Hindle, 2001).

Then the process of the selection follows. According to the requirements of each vacancy, a practical combination of examining methods – steps is used, so that all essential information for each candidate arises. In each one of those steps it is possible that the candidate could be rejected; the analytic description of these steps is: First of all, the person in charge (interviewer) examines the CVs and the applications of employment (accompanying letters) that the candidates have sent and divides them into three groups as follows: very suitable - must be interviewed, quite suitable - call for interview if insufficient numbers in previous category, or send holding letter, not suitable - send polite refusal letter, thanking them for their interest in applying (Cole, 1999). If there are numbers of very suitable candidates, then it may be necessary to have one "first" interview of short duration, aiming at the reduction of the suitable candidates who will pass from the "main" selection interview in an acceptable number (Chitiris, 2001).

The next step is the second phase of the selection process, the interview, which is the most common technique used for selection purposes. It is very important to be properly prepared before an interview. It enables the interviewer to feel confident in himself about his key role in the

process, and enables him to exploit to the full the information provided by the candidate. It also helps to minimise embarrassment caused by constant interruptions, inadequate accommodation and other practical difficulties.

Questioning plays a vital role in a selection interview, as it is the primary means; which information is obtained from the candidate at the time. Questions have been categorised in a number of different ways, however it is enough to distinguish between closed questions, which require a specific answer or a Yes/No response and open questions that require a person to reflect on, or elaborate upon, a particular point in his own way. Open questions invariably begin with what? How? Or why? It is usual to ask closed questions to check information which the candidate has already partly supplied on his application form, and to re-direct the interview if the candidate is talking too much and/ or getting off the point. Open questions tend to be employed once the interview has got under way, with the object of getting the candidate to demonstrate his knowledge and skills to the interviewer (Cole, 1999). Open questions are probably more useful in the interview, since they allow the interviewer to observe the communication dexterities of the candidate (Hindle, 2001).

There are three conduct methods of an interview: one-to-one basis, a two-to-one situation and the panel interviews. By the panel interviews it is ensured the fairness of the proceedings, since more interviewers evaluate the candidates and finally agree for the suitability of the candidate. From researches it has been found that it is required relatively few time in order the interviewers to reach a consensus over the suitable candidates. What is critical for the effectiveness of the interview of this type it is the good collaboration and the co-ordination of the examiners. There are several disadvantages, however - the candidate will find it difficult to feel at ease in such a formal atmosphere; the individual; panel members may be more concerned about being cued for their

questions than being concerned to listen to what the candidate is saying (Cole, 1999; Roth, 1992).

There are three basic types of an interview; the standardised where concrete rules for all candidates without exception are applied, the structured where predetermined structure is followed but not necessarily common for all candidates, and the "free" interview, with the form of a free flowed dialogue between the interviewer and the candidate.

Besides the interview, the candidate can simultaneously pass from various tests, according to the nature and the requirements of the vacancy. The basic function of the tests is the measurement of the dexterity and the behaviour of the candidate in different cases and under special conditions (Vaxevanidou, 2008).The tests can be divided in a lot of ways; however, the most acceptable way of classification is in two big categories; the attainment tests and the personality tests. With the attainments tests can be measured the possibly highest performance of the candidate, while with the personality tests can be examined the main characteristics of his personality.

The assessment centres is an alternative way of selection in which the candidates for high graded vacancies are subjected to an amount of questions and exercises. The processes, which are applied, are about the evaluation of the candidates' skills with regard to important sectors of professional activity. It is found from researches that the assessment centres, as a selection method, give reliable and valid results. The disadvantage of this method is its high cost and that it time consuming process.

It is vital, after every interview, concerning the suitable evaluated candidates, that a confirmation of the information they give in their CV or during the interview be done, on terms of their signed authorisation.

As far as the selection decision is concerned, there are two methods; the subjective, which is based on the personal evaluation and the objective, which is based on the results of a statistical analysis (Chitiris, 2001).

Furthermore, it is vital for particular jobs that medical examinations are done by the new employee, either because there is a relevant relation to the implementation of his work, or in order to exclude the possibility of transmission of dangerous illnesses in the working place. In any case, the physical health of the candidate should be controlled after offering the job.

The recruitment under trial gives the opportunity to the company to examine the new employee in practice, to find his skills and to be sure that he possesses the ability to perform the job required. This method is applied for a period of time (one or two years) mainly by the most banks and the biggest organisations.

Finally, the employee's integration is the last and most important step, that the companies usually neglect, since it is between the end of the selection process and the beginning that that the employee undertake his new role (Leigh, 2001). The new-employees' integration in the company constitutes one of the main functions of the Personnel Management, since it has an essential role, not only for the employees' performance, but also for their long stay in the company.

Managing a company or an enterprise and achieving its targets requires the cooperation of human resources. The administrative actions are characterized by the efforts to motivate work force and to equate company's objectives with workers' objectives. The presence of a worker in a company's project does not contribute towards the promotion of company's objectives. The contribution could be either positive or negative, depending on the similarity of objectives.

Every project team member is considered to be basically a passive element that could be motivated, could produce, but could not undertake initiatives. Thus the activation of the work force in order to produce is the baseline of every managerial effort. Two are considered to be the basic issues that preoccupy the administrative hierarchy of a company:

1. The finding of the level that employees could support efficiency or could increase efficiency in correlation with overall objectives accomplishment.
2. What are the motives related to the efficiency of the employees, in which level these are related to work productivity and in what degree a motivation system could be adapted, in order to support the effective motivation of human resources towards a predetermined direction.

METHOD

Participants

The scope of the approach adapted was not to compare organizations of similar characteristics but organizations of different fields that could be activated in the same industry (especially in the construction industry). The reason of such a selection was the fact that the type of the offered services affects in an important degree the recruitment and selection process and, moreover, the motivation policy and the level of employees' participation.

Two groups of organisations under investigation were created; one in order to examine recruitment and selection and one in order to examine motivation.

Selecting the organisations that formed the sample for distributing the questionnaires was based on the aim to cover the following 4 axes:

1. Local Characteristics
2. Construction industry.
3. Private and public sector.
4. Word wide range local enterprises.

The sample of Human Resources' Selection and Recruitment Sample was consisted of the following enterprises:

- A Societe Anonyme of the public sector, with 278 employers. The Human Resources Manager and responsible of administrative matters answered the questionnaire, whilst more details of the organisation are not publicised due to their request.
- An important technical construction company, activated and constructing important projects all over Greece and abroad, either by itself or conglomerating with other companies of the sector. It has 100 employers, whilst this number could be increased depending in the number of the undertaken projects. More details of the organisation are not publicised due to their request.
- The third company was a local development agency. Its activities are prescribed by the wider European philosophy, for more essential decentralisation, with active contribution in the planning and management of the development resources, through the coordination of all local institutional authorities. The detection, research, promotion, support and realization of integrated proposals for the growth is achieved through the productive exploitation of national and European financial support and development programs. It has 32 employers, depending in the number of projects undertaken.
- A medium-sized company of the sugar products' sector. 50% of its production is sold in Greece whilst the rest 50% abroad. It has 40 employers. More details of the organisation are not publicised due to their request.
- A local branch of a private bank (established in 1982). It has 10 employers and the answers were given by the 2nd manager.

The sample of Human Resources' Motivation Sample was consisted of the following enterprises:

- A technical company constructing private projects (Organisation No.1). The company is activated mainly in the sector of building constructions, covering issuing building permits and constructing private owned buildings (either as constructors-design and build or as developers-design, build and sell). The company employs ten individuals and is operating for more than twenty years. The selection of this company was based on the fact that it reflects the typical example of a small company with two owners (engineers with horizontal relationship). The company is considered as medium sized, at local level.

- An important technical company of general construction operations (Organisation No. 2), employing more than forty individuals. The company is producing private and public works nationally. Moreover, they own concrete production premises, for internal and external, to the company, projects.

- A factory (Organisation No. 3) producing ready to use concrete (last of the construction industry sector). The company employs ten individuals and is operating for more than twenty years.

- A participative company which produces, standardises and trades local agricultural products word widely (Organisation No. 4). It constitutes a pilot pioneering company at national level, exporting products in important markets, as the European Union and Russia. The company employs forty to fifty individuals, depending on the production level.

- As typical sample of the private sector, the local branch of an important Greek bank (Organisation No. 5) was selected, having fifteen employees.

- The local branch of a public sector organisation (Organisation No. 6). For this specific organisation, it must be noted, that the director responsible of answering the questionnaire could not answer all questions, as some of them could not be applied in the public sector. These questions were answered by a private sector expert, of the same profession discipline as the responder.

MATERIALS AND PROCEDURE

Regarding recruitment and selection three types of questionnaires were produced (closed type graded, closed type of two alternatives, open type). The questionnaires were produced for the scope of this paper and were used for first time within this paper's framework.

Regarding motivation, the questionnaire was based on the research work of Dr. E.S. Stanton (1982), Professor of Management in the Business Administration School of St. John University-New York. The initial thirty questions were adapted at local level and the questionnaire was enriched with fourteen more questions. Each question-proposal is graded from one to four depending on its subject. The possible answers to these questions were: totally agree, generally agree, generally disagree and totally disagree. In the end the grades are added, leading to a possible range of total grade between 44 and 176. The answers were weighed in the way that the lowest total grade results to adaptation of directive management model whilst the highest grade results to adaptation of participating management model, by the organisations under examination. All enterprises under examination were based in the same local environment (Pieria, Greece) and a predefined questionnaire of closed type was addressed to them.

Procedure

The completion was consisted of the following steps:

1. Questionnaire composition
2. Distribution of the questionnaires to the executives responsible for human resources management and employment relations.
3. Provision of time in order the questionnaires to be studied and analysed.
4. Predefined on-site meetings and interviews for possible specifications.
5. Questionnaires collection.

RESULTS

Human Resources' Selection and Recruitment Analysis

Graded closed-type questionnaire offered four different possible scaled answers: Always-Often-Sometimes-Never. Regarding the 25 questions of the graded closed-type questionnaire, these were divided in 4 categories: firstly the questions which displayed "absolute identification" of answers; all companies answered "Always" or "Never", secondly the questions which displayed "identification" where the companies answered "Always-Often" or "Sometimes-Never", thirdly the questions which displayed "big dispersion"; in this category the answers "Always" and "Never" occurred simultaneously (possibly the intermediary answers occurring as well) and finally the questions that displayed "small dispersion" with the answers "Often" - "Sometimes" - "Always" or "Often" - "Sometimes"- "Never". Grouping as aforementioned, led to the following results: 12%

of the answers displayed "absolute identification" and "identification", while 32% of the answers displayed "big dispersion". The highest percentage of the answers showed "small dispersion", which is 44%.

As far as the closed-type Questionnaire of two alternative choices is concerned, the 12 questions were grouped in 2 categories: in the questions with two alternatives choices as an answer and in the questions with the additional choice "Combination" of the above mentioned answers, as some of the under investigation companies couldn't give as an answer one of the two alternatives excluding the other.

The questions of the opened type questionnaire couldn't be possible to be grouped in any way; thus its answer are analysed further below.

Closed-Type Graded Questionnaire

The answers provided by the under investigation companies/organisations in the closed-type graded questionnaire are presented according to the grouping aforementioned; identification and dispersion of answers.

Absolute identification was pointed in the fact that for each enterprise the general direction is always responsible for the selection process; whilst interviews are always take place within the enterprises premises.

Identification was presented in the fact that the recruitment of formerly rejected candidates is sometimes necessary because of the specialised

Figure 1. Graded questionnaire - Grouping of answers based on identification-dispersion factor
Figure 2. Two alternatives questionnaire – Grouping of answers based on combination or selection one of the answers
type of the services (local development agency and public sector company).

Regarding big dispersion, in three companies, the responsibility for the selection process is not taken by the Department of Human Resources Management. This was expected for the two of them (industry of food, local development agency), since they do not have such a Department. The Human Resources Management Department always decides for the selection only in the Public sector company, where the decision of the selection belongs equally to this department; perhaps because of the enormous size of the human resources that recruits. Relatively to the available database, a high dissemination between the answers is observed. As it is also observed, the companies with limited workforce do not hold a database with the characteristics of its each employee or they occasionally hold; while the companies with considerate workforce do that, always or often. An exception of the sample constitutes the local development agency, which despite the limited number of its personnel, always holds a database, because of the specialised type of services and the limited offer of work at local level.

Regarding small dispersion, the internal recruitment of human manpower is being preferred by the companies that allocate a high number of human resources, compared to the external re-

cruitment (technical company and public sector company). When the personnel is vast, there is the possibility of allocating different responsibilities to people of different sectors, according to the requirements of each position and the experience that they acquired during their professional background in the company. This is a little more difficult to be achieved by a small sized company, which prefers the exterior attraction of human manpower. Nevertheless, most of the companies often give the possibility of recruitment to candidates from other country - members of the European Union. The reason is the international dimension of the used methodology and the use of the English language that is required for the management of many projects, as well as the use of standardised personnel. Only two companies exclude that possibility (bank and the food industry). For the most companies, former employees of a company are never being recruited again. The companies which are excluded have a lot of contract based projects (local development agency, technical company), so it is very likely that a former employee with experience on that specific field will be recruited. In the rest of the companies the employment is depended, which means that the employee resigns either with his will, or is being fired because his employer is not satisfied with his performance.

General identification can easily be observed in the answers of the local development agency, the Public sector company and the technical company. It can be ascertained that the common characteristic, which the three companies have, is the formality that distinguishes them with regard to practically but at the same time very important subjects of the selection process. It is also remarkable the recruitment of former employees by these companies; a reasonable explanation for that constitutes the specialised work in these companies that requires specific qualifications. Finally, an obvious identification in the negative answers of the food industry company and the bank is equally observed because of the standardised work that is considered at the recruitment of personnel.

Closed-Type Questionnaire of Two Alternative Choices

The conclusion that anyone can easily reach is that most questions - proposals that required the addition of the answer "Combination" concerned the qualifications that the ideal candidate should possess in order to be recruited by the company; such qualifications are for example the experience, the specialisation, the quantitative and qualitative characteristics, the technical and communication skills. Furthermore, the question concerning the preference of men or women for the recruitment constituted an issue of major interest.

The questions that were answered with the two alternative choices concerned the highest percentage the elements of the selection - interview, as for example the type of the questions, the method of the interview and the tests.

The conclusions about the answers that were given in all questions - proposals are presented in groups.

With regard to the qualifications that the ideal candidate should have, the overwhelming majority (60%) of the companies (technical company, food industry company and bank) considered that the time experience at work is more important than the specialization. The 20% (public sector company) considered that the specialisation is more important; while also at the same percentage (local development agency) didn't trace any difference in the degree of the importance between the two qualifications and both of them are being required.

The technical dexterities outweigh the communicational skills, according to 40% (Public sector company and technical company), while just the 20% (bank) answered the opposite. It is also remarkable that the 40% of the companies (the local development agency and the food industry company) answered that both dexterities are equally important; that shows that the candidate is examined on terms of technical and communication skills.

The companies with low manpower are these companies which considered equally important both dexterities. They included the communicational skills, perhaps because in a small working environment proper working relationships and friendly atmosphere enhances performance. On the contrary, in the big enterprises is given priority in the technical dexterities, as usually impersonal relations prevail between the workers.

Particular interest presents the fact that mostly (60%) (technical company, food industry company and bank), the candidates who are overqualified are rejected because of their high economic requirements they will probable demand. The public sector company recruits them only, as the more

Figure 3. Important qualifications

Which of the following qualifications is more important?
Figure 4. Important dexterities

Which of the following dexterities is more important?

- Technical dexterities
- Communicational skills
- Combination
qualifications do not play any particular role in the salaries of the public sector. Even if it influences the salary, the state budget has the possibility of covering the difference. Whether overqualified candidates will be recruited by the local development agency, depends on each project case and on their specialized services.

Particular interest presents also the fact that, the majority of the companies (60%) (public sector company, technical company and local development agency) does not present any certain preference regarding the recruitment of men or women, while 40% (food industry company and bank) prefer men. As it appears, in the companies

Figure 5. Overqualified candidates

Are overqualified candidates being recruited or rejected?

- Recruited
- Rejected
- Combination
with high manpower and the necessary academic background a certain preference does not exist. This shows that the women have been henceforth equally accepted with the men in the professional sector. A reasonable explanation for the preference of men over women by the industry of food is perhaps the limited presence of women in that field.

In what concerns the subjects of the selection interview process the following factors should be taken into consideration: The companies use mostly (60%) (technical company, local development agency and food industry company) the method of the "free" interview, while a lower percentage (40%) (public sector company and bank) use the standardised interview. The public sector functions are, in general, more standardised than the private sector. That is also observed in the bank because of its obligatory organisational structure. All companies prefer to conduct "open" typed questions. All companies also consider the personality tests more important than the learning aptitude tests. On the contrary 80% of companies consider the attainment tests more important than the personality tests. An obvious exception constitutes the bank, as it gives priority to the communicational skills contrary to the technical dexterities.

There is an absolute identification in all answers between the technical company and the food industry company, apart from the question that concerns the preference of men or women at work. In what concerns the interview part absolute identification is traced in the answers among the above mentioned companies and the local development agency. It is remarkable that the public sector company shows an absolute identification with the bank on the interview grounds, whereas an exception is the preference of the attainment tests instead of the personality tests, while in what concerns other issues there is total incoherence. Finally, there is a relative harmony at the answers of the public sector company and the answers of the local development agency.

Open-Type Questionnaire

Although the open-type questionnaire is not susceptible to standardised answers, the following conclusions have been reached after the relative analysis.

As for the question whether the companies have a Department of Human Resources Management, the answers are mainly positive. Only two of our sample (local development agency and food industry company) do not have such a Department and do not also consider its existence important. These companies have a common characteristic which is the small size of their personnel (30-40 individuals); this number is not sufficient to justify the operation of such department. An exception constitutes the bank, which despite the few individuals of its personnel (10 individuals) does have a Department of Human Resources Management, because of its obligatory organisational structure and its total size of the personnel at national level.

The individuals who carry out the interview are mostly two or three. There is always a representative of the Human Resources, if there is such a Department or from the administration of the company (the Director or a C.E.O.), if there is not. There are also one or two executives from the corresponding sector. In the case of the technical company the interview is conducted by the Director of the corresponding department.

Initially most companies always or sometimes recruit the candidate for a trial period of 4 to 12 months. Only the local development agency does not follow this method of recruitment, because the contracts of the company have concrete time duration and keep pace with the programmatic periods which are financed by the European funds.

The examiners are mainly influenced by the combination of the curriculum vitae and the impression that they acquire about the candidate's personality during the interview.

The candidate's body language during the interview has a major impact on all companies provided that the candidate corresponds in the requirements of the position. Characteristically, public sector company supports that the body language may reveal more than the interview itself.

Finally, the candidate is submitted in attainment tests only in two companies (the public sector company and the local development agency), when it is required by the work-position; because the public sector is more standardised, the submission of candidates in tests is expectable. Likewise tests are expected in the local development agency, where specified knowledge is demanded due to the specialized type of the services which offers.

It is therefore concluded that there is an agreement in the majority of the answers that the companies provide. General identification is found in the following companies: food industry company and the bank, the public sector company and the bank. Considerable disagreement is observed in the following companies: the local development agency and the technical company, the public sector company and the technical company.

HUMAN RESOURCES' MOTIVATION ANALYSIS

All organization under examination have gathered total grade above 110 (average grade:(44+176)/2), characterizing their management style closer to the participating model.

Despite the differences of each organization under examination, mainly due to the fact that they have different size, they are activated in different industries (construction, agriculture, finance) or in different sectors of the same industry, the grade range was rather narrow, 122-112=10, leading to 10/176=5,68% of total range.

In the organizations of the construction industry (No.1, No.2 and No.3) there is an important spread, mainly based in the different size but also in the different sector of action (private construction, public construction, concrete production). In this way, organization No. 1 is defined as the most participating, as personal relations are important

between the owners but also within the hierarchy. Moreover, the organization size is not so enormous, especially in comparison with organization No.2.

Rather higher than expected proved to be the participation level in the local branches of the private bank (organization No.5) and of the public sector organization (organization No.6). The reasons could be the increased level of familiarity due to local based environment and the obvious tense for participation and collaboration. The higher grade was the one of organization No.4, which was an expected result, since this organization operates based on quality management systems (for management and production) as HACCP and ISO 9001.

Another interesting point that resulted from the analysis is the percentage of coincidence in the answers of all organizations, examining the percentage of coincidence and dispersion in their answers. This analysis was based on the grouping of the answers in four different categories: those that presented total coincidence (either totally agree or disagree), those that presented important coincidence (agree either totally or generally and disagree either totally or generally), those that presented high dispersion and those that presented

important dispersion (one of the answers were different than the others).

Six of the forty four questions presented total coincidence of answers, leading to a percentage of 13.64%. The proposals with coincidence are those stating that: the income is determining independently of the age and family status, the employee who works hard should be rewarded accordingly and in time, when tasks are appointed full details should be described, employees should be asked regarding their tasks and plans, not only financial factors affect the employees.

Although the range of total grades is limited to 5.68% (Fig. 6), the total and important coincidence is not proved to be so high (13.64+25.00=38.64%). Generally, high dispersion (36.36%) exists, nevertheless all organization were laying in the side of participating model. It is proved thus, that no "rule" exists to characterize a participating organization, due to the existing disperse of opinions.

Regarding the type of organizations, important results emerged. Local characteristics outweighed the possible barriers of participation in the national public and private bodies (organizations No.5 and No.6). Multi-sector action (even in the same industry) leads to more directive manage-

Figure 6. Total grade of each organization
Figure 7. Coincidence-dispersion of answers
ment of human resources (organization No 2). Organizations with typical production process (organization No.3) present limited participating style due to the standardized production process. The requirement for ideas and proposals (organization No.1) leads to higher participation level. Finally, all responders were rather cautious, whilst public sector responder required full discretion.

All responders agreed that they do not recognize threat as a motivation method, which is rather satisfactory. The sector of Human Resources Management including motivation is not incorporated in the wider management framework of the organizations, which could be expected for local based organizations. Human Resources Management is implemented (in the level that it is possible) by directors-founders-owners and not by experts of the discipline.

DISCUSSION

The general conclusion drawn for human resources' selection and recruitment is that the companies that follow a similar, if not a common process of personnel recruitment are the following: the public sector company and the local development

agency, the public sector company and the bank, the food industry company and the bank.

Regarding the recruitment and selection process, the highest percentage of the enterprises applies the following: Firstly, a form of description is drawn up. The internal attraction of the human manpower is preferred especially by those companies who detain a database with the characteristics of the candidates. In general the personal contact does not influence the companies about the selection – decision. Furthermore candidates who were rejected or released in the past are not being recruited. The percentage of the recruitment of women is the same as men. Remarkable is that candidates from other country - members of the European Union are also being attracted. The newspapers are being used more as a source of attracting, whereas under no circumstances the radio is used. With regard to the qualifications that influence the selection - decision, the experience in the subject of the position is more important than the specialisation. The possession of a postgraduate title constitutes an extra qualification and not a condition for the recruitment. The technical dexterities are also very important, without undermining the importance of the communication skills. Overqualified candidates mostly are not being recruited because of their high economic

expectations. The interview is carried out mainly by a committee (a representative of the Human Resources Department and two from the responsible department of the position) in the working place. The method of the free interview with open typed questions is used. The personality tests and the attainments tests are being considered as the most important, although these are not being applied in most companies. Furthermore the initial recruitment is under trial for a period of time. Finally the Management of the Company rather than the Human Resources Department holds total responsibility for the final decision.

IT processes could support several of the aforementioned steps of a selection and recruiting procedure. IT professionals could support these steps by providing tools and methodologies that could add value to the processes but also increase the transparency factor, along with the procedure speed and, overall, lead to successful selection of the more suitable candidate for each working position.

Outcome of the analysis regarding motivation processes was that although organizations motivate their employees, mainly by prompting them to participate in different levels of decision making, and are positioned closer to the participating management model, their approach was rather un-organised and based mainly on interpersonal relations. Generally, it is proved that organizations although positioned closer to the participating management model, they have important opportunities for adapting and developing motivation models and organising leadership tactics. These tactics could be supported by IT professionals that could introduce the required IT tools for successful results in leadership and motivation.

Chapter 63
Human Capital Management and Optimization:
A Resource-Based View

Jürgen Mühlbacher
WU Vienna University of Economics and Business, Austria

ABSTRACT

Recent work in human resource development emphasises the fact that individual skills are strongly oriented towards the future. They enable a person to tackle upcoming challenges in a self-organised manner. So both the current requirements and the skills necessary in the future have to be seen as a strategic competitive advantage for the company. This change in perspective makes it possible to use further education as a strategic instrument of management development.

INTRODUCTION

Human capital has emerged as one of the most compelling sources of comparative advantage in the modern corporation. (Nahapiet & Goshal, 1998) In contrast to transaction cost theory, which is grounded in assumptions of rational and opportunistic behavior, human capital theory aligns with the resource based view of the firm. This perspective emphasizes that human capital subsumes the acquired knowledge, skills and capabilities enabling employees to serve as innovative entrepreneurs within their companies. Human capital is therefore strongly intertwined with organizational learning and corporate strategy. After discussing this integrative approach to human capital, we explore different perspectives on the management of human capital. Finally, we examine how a fit was established between human capital and organizational strategy at the Bank of Montreal. (Gorsline, 1996)

HUMAN CAPITAL AND THE RESOURCE-BASED THEORY OF THE FIRM

The first approach to see human capital as a competitive advantage showed that companies do not only have advantages based on the different quality of their initial resources, but also and mainly through the better utilization of these, which derives from the use of specific competencies within the enterprise (Penrose, 1959).

Against the backdrop of this insight, the knowledge-based approach split from the transaction cost approach. (Foss, 1996) Following this new approach, the actors' actions are not driven by self-interest and contractual relations anymore, but the actors look for specific corporate cultures that fit their own norms and values. The division of labour makes possible not just a specialization according to individual areas of interest, but also the development of an internal hierarchy. In exchange for work rendered, the company offers – apart from remuneration, which has already played a dominant role in the transaction-costs approach – also additional help in coordinating co-operation, finding one's identity and individual learning. All these functions are in this case seen as part of corporate culture (Kogut & Zander, 1996).

From these diverging approaches, a resource-based theory of the firm has been developed, which is to free the transaction-cost approach mainly

from the explicit rule of opportunistically rational behavior based only on self-interest. The most important assumption for this new perspective is the argument that by means of autonomous (and not necessarily contractual) bundling of individual competencies, synergy effects are achieved that exceed an individual's performance by far. Thus, thanks to individual specialization and the coordination of a variety of individual services, modern industrial enterprises can meet the requirements of a mass market at relatively little cost, which is impossible for sole traders (Conner & Prahalad, 1996).

Building on this finding we can conclude that particularly the heterogeneity of individual competencies in an enterprise results in a comparative competitive advantage. The main advantage is mainly the planned coordination of the different competencies. Depending on the "mobility" of specific competencies – i.e. the ability to buy these quickly on the labour market or the necessity to develop these in the company itself in the long run – the company-internal solution focuses on stable "distinctive competencies," which can hardly be imitated by the competitors. (Nordhaug & Grønhaug, 1994) From this, we created Table 1.

The change in perspectives illustrated in Table 1 results in an enormous increase in importance of classic personnel measures, leading to a strategic competency management. The new definition as a strategic core process – which is proac-

Table 1. Traditional and alternative perspectives of competency managements according to Nordhaug & Grønhaug (1994)

Human Capital Management	Traditional Perspective	Alternative Perspective
Status	Operative	Strategic
Role	Support process	Core process
Main responsibility	Middle management and HRM Department	Top management
Orientation	Reactive	Proactive
Economic evaluation	Costs	Investment
Recruitment focus	Technically best-qualified person	Best fit of task and person
Competency base	In-house	Expanded

tively handled by the top management and should not simply be delegated as a support process to the middle management – shows this clearly.

HUMAN CAPITAL MANAGEMENT

As stated by Edwar Lawler an important differentiation regarding human capital is that between the "job-based approach" and the "competency-based approach" within human resource management. The former can be seen as the traditionally prevailing approach, in which – based on a job description – a suitable employee is searched for. This approach has its roots in "scientific management." It is based on the assumption that tasks and requirements are stable in the long run. Only this makes it possible to generate cost advantages through specialization and division of labour. Given the mass production of the past century, this approach was indeed justified. However, in a more and more complex and dynamic environment that increasingly calls for individual solutions, it is advisable to focus more on the competencies and responsibilities of the individual employees (Lawler, 1994).

The "Competency Scope"

Based on these deliberations, Paul Green developed a typology – linking organizational strategies and human resource systems – that clearly shows the connection between the terms core competency, (core) values, qualifications and competencies in a company and once again highlights the differences. The central feature is the customers' needs (Green, 1999).

The upper half of this circle represents the organizational characteristics delimiting the options available. These are the technological core competencies and the values of a company that determine the purpose and the objectives. Core values complement the technical aspects of work by explaining why the work is performed. This sec-

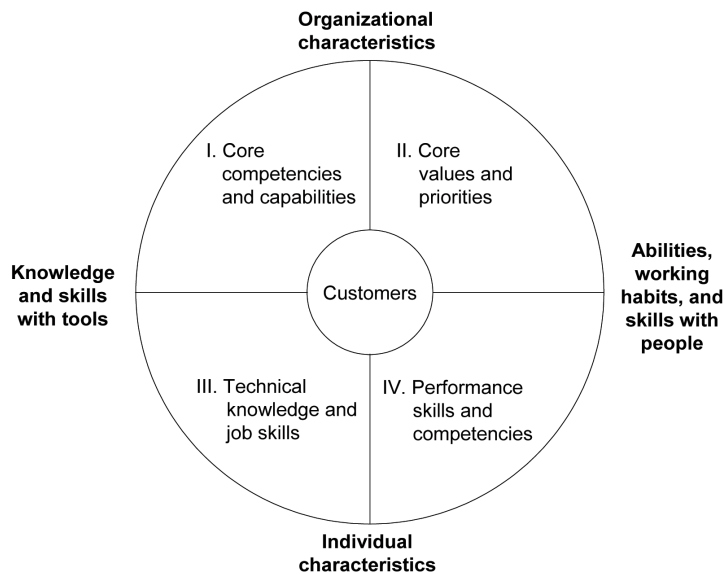
tor comprises both values and norms of corporate culture and the vision and strategic aims. In this area mainly the decisions of the top management regarding positioning and future development of the organization should be made.

The lower half focuses on the individual characteristics. As regards unwanted changes, in this area participation and integration of the employees is essential. Measures of personnel development should be aligned with the organizational characteristics and also be taken up by the individuals. From the point of view of education controlling, it would be advisable to promote mainly measurable and observable qualifications and competencies.

The vertical line in Figure 1 points at another distinction. On the left hand side we thus find mainly those areas of personnel development that reflect the classic work of many HR departments. Here, a specific (technology or method-oriented) requirement profile is foregrounded. The right hand side, on the other hand, reflects the self-organised fulfilment of tasks within the given norms and objectives. As a conclusion for this model, it is not sufficient to simple move the focus from the left to the right hand side, but it is necessary to work out an integrative solution across all four sectors, which then rightly deserves to be called organizational competency management.

As a first step towards this change, the human capital of an enterprise should be seen as a competitive advantage rather than a cost factor. This can already be observed in knowledge-intensive service enterprises such as consulting. Unlike individuals that are just doing their jobs which are designed to be easily filled through selection and training processes, they become key success factors (Lawler, 1994).

Finally, it can be concluded that only developing competencies can maintain and increase company's flexibility and ability to innovate. (Staudt & Kriegesmann, 2002) On these two factors the long-term survival of the whole company depends and, thus, it is imperative to promote them

Figure 1. The competency scope according to Green (1999)


COMPETENCY AND CAREER MANAGEMENT

It is the employees' competencies that build a significant competitive advantage and particularly these are highly at risk in the next few years: because if the employees leave the company, they take their implicit knowledge with them. For some US companies this means they lose practically half their knowledge base when the baby boomers retire. But how can a company escape this trend? The central paradox in transferring effective, implicit management- and procedural-knowledge is that constantly reinventing the wheel is inefficient, but people learn only by doing. So the best way to get them up to speed is the employment of knowledge coaches – experts who were motivated to share some of their experience with protégés (Leonard & Swap, 2004).

In addition, permanent organizational change – caused by restructuring, mergers or alliances, as well as the effects of lean management – clearly indicates that it is important rather to promote the employees' ability to organize themselves and their sense of responsibility regarding costs and performance. For this reason, the development of extensive competencies – primarily the ability to learn and to adapt – in organizations has to be rewarded much more in future. This is not the case yet, as in most companies: On the one hand pay systems work against it by punishing individuals who make lateral or horizontal moves as well as individuals who broaden their skills instead of taking more responsibility. On the other hand, selection and further career of employees ought to prefer generalist workers with a very broad range of competencies. Only for the position of functional experts the depth of their knowledge is important.

How can such a development be supported? First, alternative career paths have to be developed, so that project work and participation in competency centres are appropriately recognised – not just financially, but also in regard of career opportunities. This is already the case at the top management level. Their industry experience is

more important than their functional background. This should also be taken into account for other executives. Of course, it must be pointed out that in doing so economies of scale and expert knowledge might get lost. The challenge is to create structures which simultaneously maintain functional excellence while integrating functional expertise into processes, teams, products, or structures. (Lawler, 1994) Two examples of such structures are process organization (Daft, 2001) or hypertext organization (Nonaka & Takeuchi, 1995). Both concepts focus on the integration of knowledge and competencies by promoting team and project work and compensating for possible disadvantages in efficiency by using central functional departments for operative support.

Second, in addition to the classic "job descriptions," detailed competency models are needed. Therefore, appropriate competency development planes have to be developed in alignment with the company's strategic objectives, individual career goals and opportunities, as well as the employees' need for growth (Lawler, 1994).

Eventually it is essential also to adapt remuneration and incentive systems. Instead of short-term bonus payments, compensation (e.g. stock options) should focus on the long-term success of the companies and the interest of strategic stakeholders. Such systems also demand a competency management system that turns into a comparative competitive advantage, as it links the employees' competencies with the company's objectives.

According to Hodgetts, Luthans & Slocum (1999) three measures can be used to meet this requirement:

1. Venture Teams,
2. Multirater Feedback (360° Feedback) and
3. A both performance-oriented and learning-friendly corporate culture.

Venture teams are to be assigned a specific, continuous sub-task or -unit of the organization, which distinguishes them from classic project teams and makes them more similar to process teams. These teams consist of two or more entrepreneurs within the company. They have the authority to operate autonomously – structures, formal rules, and procedures are held to a minimum. This allows them to formulate their own objectives, based on their budgets, and makes them responsible for the success of their task or unit (Hodgetts, Luthans & Slocum, 1999).

Development and improvement proposals are to be generated from institutionalised 360° feedback. This not only guarantees staying close to the customer and integrating local employees, but also minimises the hierarchy's influence, which is one of the central tenets of this approach. In this context, however, the following points have to be taken into consideration (Hodgetts, Luthans & Slocum, 1999):

- Each person involved should know in advance for what and how the data will be used.
- The modes of behavior and competencies to be evaluated have to be specified in detail.
- Apart from members of the organization, also customers and suppliers are to be questioned.
- The results are to be returned as feedback and are the basis for planning future, mutually developed action plans.
- Results, decisions based on them and their effects are recorded and analysed over a longer period of time.

By thus pushing back the hierarchy and the influence of individual assessors (mostly the immediate superiors) a corporate culture open to criticism and learning is to be ensured. This has then to be combined with the corporate strategy in order to establish a long-term change in the company's human capital – as the approach in the following section shows.

HUMAN CAPITAL AND CORPORATE STRATEGY

In the work of Morgan McCall on developing the next generation of exceptional business leaders, we find multiple frameworks relevant to the connection between human capital and corporate strategy. (McCall, 1998) Based on the observation that the same manager can be perceived as more or less successful in different situations, it becomes important to include situational influences from the company and its environment in the analysis of essential managerial competencies. The classic competency models apply to stable environments. When situational variables change, so can the assessed managerial strengths and weaknesses as shown in Table 2.

Based on these findings, we have to move away from stable models that centre on the manager and increasingly focus on the interaction between the status quo of a person's competencies and the challenges of a dynamically changing environment. The core element of any competency development is the concept of "action learning." So the main focus of competency development shifts from standardised learning programmes to practice-oriented learning from experience (McCall, 1998).

There are similar arguments, when calling for a clear focus on the meta-competency of continuous learning, consisting of adaptability and identity (Briscoe & Hall, 1999):

Adaptability learning competencies include behaviors like:

- Flexibility,
- Exploration,
- Openness,
- Dialogue skills, and
- Change Management skills.

Identity learning competencies are based on:

- Self-assessment,
- Personal feedback,
- Authentic behavior,
- A great variety of personnel development activities within the company,
- Rewarding subordinates for developing their skills,
- Actively seeking out relationships with diverse people (e.g. in cross-cultural teams), and
- Being willing and able to modify self-perception, if necessary.

These deliberations underline the call for assigning a higher value to practice-related learning from experience in order to creating competency, by establishing an explicit link between individual behavior on the one hand and a learning-friendly

Table 2. Competencies and their dark sides (McCall, 1998)

Competency	Potential Dark Side
Team Player	Not a risk taker, indecisive, lacks independent judgement
Customer-Focus	Can't create breakthroughs, can't control costs, unrealistic, too conservative
Output Orientation	Reckless, dictatorial
Analytical Thinker	Analysis paralysis, afraid to act, inclined to create large staffs
Integrity	Holier than thou attitude, rigid, imposes personal standards on others, zealot
Innovation	Unrealistic, impractical, wastes time and money
Global Vision	Misses local markets, over-extended, unfocused
People Orientation	Soft, can't make tough decisions, too easy on people

(adaptability learning competencies) corporate culture that also creates identity (identity learning competencies), on the other hand. It clearly shows, however, that adaptability without identity only results in a reactive adjustment to the environment, or uncritical activism, and identity without adaptability leads to the fossilization of corporate culture and paralysis in the long run. For this reason, the interplay between individual actions and corporate strategy has to be considered as a central item.

Based on these considerations, a model has been developed by Morgan McCall, that aims to help translating corporate strategy into an "executive development system." On the basis of 7 questions it is determined if and to what extent the interplay between these areas exist in the enterprise (McCall, 1998) (see Figure 2).

If the answer to the first two questions is no and no useful strategy can be defined, the required competencies cannot be determined. If there is a strategy and the challenges can be met with management's existing competencies (question 3), this "quiet phase" should be used for a time-out and reflecting on future requirements. Within a strategic meeting, the company's objectives should

Figure 2. Translating business strategy into an executive development system according to McCall (1998)
be operationalized and a comparison of the tasks required and the employees' competencies should be made. Only if the answer to question 3 is "no" a survey will take place on whether competencies required in future already exist in the enterprise, or can be purchased from outside sources at short notice. In the long run it is always important to create competencies within the company in order to thus achieve a strategic competitive advantage.

The next questions (4 to 7) concern mainly the identification and development of competencies on the individual level, as well as the systematic and continuous promotion of creating competencies in the company. Here the model makes use of classic competency lists and highlights learning ability as the central competency, because according to the basic rules of "action learning," individual development of competencies takes place mainly on the basis of the tasks assigned. Classic education and training measures are to support this process. Regarding the final securing of a systematic and continuous establishment of competencies throughout the company, again a focus is laid on extensive feedback, target agreements and the incentive measures connected with it as well as mutual support in the form of learning and development networks.

Although showing the connection between corporate strategy and necessary competency is interesting, this would ultimately result in a complete fragmentation of competency development. Each industry, even each company, would have to develop its own competency model depending on its environment and the strategy chosen. Therefore McCall focuses on 11 basic competencies, which are the basis of successful executive development programs and the identification of high potentials. By means of a survey of 838 managers in six internationally active groups in the USA, Europe, Australia and New Zealand, Table 3 has been developed on determining the potential of junior managers.

This approach clearly shows how important continuous evaluation of competencies in the companies is. In general, a first step has to build on an analysis of the current situation – which is to safeguard a connection to corporate strategy. Then, in a second step, a competency model is to be created that reflects the activities requires and shows these as observable modes of behavior, in order to make it possible to make changes in the employees' behavior assessable and to link them to an appropriate incentive system. In the third and final step, support measures are to be taken in order to establish the new modes of behavior in the company. Only this enables a long-term and sustainable optimization of human capital, as can be seen in the concluding case of the Bank of Montreal.

OPTIMIZING HUMAN CAPITAL: THE BANK OF MONTREAL CASE

One of the first organizations that consciously took action on this problem was the Bank of Montreal. As early as 1990 it began a change management project which came to the conclusion that with traditional human resource management, only 20% of all measures enable an efficient link between individual performance and strategic corporate objectives. (Gorsline, 1996) Thus, they started to connect these corporate fields more closely (see Figure 3).

In order to realise this project, the competencies required were determined in interviews and summarised in the new role model of "relationship manager." (see Figure 4) In this model, particularly the competencies of "conceptual thinking" and "information seeking" are to support the alignment of personnel development measures with the future requirements of corporate strategy – in the sense of "best practice sharing." For this reason, an appropriate program is developed together with the respective employee, which neces-

Table 3. Eleven dimensions of early identification of global executives (McCall, 1998)

Seeks opportunities to learn.	Has demonstrated a pattern of learning over time. Seeks out experiences that may change perspective or provide an opportunity to learn new things. Takes advantage of opportunities to do new things when such opportunities come along. Has developed new skills and has changed over time.
Acts with integrity.	Tells the truth and is described by others as honest. Is not self-promoting and consistently takes responsibility for his or her actions.
Adapts to cultural differences.	Enjoys the challenge of working in and experiencing cultures different from his or her own. Is sensitive to cultural differences, works hard to understand them, and changes behavior in response to them.
Is committed to making a difference.	Demonstrates a strong commitment to the success of organization and is willing to make personal sacrifices to contribute to that success. Seeks to have a positive impact on the business. Shows passion and commitment through a strong drive for results.
Seeks broad business knowledge.	Has an understanding of the business that goes beyond his or her own limited area. Seeks to understand both the products or services and the financial aspects of the business. Seeks to understand how the various parts of the business fit together.
Brings out the best in people.	Has a special talent with people that is evident in his or her ability to pull people together into highly effective teams. Is able to work with a wide variety of people, drawing the best out of them and achieving consensus in the face of disagreement.
Is insightful; sees things from new angles.	Other people admire this person's intelligence, particularly his or her ability to ask insightful questions, identify the most important part of a problem or issue, and see things from a different perspective.
Has the courage to take risks.	Will take a stand when others disagree, goes against the status quo, perseveres in the face of opposition. Has the courage to act when others hesitate and will take both personal and business risks.
Seeks and uses feedback.	Pursues, responds to, and uses feedback. Actively asks for information on his or her impact and has changed as a result of such feedback.
Learns from mistakes.	Is able to learn from mistakes. Changes direction when the current path isn't working, responds to data without getting defensive, and starts over after setbacks.
Is open to criticism.	Handles criticism effectively: does not act threatened or get overly defensive when others (especially superiors) are critical.

Figure 3. Connection between corporate strategy and human resource management at the Bank of Montreal (Gorsline, 1996)
Figure 4. Tasks and competencies of relationship managers at the Bank of Montreal (Gorsline, 1996)
sitates the use of the competencies "listening, understanding and responding" and "customer service focus." Additionally, initiatives should be taken to actively utilise any opportunities regarding strategic positioning. Therefore, "achievement motivation" and "initiative" should be put to better use. This should positively influence the implementation with the help of "impact and influence," "use of expertise" and "flexibility." Finally, the competency "shares new information & learning" can be interpreted as a communicative feedback loop, which is the basis for further learning. Thus, apart from an increase in efficiency throughout the organization, it is to be safeguarded that employees are not demotivated through constantly recurring weakness analyses (Gorsline, 1996).

CONCLUSION

The planning of personnel development takes place within this new perspective with the aid of structured talks with the employees, which are connected to the company's knowledge base. The

active competency for control is intentionally kept within the employee and his/her immediate superior. Only overall key qualifications as absolute requirements are defined top-down. Demand itself is controlled decentrally. This requires a qualitative tool for prognosis that – open to modifications – records the strategic demand for competency from the employees' perspective on a regular basis (Wilkening, 2002).

In addition, it can be seen that human capital management is of an interdisciplinary nature. Areas of corporate culture and strategy, personnel and organizational development as well as information systems should be aligned – e.g. by establishing competency centres that are to develop the knowledge required for core processes. Controlling these heterogeneous organizational units takes places via corporate strategy and resource allocation – similar to the profit centre approach.

Only by means of a clearly defined and communicated corporate strategy can relevant knowledge be identified and developed in line with the strategic objectives, as well as subsequently supporting the employees as the proper carri-

ers of knowledge, as well as adapting corporate structures and processes, in order to create and optimise competitive advantages. Human capital management in this sense can be seen as a strategic business process and implemented within the company accordingly. The use of IT systems, often seen as the only and ultimately futile solution, is just an "enabler," intended to facilitate the implementation in the company.

Section 7
Critical Issues

This section contains 11 chapters, giving a wide variety of perspectives on Human Resources Management and its implications. Such perspectives include reading in fair compensation, fulfillment, ethics, and several more. The section also discusses new considerations within organizational culture and group dynamics. Within the chapters, the reader is presented with an in-depth analysis of the most current and relevant issues within this growing field of study. Crucial questions are addressed and alternatives offered, such as "information processing theory and incentivizing."

Chapter 64

Issues Influencing Electronic Commerce Activities of SMEs:
A Study of the Turkish Automotive Supplier Industry

Muammer Zerenler
Selcuk University, Turkey

Sitki Gözlü
Istanbul Technical University, Turkey

ABSTRACT

This study aims to investigate the issues of electronic commerce activities in small and medium sized enterprises as a consequence of organizational change initiated by the adoption of information technologies. The fundamental issues influencing electronic commerce practices of SMEs are their insufficiency of cognitive learning and organizational strategy, financial and distribution problems specific to SMEs, limitations of supply chain management, reluctance of organizational culture for electronic change, problems of information technologies usage, insufficiency of human resource, resistance of top management to organizational change as required by the adoption of information technologies, integration problems of new technologies with the existing systems, lack of confidence on the side of customers towards electronic commerce. A study of the Turkish Automotive Supplier Industry has revealed that electronic commerce has been adopted and its benefits are accepted. However, the industry has to overcome some technical and managerial difficulties to implement it more efficiently and effectively.

INTRODUCTION

In societies where commercial competition is accepted as an economic system, there is a close relationship between the healthy operation of the system and the existence and power of small and medium sized enterprises (SMEs) within the system. Most SMEs positively contribute to the system since they can fulfill several functions not achieved by large enterprises (MacGregor, 2004, p. 10).

SMEs are not merely economic elements; they also have vital roles in social life. Because of the fact that SMEs spread to a large area in the country, they act as a critical power in lessening regional developmental differences, spreading ownership to a vast area, creating and sustaining employment opportunities, and keeping democratic life alive.

Currently, SMEs play a fundamental role in terms of employment and macro- economic balance by increasing their shares in global economy and thus enabling high levels of employment. Overall contributions of SMEs to the economy can be outlined as the following: (Kleindl, 2000, p. 75; Walczuch et al., 2000, p. 568):

- Depending on labor intensive work and efficiency in resource use, they contribute to creating employment opportunities and lessening unemployment nationwide.
- They adapt quickly and comfortably to demand changes and variations.
- They help to balance income distribution.
- They enable making decisions quickly. Since they are mostly structured as family companies, there is a tendency to make centralized decisions (Evans and Wurster, 1997, p. 72).
- In the long run, they are in a position to become manufacturers of the inputs and intermediary goods of large industrial enterprises.
- They are flexible and supportive of innovations.

- They are effective in improving life quality by providing opportunities for the socially and politically disregarded labor force, raw materials and financial sources to operate by smaller investments (Levy et al., 1999, p. 249).
- They acquire a critical role in transmitting small funds and family capital directly to investments.
- Through manufacturing inputs such as raw materials, intermediary materials, and semi-finished products consumed by large scale enterprises, they contribute to their development and also the national economy.
- They contribute significantly to increasing regional employment opportunities since they are labor intensive; therefore prevent migration from small cities to big city centers and construct a base for self development of the region within its own potential.
- By positively affecting income distribution, preventing the accumulation of capital in the hands of large industrial organizations or a minority, they increase societal income both functionally and regionally.

SMEs are also effective in providing new ideas and inventions and adopting new technologies (Kleindl, 2000, p. 76). New technologies enable SMEs to perform more creatively and flexibly with lower costs. Small enterprises are effective in transferring various technologies to national economy and in the process of modernization traditional technology or adaptation to the transferred technology; they act as a bridge between new and traditional technologies (Evans and Wurster, 1997, p. 74). On the other hand today, the rapidly increasing automation and demand for more qualified employees force SMEs to adopt new technologies. SMEs face difficulties, basically due to lack of sources, in following new technologies, acquiring technological materials, finding and employing qualified technical personnel to

implement new technologies. Qualified employees generally prefer job security of large enterprises, corporate reputation, and high salaries.

The ability of SMEs to survive in a highly competitive environment depends on the extent and speed in activating the changes that will make their products and / or services noticeable and preferable. As SMEs achieve these goals in establishing and sustaining enterprise's relationship with the outer world by benefiting from the opportunities of technology, they make use of information technologies and its elements. At this point electronic commerce is helpful in achieving innovations and improvements rapidly and safely (Hawkins and Prencipe, 2000, p. 24).

SMEs AND ELECTRONIC COMMERCE

While globalization and technological changes create new opportunities for SMEs, at the same time they create new risks and threats. It is considered that SMEs, due to their flexibility, can meet customer expectations more quickly and they are more advantageous than large enterprises in utilizing electronic commerce (Dandridge, 2000, p. 87; Daniel et a., 2002, p. 261). Because of competition and pressures of software providers and system integrators, several SMEs search for new ways to increase their market shares by implementing electronic commerce solutions. Besides, while large companies already have necessary personnel and financial sources to implement electronic commerce, capital limitations of SMSs restrict their investments for electronic commerce (Stansfield and Grant, 2003, p. 16).

On the basis of discussions so far, it is possible to summarize the contributions of electronic commerce to SMEs as the following. Electronic commerce enables SMEs to enter new markets and thus competition gains impetus. Since it speeds up operations and lessens demand for labor, it decreases costs. As it provides effective communication between buyers and sellers, it helps to improve service and product quality. Enhancing data share it contributes positively to the efficiency of work processes and overall economy (Eikebrokk and Olsen, 2007; Van Beveren, 2002; Levy et al., 1999).

Generally speaking, all of the contributions listed above can be deemed convincing. For instance the fact that with a lower investment SMEs can reach the markets which they can never attain through other ways seems rather feasible. Yet when this issue is discussed elaborately, the matter surfaces in a more complicated manner. Quite probably SMEs will face a difficulty in employing qualified human resources that can develop the information system within its own structure. In that case, the enterprise will be forced to employ people / companies out of the enterprise for the sales website. Employing people outside the enterprise makes it difficult to have a flexible and expandable performance applicable in their own sector. The fact that system is established / organized in a separate location will bring drawbacks in terms of updating and securing commercial safety (Dans, 2001, p.77). As it is illustrated in this scenario, several cultural, economic and commercial reasons may hinder SMEs' electronic commerce performance. Let aside all these points, it is not for certain that even a well prepared website – or other digital tools, can immediately find a market or open inaccessible markets (Liew, 2009, p.17).

Successful implementation of electronics is related to a multivariate and complicated process, which is connected with social and economic elements as much as with technical, technological, physical and legal infrastructure. In this section, the objective is to comparatively analyze the factors that affect / prevent SMEs' successful implementation of electronic commerce activities and to discuss sample cases unique to several SMEs operating in different sectors.

THE EFFECTS OF ELECTRONIC COMMERCE APPLICATIONS IN SMEs

Electronic commerce provides important opportunities to SMEs in reaching new markets and competing with rivals. Virtual shops on internet enable SMEs to reach distant markets by offering an effective and economical marketing channel. Therefore SMEs obtain a chance to enter global markets without necessitating high investments and expenditures and offer inexpensive, fast, and high quality products in these markets (Evans and Wurster, 1997:77). On the other hand product development and marketing processes are shortened in SMEs, where electronic commerce is actively used. In the past, thanks to the application of information technologies, SMEs that followed / copied large scale enterprises, obtained critical time advantages in product development and marketing processes (Heijden, 2000, p. 41; Walczuch et al., 2000, p. 570; Levy et al., 1999, p. 252; Coppel, 2000, p. 17; Porter, 2001, p. 67).

Regardless of the fact that electronic commerce contains in itself various advantages for SMEs, still it is hardly possible to assert that SMEs make enough use of electronic commerce. Researches on this issue reveal that SMEs generally use Internet as a basic communication means and regard it as an alternative communication tool that cuts off costs more than traditional communication mediums such as fax and telephone (Kleindl, 2000, p. 78; Fisher, 2000, p. 61; Soliman and Yousef, 2003, p. 548).

It is clear that job opportunities for electronic commerce provided to SMEs vary at different levels for each sector. Among the reasons, there are the type of commerce, technological infrastructure of the country, Internet utilization ratio, and cognitive literacy. Within this scope it is crucial that SMEs take into consideration several factors effective in their investments for electronic commerce. These factors can be outlined in general as the following issues (Liew, 2009, p. 25):

Target market and geographical region where business is concentrated: Today a great majority of SMEs produce for national markets and most of the exporting enterprises also have domestic market oriented commercial expansion. Orienting towards foreign markets by using electronic tools and methods renders it a requisite for an enterprise to change its basic job performance applications such as product marketing, managing customer relations, and securing after-sales customer assistance (MacGregor, 2008, p. 47).

Products and services offered through electronic channels: Enterprises in developed countries have required infrastructure and sufficient experience in selling products and services through electronic commerce. Electronic commerce can be effectively activated particularly in service industries, where information provides significant added value.

Internet based commerce opportunities and compatibility of production chain systems as business development method: A good deal of industrial products may not be suitable for direct sales on Internet. The reasons may be specified such that seller has a limited number of buyers with web page access, physical contents of product, specific features of product, or restrictions for marketing. Considering the fact that enterprises will keep on using traditional marketing and distribution methods, holding a position on web and catalogues, being a part of commercial opportunities and presentation chain webs can be valued as supportive services for commerce (Van Beveren, 2002, p. 253).

A research - Digital Marketing Compass - conducted in the beginning of 2009 focused on substantial investments, budget plans for future, and attitudes concerning electronic marketing of the total 783 decision makers. In Digital Marketing Compass, unlike many studies on electronic marketing, it has been pointed out that not only "large scale" companies, but also SMEs increased their electronic marketing investments a significant amount. According to the research,

various opportunities provided through electronic marketing is generally known well by SMEs and used appropriately. In 2008 web based marketing utilization was 32%. The most striking outcome of this research is related to the orientation of SMEs towards international markets. Electronic based marketing activities of export-oriented SMEs were ahead of traditional marketing methods in 2008 (http://www.ogilvy.com.tr/digitalmarket-ingcompass/).

Cost and suitability of Internet access / hosting services: Under the condition that Internet access costs are reasonable, enterprises will more extensively use electronic mail, which is faster and less expensive than communication by telephone and fax. Besides, the costs of creating and supporting a website increase in line with the contents of site and the level of applied technology (Sadowski, 2002, p. 80; Quayle, 2002, p.1151).

The cost of accessing data for the market and potential partners: Private websites offering commercial data perform this mission in return for a certain price, which may be unaffordable for some SMEs. However, most public institutions provide supportive information for commerce free on Internet. Sustaining these services and reducing the cost of paid services in the long run will help SMEs to detect their target markets, access reliable data concerning their partners, determine the correct distribution channels, learn legal and regulative rules, reach financial sources, risk management, and logistic services (Colombo, 2001, p. 179).

Moreover particularly for SMEs with a unique product and operation model, it will be possible to finance electronic commerce investments in a short period. Because the extensive size of the market achieved through electronic commerce provides a market these enterprises can never reach with the help of traditional methods. Freeing themselves from the obligation of being local can create a global-scale breakthrough for companies with the best product and business performance (Stansfield and Grant, 2003, p. 17)

THE PROBLEMS AFFECTING ELECTRONIC COMMERCE ACTIVITIES OF SMEs

The basic problems affecting electronic commerce applications of SMEs are inadequacy of cognitive learning and organizational strategy, financial and distribution problems specific to SMEs, restrictions in supply chain management, reluctance of organizational culture for electronic transformation, problems in the application of information technologies, lack of qualified personnel, resistance of top management against organizational transformation necessitated by applying information technologies, integration problem of new technologies with available systems, customers' lack of trust towards electronic commerce, and their worries concerning privacy (Vinberg, et al. 2000; Oyelaran-Oyeyinka and Kaushalesh Lal, 2006).

Janenko (2003) believes that one of the most important problems SMEs face in electronic commerce activities is "automatic success deception". According to Janenko, many SMEs have automated several aspects of their work processes through websites and are convinced that success will come automatically (2003). Varianini and Vaturi (2000) have found out similar causes for the problems affecting digitalizing process of SMEs such as to sustain a fixed market information flow, not possessing a flexible organization structure, not detecting clear targets, and lack of safety and integration. Farhoomand and Lovelock (2001) also, has discovered numerous negative elements affecting electronic commerce in SMEs such as poor income / outcome / profit model, lack of competition advantage, insufficiency in providing benefits to customer, organizational problems, and the conflict between website and current business partners.

As stated by Kshetri problems affecting electronic commerce negatively are mostly concentrated on economic and social areas (2007, p. 446). Economic problems can be outlined as low level of

information technology applications, inadequacy of Telecom infrastructure, lack of capital, low level of credit card usage. The social problems are low level of cognitive literacy, foreign language (mainly English) insufficiency, promotion and marketing problems of local websites.

According to Kshetri the problems affecting electronic commerce can be categorized under three groups such as pre-electronic commerce, in electronic commerce processes, and post-electronic commerce (2007, p. 447). Pre-electronic commerce problems are mostly related to the adequacy of a country's cognitive infrastructure. Credit card usage nationwide and financial problems are observed in the electronic commerce process phase. Post-electronic commerce problems are distribution infrastructure and after-sales services. Within a macro point of view, Kshetri bases this grouping mostly to the technical problems associated with information infrastructure of countries. Peterson et al. (1997, p. 337) classify problems in electronic commerce as financial, legal, infrastructure, safety, customer privacy, protection of intellectual and industrial rights, problems faced during delivery, and customs operations. Dornan (2001, p. 27) on the other hand groups problems affecting electronic commerce just like Peterson et al.

While some authors point out that in electronic management activities of SMEs, efficiency of non-commercial based transformation will increase, traditional commerce will at the same time affect / delay / repress the development of electronic commerce activities (Heinen, 1996; Chaffey, 2007, Li, 2006; Chen and Siems, 2001; Sadowski, 2002). Some authors advocate that the development of electronic commerce in the entire organization will be experienced faster at the end of e-commerce based transformation process (Jelassi and Enders, 2008; Bayles, 2001; Strader and Ramaswami, 2002).

According to McGregor and Vrazalic in terms of adopting electronic commerce, SMEs can be categorized into two groups such as potential adopters and non-adopters. The non-adopter group cannot use electronic commerce due to internal causes of enterprises and external causes related to technological, economic, politic, legal, social, and cultural problems (2006, p. 7). Kapurubandara and Lawson advocate that in overcoming these obstacles methodologically "decision taking" and "adoption" processes take place (2006, p.2). Stockdale and Standing categorize all the factors under four main groups such as "lack of resources and data, skill levels of employees, safety issues and preparation of small enterprises" (2004). Kurnia and Johnson include supply chain structure in this grouping as well (2000). In Table 1, it is possible to summarize the different views mentioned above.

In this study, we evaluate the problems affecting successful electronic commerce applications of SMEs – as it is widely accepted in relevant literature; under two groups such as cultural and technical problems (Rowley, 2002; Warren and Hutchinson, 2005; Gottschalk, 2005; Combe, 2006).

CULTURAL PROBLEMS

Top Management Support

Management support is the driving force in electronic commerce applications in corporations. According to Delone top management support is the most crucial factor for information technology applications in SMEs (1988). In particular, without the support of top management in decision-making process, it is not possible for SMEs to realize structural and technological transformation in electronic commerce by making required decisions and moreover without their support, any initiative regarding this matter may become unsuccessful (Grandon and Pearson, 2004).

Table 1. Review of literature

Lack of adequate trust towards external consultancy firms	Lawrance (1997), Van Akkeren and Cavaye (1999), Chau and Turner (2001).
Deficiency of electronic commerce standards.	Tuunainen (1998), Dandridge, (2000), Webb and Sayer, (1998).

Source: Robert C.MacGregor, Lejla Vrazalic, "A Basic Model of Electronic Commerce Adoption Barriers", School Of Economics and Information Systems, University of Wollongong, Australia, p. 515

Imperfect Entrepreneurship

Social habits originating from the past of a country are among the main factors determining the implementation speed and form of new technological developments. These habits, which determine the confidence of people to their environment and economy, particularly to money earning process, are also basic causes lying behind economic differences among countries.

Unsuitability of Organizational Culture for Electronic Commerce

One of the potential problems almost any organization aiming electronic commerce implementation is that organizational culture may not be suitable for organizational transformation necessitated by electronic management. Technological transformation and electronic business environment as required by electronic commerce will cause vital changes such as developing infrastructure and training activities compulsory particularly for organizations where bureaucratic work is dominant (Chen, 2004).

Ambiguity of Benefits

Another problem for SMEs is the ambiguity of benefits that will be gained through electronic commerce implementation. Since electronic commerce is a recent phenomenon, it is hard to compare successful examples of SMEs. Small enterprises in particular are inclined to be more influenced by tangible practice results rather than theoretical knowledge.

On the other hand, although it can be possible for almost any field, electronic commerce may have high success in certain products but low in others. For instance in intangible goods such as music, software etc. that can be easily transmitted from one place to another through websites, electronic commerce provides numerous advantages. However, for products which are hard to be transmitted physically, the advantages of electronic commerce are relatively limited (Levy et al., 1999, p. 244).

Innovativeness and Insufficiency of Innovation Management

According to Zhao, similar electronic management applications that have become widespread in companies decrease the effectiveness of competition tools. They seriously differ from traditional business models, and their advantages and similarities reduce benefits of suppliers and customers (2006). Since innovation strategies in electronic management applications will provide quick and flexible dynamism necessitated by the demands of shareholders and electronic transformation, SMEs will have to prioritize their innovative activities (Singh and Waddell, 2006).

Difficulty of Changing Shopping Habits

This problem is particularly valid in countries where traditional life style is dominant. Transformation in shopping habits takes place at a slower pace than electronic commerce development of any country. It is common that people prefer to buy from people they already know after seeing and touching goods. Shopping from a virtual environment, not knowing the nature of the product or its delivery conditions may not be quite acceptable for some people.

On an Internet shoe seller zappos.com established in 1999, there are more than 3 million pairs of shoes. One of the most important features of this company which ensures 365 day refund guaranty is its free cargo service for both customer deliveries and returns. Seventy-five percent of all orders come from satisfied customers. Following his/her first shopping a customer makes 2.5 times more shopping in the next 12 months after the first order. Forty-three percent of the recently gained customers are from WOMM (word of mouth marketing) process. They provide a toll-free call line. Unlike other big e-commerce sites (Amazon, overstock, e-bay etc.) they place their number on each page. If their product does not meet the requirements of customers, they recommend other competitor sites. So far none of its customers, by providing their name or no name, has made any complaints (www.zappos.com).

Locality

For enterprises, one of the most significant economic developments introduced by Internet is the expansion of local markets to a global scale. Economic activities such as web-based advertisements, promotions, job offers, marketing activities, and sales are accessible for any Internet user enterprise and customers. Thus, it becomes easier for enterprises expanding towards foreign markets to sustain and enlarge their activities. Besides it is regarded as an opportunity not to be missed for medium and small sized enterprises, which have fully utilized foreign market potential (Reynolds and Mofazali, 2000; Combe, 2006).

TECHNICAL PROBLEMS

Inadequacy of Human Resources

Human resources management approach and its applications have now become effective in a new field described as electronic human resource by the influence of information technologies. Basically electronic human resource concept means supporting human resources management approach by

a new structuring in the electronic environment. It is viewed as a way to support human resource oriented strategies, policies, and applications through Internet based channels (Williamson et al., 2003, p.247).

As an outcome of current use of information technologies in enterprises, new employment opportunities emerge in the relevant sectors, and demand for expert technology personnel increases in return. However, throughout the world parallel to the fast development of electronic commerce, new job opportunities and demand for human resource increase, but the supply of qualified human resource does not grow at the same pace (Lai and Chen, 2009).

Electronic commerce applications require changes in the commercial and organizational structures and qualifications of personnel. In several countries, lack of information personnel has turned out to be a critical problem. Although it is early to make a guess on the future demand for qualified labor force, it can be regarded as an indicator that of all the personnel working in electronic commerce related enterprises, an average of 45-50% are employed in sales and marketing, 25-35% in research-development, and the rest in management, finance, and other areas (Zerenler, 2007, p. 223).

Insufficient Marketing Strategies

The popularity of electronic commerce as a business medium is related to the capacity of Internet, namely its future potential, its attractive qualities, its dynamism in providing global share of information and resources, and Internet's power in offering an effective channel of advertisement, marketing and direct distribution of certain products and / or services. In his book titled "Supra-Competition" Edward de Bono states "despite everything you must not fall behind your rivals otherwise you cannot sustain your presence. Price, quality, product differentiation and setting special markets are all traditional mediums serving this objective" (1994,

p. 27). Indeed, enterprises competing in today's modern world are obliged to implement electronic based marketing activities, which have turned out to be a necessity rather than an advantage in competition that is becoming increasingly violent and different. Thus in such an environment where even electronic commerce is dedifferentiated, followed, and imitated by rivals, differentiating electronic marketing to adapt them to the basic qualities of enterprise would reply to the predictions of Bono, namely being supra-competition.

Electronic marketing is regarded as a revolutionary tool transforming all business processes of enterprises. Electronic marketing also, causes transformation of the traditional market structures (Calin et al., 2001, p. 36). The central role of this transformation belongs to Internet. Internet's progress is the most vital determinant of electronic marketing development. In addition, electronic marketing transforms purchase decision process of buyers as well. As buyers get involved in electronic marketing, they catch a chance to examine more options than traditional markets and thus able to make quicker decisions.

The fact that electronic commerce is full of opportunities for enterprises and it has risk minimizing quality account for the reasons not to be used. The answer for the question how to use and how to make the best of it, is related to strategy formulation. Fearing that other enterprises will seize their own markets through Internet and planning the cost of not using Internet as a defense reflex, several enterprises choose to find methods to use Internet more effectively. To achieve this end, conscious application and marketing strategies unique to Internet use should be developed (Zerenler, 2007, p. 267). If electronic commerce or cognitive business processes are, above all, established on the information bases of sector and markets, then these enterprises starting business without sufficient pre-researches may face failure. To make a right start, it is a must that enterprises planning to operate in this field should conduct

pre-researches and also forms the required information infrastructure.

The Size of Enterprise and Lack of Knowledge

Parallel to the phase of entering information based economy, for the purpose of adapting SMEs to the new work conditions introduced by this economic system, both national governments and international corporations initiated activities to inform enterprises about electronic commerce. A great majority of relevant literature points out the fact that in most countries, except USA, a great portion of SMEs is not yet totally aware of electronic commerce benefits (Coppel, 2000, p. 71). On the other hand, some authors hold the view that enterprise size also, has an effect over cognitive literacy and electronic commerce competency. As the enterprises get smaller in size, it is witnessed that Internet use that constitutes the base of electronic commerce falls backward. According to a research conducted by Levy et al., in enterprises with more than 1000 workers Internet usage ratio reaches to a level of 42%, whereas this ratio decreases to 14% for SMEs employing 1-49 workers (2001, p. 135).

Inability of Managing Technology

Selecting the technology required by SMEs to achieve their strategic and short-term goals, planning the required technology applications, deciding for transfer or manufacturing and realizing the activities for implementing this decision within the framework of a plan and program are among the basic activity issues of technology management. Strategic technology selection and goal-oriented work planning will ensure successful application of technology management.

Although electronic commerce offers wider range of opportunities for enterprises where information technologies are intensively implemented or manufactured, the very same advantage is hard

to be viewed in the sectors far away from these technologies. In short, sector features may be restrictive in electronic commerce applications (Zhao, 2006, p.47).

Language and Cultural Elements

In the Internet environment, making it possible to access resources from all over the world, it is observed that language and cultural elements also demonstrate significant effects. Although 70% of Internet contents are in English, half of Internet users do not understand English. Still as stated by Coppel, even without this language problem, customers are more eager to shop from websites in their native tongue (2000, p.21).

English that is spoken like a native language in almost any international activity is dominant in electronic management operations as well. Yet companies marketing to regions where Spanish, Chinese, and Urdu languages are common should direct their marketing activities by taking regional languages into account.

Aside from the language problem, cultural elements also greatly affect electronic commerce activities of SMEs. Since many visual elements from colors to symbols present cultural differences among societies, many SMEs willing to benefit from global nature of Internet encounter difficulties.

Infrastructure and Environmental Problems

The foundation of electronic commerce is structured over communication infrastructures and information technologies. Particularly in developing countries communication costs are high and technological infrastructure falls short. High communication cost is one of the most important problems in electronic commerce applications. Generally, it is possible to comment the following suggestions for solving infrastructure problems

(Reynolds and Mofazali, 2000, p.81-83; Chen, 2004, p.161):

- Telecommunication infrastructure should be improved; and it should be possible for SMEs to benefit from these services in private.
- All forms of electronic commerce; particularly commerce through Internet, can be conducted by providing information flow through communication infrastructure. In cases where only Internet centered structuring is an issue, potential cutbacks and problems on Internet may cease commerce. Hence, alternative connection forms should be structured.
- The obstacles keeping communication and markets of information technologies away from competition should be abolished.
- Technical standards in communication should be determined.
- Environment of confidence should be established for service providers, users, and consumers taking place in electronic systems and operations.

Connection Problems

Connection problems are among the most frequently faced obstacles on Internet in electronic commerce applications. This problem, which does not merely restrict electronic commerce but all types of Internet use, is a deficiency causing information access efforts to become fruitless (Nusair and Hua, 2009).

There are attempts to simplify Internet connection and increase the access speed of countries. Failure to provide an effective infrastructure and telecom activities, which are public in many countries, restrict the operations of private sector. Restricted activities introduce high costs, poor quality yet costly access options. Recently the attempts to enable access through satellite and

improving the present options by using high quality cables have been speeded up by private sector.

Legal Problems

Legal problems are the foremost reason critically determining the transformation of electronic commerce implementation into a global structure. Many issues such as the validity and binding of a computer based contract, validity of data kept in computer environment and their power of evidence, validity and applicability of digital signature, protection of intellectual and artistic works on Internet environment, legal recognition of information based crimes and prevention of unfair competition affect SMEs greatly. The main legal problems in electronic commerce applications can be outlined as the following (Kalakota and Whinston, 1997, p. 33):

a.   Intellectual ownership rights,
b.   Taxation,
c.   Approval procedures,
d.   Deficiencies in international laws,
e.   Privacy rights of people,
f.   Validity of electronic documents problem,
g.   Validity of digital signature problem,
h.   Determining responsibilities of service providers,
i.   Necessity to review laws by considering electronic environments,

Although so far insignificant developments have been achieved in universalizing legal infrastructure of electronic management operations among countries in areas such as digital signature, reliable third party, information management and safety, information crimes and coordination of electronic commerce, still some critical legal expansions have been achieved.

Safety Problems

Just as in traditional commerce, the basic condition in electronic commerce is the users' trust to the system. In a commercial procedure necessitating any contract or electronic communication even just for information transfer, the users (individuals or companies) on rightful grounds do not want third parties accessing to their private personal / corporate information, namely commercial, financial. Besides in communication that is open to third parties aside from privacy of personal data, integrity of transferred information (or in other words receiving the knowledge as it is originally) and confirmation of the identities of parties should also be guaranteed. The condition, which is being discussed in terms of technique and basic human rights, is to utilize which technique, administrative and legal tools to guarantee desired levels of privacy, information integrity and identity confirmation. Unless they are provided in sufficient levels, global development of electronic commerce will be affected significantly (Sadowski, 2002, p. 81).

Safety problems SMEs can face in commercial activities during electronic commerce operations can be expressed as indicated below (Palvia and Palvia, 1999):

- Access to web sources, which have no access authority,
- Damaging information and web resources,
- Changing, mixing or making additions to information,
- Transferring information to unauthorized personnel,
- Stealing information and web sources,
- Denying purchased services, transmitted or received information,
- Claiming to have received or transferred information, not received or transferred at all (Kraemer and Carayon, 2007).

According to the estimations in U.S.A., the value of the data stolen in one year is above 10 billion US dollars. As stated in a research conducted in 1996 on 1320 firms; 78% of participants declared to have lost money due to safety break, 63% asserted to have faced loss due to viruses, and 20 users stated to have lost at least 1 million US dollars (Singh and Frolick, 2000, p. 58).

GENERAL REVIEW

Developments in electronic commerce provide brand new advantages in terms of SMEs information technologies usage and access to global markets. However, SMEs have many problems including lack of technological infrastructure and locality, language, infrastructure, environment, legal, safety as categorized under two groups namely technical and cultural. Except U.S.A. and Singapore, which are developed countries regarding information technologies and electronic commerce, SMEs stick to the "wait and see" policy in many other countries. Governments and certain international organizations concerned with this issue have been working on comprehensive projects on a global scale to enable active participation of SMEs in electronic commerce. Furthermore, the fact that SMEs free themselves from traditional commerce practices and adopt new methods thoroughly seems to be closely related to the drive in market conditions and transformation in current business culture.

Prospective contributions that will emerge with electronic commerce implementations in SMEs are presented below (Burgess, 2002, p. 79; Kotler, 2000, p. 519; Mehrtens et al., 2001, p. 169):

Improved customer base: Enterprises may implement their electronic commerce activities without any regional boundaries, time or country limits. Hence, they may obtain important advantages in global activity by carrying their operations across the borders of region and country.

Time saving in delivery of product and services: Industrial market movement of goods and delivery time may cause great commercial

problems. Since almost any enterprises avoids keeping stocks and thus order only when necessary, delivery time gains more attention. Web-based orders, compared to traditional orders, are provided and processed more quickly.

Increased sales: An increase trend in the sales of enterprises is observed at the end of electronic commerce process. Increased sales incomes are even more important for small enterprises. Online sales to customers, order chances and online check of the status of orders would add to customer satisfaction and sales.

Deactivation of mediators: The spread of Internet based electronic commerce has deactivated the mediators operating from producer to customer in the supply chain. Hence, producers offer cheaper, quicker goods and services to customers. Continuous and more appropriate information flow is attained.

Increased customer satisfaction: One of the most important outcomes of electronic commerce is increased customer satisfaction and service level. Because of electronic commerce, customers receive products and services on time; acquire online information, are connected directly to a customer based communication system. The needs of customers are determined by customers themselves and thus increase customer satisfaction.

Improved efficiency and reduced costs: Decreased use of paper and manual operations, automation of electronic commerce, news, business and operation processes play vital roles in reducing operation costs of enterprises.

Increased competition: Because of Internet, all enterprises regardless of their size, acquire equal conditions while accessing their customers. By electronic commerce, SMEs will be able to compete against large-scale enterprises with their recognized trademarks, purchase power, and mature structure (Poon and Swatman, 2000, p. 247).

Decrease in Order Processes and Bureaucracy: It is inevitable that once orders are transferred to the Internet, the size of personnel will decrease as compared to the traditional method of receiving and registering orders. In the same way, due to electronic works in place of paper work, enterprises will focus on stocks and inventory and search new ways to develop more creative cooperation with their suppliers. In this way, simplification occurs in routine orders processes and repeated works are automated. Thus, unnecessary applications are eliminated.

Trained customers: Electronic commerce will enhance cognitive literacy of customers and thus they become intellectually more capable. In order to make use of electronic commerce, customers are expected to possess Internet knowledge and computer skills.

Trained employees: Electronic commerce has positive effects on knowledge accumulation of employees as well. To ensure the success of electronic commerce, continuous training programs should be implemented and employees should adapt to the organizational transformation introduced by electronic commerce.

Basic economic effect of electronic commerce is that it creates an economic activity area where handicaps are less in number. This particular effect is basically an outcome generated by rapidly developing information technologies. Since electronic commerce uses this rapidly developing infrastructure, it will have such a great effect on economic life as well. Electronic commerce integrates potentially all the producers, suppliers, users and customers. Hence, it may be acknowledged that it is endowed with capabilities providing many forms of satisfaction that has been dreamed ever since the beginning of industrial revolution.

A STUDY OF THE TURKISH AUTOMOTIVE SUPPLIER INDUSTRY

A. Scope of the Research

The purpose of this research is to study the influencing factors, obstacles, and reasons for initiating electronic commerce in SMEs that are active in

2008 as suppliers of the Automotive Industry in Turkey. Population being too large in size, the sample of the research is arbitrarily chosen from the data base of TAYSAD, which is the Association of Automotive Suppliers in Turkey. The reasons of referring to the TAYSAD data base are as follows:

a. All organizations active in the industry are legally required to become a member of the Association,
b. its data base is frequently updated, and
c. information about the member profiles is easily accessed.

Examination of the TAYSAD data base has revealed that 268 organizations are currently registered. The suppliers not fitting the criteria or scale, or currently inactive have been eliminated and thus only 192 organizations are included in the research.

TAYSAD established in 1978 and a member of CLEPA - the European Association of Automotive Suppliers (www.clepa.be) - is the only authorized association representing the suppliers in the Turkish Automotive Industry. The Association is creditable in all automotive part and component transactions by the foreign and domestic organizations.

The product range of the TAYSAD members is sufficient to create 85-90 percent of the Turkish Automotive Industry production locally. The 268 registered members of the Association provide parts and components for the Turkish Automotive Industry and create 65% of the production and 70% of the exports. Eighty-five percent of the members are active in the Marmara region, 10% in the Aegean, and 5% in the others. The registered 268 companies of TAYSAD employ 72 000 workers and provide employment for 127 000 people including its suppliers. Fifty-eight registered companies have foreign partners with varying degrees of capital share.

The questionnaires were distributed to 268 companies as e-mail attachments, surface mail,

face-to-face interviews, or by invitation to visit the website www.selcuk.edu.tr/zerenler/anket.01. html in the months of May and June 2009. As 31st of July 2009, 192 responses have been received(a response rate of 71.6); but twenty-four of the organizations registered in the data bank of TAYSAD could never be reached. Eighty-five responses were received as e-mail attachments, 42 by surface mail, 36 face-to-face interviews, and 29 by website visits.

B. Findings of the Research

As it is seen in Table 2, 33.6% of the organizations involved in the study have been active in the last 10 years. The companies with employment 200 and above are not included in the research. Hence, the study encompasses only small and medium size enterprises. The results illustrate that most of the respondents in the survey are top level professionals.

The implementation level of the electronic commerce instruments in the companies involved in the study is illustrated in Table 3. Comparing the current level to the level three years ago in-

Table 2. Characteristics of the companies

Operation period	Frequency	Percentile
Between 6-10 years	79	41.2
Between 11-25 years	73	38.0
More than 26 years	25	13.0
Between 1-5 years	15	7.8
Total	**192**	**100.0**
Status of the respondent	**Frequency**	**Percentile**
General manager	51	26.6
Information center manager	47	24.5
Marketing manager	32	16.7
Public relations manager	22	11.5
Owner	17	8.9
Information expert	14	7.3
Board member	9	4.5
Total	**192**	**100.0**

Table 3. Implementation level of electronic commerce instruments

Electronic commerce instruments	Three years ago		Current		Change	Wilcoxon Test	
	Average	Std. Dev.	Average	Std. Dev.		Z	P
Internet	4.36	0.68	4.83	0.84	0.47	-2.172	<.001
Telephone (deck)	3.92	0.72	4.02	0.90	0.1	-3.264	<.001
Electronic mail	3.87	0.88	4.76	0.72	0.89	-4.634	<.001
Fax	3.76	0.64	3.28	0.94	-0.48	-3.268	<.001
Electronic data interchange	3.41	0.82	3.56	0.88	0.15	-4.264	<.001
Electronic payment and money transfer systems	3.29	0.90	3.85	0.73	0.56	-3.825	<.001
Television	1.63	0.74	1.72	0.96	0.09	-4.106	<.001
Telephone (mobile)	1.18	0.62	2.23	0.58	1.05	-3.634	<.001

dicates an increase in the implementation of electronic commerce instruments. As is it discussed in the previous sections, significant increases of implementation are expected in the near future as the SMEs gain more awareness. SMEs may gain competitive advantage against large scale enterprises and access to markets at low cost performance through increasing their electronic commerce abilities. As it is known, one of the major obstacles constraining electronic commerce activities of SMEs is distribution systems. However, it is possible to overcome this obstacle through utilizing distribution chains of large scale companies or outsourcing from the service suppliers in this field.

The results in Table 4 indicate that the companies aim to utilize time advantage of electronic commerce for accessing new markets. In general, SMEs face problems in accessing new markets because of reasons such as limited financial resources, insufficiency of qualified labor, and locality of marketing and distribution systems. Electronic commerce seems to provide advantages to overcome these problems. If compared to traditional commerce, SMEs obtain significant benefits of electronic commerce implementation against large scale companies as they move from local markets to global competition. Indeed, SMEs have acquired important advantages against large

scale companies through electronic commerce despite the differences among industrial sectors.

The results in Table 5 reveal that the most important impact of electronic commerce is enhancement of business activities. In addition, issues such as better access to global markets, improvement of customer services, increase of competitiveness, increases in future revenues through creating new products and services, increases in future revenues through creating new products and service, more options provided to customers at cheaper prices, increase of delivery speed, and better inventory performance have provided benefits to companies in their electronic commerce activities. On the other hand, better understanding of customer demands and

Table 4. Importance level of electronic commerce implementation

Opinion	Arithmetic average	Standard deviation
Accessing new markets	4.68	0.90
Achieving competitive advantage	4.43	1.04
Gaining extra revenues	4.19	0.78
Cost reduction	3.95	0.92
Impact of rivals	3.76	1.07

Note: (i) n=143; (ii) In the scale, 1 indicates no impact, 5 definite impact; (iii) Friedman two way ANOVA test (χ^2=482.256 and p<.001), the results are statistically significant.

expectations, better distribution performance, and achievement of more effective knowledge management seem to influence less than the other factors. However, overall all factors being above average indicates that electronic commerce generate some significant effects on SMEs. In fact, electronic commerce implementation has created some positive major impact on areas, which face many problems and limitations. The automotive suppliers industry provides parts to the major industry. Hence, it has a significant value because of its volume of transactions, but limited in terms of its customers. The automotive suppliers industry utilizes the benefits of electronic commerce implementation in order to enhance business, to facilitate business processes, and access to customers.

In Table 6, the importance level of obstacles constraining electronic commerce activities is shown. The companies point out that lack of three

dimensional visual, touch effects, and test drives for automobiles and parts is the major obstacle constraining electronic commerce activities. As stated in the previous sections of the study, commodities such as automobile and real estate are not the goods that can be easily purchased because of their value and consumption. Hence, their purchasing process is more complicated and requires longer time as compared to non-durable goods purchased and consumed more frequently. In the light of these circumstances, the situation is quite the same for the products of automotive supplier industry. Even though the model, type, price, and other characteristics of the demanded products are well known by customers and providers, the lack of three dimensional visual, touch effects, and test drives significantly influence electronic commerce just like in traditional com-

Table 5. Impact of electronic commerce

Impact	Arithmetic average	Standard deviation
Enhancement of business activities	4.17	0.92
Better access to global markets	4.02	0.90
Improvement of customer services	3.86	1.02
Increase of competitiveness	3.77	0.84
Increases in future revenues through creating new products and services	3.55	1.06
More options to provided customers at cheaper prices	3.19	1.10
Increase of delivery speed	3.12	0.76
Better inventory performance	3.04	0.88
Better understanding of customer demands and expectations	2.93	1.02
Better distribution performance	2.85	0.94
Achievement of more effective knowledge management	2.72	0.98

Note: (i) n=173; (ii) In the scale, 1 indicates no impact, 5 definite impact; (iii) Friedman two way ANOVA test (χ^2=386.721 and p<.001), the results are statistically significant.

Table 6. Importance level of obstacles constraining electronic commerce activities

Obstacle	Arithmetic average	Standard deviation
Lack of three dimensional visual, touch effects, and test drives for automobiles and parts	4.43	1.88
Lack of customization for automobile parts	4.29	0.94
Internet not being reliable	3.86	0.86
Requirement of Internet address for the companies	3.71	1.04
Lack of technological infrastructure of the major industry	3.58	0.90
Major industry preferring traditional commerce	3.36	1.12
Lack of face-to-face communication with sales people	3.09	0.76
Insufficiency of Internet payment methods	2.91	0.81
Small number of product varieties	2.85	1.02
Poor designed websites	2.62	1.13
Insufficiency of websites	2.57	1.06

Note: (i) n=192; (ii) In the scale, 1 indicates no impact, 5 definite impact; (iii) Friedman two way ANOVA test (χ^2=724.363 and p<.001), the results are statistically significant.

Table 7. Opinions about the future of electronic commerce

Opinion	Arithmetic average	Standard deviation
Organizations will become more dependent on electronic commerce.	4.62	1.06
Electronic commerce will provide strategic competitive advantage.	4.31	1.02
Electronic commerce will impact organizational structure of the companies radically.	4.17	1.08
Electronic commerce will be a part of conversion for our business.	3.79	0.92
Currently, electronic commerce is part of our business.	3.38	0.90

Note: (i) n=192; (ii) In the scale, 1 indicates not accept, 5 definitely accept; (iii) Friedman two way ANOVA test (χ^2=682.136 and p<.001), the results are statistically significant.

merce activities. However, companies nowadays can easily monitor the products they want to purchase in the Internet and place their orders.

Lack of customization for automobile parts is another major obstacle to foster electronic commerce. However, as mentioned in the previous sections, mass customization practices are increasingly employed in many industrial sectors, including the automotive industry. In the automotive industry, it is extremely important to meet and even exceed customer expectations and needs. Lack of customization for automobile parts as pointed out by the companies may be attributed to an important limitation of technological capability. Hence, the Industry is required to develop its technological infrastructure, qualified manpower, and sophisticated information systems.

Table 7 exhibits the opinions of the companies about the future of electronic commerce. The companies have pointed out that organizations will become more dependent on electronic commerce in the future. In addition, it is generally agreed that electronic commerce will increasingly provide strategic competitive advantage. SMEs generally consent that electronic commerce will impact organizational structure of the companies radically, be a part of conversion for our business, and already plays a significant role in today's business.

CONCLUSION

Globalization and intensive influence of information technologies renders it indispensable to carry out commercial activities in electronic ways. Small and medium enterprises (SMEs) are increasingly utilizing the electronic commerce for their commercial activities. Hence, electronic commerce is developed almost in every industrial sector as witnessed by the increasing number of examples. It provides too many advantages and benefits to companies and other organizations.

Electronic commerce has significantly transformed the way in which firms conduct business, allowing them to gain more business opportunities and competitive advantage. However, the results from the study have revealed a lack of or slow uptake of electronic commerce technologies among the local SMEs. The objectives of this study were to understand and determine the importance of internal and external barriers; and thus provide support to overcome their problems. Among the different variables studied, technical, financial and social/ cultural barriers have been reported to create significant influence in the context of electronic commerce development in the SMEs.

The study conducted in the Turkish Automotive Supplier Industry has revealed that electronic commerce has been adopted and its benefits are accepted by the companies. However, the industry has to overcome some of the difficulties to implement it more efficiently and effectively.

Chapter 65

People, Technology and Human Resource Development (HRD) Philosophy

Claretha Hughes
University of Arkansas, USA

Matthew W. Gosney
University of Arkansas, USA

ABSTRACT

Technology and people are present in all organizations. How they are managed and developed is essential to the competitive advantage of organizations. Understanding the dynamics of this relationship is an area that needs to be better understood within the Human Resource Development (HRD) field. This chapter will explore the extent that HRD philosophy addresses the relationship of people and technology. Comparing people and technology has been a debate since the industrial revolution occurred in America (Swanson, 1982; Swanson, & Torraco, 1994). Man and machine are as essential to organizational prosperity as air and water is to living; yet, it is not often researched and published in HRD literature (Githens, Dirani, Gitonga, and Teng, 2008). Could this be why HRD professionals do not have a seat at the proverbial table in corporate America? Are HRD professionals and researchers denying that there is a relationship between people and technology in organizations? Are HRD professionals and researchers limited by their beliefs concerning the comparison of people to technology?

INTRODUCTION

According to Zakaria (2010) "technology and globalization are shattering the middle class" in America (p. 31). American workers are being displaced by the productivity gains of technology and

the competition for cheap laborers in a globalized economy. Until these issues are acknowledged and addressed within the field of HRD, middle class workers will remain at a disadvantage within the global job market.

The field of HRD covers training and development, career development, and organization development (Mankin, 2001; Swanson & Holton,

2001). All of these areas are vital to employee development within organizations. Employees want to be trained and developed so that they can build successful careers and work within viable organizations. The current global recession with its high number of unemployed workers has shined a light on the need for HRD. Aguinis and Kraiger (2009) suggest that there is "[a]n important challenge for the practice of training… to integrate the training function with employee selection, performance, management, rewards, and other human resource practices (Aguinis, 2009; Aguinis & Pierce, 2008; Cascio & Aguinis, 2005)" (p. 467).

Since the industrial revolution, when Henry Ford introduced the production line into the manufacturing of cars, technology has a huge presence within organizations. With the introduction of robots, computer technology, simulations, and avatars, employees are being realigned and displaced by the use of technology in the workplace. Yet, the impact of technology on the development of people has rarely been discussed within the HRD literature (Githens, Dirani, Gitonga, & Teng, 2008).

Organizations and theories that define or explain human behavior within organizations has been the focus of research studies in fields including sociology and business. HRD is a relatively new field of study and its theories and philosophy are dynamic and continuously under debate. Organizations are mutable and have goals of success through the people and technology that are present within all organizations. The management and development of both people and technology is essential to the competitive advantage of organizations. Understanding the dynamics of the relationships and influences upon the relationship of people and technology within organizations is an area of study that should be explored within the HRD field.

This chapter will explore the extent that HRD philosophy addresses the relationship between people and technology. We will examine if HRD professionals and researchers deny that there is a relationship between people and technology, and if HRD professionals and researchers are limited by their beliefs concerning the comparison of people to technology.

BACKGROUND

The field of HRD has made its way from sociology, to business, to education and is still looking for a place of its own (McLean et al., 2008). HRD has rich history that is not well known or explained in the HRD research literature. Without an explanation and chronicling of its history, HRD's search for a clear philosophy of HRD is ongoing, and remains under debate amongst HRD researchers and professionals.

HRD Theory Building

Swanson (2001) identifies three foundational theories of HRD: psychological theory, economic theory, and systems theory that make up the legs of his three-legged stool model. These three theories are important to HRD and many theories have been derived from these three to support the development of HRD as a discipline; however, they are not the only theories that can support the field. The following theories are some that have been used to contribute to defining HRD:

1. Commonly held theories of HRD (Weinberger, 1998);
2. Operational definitions of expertise and competence (Herling, 2000);
3. Organization development: An analysis of the definitions and dependent variables (Egan, 2000);
4. An investigation into core beliefs underlying the profession of HRD (Ruona, 1999); and
5. Philosophical foundations of HRD practice (Ruona & Roth, 2000).

There are also examples of HRD theory building efforts which include:

1. Systems theory applied to human resource development (Jacobs, 1989);
2. Foundations of performance improvement and implications for practice (Swanson, 1999);
3. A theory of intellectual capital (Harris, 2000);
4. A theory of knowledge management (Torraco, 2000); and
5. The development and validation of a model of responsible leadership and performance (Lynham, 2000).

All of these theory building efforts have contributed to the emerging field of HRD; however, McLean et al. (2008) suggests that HRD has much to learn from "EVERY field and discipline that touches on human behavior" (p. 249). Remaining open to new concepts and formulations provides opportunity for continuous debate and development within HRD. Following is a brief discussion on two theories and their potential correlation with HRD theory and practice, as well as a discussion of some of the roots of HRD in the behavioral and business sciences.

Organization Theory

Organization theory is important to HRD because of its focus upon organization development. Organization development has been defined by many and involves the principles, processes, and performance within organizations (McLagan, 1989; McLean & McLean, 2001; Egan, 2002; Cummings & Worley, 2005; McLean, 2006). McLean (2006) broadly describes organization development as:

… any process or activity, based on the behavioral sciences, that, either initially or over a long term, has the potential to develop in an organization setting enhanced knowledge, expertise, productivity,

satisfaction, income, interpersonal relationships, and other desired outcomes, whether for interpersonal or group/team gain or for the benefit of an organization, community, region, or, ultimately, the whole of humanity. (p. 9)

Hinings and Greenwood (2002) trace the history of organization theory from its roots (Weber, 1964) as a discipline in sociology to its migration in business. HRD as a field finds itself in a quandary of identification. It is housed in colleges of Education, Business, and Human Services among others, with each college potentially exploring the philosophy and practice of HRD in slightly different ways. It does have as one of its aims, however, an understanding of organization development.

Institutional Theory and HRD

Bush (1987) defines an institution as a "set of socially prescribed patterns of correlated behavior" (p. 1076). He then states that the concept of correlated behavior consists of two key tenants; behavior within an institution is not random but purposeful and correlated, and values are the "correlators." In Bush's definition one can detect the role of HRD in an organization and a plausible explanation for the genesis of HRD as a discipline within corporate institutions.

Bush then later identifies two types of values; ceremonial and instrumental. He states that ceremonial values "provide the standard of judgment for invidious distinctions, which prescribe status, differential privileges, and master-servant relationships, and warrant the exercise of power by one social class over another (p. 1080)." Could this, in a corporate institution, be defined as "culture?" And, could one of the responsibilities of HRD be the dissemination and legitimization of an institution's culture? Buchholz (1977) suggests that HRD's purpose is to support "a set of beliefs regarding the nature of work …" (p. 585); in essence a corporate culture.

Bush defines instrumental values as "the standard of judgment by which tools and skills are employed in the application of evidently warranted knowledge to the problem-solving process of the community (p. 1080)." He notes that these values are not unchangeable, that they can evolve with time as the needs of the organization change. Could instrumental values be operationally defined as competencies? Regardless of if the competency is job-specific or a universal competency to the organization, it seems consistent with this concept of instrumental values. Once again, HRD is the keeper of this type of organizational meme (Clardy, 2008).

Davis and North (1970) attempted to develop an institutional theory model that roots the motivation for innovation in financial concepts. The authors identify three exogenous change agents that potentially put at risk institutional innovation. They are:

1. Potential income from arrangemental innovation might increase because some exogenous change could lead to the emergence of an externality where none existed before, to a restructuring of risks, to a shift in transaction costs, or to the application of a new technology subject to increasing returns.
2. The costs of organizing and/or operating a new institution might change because of the invention of a new arrangemental technology, of institutional change in the non-economic sector, or because the price of the factors used in the new or in competing existing institutions may change.
3. Some legal or political change might alter the economic environment and make it possible for some group to effect a redistribution or take advantage of an existing external profit opportunity. (Davis & North, 1970, p. 139)

Items two and three indicate the need for HRD (particularly 3). As cost and organizational leverage factors change or come at risk due to innovation (or potential innovation) HRD becomes a risk-mitigating factor. HRD as a function manages human capital risk (Bhattacharya & Wright, 2005) and thus allows organizations to maximize profit (which, per Davis and North, is the goal of any organization). How does HRD accomplish this? A myriad of ways; HRD in an organization may be tasked with managing through change, thus assisting in ensuring its acceptance within the organization. It may assist the organization as a whole in learning new technology or ways of behaving that the overall organization has identified as critical for innovative change. It may aid in mitigating external risks such as political or legal pressure by assisting the organization in complying with legal or political mandate.

Scott (1987) describes institutionalization as

the social process by which individuals come to accept a shared definition of reality – a conception whose validity is seen as independent of the actor's own views or actions but is taken for granted as defining the 'way things are' and/or the 'way things are to be done.'(p. 496)

Perhaps this definition of institutionalization best illustrates the link between HRD and Institutional Theory. HRD, through the lens of Institutional Theory, becomes the operational arm by which the "shared definition of reality" is propagated throughout the organization.

Kuchinke (2000) argues that HRD is spending too much time debating what HRD "should be" and not enough time figuring out "what it is." He proposes that institutional theory be the theoretical framework from which empirical research be hung, and that HRD scholars begin to focus on empirical research that explores this framework. Institutional theory is, in essence, a systems theory coming out of sociology.

HRD Philosophy

Philosophy has been defined by the Greek as the love of wisdom (Jasper, 1951). HRD professionals and researchers consider it an accomplishment when they inspire the love of learning in individuals. Wisdom is derived from what one knows and experience, thus everyone has a personal philosophy. Jaspers (1951) stated "There is no escape from philosophy. The question is only whether a philosophy is conscious or not, whether it is good or bad, muddled or clear. Anyone who rejects philosophy is himself unconsciously practicing a philosophy (p.12)." If we are to take Jaspers at his word, HRD does have a philosophy of theory and practice. Uncovering that philosophy, however, has proven troublesome. Jaspers also notes

"This meaning of the word still endures: the essence of philosophy is not the possession of truth but the search for truth, regardless of how many philosophers may believe it with their dogmatism, that is, with a body of didactic principles purporting to be definitive and complete. Philosophy means to be on the way. Its questions are more essential than its answers, and every answer becomes a new question." (p. 12)

HRD, and the accompanying philosophy that defines and informs it, is very much "on the way." Over the course of its existence a host of HRD philosophic principles have, as Jaspers suggests, purported to be definitive and complete. As the discipline has grown and matured, so have the underlying philosophies changed and expanded.

Slichter (1920) in his early 20th century article explored the relationship between business philosophy, in this case capitalism, as the potential genesis of low worker morale. Morale is now known as "engagement," an area generally associated today with HRD. In the formation of a philosophy of HRD, it is impossible to ignore the economic philosophy of capitalism from which it sprang.

As McLean et al. (2008) previously noted, HRD can learn from and is informed by all of the behavioral sciences. Slife and Williams (1995) investigated the major theories of behavior science: psychoanalysis, behaviorism, humanism, cognitivism, eclecticism, structuralism, and postmodernism. Of these major theories, Vince (2003) suggests that "HRD policies and practices have traditionally been informed by a tired humanism that imagines [employee] development separately from the social, political, and emotional dynamics of organizing as well as the economic pressures on business (p. 559)." Consistent with Jaspers' "philosophy of philosophy," however, such an approach to HRD appears to be diminishing and a more holistic philosophy is taking its place. Institutional theory, as a branch of systems theory, demonstrates this shift.

Ruona and Lynham (2004) provide an in-depth, three-pronged approach to the philosophy of HRD: Ontology, Epistemology, and Axiology. Ontology is how we see the world. Epistemology is how we come to know and think about the world. Axiology is how we should act in theorizing, researching about and practicing in our world. The authors suggested that these three components make up a philosophical framework by which all of HRD can be examined. The authors also suggested such a framework to benefit the individual practice of HRD, the research and theory building associated with the profession of HRD, and the evolution of HRD.

As HRD continues to evolve one of the major issues of concern is the ability of researchers and professionals to bridge the gap between research and practice. Short (2006) states that

despite increased research activity in the field, few advances in practice have been clearly grounded in research (Jacobs, 1999), and it would be optimistic to claim that HRD research is influencing practice in meaningful ways (Berger, Kehrhahn, & Summerville, 2004). In fact, it has been expressed that the gap has been around for as long as we

can remember (Short, Sherlock & Sugrue, 2004), and it is not going away anytime soon (Yorks, 2005). (p. 344)

Kuchinke (2004) discusses three reasons the tension exists between theory and practice. They are:

1. Proximity of theory and practice. (Theory and practice aren't a duality but a continuum, thus it becomes difficult in the middle to distinguish between the two.)
2. Theoreticians and practitioners as denizens of separate communities.
3. The limitation of social science research.

Recognizing the gap, many HRD scholars are searching for meaning and methods to close the research practice gap and implement research techniques and strategies developed in academia within the workplace (Hughes, Wang, Zheng, & McLean, 2010). Torraco (2004) and Storberg-Walker (2006) mention a general lack of *actionable* theory-building in the discipline.

People, Technology, and HRD

Much of the research regarding technology and HRD centers upon computer technology and how it relates to educating employees in the workplace. Learning Management Systems (LMS's) that manage employee training and development are important tools for HRD professionals in the workplace. However, HRD professionals and researchers must go beyond managing the systems to helping employees operate technological equipment within the workplace. These are the systems that are displacing most of the middle class workers (Zakaria, 2010) because they are not equipped or educated to operate high technology and cannot be trained quickly enough to meet the global needs of organizations. Instead companies are bringing in foreign workers to meet immediate workplace needs in the US. Githens,

Dirani, Gitonga, and Teng (2008) conducted a meta-analysis of technology-related research in HRD publications from 2000 to 2006. Their findings that only 10% of 1675 articles in five journals were related to technology imply a lack of interest in technology by HRD researchers and professionals. This is discouraging because Swanson (2008) notes the following assumptions regarding the role of human expertise and skill they bring to organizations. They are follows:

1. Organizations are human-made entities that rely on human expertise in order to establish and achieve their goals.
2. Human expertise is developed and maintained through HRD processes for the mutual long-term and short-term benefits of sponsoring organizations and individuals involved.
3. HRD professionals are advocates of individual, team, work-processes, and organizational integrity.(p.331)

If HRD is to advocate the success of work-processes, how can they do so without an understanding of technology's role in workplace success?

People and technology are essential to the functioning of an organization. Hughes' (2010) People as Technology Conceptual Model is an integrative part of an organization's value creation strategy. The PT conceptual model describes the potential value that technology development and people development can bring to and organization. Operationalization of this model has the potential to be a promising management practice (Espedal, 2005) that will provide a solution when organizations struggle to implement their best practices without the best people in the right jobs at the right time and the best technology (Brache, 2002; Espedal, 2005; Martelli, 1998; Pfeffer, 1994; Stewart, 1997). People and technology must blend to the extent that the process is a win-win for employees and organization (London & Diamante,

2002). This concept is useful within all business strategies including JIT, Lean manufacturing, ISO, TQM, and Six Sigma because it enhances the foundation of the strategy, the people, and the process (Snell & Dean, 1992).

Much of the HRD technology related research "focused on educational technology in higher education settings, while non-profit organizations and government/military settings were underrepresented. Overall, non-training topics were [also] underrepresented" (Githens, et al., 2008, p. 1). The opportunity for research in technology related research within HRD is extensive and needed. Re-training of the American workforce in high-tech skills is an area where HRD researchers and professionals' skills are warranted.

Training and development and career development areas of HRD are being influenced by the technological advances that are being made in the global economy (Zakaria, 2010). Robots and other simulation systems have been introduced into workplaces and are displacing the need for employees. This is not a new phenomenon, but is much more recognizable during this economic downturn. How organizations adjust to these developments impacts the future of its employees and its existence.

FUTURE TRENDS

The future of HRD is continuously evolving. Organizations are continuously changing processes and procedures, developing employees, and trying to remain competitive in a global economy. HRD professionals and researchers must also be willing to continuously change and evolve to help organizations achieve their goals. Some of the key strategies are:

1. HRD professionals and researchers must end the debate (Kuchinke, 2000; Murphy & Garavan, 2009) and begin to, as noted by McLean et al. (2008) learn from every field

that touches human behavior. In this case, a focus on the history or organization theory and its evolution from sociology to business to HRD would enhance the development and understanding of HRD philosophy.

2. HRD professionals and researchers must find a way to bridge the gap between research and practice. They must come to terms with the fact that while their focus is on the gap, organizations are struggling to reach their goals without effective and efficient strategies from the HRD field.

3. HRD professionals and researchers must understand the relationship between people and technology and not focus on one or the other in isolation. They must develop methods of valuing both people and technology within the workplace.

4. Technological innovations in the workplace are on an explosive upward trend. HRD researchers and professionals must understand these innovations to ensure that as people are developed their roles are not diminished or further eliminated but enhanced by technology.

5. HRD professionals and researchers must work to meet the business needs of workers in all organizations and provide technological based solutions along with their people based solutions. The same way that engineers cannot accomplish their design goals without people implementing their designs, HRD professionals and researchers cannot plan people strategies without understanding technological implications (Betz, 1993).

6. Ultimately, HRD must consider public policy as a potential future area of research. Understanding the broader labor relations and economic implications of their decisions within the public policy arena can only strengthen HRD practice.

CONCLUSION

HRD professionals and researchers do not appear to deny that there is a relationship between people and technology there is very limited research that supports their effort to understand the relationship of people and technology within organizations. HRD professionals and researchers are limited by their beliefs concerning the comparison of people to technology because their ability to expand their research and practice is limited by their beliefs or focus upon issues that are not adding to the knowledge base in these topic areas. A mind shift needs to occur before progress can be made in this area of inquiry: people, technology and HRD.

Understanding the history, philosophy and theories of HRD provides an opportunity for HRD researchers and professionals to build a solid foundation upon which they can enhance human behavior within organizations. They can begin to blend research and practice in a way that allows individuals and organizations to thrive and achieve competitive goals. It will also allow them to value the relationship between people and technology so that organizations can maximize the efforts of both people and technology and not one or the other (Carrig & Wright, 2006). Without these changes HRD professionals will never win a seat at the 'table' in corporate America or any other organization even though it is central to training and development, career development, and organization development.

The future is optimistic for HRD researchers and professionals. There are numerous ways that HRD can be developed to transform institutions to meet organizations' needs for global competitiveness. Without competent, well-trained employees, organizations will not be able to compete to win (Welch, 2005). Welch (2005), states "To manage people well, companies should [e]levate HR to a position of power and primacy in the organization, and make sure HR people have the special qualities to help managers build leaders and careers. In fact, the best HR types are pastors and parents in the same package" (p. 98). He suggests the pastors and parents type because they "*know* the business - its every detail" (p.102).

Knowing the business implies knowing, the people, the technology, and the organizational strategies for success in a competitive marketplace. HRD with its emphasis upon training and development, career development, and organization development has the capacity to know the business. However, their philosophical shift must lean towards institutional and organization theory while standing upon the three-legged stool of psychological theory, economic theory, and systems theory (Swanson, 2001).

KEY TERMS AND DEFINITIONS

Axiology: The study of the nature, types, and governing criteria of values and value judgments.

Epistemology: The branch of philosophy that studies the nature of knowledge, in particular its foundations, scope, and validity.

Exogenous: Originating outside an organism or system.

Globalization: To become international or start operating at the international level, or cause something, especially a business or company, to become international.

Mutable: Tending or likely to change.

Ontology: The most general branch of metaphysics, concerned with the nature of being; the study of existence.

Operationalize: To put something to use or into operation.

Philosophy: A set of basic principles or concepts underlying a particular sphere of knowledge.

Chapter 66
Knowledge Worker Faire Compensation:
Ethical Issues and Social Dilemmas

Gonçalo Jorge Morais Costa
De Montfort University, UK

ABSTRACT

One of the key characteristics in knowledge management is the importance of human resources. Therefore, main stream literature has been discussing the concept of knowledge worker, its characteristics, and duties versus rights, and human resources policies in its dissimilar perspectives (knowledge workers retention, personal mastery, intellectual property rights, among others). Although, empirical studies seem to disregard if knowledge workers feel that are well compensated, or what dimensions entail faire compensation. Hence, this chapter aims to recognize knowledge workers feeling about faire compensation, and what elements are essential to achieve it through a conceptual framework. For that, the chapter is divided into six sections: the research questions; knowledge worker (key characteristics and responsibilities versus rights); fairness (etymology and the contribution of Rawls); linking the theoretical basis; empirical results (methodological remarks, findings and discussion); future research directions (the surrealist assumption, Dali surrealism and the metaphorical assumption).

INTRODUCTION

The last decades have witnessed production of research on knowledge work, due to a conviction that economic achievement of post-industrial societies progressively depends on skills to utilize knowledge (Stehr, 2001; Castells, 2000). There-

fore, beyond manage knowledge organizations need to realize that human resources are essential to promote knowledge creation, utilization and sharing. In spite of this level of criticality that human resources introduce the concept of "knowledge worker" entails an ambiguous perception (Pyöriä, 2005; Alvesson, 2004; 2001). This is a consequence of an attempt to resume its distinctive

features, as for instance: processes information (Davenport, Järvenpää & Beers, 1996); utilizes information and communication technologies (Garavelli *et al.*, 2003); has problem-solving skills (Tsoukas & Vladimirou, 2001); produces non-routine work (Lillrank, 2002); has increasing levels of autonomy (Darr, 2003); and, is collaborative (Kristensen & Kijl, 2008).

Furthermore, in order to attract these workers (Gayton, 2008) with high levels of personal mastery (Senge, 2006) it is essential to create an effective Human Resources policy. Literature has been recognizing this quandary and assumes that human resource management practices need to be internally consistent so that they mutually reinforce each other, namely career structure and reward systems (Currie & Kerrin, 2003). In that sense, an array of organizational incentives can be highlighted: monetary and non-monetary rewards, as well as intrinsic and extrinsic (Bartol & Srivastava, 2002); despite dissimilar motivation strategies for knowledge workers (Petroni & Colacino, 2008).

As a result, this contribution endeavours to discuss knowledge workers feeling about faire compensation, and what elements are essential to achieve it through a conceptual framework based on the theory of justice (Rawls, 1971). The author still refers that the argument will consider the concept of fairness about compensation as a combination of three dimensions of organizational justice: distributive, procedural, and interactional (e.g. Cropanzano & Randall, 1992).

THE RESEARCH QUESTIONS

Since this contribution is not promoting a traditional approach to human resources managing, namely knowledge workers. Despite the novelty of the subject it entails a minor component of the author PhD research project (for further details chapter 16), leading to the following research questions:

1. Do you consider that knowledge creation, management and sharing into the organizational environment are fairly rewarded?
2. State what is meant to be a fair compensation regarding knowledge creation, management and sharing in an organizational environment?

The initial research query examines if knowledge workers feel that are fairly rewarded, as well as the question was also posed to middle managers and top managers in order to understand each group perception. Yet, it is compulsory to notify the potential Readers that is an open choice question with the subsequent answering possibilities: never, rarely, usually, often, always, and I do not respond. On the other hand, the second question seeks to recognize fair compensation dimensions through an ask for agreement option.

KNOWLEDGE WORKER

Key Characteristics

Following Kelloway & Barling (2000) it is possible to illustrate knowledge workers as investors, because these choose when they want to use their knowledge. So, knowledge workers are likely to employ their knowledge as an extension of their skills, motivation and opportunity. Or, Davenport & Prusak (2000) define knowledge workers as those who create knowledge, or the prevailing component of their work is knowledge. Although, this definition was enhanced in order to include the ones who also distribute and employ knowledge (Davenport, 2002). Concluding, the author will follow Horvath (2001) definition: "anyone who works for a living at the tasks of developing or using knowledge". Additionally, for Efimova (2003) knowledge work can be explained through the iceberg metaphor: unlike traditional work its interactions seem invisible, because informal circumstances may represent until 80%.

Thus, knowledge workers impose a shift in the balance of organizational power, because power in social contexts assumes three primary sources (Nickols, 2003, pp. 5): "politics (i.e., power derived from relationships among people); position (i.e., power derived from formally constituted authority); and profession (i.e., power derived from specialized knowledge)."

Responsibilities vs. Rights

Bearing in mind that every worker is bounded to duties and rights, it is reasonable to claim that a trade-off arises. For The Free Dictionary (2010a), trade-off can be defined as an exchange of one thing in return for another, especially relinquishment of one benefit or advantage for another regarded as more desirable.

For the purpose of this analysis the author introduces the work of Storey (2005) as regards to knowledge worker requirements:

- behaviour- resumes the organizational expectation that workers have the ability to be creative and proactive instead of complying with repeated custom actions. Another prerequisite is to present educational qualifications along with pertinent professional experiences, as well as the possess the ability to learn constantly;
- capabilities- ability to deal with large amount of complex data or information, as well as to learn from it in order to respond to the external environment challenges through semi-structured organizational routines;
- motivations- knowledge workers need to be motivated in order to enhance their personal mastery, and for that the organizational values, culture and climate are vital.

FAIRNESS

Etymology

According to the Wiktionary (2010) fairness is the property of being fair; and fair means free of bias, which evolved from an earlier meaning "morally pure" (Online Etymology Dictionary, 2010). Moreover, fairness or fair entail a similar definition in nowadays: having or exhibiting a disposition that is free of favouritism or bias; impartial: a fair mediator; just to all parties; or even, equitable: a compromise that is fair to both factions (The Free Dictionary, 2010b).

The Contribution of Rawls

John Rawls (1971) defined justice as fairness: "it conveys the idea that the principles of justice are agreed to in an initial situation as fair." (p. 12). Rawls still claims that individuals decide under the veil of ignorance, meaning that are not entirely aware of their personal features and role in society. Hence, this assumption leads us to conclude that people do not pursue personal interests, and by that mean assuring equality. In addition, this author refers three psychological factors that sustain the principle of justice: morality of authority, morality of association, and morality of principles. Therefore, Okin (1989) criticizes Rawls moral development assumptions namely the duty to teach morals and gender neutrality. Although, the author will disregard Okin criticism as pointed out by Hartline (Hartline, 2008).

LINKING THE THEORETICAL BASIS

After framing the theoretical components it is time to understand how these variables interact, and most importantly which key issues promote the existence of a fair compensation within knowledge environments.

Remembering Horvath (2001), "anyone who works for a living at the tasks of developing or using knowledge" is considered a knowledge worker. This statement induces to the following assumption: knowledge process (creation, retention/utilization, and sharing), meaning that Rawls (1971) macro analytical guidelines will be:

- justice and knowledge creation and sharing;
- justice and fair protection and retribution;
- justice and fair compensation;
- justice and recognition of human dignity and autonomy.

Justice and Knowledge Creation and Sharing

According to Hurley (2005), knowledge workers are morally accountable with reference to knowledge production and sharing within the organizational environment. In addition, that moral accountability is also bounded to organizations (Costa, Prior & Rogerson, 2008a), because it is compulsory the existence of a knowledge sharing environment. Nevertheless, to promote ethical environments concerning knowledge sharing is extremely difficult, and not utopian like Wilson (2002) points out. The answer relies on balancing the ethics of self-interest versus knowledge sharing (Wang, 2004).

Justice and Fair Protection and Retribution

Lambert *et al.* (2005) defends that exclusively spotlighting upon employee rewards or outcomes, is expectable to deal with sanction in a fair and just manner, which is consistent with the claim of Costa, Prior & Rogerson (2008). The focus on fairness should act for rewarding and sanctioning, because workers have a moral responsibility not simply to be productive but also share the produced organizational knowledge (O'Neill &

Adya, 2007). The following example resumes the previous arguments:

an employee might compare the pay and benefits received by their fellow employee and make a comparison of their effort at work with their rewards. As a result of this comparison, individuals decide to exert more or less effort, or change their perceptions of inputs or outcomes. Equity is perceived when the input/outcome ratio of the individual is equal to those of others compared with. Perceived inequality, for example, an employee who perceives rewards are inequitably distributed among employees in their organization, might react with seeking employment elsewhere. (Haar & Spell, 2009, p. 1829)

Justice and Fair Compensation

Distributive justice principles would acknowledge that a worker deserves additional compensation, however does not portray the reasons to such claim. In fact, distributive justice frequently evaluates job satisfaction and workers intentions to continue working (Greenberg & Cropanzano, 2001). Although, workers are also concerned with the fairness of procedures that enable compensation systems, which according to these authors are: be a consistent process, free from bias, correct, participative and ethical.

On the other hand, procedural justice will shed some light over the impact of organizational values and mutual trust, because workers that are fairly treated easily accept if necessary a decreasing in their payment (Turillo *et al.*, 2002). Furthermore, fair compensations must reproduce desirable values and ways of achieving organizational goals (Verplanken & Holland, 2002), since compensation systems structure typically reflects the underlying organizational ideology. Therefore, these systems must entail acceptable ethical and moral values (Cropanzano *et al.*, 2001), which for example CEOs exorbitant wages are an example (Lavelle, 2002).

Justice and Recognition of Human Dignity and Autonomy

Miller (1999) refers that a core component of any theory of justice embraces human rights, which in this case configures the following dimensions:

- the right to life- includes the right to feel secure and safe, which means that organizations ought to inform society about potential harm (Ryan, 2002);
- the right to the freedom of expression of ideas- is bounded to the moral accountability of knowledge workers produce knowledge, as well as organizations create a knowledge environment (du Plessis, Britz & Davel, 2007);
- the right of access to those ideas- debates the existing trade-off between personal effort and benefit (Ford & Staples, 2005);
- the right to protect and control expressed ideas- resumes the trade-off among workers faire compensation, and the organizational moral right to protect its economic interests (Blyth, 2005);
- the right to privacy recognizes the autonomy and dignity of individuals- knowledge environments must respect individual privacy rights (Baskerville & Dulipovici,

2006), which leads to a necessary discussion about privacy (Stahl, 2007).

Intermediate Conclusion

The quotation of O'Reilly III & Pfeffer (2000, pp. 3) summarizes in an interesting way the overall discussion: "great people want to work at great places where they can actually use their talents, where they are treated with dignity, trust, and respect, and where they are engaged by the values and culture of the organization."

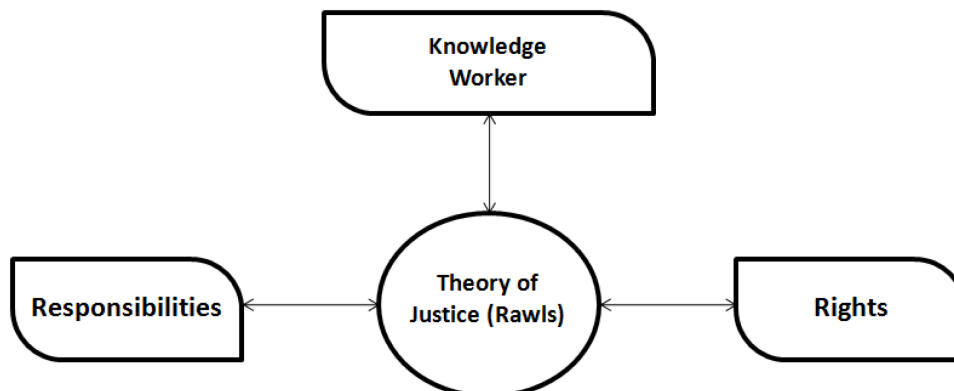
Theoretical Framework

As a final remark, the author refers that Figure 1 depicts these concepts and their relationships (theoretical framework).

EMPIRICAL RESULTS

Methodological Remarks

Creswell (2003) refers that a qualitative research may induce several angles of analysis. For that, in order to explore an event from an in-depth insight the researcher might choose a diminutive but informative case, or might perform a simple inferential numerical analysis. On the other hand,

Figure 1. Theoretical framework


Miles & Huberman (1994) denote that descriptive research intends to make complex issues logical by reducing them to their fundamentals; or, if the researcher is not entirely conscious of the facts, in spite of recognizing the research issue (Zikmund & Zikmund, 2000). And, explanatory research endeavours to exemplify certain phenomena from contrasting insights (Yin, 1994), which entails the research problem.

In addition, to consent subjective and inquisitive outcomes a blend of interpretative and critical theory is consistent with look for meaning in context. So, to identify how a reality appeared is imperative to analyse the social and historical environment (Klein & Myers, 1999), regardless the possibility to question the output (Sandberg, 2005). Likewise, the study of social reality is inner to critical research as acknowledged in numerous narratives of critical research (Hirschheim & Klein, 1994).

Finally, empirical data was collected throughout questionnaires and interviews (PhD research project- see chapter 16), and informational conversations. Semi-structured interviews sponsor a method to acquire the informants beliefs and opinions through a verbal exchange (Burns, 2000); a questionnaire can serve as an inductive method with the aim to formulate new theory with higher or lower levels of validity according to the type of questions (Gill & Johnson, 2002); and, informational conversations intend to discover, understand and gain insight of people experiences (Paton, 1980).

Findings

PhD results

The empirical outcomes highlighted in this section involve two levels of analysis: pre-tests and pilot studies results. In short, pre-tests were performed to 50 individuals with divergent professional and educational backgrounds during February 2009; and, the pilot studies have occurred in June 2009 within a learning organization that operates in Portugal, being their sample size objective 25 per cent of the organizational population. Moreover, for further details as regards to the methodological and analytical procedures read chapter 16; although, an important remark is: the results for each procedure will be divided into simple inferential numerical analysis (global and by focus group- top management, middle management, and workers) for research question 1, and content analysis for research question 2 (just focus groups).

The results demonstrate the denial of a fair compensation, and it is interesting to denote that middle managers seem to share workers perspec-

Table 1. Research question 1 results

Pre-tests		Results
Global		The generic results were: never (8%), rarely (50%), usually (22%), often (16%), always (4%)
Group	**Top management**	More than 80% believed that workers are fairly compensated (combining usually, often and always)
	Middle management	60% referred never and rarely
	Workers	The combination never and rarely entailed over 85%
Pilot studies		**Results**
Global		52% acknowledged rarely, 24% usually and 20% often
Group	**Top management**	100% argued that workers were fairly compensated
	Middle management	Combining never and rarely
	Workers	62% claimed rarely

tive with reference to this topic. Nonetheless, a higher detail of analysis is decisive for understanding these results (observe the following sections), and the dimensions of faire compensation (content analysis). Hence, some keen examples of fair compensation and its dimensions are illustrated in Table 2, as well as translation was not performed in order to avoid the lost of sensitive meanings.

Academic Experiences

This subsection endeavours to shed some light over the author personal experiences in his lecturing or participation in worldwide conferences, and a major conclusion seems to arise: fair compensation tends to demonstrate extreme positions! The expression "extreme positions" intends to portray the existing gigantic gap about faire compensation: managers' assumption is that workers are often fairly rewarded; and, workers acknowledge the absence of a fair compensation. For instance, during IIRH 2010 Conference in Setúbal, Portugal, devoted to *Research in Human Resources* it was interesting to denote that despite literature refer that people are the "core", and what stimulus managers need to produce to engage a knowledge environment the empirical results demonstrate that these policies do not engage personalization, compensation features resume traditional approaches which are not suitable for a knowledge economy, or even that managers actions do not match their discourse. An example was the keynote speech of Francisco Cesário, CEO of PT Contact:

Nós apostámos em transferir parte dos nossos call centers para zonas do país com elevadas taxas de desemprego (interior), pelo que se prova a nossa responsabilidade social (…) (transfer of "production" to areas with high rates of unemployment, as a sign of moral responsibility)

However, when confronted about the true reasons for this movement the answer was:

Razões económicas! Por exemplo, as entidades públicas locais cederam um espaço para permitir a instalação da empresa, assim como efectivamente os salários auferidos pelos colaboradores destas regiões são inferiores aos praticados em Lisboa ou no Porto (..) (economic reasons! Being examples, the local government support, and these workers lower salaries when compared with Lisbon or Oporto)

These arguments clearly demonstrate that beyond rich literature is vital to educate managers to be open-minded and ethical! In fact, this corroborates the numerous informal dialogues undertaken with the editor learners about the perception of faire compensation in knowledge environments. Their responses, representing professional experiences, demonstrate that two additional critical issues seem to arise: the Human Resources policies shortcomings about intellectual property rights (personal versus organizational), as well as the gap amid managers and workers compensation.

Eu rejeito por completo que as experiências pessoais vivenciadas pela minha pessoa na organização sejam propriedade intelectual desta (personal experiences as intellectual organization property- a explicit denial)

É inacreditável a diferença existente entre os valores auferidos pelos colaboradores e a gestão, até porque esta comete erros de palmatória! (gap between managers and workers compensation, as well as knowledge workers have the ability to question about strategic options)

Professional Experiences

While as a Key Account (before embracing lecturing), or acting today as a consultant the author has observed that faire compensation is an extremely complex issue in organizational contexts, namely in small and medium enterprises (SME's). De-

Table 2. Research question 2 results

Pre-tests	Results	Analysis
Top management	"*Justa compensação: o retorno (pessoal e profissional) pela participação individual nos processos de criação, gestão e partilha do conhecimento*"	The importance of knowledge creation, use and sharing
	"*Justa compensação não assenta em princípios meramente economicistas, mas também de reconhecimento e valorização do colaborador*"	The recognition of the financial and non-financial dimensions
	"*Justa compensação: quando alguém recebe algo em troca do seu trabalho ou esforço por ter conseguido um feito com relevância para a organização, sendo partilhado por toda a equipa*"	The identification of the financial and non-financial elements
Middle management	"*Justa compensação pode ser monetária, ou melhores condições no ambiente organizacional*"	The acknowledgment of financial and non-financial realities
	"*Todas as pessoas na organização quando partilham ideias ou colaboram devem ser reconhecidas, ou monetariamente ou através de novos cargos, etc*"	Primacy regarding recognition for those who create, use and share knowledge
	"*Compensação: plano de carreira e promoção de acordo com o desempenho, assim como, prémios monetário*"	The traditional perspective: pure economic
Workers	"*Acho que se deve recompensar de forma justa aqueles que contribuem para a criação, gestão e partilha do conhecimento*"	Again, the significance of knowledge as a process
	"*A justa compensação poderá mostrar-se pela análise, validação e quiçá adaptação e partilha de novas ideias, podendo assim ser um contributo positivo para a empresa*"	The importance of knowledge sharing
	"*Justa compensação pode ser monetária, flexibilidade de horários, aumento da autonomia*"	A interesting bound: enhanced autonomy as a way of fair compensation
Pilot studies	**Results**	**Analysis**
Top management	"*Justa compensação é o reconhecimento a todos os colaboradores que fazem parte da organização*"	The evidence of an organizational transversal process
	"*Justa recompensa surge através de factores monetários e não monetários*"	Economic and non-economic factors
	"*Tudo depende do impacto e das próprias pessoas em causa*"	Personalization as a fact
Middle management	"*Entendo os valores financeiros associados (salário e/ou promoções), e os não financeiros (reconhecimento)*"	The combination of economic and non-economic principles
	"*Compensação pode resumir-se apenas ao reconhecimento verbal do esforço no desenvolvimento do conhecimento. Não tem que se reflectir obrigatoriamente em valores monetários*"	Recognition as a crucial factor
	"*Em termos pessoais uma perfeita compensação é saber qual o meu trabalho e papel organizacional, e através dele respeitarem a minha autonomia e privacidade*"	Autonomy and privacy as basics for faire compensation
Workers	"*O conhecimento que o colaborador possa partilhar e que o vá afectar positivamente ou negativamente na evolução dentro da empresa*"	Knowledge sharing substance
	"*Justa compensação é a partilha de conhecimento sustentada na confiança mútua*"	Sharing knowledge and trust as keys for faire compensation
	"*As nossas organizações ainda não estão adaptadas à realidade de que as empresas são as pessoas e não o contrário, isto é, o mérito deve trazer mais valias, apesar do objecto de trabalho ser raramente recompensado seja por estímulo oral ou por valores compensatórios (financeiros ou outros)*"	The claim that Human Resources policies are inadequate

Table 3. Professional experiences as regards to question 2

Professional experience	Context	Results	Analysis
Meeting	Discussion about innovation in rewarding workers	"*Os colaboradores não necessitam de incentivos adicionais, pois já auferem o salário (...) Além disso, autonomia significa que não podemos controlar o seu trabalho*"	Ignoring literature recommendations
Conference about organizational innovation	Human Resources Manager speech	"*Nós temos uma verdadeira política de recursos humanos, pois valorizamos o conhecimento dos nossos colaboradores (...). Um exemplo foi a atribuição de um prémio de produtividade de 400€ a um colaborador por ter criado um produto financeiro totalmente novo que vai ser introduzido nos mercados financeiros*"	The quandary of fair compensation

spite this observation a detailed analysis will be underlined in subsection discussion; so, about of empirical evidences at a professional level is the author intention to highlight two essential quotations: the first occurred during a meeting with a CEO of a medium learning organization; the second happened in a conference organized by a major financial institution on the topic organizational innovation. Nevertheless, it is vital to detail the context of each quotation, as well as to understand the content of these quotations (observe Table 3). Once again, translation was not executed in order to avoid the lost of insightful connotations.

Discussion

More people feel that are treated fairly, more reasons will have to identify with that group. This assumption is also recognized in organizational environments, because empirical data demonstrate that workers are less worried their absolute income (Adams, 1963). In fact, Cohen (2008) highlights that Rawls social requires benefits and burdens distribution by individuals, as well as inequalities concerning incentive payments are indeed fair. The reason for his claim relies on the following argument: workers with higher levels of productivity will benefit the organization, and as consequence all organizational members will benefit from that situation. Even so, a CEO salary when compared to the remaining organizational members is a social

dilemma. For instance, Söderström *et al.* (2003) have demonstrated tremendous gaps between CEOs and other professions; Piketty & Saez (2006) study acknowledges that CEO salaries between 1980-1998 raised 9 per cent average and workers just 3,7; and, the major problem is the historical data of unethical and fraudulent behaviours as regards to corporate performance for CEOs personal gain (Meyer, 2003). The knowledge economy has enhanced this dilemma because knowledge workers possess enough competencies, skills and knowledge to question managers' strategic decisions as well as their consequences. In addition, it is common to observe that knowledge workers academic and professional background is higher than the CEO, namely in small medium companies, which enhances this dilemma. Thus, the author disregards Nichols & Subramaniam (2001) claim that CEO compensation is a matter of personal judgment.

On the other hand, procedural fairness is related to the process of distributive fairness and can be summarized through:

• participation- reflects the opportunity of knowledge workers express their knowledge, which bounded to a tangible and intangible reward as regards to knowledge sharing will promote a truthful sharing environment (Cabrera, Collins & Salgado, 2006). This is consistent with the recognition that sharing activities improves and

sustains knowledge professionals (Wasko & Faraj, 2005), as well as if knowledge workers feel that their knowledge is "snatched" tend to become self-protective and secretive;

- neutrality- a precondition to achieve it the conviction that rules do not allow personal advantages to enter their decision-making. Fehr & Rochenbach (2003) also demonstrate that sanctions that serve the punisher's self-interests disable cooperative behaviour, whereas sanctions perceived as pro-socially;

- and dignity/respect/autonomy- empirical evidences highlight that knowledge workers treated with dignity and respect enhance their levels of sharing behaviour and altruism (Moorman, Niehoff & Organ, 1993). Furthermore, autonomy encompasses for managers the following actions: acknowledge the knowledge worker understanding, afford it significant information in a non-manipulative way, offering decision making, and encouraging proactivity (Baard, Deci & Ryan, 2004), because a supportive management style to autonomy is crucial to promote knowledge sharing (Vansteenkiste *et al.*, 2004).

FUTURE RESEARCH DIRECTION

The Surrealist Assumption

According to the Merriam-Webster Dictionary (2010), surrealism resumes the principles, ideals, or generating fantastic or inconsistent imagery or effects in art, literature, film, or theater through deviant juxtapositions and blends. As such, it reproduces quite well the proposals to be introduced by the author for future research.

Dali Surrealism

Dali through is *Paranoia Critical Method* assumed a way to observe reality in order to reflect double images in the same composition (Salvador Dali Art Gallery, 2010). Moreover, his artwork is not merely used in artistic creation, but equally in scientific work because surrealist theory of automatism was transformed in a method. For Ruffa (2005), by linking surrealist actions and scientific research Dali demonstrates that we systemically have partial or total lack of understanding regarding a subject, meaning that reflection upon existing models is required. As a result, "Dalí draws our attention to the fact that there is no ontological difference between the scientific and artistic spheres, and nor is one superior to the other in terms of their approach to reality" (Ruffa, 2005, pp. 12).

The Metaphorical Assumption

After a careful research with reference to Salvador Dali paintings, the author has decided to illustrate *The Ship* (1943). In his painting, Dali inspires us to question ourselves instead of being slaves ("tied up to the strings of life"), as well as to promote change ("go by the wind"). The wind is seen as the life flow which people may dare (Coelho, 2009). In fact, the aim of these proposals is to acknowledge the need to challenge the established principles with reference to knowledge workers without ignoring compensation systems literature (e.g. Scott *et al.*, 2007) despite the several critics that will arise.

Therefore some proposals that organizations should entail are:

- personalize the compensation systems- as Cohen (2008) demonstrates it is possible to sustain equity and fairness;
- creative rewarding systems- personalization will promote creative rewarding systems. From the author professional experience, typically too many constraints are

imposed in designing novel ways of acknowledging the topic. For some ideas the author suggests the work of Zairi, Jarrar & Aspinwall (2010), or Petroni & Colacino (2008);

- protect tacit and explicit knowledge- is common that organizational tacit and explicit knowledge is not entirely protected. Explicit knowledge encompasses a simple resolution; however, organizational tacit knowledge is bounded to workers personal knowledge which resumes the trade-off between self-interest and versus knowledge sharing (Wang, 2004). A potential solution is to "draw a moral flexible rule" that acknowledges personal experiences as non-organizational property. Through this assumption knowledge workers will feel treated with fairness and dignity leading to a truly knowledge sharing environment;

- acknowledge intellectual property rights- as previously referred Human Resources policies do not address this issue. Define a Solomonic decision, meaning to acknowledge workers intellectual property rights as for instance, offer a percentage over the market outcome of the product or service for a period of time which can be diminished if the worker leaves the organization. Bearing in mind the second example of professional experiences, the financial institution ought to reward the worker with a percentage of the market result during a year!;

- create a knowledge sharing environment- despite the existing backgrounds and competences of knowledge workers, it is vital to be aware of the existing relationships in knowledge sharing amid "those who know" and the "know-notes" (Wang & Noe, 2010);

- assume that knowledge workers values maybe contradictory to organizational values- organizational culture is "a spheri-

cal concept (metaphorical symbolism for perfect and constant), and therefore does not reproduces the existing challenges that knowledge management enables" (Costa, Prior & Rogerson, 2010, pp. 84). Although, to recognize values diversity and knowledge workers autonomy will allow to enhance knowledge sharing (Berg, 2010), and ultimately a growing identification with the organization ethical values;

- actions versus discourse ethics- managers primary responsibilities inherent in the organizational ontology through discursive ethics resumes two assumptions: normative claims in order to be valid require a cognitive meaning and can be treated *like* claims to truth; the justification of norms involves a real discourse be carried out and thus cannot occur in a strictly monological form, i.e., in the form of a hypothetical process of argumentation occurring in the individual mind (Rhen, 2002).

As a final remark, the author reveals the following thought for managers: do not question the financial value of increasing compensations if knowledge workers demonstrate higher levels of productivity, because it would be a sign of a competitive organization as well as additional profits. Besides, the economic approach skews any changing attitude as regards to non-monetary compensation, which is sometimes far more important than the monetary one.

CONCLUSION

Changing traditional compensation systems enable several theoretical constraints namely "psychological and cultural", however neglecting that possibility induces to a lack of organizational retention concerning knowledge workers. Knowledge workers have distinctive characteristics that require a novel approach to its rewarding as the

empirical results clearly demonstrate, which top management continues to ignore. A potential justification for today's organizational reality might be the novelty of the topic, but clearly depicts the *status quo* of knowledge society and managers lack of moral reasoning. In fact, despite the introduction of ethics in business the truth is that managers still ignore it, or use it as a marketing tool (similar to corporate social responsibility) which will endanger organizational survival. The assumption for this resumes the lack of recognition about justice in knowledge creation and sharing, fair protection and retribution, fair compensation, and the recognition of human dignity and autonomy. As a final remark, the author argues that the conceptual framework also enables a positive and feasible response to the research questions; yet, is urgent to enhance the number of empirical studies and novel approaches to the topic.

KEY TERMS AND DEFINITIONS

Compensation: Something given or received as a counterpart for actions taken. Compensation systems in organizational systems assume two major dimensions: monetary and non-monetary.

Equity Theory: The perception of fairness in allocating resources within social and professional realities.

Fairness: Inexistence of favouritism or bias, impartiality, or equity.

Human Resources Policies: Formal rules and guiding principles that organizations need to encompass for hiring, training, evaluating, and rewarding its organizational members.

Knowledge Workers: Everyone who works that needs to create, manage and share knowledge.

Chapter 67
The Relationship between the Fulfillment of the IT Professional's Psychological Contract and their Organizational Citizenship and Innovative Work Behaviors

ABSTRACT

Little is known about the relationship between of the level of fulfillment of the IT professional's psychological contract and their innovative work and organizational citizenship behaviors. Using psychological contract and social information processing theories, this study proposes to answer the research question: What is the relationship between the level of fulfillment of the IT professionals' psychological contract and their organizational citizenship and innovative work behaviors? Survey data were collected from 209 IT professionals using group-administered paper and on-line surveys. Results show positive relationships with the level of fulfillment of the IT professional's psychological contract and their innovative work behavior, as well as four of their organizational citizenship behaviors, specifically loyalty, advocacy participation, obedience, and functional participation. Extending the body of knowledge, the dimensional approach of the psychological contract was used resulting in the scope, focus, and tangibility dimensions being the most significant predictors of the organizational behaviors.

INTRODUCTION

Management continues to view information technology (IT) professionals as human capital, and use this resource to maximize organizational effectiveness, enhance performance, and maximize organizational goals, all while perhaps cutting IT costs (Josefek Jr. & Kauffman, 2003). In coordination with these strategic goals, IT departments are expected to be leaner, yet remain multi-talented and innovative (Koch, 2006). Pring (2003) calls attention to the fact that organizations still need innovation and value delivered from their IT professionals, even when organizations are focusing on cost management issues, such as IT service providers. And while organizational effectiveness is affected by the productivity and performance of employees, there are other work behaviors beyond the dependable role performance that are also sought after by management. Two such extra-role behaviors are innovative work and organizational citizenship.

Research and practitioner literature stress the importance of innovation and organizational citizenship in IT professionals. While an IT professional's job may have an implicit degree of creativity and innovation required, organizations may have difficulty monitoring creativity and innovation objectively. Koch (2006) states that IT departments continue to need IT professionals who have not only in-depth technology knowledge, but can also create new products and capabilities. Innovative work may also be an acknowledged element to the job, as evidenced by one IT professional who was quoted saying, "…it's all about solving problems of the business…and there's always something new to learn" (Murphy, 2005). According to CIO Magazine, even when organizations are faced with cost cutting mandates, chief information officers (CIO) are still charged with emphasizing innovation and creating competitive advantage (Varon, 2005). In fact, 65 percent of the CIOs surveyed believe that "bringing ideas for IT-enabled business innovation to the table is a significant or dominant aspect of their roles" (Varon, 2005).

Organizational citizenship continues to be seen as a vital component to organizational effectiveness. Podsakoff, Whiting, Podsakoff, and Blume (2009) found organizational citizenship behaviors (OCB) is related to a variety of organizational-level outcomes including productivity, efficiency, reduced costs, customer satisfaction, and turnover. In Ang and Slaughter's (2001) research specific to IT professionals, contract workers exhibit lower extra-role (citizenship) behaviors than permanent systems developers, and supervisors evaluate a contract workers loyalty and obedience lower than permanent systems developers. Moore and Love (2005) find differences by job category, in that levels of organizational citizenship behaviors are lower in the IT employees than the employees from work areas other than IT.

The current IT job market complicates this situation as organizations consider management strategies to keep their IT professionals engaged, productive, appreciated, and on the job, or lose them to another company (McGee, 2005; Motti, 2006). The psychological contract, the employee-employer relationship with respect to perceived obligations to each, has been theorized to unite the employee with their organization and regulate their behaviors (Robinson, Kraatz, & Rousseau, 1994). One online poll found that 69 percent of the IT professionals surveyed were looking for a new employment position, and the number one reason given was that they did not like the current employers' management or culture (McGee, 2005). Research shows that when the employee's psychological contract is breached or violated, it can lower job satisfaction (Robinson & Rousseau, 1994), organizational commitment (Coyle-Shapiro & Kessler, 2002; Suazo, Turnley, & Mai-Dalton, 2005), and organizational citizenship behaviors (Coyle-Shapiro, 2002; Robinson, 1996; Robinson & Morrison, 1995), and increase intentions to quit (Suazo, 2009).

Psychological contract research has been conducted with professions from a wide variety of industries, e.g., government employees (Coyle-Shapiro, 2002), professional workers from the banking and hospital industries (Van Dyne & Ang, 1998), service employees (Suazo, 2009), and professional employees from aerospace, electronics, accounting firms (Porter, Pearce, Tripoli, & Lewis, 1998), all of which improve the generalizability of the research. Yet, there has been little empirical research sampling IT professionals, and until Martinez in 2004, no direct research of their psychological contract. And while some IT research supports differences between IT and non-IT professionals' attitudes and behaviors (Cougar, Zawacki, & Oppermann, 1979; Moore & Love, 2005), which justifies studying IT professionals, there is also research questioning those differences (Wynekoop & Walz, 1998). Current research offers no distinctions for the IT profession, and with the present volatility of the IT job market and high expectations of innovation and performance by management, this study empirically examines the relationship between the perceptions of the IT professionals' level of fulfillment of their psychological contract and their innovative work behavior and organizational citizenship behaviors.

In the sections that follow, we will present the theoretical framework and relevant literature to the study. We will discuss the research model and hypotheses. We then test our theoretical model using cross-sectional data and present the results. We conclude with a discussion of the implications of the findings for practice and research.

LITERATURE REVIEW

The study offers two complementary theoretical perspectives together in examining the IT professional's perceptions of the employer-employee relationship and resulting organizational behaviors. Researchers have drawn on Rousseau's (1989) psychological contract theory to help explain differences in employee attitudes and behaviors in the work place (Coyle-Shapiro, 2002; Janssen, 2000; Sels, Janssens, & Van Den Brande, 2004). The psychological contract perspective has also been applied to identify perceptions of IT outsourcing success (Koh, Ang, & Straub, 2004).

Salancik and Pfeffer's (1978) social information processing theory explains that employees receive social cues from not only their own behaviors, but also their employer's behaviors. These social cues can modify their beliefs of perceived obligations owed to and from their employers. Herriot and Pemberton (1997) parallel this view by proposing that development of the psychological contract is a social process, because beliefs of the contract originate from each party through direct or indirect communication.

This study uses both theories to examine the IT professionals' perceptions regarding their employers' fulfillment of those obligations within the realm of the psychological contract and the subsequent effects to their organizational behaviors – organizational citizenship and innovative work. Specifically, this study proposes to answer the question: What is the relationship between the level of fulfillment of the IT professionals' psychological contract and their organizational citizenship and innovative work behaviors?

Fulfillment of Psychological Contract

Rousseau (1989) defines the psychological contract as "an employee's beliefs regarding the terms and conditions of a reciprocal exchange agreement between that focal person and another party" (pg. 123). While the psychological contract is normally perceived as unwritten, it has "the power of self-fulfilling prophecies: they can create the future" (Rousseau, 1995, pg. 9). The employee's perceptions form the psychological contract, which in turn becomes a reciprocal obligation. Hence, the employee believes certain obligations, such as job security and good pay, are owed to

the employer after, for instance, an employee's loyalty or hard work (Rousseau, 1990). Consequently, the employee's psychological contract is the essence of the perceived relationship formed between the employee and employer, yet because the terms are subjective, the actual parties to this relationship may not necessarily agree to its terms (Rousseau, 1989).

The degree of fulfillment, change, breach or violation perceived within the context of the psychological contract refers to the instance where the employer may fail to live up to some aspect of their obligations, and the employee, in turn, believes less is owed to their employer (Robinson & Morrison, 1995; Robinson & Rousseau, 1994; Rousseau & Tijoriwala, 1998). Most research empirically measures the psychological contract or the fulfillment of the psychological contract using the evaluation or content approach, which examines the specific aspects or tangible terms of the perceived employer-employee relationship, e.g., employer's obligations of high pay and career development (Robinson, 1996; Rousseau, 1990; Van Dyne & Ang, 1998).

This study uses the dimensional approach, which characterizes distinctive properties and offers a more extensive understanding of the employee's psychological contract. It also offers an improved assessment in trying to understand the employee-employer relationship in today's dynamic employment environment. The diversity of employment arrangements within the IT industry warrants a more diverse understanding of today's IT professionals' employment situation (Agarwal, De, & Ferratt, 2001; Ang & Slaughter, 2001; Ferratt, Enns, & Prasad, 2001). Investigating the dimensions of the employment relationship might better fit the organizational and employment context of IT professionals (McLean Parks, Kidder, & Gallagher, 1998). This study adopted six dimensions of the psychological contract: stability, scope, tangibility, time frame, focus, and volition.

The stability dimension of the psychological contract refers to the extent the contract is con-stant or static opposed to dynamic and evolving as perceptions of obligations and entitlements framed within the psychological contract evolve in response to changing needs (McLean Parks et al., 1998). An IT professional whose organizational tenure or employment arrangement is short-term may have difficulty establishing trusting relationships, which enables a more flexible and malleable psychological contract, which is more common when job length is long-term.

Scope refers to the extent of the boundary between an IT professional's employment relationship and other portions of one's life, e.g., the amount an individual's work responsibilities spill over into their personal life (McLean Parks et al., 1998). The scope of the psychological contract can vary from very narrow to very broad.

Tangibility refers to the explicitness of the psychological contract with respect to the employee's degree of understanding to the defining boundaries, terms and expectations of the employment relationship, most important being that the specific terms of the contract are visible and are not ambiguous to third parties (McLean Parks et al., 1998). McLean Parks et al. (1998) proposes that the more specific and observable the terms of the employment contract and job description, the less likely the employee will go beyond the minimum requirements of the job.

Time frame dimension of the psychological contract has end points representing a close-ended, specific contract at one end and an open-ended, indefinite contract at the other end (Rousseau & Wade-Benzoni, 1994). McLean Parks et al. (1998) contends that an open-ended contract may be viewed as a long-term employment relationship; whereas, a close-ended contract may be characteristic of a short-term employment relationship. IT professional's time frame dimension may be affected if working in an organization with high turnover or outsourcing issues, versus if working in an organization with minimal turnover, as evidenced in EE Times (2005).

Focus of the psychological contract refers to the relative emphasis on economic versus socio-emotional concerns on one continuum with extreme end points for the two. For instance, a psychological contract geared toward material and monetary rewards at one end and truthfulness, sharing, respect, development opportunities, etc., at the other end is typical of a economic versus socio-emotional continuum (McLean Parks et al., 1998). Rousseau (1989) states that the longer employment relationships continue, there will be recurring exchanges of contributions, which in turn will strengthen the employee's perceptions of the relationship and fall more on the socio-emotional continuum.

Volition of the psychological contract is "the degree to which employees believe they had a choice in the selection of the nature of the employment relationship…" (McLean Parks et al., 1998, pg. 720). Volition also refers to alternatives one may or may not have with respect to jobs, because of their level of expertise, or specialized talents or skills (McLean Parks et al., 1998). Therefore, IT professionals may believe they have a higher level of volition when their skill set is unique or in demand.

When the organization fails to respond accordingly to their obligations as perceived by the employee, employees may construe the contradiction as some extent of non-fulfillment of their psychological contract. Even though this incongruence is a subjective experience, with any perceived non-fulfillment, employees may change their beliefs about what they subsequently owe their employer (Robinson et al., 1994; Rousseau, 1989). The effects of the non-fulfillment of the IT professional's psychological contract using the dimensional approach on their organizational citizenship behaviors and innovative work behavior has not been assessed in this context. Organizational citizenship and innovative work behaviors are described next.

Organizational Citizenship Behaviors

Smith, Organ, and Near (1983) defines OCB as the extra-role, discretionary actions that help others in the organization perform their jobs or show support for and conscientiousness toward the organization. Organ (1988) identifies five OCB dimensions: altruism, conscientiousness, civic virtue, courtesy, and sportsmanship, which have been used to investigate the relationship with trust and satisfaction (Rioux & Penner, 2001) and to identify an employee's motives toward OCB (Brief & Motowidlo, 1986). Many researchers have offered other perspectives to OCB (e.g., Borman, Penner, Allen, & Motowidlo, 2001; Brief & Motowidlo, 1986; Van Dyne & LePine, 1998), as well as recognized that it's logical to identify variables that might increase those behaviors in organizational settings (Podsaskoff, Whiting, Podsakoff, & Blume, 2009).

Van Dyne and Ang (1998) proposes that organizational citizenship can be regarded as a behavioral gauge of the employee's perceptions and subsequent responses to their relationship with their employer. The relevancy of these perceptions is important when IT professionals are placed in a work environment in which their job performance is partially judged by the amount of OCB performed. For example, Yen, Li, and Niehoff (2008) found that IT implementation teams exhibiting higher levels of OCB, resulted in more effective project management and information system success. It is instances such as these that citizenship behaviors continue to remain a vital component of the IT professional's performance and are essential for proper organizational practices (Moore & Love, 2005).

This study examines a set of organizational citizenship behaviors that have been used in prior research: helping, loyalty, advocacy participation, functional participation, and obedience (Ang & Slaughter, 2001; Coyle-Shapiro, 2002; Van Dyne & Ang, 1998), but not all within the context of IT professionals, yet these citizenship behaviors

fit within the conceptual realm of behaviors that might be expected of IT professionals.

Helping refers to discretionary actions that have some assisting effect and are directed at a specific individual or group and the task performed has some organizational relevance (Coyle-Shapiro, 2002; Smith et al., 1983; Van Dyne & Ang, 1998).

Graham (1991, pg. 255) and Van Dyne et al. (1994, pg. 767) define loyalty and obedience as follows: Loyalty refers to identifying with the organization and having allegiance to the organization, going beyond the "parochial interests of individuals, work groups, and departments." Typical behaviors include "defending the organization against threats, contributing to its good reputation, and cooperating with others to serve the interests of the whole." Obedience refers to accepting the "rules and regulations governing organization structure, job descriptions, and personnel policies." This would include such actions as having "respect for rules and instructions, punctuality in attendance and task completion, and stewardship of organizational resources."

Advocacy participation refers to "behaviors that are targeted at other members of the organization and reflect a willingness to be controversial" and "maintaining high standards, challenging others, and making suggestions for change (Van Dyne et al., 1994, pg. 780). This behavior might be an important component in project management team relationships.

Functional participation refers to behaviors that have a personal focus, yet still contribute to organizational effectiveness, such as "performing additional work activities, self-development and volunteering for special assignments" (Van Dyne et al., 1994, pg. 780).

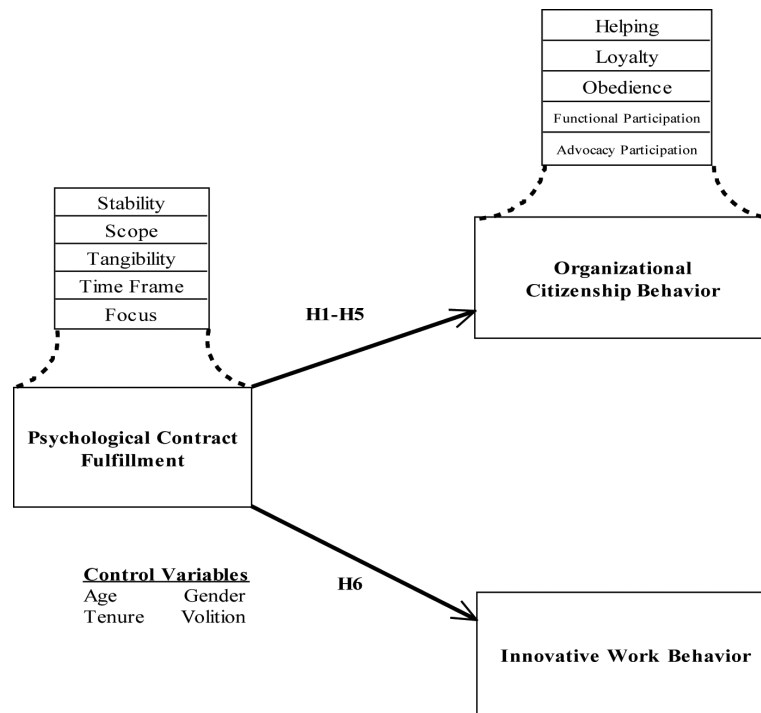
Innovative Work Behaviors

The concept of innovation is defined a multitude of ways (Kanter, 1983; West & Farr, 1990b; Zaltman, Duncan, & Holbek, 1973). Using West and Farr's (2000) definition, Janssen (2000) finds the level

to which workers respond innovatively to their job is determined by their perceptions of fairness on the job. In a different study, the employee's perceived obligation to innovate, job autonomy, and pay have a direct effect on their innovative work behavior (Ramamoorthy, Flood, Slattery, & Sardessai, 2005). In the same realm as innovative work, empirical evidence indicates that perceptions of an employee's work environment and creativity climate directly affects the creativity of projects (Amabile, Conti, Coon, Lazenby, & Herron, 1996). Clinton, Hardgrave, and Armstrong (2005) finds the interaction of IT professionals and their environment most important when examining the person-job cognitive style fit on innovative performance. Supporting anecdotal evidence found in the popular press (Koch, 2006; Murphy, 2005), this study examines innovative work behavior, which are planned actions that hope to accomplish some beneficial result, as defined by Janssen (2000).

RESEARCH MODEL AND HYPOTHESES

The psychological contract and social information processing theories are adapted to predict two organizational behaviors of IT professionals, organizational citizenship and innovative work. Using the dimensional approach to the psychological contract, the IT professional's perceptions of their employer's fulfillment of their obligations are investigated as predictors of their organizational behaviors. The research model for this study is shown in Figure 1. From left to right, the level of fulfillment of the psychological contract using five dimensions (stability, scope, tangibility, time frame, and focus) are proposed to affect each of the IT professional's five organizational citizenship behaviors (helping, loyalty, obedience, functional participation, and advocacy participation) and innovative work behavior. The model depicts four control variables: volition (a dimension of

Figure 1. Research model with hypotheses


the psychological contract), and age, gender, and tenure, which are discussed later in the paper.

The key assertion in the study is that higher levels of fulfillment of the IT professional's psychological contract will positively affect the relationship with their organizational citizenship behaviors and innovative work behavior. Studies using the content or evaluative approach have found psychological contract violations related to lower extra-role behaviors (Robinson & Morrison, 1995), lower performance and civic virtue behavior, (Robinson, 1996), lower OCB (Coyle-Shapiro, 2002), as well as lower trust and job satisfaction. Robinson and Morrison (1995) found employees less likely to perform civic-minded behaviors when they felt their employer had not fulfilled their obligations to the perceived contract.

Even though citizenship behaviors are viewed as a collective act by Organ (1988), researchers often consider OCB as a multi-dimensional construct and look at the significance of each

dimension under study (Coyle-Shapiro, 2002), or investigate selective dimensions of OCB (Ang & Slaughter, 2001; Robinson & Morrison, 1995; Van Dyne & Ang, 1998). As such, it is proposed that higher perceptions of their employer's fulfillment of their obligations (within the IT professional's psychological contract) will be positively related to higher levels of each of the dimensions of OCB under study: helping, loyalty, obedience, functional participation, and advocacy participation. The five hypotheses below reflect this distinction:

Hypothesis 1: Higher perceptions of fulfillment of their employers' obligations of the psychological contract will be positively related to higher levels of the IT professionals' organizational citizenship behavior dimension - helping.

Hypothesis 2: Higher perceptions of fulfillment of their employers' obligations of the psychological contract will be positively related

to higher levels of the IT professionals' organizational citizenship behavior dimension - loyalty.

Hypothesis 3: Higher perceptions of fulfillment of their employers' obligations of the psychological contract will be positively related to higher levels of the IT professionals' organizational citizenship behavior dimension - obedience.

Hypothesis 4: Higher perceptions of fulfillment of their employers' obligations of the psychological contract will be positively related to higher levels of the IT professionals' organizational citizenship behavior dimension – functional participation.

Hypothesis 5: Higher perceptions of fulfillment of their employers' obligations of the psychological contract will be positively related to higher levels of the IT professionals' organizational citizenship behavior dimension – advocacy participation.

Innovative work behaviors, as well as citizenship behaviors, have been thought of as extra-role behaviors that are not obligatory, are outside the normal job description requirements, and are not clearly distinguished within the formal reward system (Katz & Kahn, 1978; Organ, 1988). In Janssen's (2004) investigation of fairness perceptions in non-management employees' relationship between job demands and innovative work behavior, he finds the level to which the employees respond innovatively to their job is determined by their perceptions of fairness on the job. Thus, it is proposed that one's perceptions of the level of fulfillment of their employer's obligations will be positively related to one's innovative work behavior. Accordingly, the following research hypothesis is proposed:

Hypothesis 6: Higher perceptions of fulfillment of their employers' obligations of the psychological contract will be positively related

to higher levels of the IT professionals' innovative work behavior.

METHODOLOGY

Procedure and Sample

Data were collected from a convenience sample of working IT professionals located throughout the United States. The questionnaire was administered through two means: an on-line survey and a group-administered paper survey. Participation was strictly voluntary. The respondents were obtained from two sources: alumni from the management information systems program and graduate students in management information systems program evening classes of a major southeastern university.

For the on-line survey, a letter of invitation to participate was mailed to the intended respondents. A postcard was mailed about three weeks after the first mailing as a follow-up reminder to those who had not yet responded.

Three hundred twenty-four responded to the survey. Of that number, 251 completed the on-line survey, 36 completed the group administered survey, and 37 responded to the on-line survey, but did not complete the questionnaire. The overall response rate was 9.7% with 287 responding out of 2,950 potential respondents. Possible factors influencing the response rate was the length of the questionnaire and the controls established within the on-line survey, in that those responding to the on-line survey had to answer a minimum number of questions to successfully submit the questionnaire. Basic demographic information was asked for in the event the respondent could not or chose not to complete the survey. This enabled verification that those who did not participate were not so different from those who chose to participate. T-tests conducted found no significant differences between those who responded to the survey and

those who chose not to respond; therefore, potential non-response bias was negligible.

Only those respondents who were permanent employed IT professionals were used in this study, providing 209 usable questionnaires. With two sources of data, group administered (n = 18) and on-line survey (n = 191), and the initial and second mailings inviting those to participate in the on-line survey, method bias was also assessed. Again, t-tests were conducted, and no significant differences in any of the demographics collected at α =.01.

Measures

To stay consistent with prior research, all scales in the measurement instrument, except focus and volition, were adopted from existing instruments with proven reliabilities. In an effort to have consistent end choice points throughout the measurement instrument, any scales not having choice end points of 1-6 were changed to choice end points of 1-6, which forces a non-neutral choice on behalf of the respondents (Spector, 1992).

The items measuring psychological contract fulfillment, OCBs, and innovative work behavior are presented in Tables 2, 3, and 4. Psychological contract fulfillment dimension scales for stability, scope, tangibility, and timeframe were adapted from Sels and his colleagues (2004). Specifically, respondents were asked to indicate "the extent to which you believe the organization has fulfilled this obligation to…"

Measurement items for the focus and volition dimension were developed for this study. Using the domain definition from McLean Parks et al. (1998), five items were developed to measure and operationalize the focus dimension as it relates to the fulfillment of the psychological contract. Volition was measured as a single item. Respondents were asked, "Which employment arrangement would you prefer to work?" This response was compared to their current employment arrangement, which they provided, and this provided an

indication as to whether their current arrangement was voluntary (Morrow, McElroy, & Elliott, 1994; Stamper & Van Dyne, 2001). Following McLean Parks et al.'s (1998) conceptualization of volition, volition is also hypothesized to be a control variable in the research model.

The OCB dimensions helping, loyalty, advocacy participation, functional participation, and obedience were measured using items adapted from Coyle-Shapiro (2002). Innovative work behavior was measured using the eight-item scale developed by Janssen (2000), which assesses Kanter's (1994) three stages to innovation: idea generation, idea promotion, and idea realization.

Researchers find that certain demographic characteristics tend to correlate with outcome behaviors. Forms of OCB may be a function of tenure and thus, tenure may be a moderator between antecedents and OCB (Organ and Ryan 1995). Organ and Ryan (1995) also argue that gender might be a predictor of OCB, considering the beliefs that females may perform more aspects of OCB, e.g., altruism and courtesy factors. In their study investigating OCB in restaurant employees, Stamper and Van Dyne (2001) find age, gender, and organizational tenure related to their work status. Accordingly, age, gender, tenure in the employment arrangement, and volition assessed and statistically controlled in this study,

DATA ANALYSIS

All data analysis was accomplished using SPSS. Pearson correlations were used in the analysis of correlations between the constructs. Analyses of the factor structures were examined using informal confirmatory factor analysis with Promax rotation and extracting the number of factor theorized in the literature. Promax rotation method was used due to moderate correlations among the factor items, which are shown in the Appendix.

Sample Characteristics

The IT professionals responding to this study reflect a representative sampling comparable to the IT workforce as described by ITAA's (2005). The respondents held a wide variety of IT job titles and were in all of the Information Technology Association of America's (ITAA) career field clusters except one (technical writing). The study sample was well educated with 85% having at minimum a bachelor's degree. Approximately 45% had attended formal education within the past five years. The demographic data (see Table 1) supports ITAA's 2005 report that "The IT labor force is a highly skilled, highly educated population" (pg. 6). The study sample and ITAA IT workforce were also comparable in median age, percentage over 45 years of age, and gender. Median age for the sample was 37 years, 25% were over 45 years of age, and 35% were female. Eighty-eight percent of the IT professionals were in their preferred employment arrangement, while 10.2 percent preferred another arrangement. Median tenure in their employment arrangement was five years.

Reliability and Validity of Constructs

Content validity of the measurement instrument was established mainly through the adoption of existing instruments and use of recommended concepts found in the literature. With the development of new measurement items for the focus dimension of the psychological contract, particular attention was taken during pre-testing with domain experts

and pilot-testing of the instrument. All reliabilities were above Nunnally and Bernstein's (1994) recommended acceptable level of at least .70 with one exception. The reliability for OCB obedience was $\alpha = .61$, which closely follows the $\alpha = .63$ reliability in Coyle-Shapiro's (2002) study. Means, standard deviations, and inter-correlations of the study variables are shown in the Appendix, as well as the study variables' internal reliabilities (Cronbach's alpha) at the diagonal.

Construct and discriminant validity were assessed through informal confirmatory factor analysis and found to be satisfactory. Five factors extracted for fulfillment of the psychological contract explained 75.5% of the variance; five factors extracted for OCB explained 72.9% of the variance; and the one factor for IWB explained 62% of the variance. An evaluation of convergent validity was possible for two study variables, OCB advocacy participation and innovative work behavior. The measurement items in each variable relate to sharing ideas, making improvements, suggestions, etc., and the two study variables were found to be correlated at $\alpha = .703$. Tables 2, 3, and 4 present the measurement items used in the questionnaire for each factor and the factor loadings from the pattern matrix for fulfillment of the psychological contract, OCB and IWB.

Results

The items retained for each construct were summed and averaged creating the variables used in the analysis. Separate regression analyses were per-

Table 1. Demographic profile of respondents

(n = 209)	Mean	Median	Range
Age	38 years	37 years	22 – 64 years
Employment tenure	5 ½ years	5 years	Less than a year – 25 years
Gender	Female: 73 (35%), Male: 136 (65%)		
IT Field	Database Development 16%, Programming & Software Engineering 34%, Technical Support 18%, Enterprise Systems & Analysis 16%, Network Design & Administration 10%, Other 6%		

Table 2. Measurement items with factor loadings for fulfillment of the psychological contract

Measurement Items	Factor Loadings
Time Frame	
Provide me with job security	.876
Make a commitment to me for a long time	.906
Won't immediately release me if things are going badly	.834
Offer me another job if my current job would disappear	.770
Do everything in their power to keep me on the job	.713
Scope	
Appreciate me for what I do and who I am	.882
Consider not only the end result, but also my personal effort	.855
Treat me as a person, not as a number	.824
Allow me to be myself within this firm	.865
Focus	
Notify me of any available financial rewards	.680
Establish a respectful and trusting relationship	.664
Provide development opportunities	.839
Provide any and all materials necessary to do the job	.970
Be truthful even when it may harm the relationship	.487
Tangibility	
Specifically describe the performance appraisal criteria used in this firm	.770
Unambiguously describe my obligations within this firm	.925
Unambiguously describe my rights within this firm	.674
Stability	
Stick to agreements despite changing circumstances	.783
Consider written or oral agreements as permanently valid	.996

Table 3. Measurement items with factor loadings for OCB

Measurement Items	Factor Loadings
Advocacy Participation	
I make creative work-related suggestions to co-workers	.872
I make innovative suggestions to improve the functioning of the department	.844
I share ideas for new projects or improvements widely	.776
I encourage others to speak up at organizational meetings	.843
Loyalty	
I tell outsiders that this organization is a good place to work.	.942
I defend the organization when other employees criticize it	.822
I represent the organization favorably to outsiders	.899
Functional Participation	
I work beyond what is expected	.852
I exceed formal requirements of the job	.914
I go the 'extra mile' for the organization	.837
Helping	
I help others who have heavy workloads	.905
I help others who have been absent	.918
I go out of my way to help colleagues with job-related problems	.707
Obedience	
I neglect aspects of job responsibilities	.846
Regardless of circumstance, I produce the highest quality of work	.535
I follow work rules and instructions with extreme care	.742

formed with each of the organizational citizenship and innovative work behaviors as the dependent variables and the five dimensions of fulfillment of the psychological contract, as the independent variables. To control for other factors potentially confounding the relationship between the level of fulfillment of the psychological contract and the organizational behaviors, age, gender, tenure in the employment arrangement, and volition were included in the regression equations. All variables were entered into the regression simultaneously.

As Table 5 shows, perceived higher levels of fulfillment of the psychological contract dimensions were positively related to four dimensions

Table 4. Measurement items with factor loadings for IWB

Measurement Items	Factor Loadings
I create new ideas for difficult issues	.767
I search out new technologies, processes, working methods, techniques, and/or product ideas	.703
I generate original solutions for problems	.734
I mobilize support for innovative ideas	.801
I make organizational members enthusiastic for innovative ideas	.759
I transform innovative ideas into useful applications	.771
I introduce ideas into the work environment in a systematic way	.698

Table 5. Regression analysis results explaining variance in organizational behaviors

Dependent Variable	R	R^2	R^2_{Adj}	F
OCB Loyalty	.76	.57	.55	28.01***
OCB Advocacy Participation	.44	.19	.16	5.09***
Innovative Work Behavior	.43	.18	.15	4.74***
OCB Obedience	.34	.12	.07	2.73**
OCB Functional Participation	.30	.09	.05	2.12*

*p <.05, ** p <.01, ***p <.001

of citizenship behavior – loyalty and advocacy participation (p <.001), obedience (p <.01), and functional participation (p <.05), providing support for Hypotheses 2-5. Hypothesis 1 was not supported by the data; no relationship was found between perceived levels of fulfillment of the psychological contract dimensions and OCB helping. Perceived higher levels of fulfillment of the psychological contract dimensions were also positively related to innovative work behavior at p <.001, providing support for Hypothesis 6.

Table 6 highlights significant predictor variable regression coefficients of all regression equations, except for OCB helping, which was not significant.

DISCUSSION

Innovative work and citizenship are two qualities deemed vital to an IT professional's conduct. In today's world, businesses are constantly changing to adapt to competitive pressures, and they depend on their IT talent to help facilitate that process through their creativity and innovation. Whether the job is to beat the competition or just keep up, innovation remains the goal (Kanter, 2006; Varon, 2005). Citizenship behaviors, such as loyalty,

Table 6. Regression equation using significant predictor variables to explain variance in scores for organizational behaviors

	Loyalty	Advocacy Part	Innovative Work Behavior	Obedience	Functional Part

advocacy participation, obedience, functional participation, and innovative work behavior on the part of IT professionals are still important to overall organizational success, even when the job is less clear (Moore & Love, 2005).

Organizational Citizenship Behavior

The individuals' organizational citizenship behaviors can be a gauge of their responses to their relationship with their employer (Van Dyne & Ang, 1998). IT professionals, who perceive the relationship with their employer is not what it should be, may retreat from their level of involvement within the job or project or withdraw from active participation, or even start to become complacent in their work. Yet, Yen et al. (2008) found that cooperative and helping behavior has a significant impact on information system success.

Applying psychological contract and social information processing theories, the results of this study provide empirical evidence to indicate that increased levels of fulfillment of the IT professionals' psychological contract are positively related the IT professionals' increased performance of organizational behaviors.

This study has examined in greater depth than prior research the importance the IT professional's perception that the psychological contract between the employee and employer has been fulfilled and the potential impact this has on organizational citizenship behaviors. Even though these behaviors are subtly expected by supervisors, they fall outside the traditional productivity and task performance measures (Ang & Slaughter, 2001). Employees, if they perceive that promises have not been met have the potential to "under perform" in areas that are not directly observable by the manager. The IT professionals' citizenship behavior, especially advocacy participation, is strongly affected by the scope and tangibility dimensions of the psychological contract.

Scope refers to the level that the employer typically fulfills their obligations, such as expressing appreciation of the IT professional's work, taking the IT professional's personal effort into consideration, and their treatment of them. Therefore, the IT professional might speak out more while making creative and innovative suggestions, share ideas, and encourage others to speak up, and thus supporting the organization overall, the more the IT professional felt their employer had fulfilled their obligations to express their appreciation to them. Or the direct opposite is true; the IT professional may fail to speak up, share ideas, or make innovative suggestions, if they feel that their employer has not fulfilled their obligations related to scope.

High levels of fulfillment of the tangibility dimension of the psychological contract, the explicitness to defining the boundaries, terms and expectations of the employment relationship, was also positively related to high levels of advocacy participation. Acquisition for technology companies can be challenging for IT professionals, in that innovation and creativity are still expected, even during changes to the organizational structure (Christensen, 2006). Therefore, the clearer the terms of the employment contract and the employer respecting and upholding those terms, the more willing the IT professional will be to make suggestions and share ideas.

High levels of fulfillment of the scope and focus dimensions of the IT professional's psychological contract were positively related to the IT professional's OCB dimension – loyalty. Therefore, the IT professional's level of loyalty to the organization, can be influenced by the amount the employer expresses appreciation of the IT professional's work, takes the IT professional's personal effort into consideration, and treats them with respect, which relate to the scope dimension. For this study, the IT professionals' focus represents a more socio-emotional concern in their psychological contract. Consequently, the more the IT professional feels that the employer has fulfilled their obligations to provide development opportunities, provide a trusting and respectful employment relationship,

and be truthful, the more the IT professional is willing to be loyal and defend the organization. Age is also found to be a significant predictor of loyalty, in that older IT professionals indicate greater loyalty to the organization than younger IT professionals.

High levels of fulfillment of the tangibility dimension of the psychological contract were positively related to high levels of the OCB dimension – obedience. The tangibility dimension again refers to the explicitness to defining the boundaries, terms and expectations of the employment relationship. Therefore, the clearer the terms of the employment contract and the more the employer respected and upheld those terms, the more inclined the IT professional was to produce quality work, follow rules and not neglect aspects of their job responsibilities.

The study corroborates prior research by Organ and Ryan (1995), in that females exhibited higher levels of organizational citizenship than males. Females indicated higher obedience than males. Gender was the sole significant variable in explaining the OCB dimension – functional participation, which relates to higher levels of working beyond expectations, or exceeding formal job requirements, and going the extra mile.

Innovative Work Behavior

The relationship between employee and employer is tenuous in today's IT labor market. The scope and tangibility dimensions of the psychological contract had the most influential effects in the relationship. Managers making simple gestures, such as expressing appreciation to their IT professionals can improve a situation considerably (Motti, 2006). This study finds that if employers fulfilled their obligations to express appreciation of the IT professional's work, consider their personal effort in the performance of their jobs, improve their treatment of them, and stick to agreements, the IT professional was motivated to perform greater levels of innovative work be-

havior, such as create new ideas, search out new processes, transform innovative ideas into useful applications, etc. West and Farr (1990a) recognize innovative work behavior can be an intentional act, which can be withheld, as easily as it can be performed. The innovativeness and creativity of IT professionals remains a vital component to the organization, and the ability of the employer to improve perceptions of the employer-employee relationship is found to be a common denominator in the equation.

The IT professional's volition, or their preferences for their permanent employment arrangement, was also found to affect their innovative work behavior. However, it was the IT professional, who preferred an employment arrangement other than their permanent arrangement, who indicated higher levels of innovative work. This suggests that perhaps the IT professionals engage in innovative work as a means to facilitate some other objective.

CONCLUSION

An important contribution of this study is its investigation into the innovative work behavior of IT professionals. While research continues to investigate the motives and cognitions around creative and innovative work behavior (Christensen, 2006; Janssen, 2000; Ramamoorthy et al., 2005), this study finds that some aspect of the IT professional's innovative work behavior may be determined by the level of fulfillment of their psychological contract. Recognizing the importance of how IT professionals perceive their environment, these perceptions can affect their creativity, which is the seed of all innovation (Amabile et al., 1996).

Another important contribution of this study is in the use of the dimensional approach to the psychological contract. This more expressive view of the perceptual nature of the psychological contract explored the underlying dimensions of the

psychological contract, while assessing the level of fulfillment. The dimensional approach enabled examination of the psychological contract and its affect on employee behavior by seeking to understand in greater depth, the motivations behind the IT professional. This is an improved illustration over the content approach of the psychological contract, especially with the increasingly complex employer-employee relationship of those in the IT industry.

A strength of this study is in the research methodology as it relates to the data collection and the sample. The administration of the questionnaire was through two means: an on-line survey and a group-administered paper survey, and the respondents were obtained from two sources: alumni from the management information systems program and graduate students in management information systems program evening classes of a major southeastern university.

This study used cross-sectional data and was strictly based on self-report data and did not look at IT employee evaluations by peers or supervisors. As in all research that involves self-report data, there is the potential for self-report bias (Organ & Ryan, 1995; Spenner, 1990); however, Spector (1987) contends that the typical criticism in using self-report measures involving attitude and perception measures may not be factual. Rioux and Penner (2001) obtained ratings from a number of different sources, e.g., self, peers, and supervisors, in an effort to minimize mono-method bias and found self-ratings of OCB comparable to both peer and supervisor ratings.

Possible factors influencing the low response rate of 9.7% was the length of the questionnaire and the controls established within the on-line survey. Those responding to the on-line survey also had to answer a minimum number of questions to successfully submit the questionnaire.

The psychological contract dimensions first empirically tested by Sels et al. (2004) and then analyzed in this research require additional studies to further validate and improve the scales,

particularly stability. The focus scale, which was developed for this study, also requires further validation and improvement. The low adjusted R^2 values of the regression models suggest that there are other factors, such as job demands, perceptions of fairness, or personality factors, that may help to further explain the organizational behaviors of IT professionals (Organ & Ryan, 1995), and should be investigated.

For practitioners, the results indicate that the IT professional's perceptions are very relevant in the employee-employer relationship, as Karl Weick so aptly stated, "believing is seeing" (2001, pg. 195). The strong relationship found between the OCB dimension – loyalty and the IT professional's level of fulfillment of their psychological contract sends an unmistakable message to management for the continued need for clear communication between employer and employee. Shore and Tetrick (1994) contends that if organizations don't understand the employee's psychological contract under which they are operating, some strategic business decisions for cost savings and improvements may result in violations to the employee's psychological contract. And as seen in this study, the IT professional's performance of organizational behaviors, specifically their citizenship behaviors - loyalty, obedience, advocacy participation and most importantly innovative work behavior, are affected by their perceptions of their employer's fulfillment of psychological contract obligations to them.

Management has the ability to improve the employer-employee relationship by focusing on and addressing specific issues found within the dimensions relating to the IT professionals' psychological contract. Management could conceivably ask employees to anonymously rate the company's performance on issues such as being clear about opportunities for advancement, improving trust within the organization, providing development opportunities, and finding ways to show appreciation for work performance Low scores may suggest that the employer look closely

at its practices in certain key areas. Yen, et al. (2008) found that training in cooperation and helping behaviors within project management teams influenced their success and when team members went above and beyond their job descriptions, projects were more successful. Using the dimensions of the psychological contract offers tangible employment relationship topics for management to identify and improve upon; it might be something as simple as investing in training opportunities or looking for tangible ways to show appreciation for a job well done (Motti, 2006).

Future research should extend this study by including IT professionals in relevant employment arrangements other than permanent full-time. Sourcing IT jobs beyond the permanent full-time employee has most likely altered how many human resource and management issues are executed (Ang & Slaughter, 1995), and the variability of employment arrangements for IT professionals or their working conditions is not likely to stabilize with continued offshore outsourcing, downsizing, or healthcare cost shifting (Koprowski, 2005). The dimensional approach to the psychological contract tells a more comprehensive story of the IT professional's understanding of their employer's obligations to them and as to what influences their subsequent behaviors, both organizational citizenship and innovative work. This study demonstrates that this approach might also be appropriate when investigating IT professionals in varied employment arrangements. Saying this however, future research might address how important the psychological contract.

The construct, OCB, has received attention referring to the need of better identifying its dimensions (Van Dyne et al., 1994), because of the blurring of the separation between in-role performance and OCB. Most OCB studies have been subject to non-managerial or non-professional respondents. IT professionals do not likely fall into these categories, and hence with their job descriptions, in-role performance and OCB may be harder to distinguish. Organizational behaviors,

OCB and IWB, were the focus in the study. Future research might consider investigating whether organizational behaviors within the OCB and IWB domain are considered in-role or extra-role behaviors by IT professionals. Other research might address what supports or leads to cultural or innovative behaviors within organizations.

With the ever-changing roles of the IT professional, management is challenged to understand how the employee perceives their role and the organization's role in achieving cutting-edge performance and creating competitive advantage in this global workforce. This study does not provide all the answers to understanding what affects their behaviors. However, we believe we have expanded our understanding of how IT professionals perceive their employment relationship and how the extent that the employer has fulfilled their obligations to the IT professional that this affects their subsequent innovative work and organizational citizenship behaviors.

Chapter 68

Ethics and Learning Organizations in the New Economy

Alexis Bañón

ABSTRACT

In the context of the new economy, business organizations need to learn faster, and to maintain and to improve knowledge, producing creative solutions based on their knowledge, skills, and new technologies to develop a customer responsive culture in a more economic and efficient way.

In order to achieve this, CEOs and Human Resource (HR) policies should potentially contribute to knowledge development by creating authentic learning organizations. The authors propose in this study that learning improvements in organizations are not just a matter of techniques or aptitudes, but also a matter of feelings, attitudes, and, above all, of the moral habits of their members. The authors strongly suggest complementing currently established conceptions of knowledge management and organizational learning through an explicit inclusion of ethics and ethical learning in organizations.

INTRODUCTION

In the context of the New Economy, but especially in a moment of general economic crisis, organizations require the ability to understand what is happening outside their environment in order to create a competitive advantage. And what is probably more important, new business organizations need to learn faster, and to maintain and to improve knowledge, producing creative solutions based on their knowledge, skills and new technologies to

develop a customer responsive culture in a more economic and efficient way.

In order to achieve this, CEOs and Human Resource (HR) policies should potentially contribute to knowledge development by creating authentic learning organizations. These organizations enable a learning environment for all members to consciously transform organizations and their contexts into situations "where people continually expand their capacity to create the results they truly desire, where new and expansive patterns of thinking are nurtured, where collective aspiration is set free, and where people are continually learning to see the whole together" (Senge, 1990, p. 3).

Moreover, we propose in this study that learning improvements in organizations are not just a matter of techniques or aptitudes but, also, a matter of feelings, attitudes and, above all, of the moral habits of their members. In this chapter, we strongly suggest complementing currently established conceptions of knowledge management and organizational learning through an explicit inclusion of ethics and ethical learning in organizations, to build up ethically healthy organizations where the process of learning is easier than in ethically unhealthy organizations.

Our purpose is to show that organizational ethical healthiness is an essential facilitator of the processes of learning by learning organizations in the context of the New Economy and global crisis.

This chapter is divided into five sections. The first section analyzes organizational learning and the concept of learning organizations. The second describes the explicit need to consider ethics and ethical learning competence among agents in a learning organization context. The third section distinguishes between ethically healthy organizations from ethically unhealthy organizations, as concepts that help to better understand the ethical quality of an organization. The fourth section lays down the argument that the ethical healthiness of the organization is an essential contextual facilitator for learning processes and for constructing

learning organizations. Finally, some conclusions and future lines of research are put forward.

1. LEARNING ORGANIZATIONS

For many years, we have been hearing that we live in a "knowledge society" (Toffier, 1990; Bell, 1973; Drucker, 1968). As is widely accepted today, the concept of knowledge is based on two primary elements: information (explicit knowledge) and know-how (tacit knowledge) (Simmonds et al., 2001; Nonaka, 1991).

Information is considered to be the knowledge that can be transmitted without loss of meaning and truth, once the syntactical rules required for interpreting it are known. Thus, knowledge as information implies knowing what something means, and that it can be written down (Grant, 1996; Nonaka, 1994). In this sense, defining knowledge as information whose validity has been established through evidence allows distinguishing it from opinion, speculation, beliefs, or other types of unproven information (Liebeskind, 1996).

On the other hand, know-how, as tacit knowledge, is a much more complex concept than information. It can be defined as the accumulated practical skill or experience through time that allows one to do something efficiently. Therefore it is a personal quality -that involves both cognitive and technical elements- difficult to formalize and to communicate because it is not easy to write down (Grant, 1996; Nonaka, 1994).

Knowledge appears then as the key element to define the learning process (individual and organizational) because it can be understood as the result of transforming information into knowledge (Nonaka, 1994), although other understandings conceive learning as an outcome (Nicolini and Meznar, 1995; Dodgson, 1993).

But, if we understand learning as a process, can we distinguish individual learning from organizational learning? Is it possible to distinguish different types of learning according to the subject of the

learning involved, individual or organizational? According to Weick (1991) "individual learning occurs when people give a different response to the same stimulus" while "organizational learning occurs when groups of people give the same response to different stimuli" (p. 121). Therefore, it seems reasonable to talk about organizational learning as something different from individual learning (Kim, 1993). The question now is if we can associate organizational learning to a well-managed knowledge organization or if having organizational learning is not necessarily the same as managing knowledge correctly. In other words, is organizational learning of an organization the same as being at the head of a learning organization?

According to the literature, learning organizations appeared as a result of the adjustments and pressures modern organizations had to face to remain competitive in the business environment (O'Keeffe, T. 2002). These types of organizations facilitate the learning of their members to be able to continuously transform themselves (Pedler *et al.*, 1997). They accomplish their goals based on a culture of trust that generates free and reliable communication, allowing co-operation between individuals and groups (Argyris, C. 1999), mainly focusing on five features: systems thinking, personal mastery, mental models, shared vision and team learning (Senge, P.M. 1990). All the above mentioned contextualizes Senge's (1990) definitions of Learning Organization quoted by Malhotra (1996) as the organization as "a group of people continually enhancing their capacity to create what they want to create".

Academic literature does not always agree as to the answer to the question of whether the Learning Organization and Organizational Learning are different concepts (McGill et al.,1992) Nevertheless, we understand that Organizational Learning and Learning Organization are distinguishable based on Ang & Joseph's (1996) idea that differentiates process -Organizational Learning- from structure -Learning Organization-. In this sense, and accord-

ing to Malhotra (1996), a Learning Organization is an "Organization with an ingrained philosophy for anticipating, reacting and responding to change, complexity and uncertainty" (p. 2).

In synthesis, all these authors suggest that the Learning Organization creates the conditions for a constant Learning Organizational Environment. But, what are those conditions, or what should those conditions be?

2. EXPLICIT CONSIDERATION OF ETHICS AND ETHICAL LEARNING

Organizations where knowledge is managed have in common the fact that knowledge (tacit and explicit) is shared between human beings. This premise is not only true for creating and processing knowledge, but also for its management. But, what kind of knowledge should people and organizations acquire? Is it enough with information and know how? Knowledge has different effects and, broadly understood, its concept not only develops theoretical or scientific dimensions (*knowing*) and practical or technical-artistic ones (*knowing how*) but, also, ethical conduct (*knowing how to live*) (Guillén, Fontrodona and Rodriguez, 2007). Therefore, we strongly suggest that humans must learn by acquiring not only knowledge and skills (technical habits), but also moral virtues (ethical habits).

Unfortunately, moral dimension has received scant attention in knowledge management literature, but also in general management. As Sumantra Ghoshal (2005) plainly described, "many of the worst excesses of recent management practices have their roots in a set of ideas that have emerged from business school academics over the last 30 years", the question is that "by propagating ideologically inspired amoral theories, business schools have actively freed their students from any sense of moral responsibility" (2005, p. 75).

Morality or ethics has to do with the right and proper completion of a human person with hu-

man excellence (through rational judgement and practical action). The moral dimension demands a kind of moral or ethical learning understood as the acquisition of theoretical moral principles of conduct and of practical moral virtues (Guillén, 2006). And in this sense, ethical knowledge or competence could be described as the possession of certain principles or behavioural norms for achieving good ethics, combined with practical habits for personal improvement. Some of these relevant virtues described in business ethics literature are fairness, responsibility, loyalty, honesty, integrity, humility, tolerance, determination, enthusiasm and courage, among others (Solomon, 1992).

By broadening the object of management to the study of moral human conduct, a new line of research opens up that complements the current findings in social sciences and allows the study of aspects that have not been discussed in previous research. We maintain that an assumed evaluative ethical "asepsis" ends up being extremely limited in understanding human behaviour in organizations. The contribution of ethics complements the study of organizations and the behaviour of its members by addressing it in terms of good or bad in relation to how it affects the improvement of the person or people involved and of society as a whole, but also explaining some requisites that are indispensable to understand organizations as groups of human beings.

In this way, together with the climate of desirable and demandable *competencies* and *skills –technical habits–* for a correct management of knowledge, we consider it important to complement the current scope by also considering *ethical or moral habits*. This allows us to take a deeper look at aspects such as fairness, trust, reciprocity or commitment, essential for explaining learning organizations.

Ethical knowledge is both theoretical and practical, and implies a way of growing in the human sense, of becoming a better human being, or what the ancient Greeks called being "virtuous".

Ethical or moral virtue (human excellence in Greek) is a stable character habit in people that enables the achievement of ethical goodness. The habits of the will are those denominated by the Greek philosopher as moral or ethical virtues. As we have just stated, to act correctly does not only require a sound choice of methods, but also a correct inclination towards the goals. In reference to the acquisition of these habits, Aristotle wrote: "we become just by doing just acts, temperate by doing temperate acts, brave by doing brave acts" (Nicomachean Ethics, II, 1, 1103b). The moral virtues are those operative habits which make human beings behave in a way which contributes to making their personalities flourish.

For example, the virtue of sincerity is the habit required as a result of repeatedly telling the truth. In the same way as occurs in other areas of theoretical and practical learning, such as in sports or in handling vehicles, repeating acts generates habits. In a moral sense, moral habits are generated, and are called virtues when they contribute to enriching the person as a human being. Someone who habitually tells the truth acquires the habit of sincerity, while a person who is normally fair acquires the moral virtue of fairness, and the same thing happens with any number of other virtues such as prudence, strength, hard work, order or patience.

Both, moral virtue and competence are kinds of human knowledge. While competence embodies notions of learned skills and technical efficiency, *virtues* offer perspectives to shape the way we live bounded up in ideas of morality (Macaulay and Lawton 2006). Virtue and competence are distinguishable concepts although they are interrelated because they require one another: "Competencies embody certain virtues, whereas virtues require competence in order to successfully implement them through virtuous actions" (Macaulay and Lawton 2006, p. 702).

Having arrived at this point, the question should be asked: What exactly is the relevance of ethical knowledge and learning, and how does

it affect learning organizations? To be able to answer to this question, we should first consider how the ethical personal level of analysis affects the organizational level.

3. THE ETHICAL HEALTHINESS OF THE ORGANIZATION

In this section, we examine in more detail the role played by the organization in terms of *means* or context, and in terms of a climate capable of enabling or impeding the process of transmission, reception and creation of knowledge on the part of its members. The interesting question to be addressed here lies in analyzing to what extent the ethical quality of the organization affects this process.

If we look at the concept of a "virtuous person," by analogy, we can probably discover elements that could be present in the concept of a "virtuous organization". Collier (1995) described "virtuous organizations" based on the idea that the organization is a "moral person" and that it is meaningful to speak about organizations as "virtuous". She then lists four features of virtuous organizations: appropriate purpose, discernment of purpose in relation with human flourishing, action to fulfil the purpose and qualities to attain goods. The first two characteristics are related to principles and judgement, and the second two have to do with practices.

In a similar way, avoiding the debate of considering organizations as moral individuals, Guillén (2006) describes the ethical quality of an organization by using the clinical analogy and by distinguishing between ethically healthy and unhealthy organizations. This study adopts the use of such terminology.

3.1. Ethically Unhealthy Organizations

An ethically unhealthy organization "is that which contributes, to a lesser or greater extent, to the human *impoverishment* of its members, of the people involved in achieving its mission and those affected by its activity" (Guillén, 2006, p.36). In biological terms, we say that an organism is sick when its members and the functions they perform suffer some kind of pathology or dysfunction. In ethical terms, the "pathology" is equivalent to actions that lack a human quality, without moral competence or virtues such as honesty, sincerity or veracity, to give just a few examples.

If a member of the organization ends up being selfish, bigheaded or a liar as a result of belonging to that organization, we can state that this is the case of an unhealthy organization; an organization that destroys or impoverishes the human quality of the people in the organization and those it serves.

Does the organization I work for allow me to grow in human virtues? Am I better or worse as a person since I began working at that organization? If the answer is no, if instead of being more sincere, more hardworking, more generous or more honest we are the complete opposite, then it is likely that the organization in which we work suffers some kind of ethical illness and in such cases, it might be a good idea to ponder to what extent we are one of the causes of that situation.

The ethical sickness of an organization can be explained by the poor moral quality of its aims or its means, or of the people that make it up (its moral competence). This would be the case of organizations in which the objectives or reward systems might lead to dehumanizing their workers. Generally speaking, any management mechanism an organization uses and the people that manage it have an influence on the behaviour of its members, in the same way as they affect it by giving a good or bad example. When these aims, means or people lead to a deterioration of the moral virtues

of members, then we are dealing with an ethically unhealthy firm.

The ethically unhealthy firm destroys the human element, and thus does the same to human relationships in the deepest sense, as it does with the trust these relationships are based upon. Although it may be efficient in economic terms, this organization is destructive in ethical terms and is doomed to a lack of union, to disintegration.

The same happens to ethically unhealthy firms as it does to organisms under the attack of some type of virus; it tends to spread and propagate to the other cells. This would be the case of negative behaviour or reactions guided by jealousy, envy or suspicion. To deny this fact would be to deny the reality of the ethical condition of human beings, elements that constitute the organization.

Just as we can refer to the ethical sickness of an organization, we can also talk of the opposite; the ethical health of an organization. When ethically positive behaviour is accepted, praised, and promoted within an organization, we have what can be classed as a "healthy" organization in the ethical sense.

3.2. Ethically Healthy Organizations

An ethically healthy organization "is one that contributes, to a greater or lesser extent, to the human enrichment of its members, of the people involved in achieving its mission and those affected by its activity" (Guillén, 2006, p. 37). The ethical health of an organization can be explained by the good moral quality of its aims, of its means or the people that constitute it. An organism is healthy when its members and the functions they carry out are correct. In ethical terms, correctness is equivalent to acting with human quality in line with moral standards.

The ethical health of an organization can be explained by the possibilities it provides to its members for their personal human enrichment, for their growth in virtues, as well as those of the people it serves. All of this can be attained

precisely via the development and practices of the work of each of its members.

Some examples might help to further clarify this concept. "In an ethically healthy organization, constructive and not destructive criticism is habitually provided; people are able to work in teams, members are aware that this enriches people as individuals and the organization as a whole, both at an intellectual level and in terms of habits and emotions; collaboration with others is common, members do not try to "trip each other up"; knowledge is shared experience and does not remain with isolated members for selfish reasons or due to a fear of opportunism; people cooperate to work towards the common good of the organization and of society in general, not exclusively for self gain: in short, people attempt to work using their human qualities, thereby contributing to "building" trust and hence building the organization and stable human relationships" (Guillén, 2006, p. 37).

The concept of "ethical health" is a gradual one, i.e. health is understood as the absence of sickness, but this sickness can vary in size. Indeed, and talking in the strictest sense, even in healthy organisms, there are always small imperceptible pathologies. Precisely because it is people that make up organizations, moral defects are always present and can lead to small anomalies, misunderstandings, etc. Therein lays the possibility of making mistakes, of doing wrong. This is a fact of universal experience, all human beings do things wrong in moral terms. It is for this very reason that the concept of ethical health, in the same way as biological health, allows us to apply suitable remedies, to make rectifications after making mistakes. We are thus faced with a concept of moral health that is dynamic, that can improve or worsen, that grows or decreases, that is always gradual, precisely because human beings are free and we are responsible for our own actions, and are capable of recognizing mistakes and of finding the means to change and rectify. In this sense, it is possible to talk of degrees in the ethical

quality of organizations. Perfect health would not exist, but it is possible to have a permanent trend towards that goal.

Following this logic, the healthy organism is not only free of sickness, but its health gets better the more it moves towards a complete state of wellbeing, towards total health. The concept of excellence can thus be used to qualify a permanent search for ethical health. Moral excellence presupposes the existence of ethical health along with a *permanent and complete* effort towards improvement. One can thus define an ethically excellent organization as "one that permanently makes an effort to contribute to the *full* human development of *all* its members, of *all* the people involved in achieving its mission and *all* those affected by its activity" (Guillén, 2006, p. 38).

Evidently, the concepts of ethical *sickness, health* and *excellence* are not exact terms, as they refer to human groups in a permanent state of dynamism. In an excellent organization, there may be, and indeed there is, occasional behaviour of a lower ethical quality. However, we can talk of excellence when this dimension forms a habitual part of the means, aims and behaviour of the people in the organization. When the ethical quality of the behaviour of members of the organization ceases to be a common goal for all, we may still be talking about organizations that are more or less ethically healthy, but we can no longer state that they are excellent.

In the same way that the relationship between health and excellence is a question of degree, in a positive sense, so is the relationship between health and sickness. When we talk of ethical sickness, this emphasizes the existence of more or less stable behaviour that encourages the destruction of the human qualities in people, their debasement, and their lack of union, and in the long-term, if measures are not taken, the *dysfunction* of the organization.

The term ethical health therefore allows us to describe organizations that, in general terms, do not encourage dishonest, unfair, deceitful, damaging

behaviour. They are thus organizations that allow or even contribute to human development. To the extent that this contribution becomes a mission and permanent task in the organization, with the stable purpose of the continuous improvement of all those affected by the activity of the organization, we can then talk of a total ethical bill of health, of complete ethical quality or ethical excellence.

Having reached this point, and returning to the question that we proposed in previous section: To what extent can we say that the ethical quality of the organization influences or may influence the process of the transmission, reception and creation of knowledge, the process of learning in organizations?

4. THE ROLE OF ORGANIZATIONAL ETHICAL HEALTHINESS IN ORGANIZATIONAL LEARNING

Learning organizations find themselves in a permanent process of knowledge communication. We suggest that this communication requires members in the organization that are capable of being good transmitters, receivers, and also good message creators. In order to explain the role of organizational ethical healthiness this section firstly focuses on an individual level of knowledge transmission and creation understood as a process of constant dialogue, and then moves on to examine the organizational plane.

4.1. Understanding Learning Processes as a Permanent Dialogue

Particular people acquire knowledge in organizations and this knowledge is communicated, by in large, through dialogue to the other members. Each individual can play different roles or go through different stages of the process of communicating knowledge.

The first stage involves a *knowledge receiver*, understood as the person that receives knowledge

that allows him/her to carry out tasks, but also to develop skills, competencies and habits that he/she can then maintain, which do not necessarily have an impact on the rest of the organization. The analogy here could be that of a "pool" or store of knowledge. Logically, people can be either good or bad pools of knowledge.

A second stage of the process of the communication of knowledge is that which acts as a knowledge transmitter, i.e. the person that transfers acquired knowledge to other members of the organization. Closing the circle would mean a person who is both, a receiver and transmitter of knowledge, the stage where they do not only receive but also impart knowledge either by informing or by training (teaching). Returning once more to the hydraulic analogy, this person would represent an excellent channel for knowledge, as this channel not only receives, but also gives.

But the transmission and reception of knowledge alone (explicit and tacit) are insufficient. Today, it is not enough to have good pools and channels of knowledge. Firms in the New Economy are complex organizations facing complex environments. Their reality does not allow them to make do with faithfully receiving and transmitting what they have learnt. They need *all* their members to vindicate their condition as free people with understanding, free will and feeling for creating value in their tasks via a level of involvement that generates new knowledge, ideas, principles, values, procedures, attitudes, behaviour etc.

Learning organizations in the New Economy require the creation of knowledge and for this reason cannot afford to waste opportunities wherever they may stem from, either from within the organization or outside it. Therefore, firms must not only promote downward learning but also upward and horizontal learning. The organizational structure must promote and absorb learning and/or knowledge creation situations from boss to subordinate, subordinate to boss, among peers and not only within the firm but also outside it.

Firms today must focus their attention on all aspects that are necessary not only for learning, but also for teaching, teaching how to learn and learning how to create knowledge. Within the framework of the communication of knowledge, it is not enough to be good receivers and communicators of messages, it is also essential to be able to create new messages. It is necessary for each member of the organization to be a good "pool", a good "channel" as well as an authentic "source" of knowledge or knowledge creator. The "source" not only gives and receives, but also creates. Learning, creating and teaching are the obligations of the members of an organization that wishes to be called a learning organization.

In response to our initial question on the relevance of moral habits or ethical virtues in knowledge management, an answer is already beginning to surface. In the communication of knowledge in organizations, it is not only knowledge and technical skills that are involved, but also attitudes and moral habits or virtues.

Those that are sceptical about recognizing the place of ethics in business might argue that knowledge management, in so far as it can be parameterized, can also be managed using protocol and measurements that allow for its creation, processing and retention. But, can ethics and ethical knowledge be managed?

If we distinguish between explicit and tacit knowledge, the former is liable to be formalized, and can hence be measured and managed. Conversely, tacit knowledge is not a formalized type of knowledge. On the contrary, at times it is neither understood nor perceived; it is *silent knowledge.* Due to its nature, this type of knowledge can be neither measured nor managed in a controllable way, and the same can be said about tacit ethical knowledge. Nevertheless, tacit knowledge and the most ambiguous and non-delimitable explicit knowledge will only have an effect on the organization in so far as enough conditions of trust exist for these effects to occur and remain over time.

As we go on to suggest, organizational ethical healthiness is essential in learning organizations.

4.2. Organizational Ethical Healthiness: A Contextual Learning Facilitator

In this study, we maintain that; *the better the ethical health of an organization the easier it should be for its members to act as good pools, channels and sources of knowledge*. We are aware that empirical support will be necessary to validate this proposition, but the purpose of this study is to present just such a thesis. We maintain that moral competence, ethical virtues, or their absence as well as the greater or lesser presence of ethical aims and means, have a direct repercussion on the way people work, teach and create knowledge around them. Put differently, theoretical and practical knowledge, the acquisition of intellectual, psycho-affective and technical competencies is inseparable from moral knowledge and indeed has a direct repercussion on the way in which this knowledge develops.

We agree with Zamagni (2010)[1] when he points out that to "make the most of the tacit knowledge of our employees, we have to know how to establish reciprocal relationships with them, because I can force someone to arrive at work at 8 in the morning or to be in the office for 8 hours, but I can't force them to contribute their best ideas, their intellectual capital to the organization. (…) The only way of taking advantage of people's tacit knowledge (….) is through reciprocity" (p.2). In other words, the way of getting the best out of each member of the firm is through the reciprocal, mutual and parallel growth between the firm and its members in an atmosphere of reciprocal moral trust, which is the best way of managing tacit knowledge.

When it is someone's duty to transmit information in an organization, that person will perform the task better from an ethical point of view and hence also from a professional one, in so far as

the knowledge acquired will be transmitted with *high fidelity* to the rest of the organization. From the organizational perspective, this attitude or moral competence, of being a right "channel" of knowledge, represents an element of union, a unity in a *win - win* relationship based on a job well done. Furthermore, this moral competence has repercussions for the personal development of the agent and his/her contribution to the development of the organizational fabric.

Being an element of union and unity becomes a behavioural norm or ethical principle of action for whoever wants to carry out their work correctly in the organization. "Behaving intelligently, using information correctly, analyzing it and making sure it reaches the people that have the right to access that information generates trust and builds organizations. Work provides the chance for the development of personal and organizational welfare." (Guillén, 2006).

In addition to the moral virtues of fidelity and unity, members of the organization also require *humility*. Without humility among superiors, subordinates and peers, it is not possible to have a climate that is capable of recognizing limitations and of learning from those that can teach. The firm understood in this sense must be capable of detecting the generators and builders of knowledge regardless of their hierarchical level. When the intermediate managers are capable of recognizing their limitations and learn from those that can teach them, be they superiors or subordinates, they are in a condition to become generators or builders of trust, the course along which tacit knowledge truly flows.

Another essential moral competence for knowledge creation is *prudence* or practical wisdom for determining the degree to which it is possible to cooperate in the development of knowledge. The nature of the virtue of prudence allows organizations to discover which ethical principles are applicable in each particular case and to what extent it is necessary to evaluate the

degree of commitment of the organizations with its members, and vice versa.

Together with the virtues of humility and prudence, and in line with a concept in the field of knowledge management understood as communication, a good transmitter of knowledge requires another moral competence, that of having a conversational nature. In this sense, *dialogue* is a key component that demands reciprocity and the willingness to listen. Dialogue enables the establishment of the dual teaching-learning flow in both directions and senses: horizontal – from left to right and right to left- and vertical –up-down and bottom-up–.

Regardless of whether or not the firm is looking to manage that *knowing how to live*, going further than *knowing* and the *know-how* of its members, ethical health is an essential condition for the transmission and generation of both explicit and tacit knowledge. Without trust on an ethical plane, it is extremely difficult to get out of the plane of obligation, whilst conversely, when we can trust that the organization in which we work has aims that are in harmony with our wellbeing and that of society, we are dealing with the most suitable breeding ground for a fluid communication of knowledge, so that all the members of the organization can truly be pools, channels and sources of knowledge. It is for this reason that learning organizations require permanent communication and articulation via continuous dialogue between the organization's members: people.

5. CONCLUSION

The New Economy and current worldwide economic crisis demands that firms should be capable of reinventing themselves if necessary. Today's problems do not only demand internal free and reliable communication, but a higher level of co-operation and trust between individuals and firms. In this study, we propose that organizational ethical healthiness constitutes an essential facilitator for building authentic learning organizations. Today, technical learning is essential but it should be complemented with the ethical one.

State of the art equipment and technology are no longer a key differentiating element as the cost of acquiring the latest technology is within the reach of practically anyone. In any case, both information and technology can be bought. The same thing cannot be said, however, for aspects such as innovation or knowledge creation, and even less so in the case of behavioural dimensions such as personal involvement or initiative resulting from a high level of commitment on the part of workers towards the organization.

Current organizational reality implies making a major leap towards placing their value added in those elements that are inherent to each firm and are non-transferable. If we understand the organization as a group of people arranged in such a way as to achieve an objective or aim, are these people, their actions, relationships, contributions, originality and singularity not the DNA of each firm?

Despite the fact that it may seem obvious to highlight the importance of people in the organization, there is no doubt that 'people' concentrate and represent knowledge and organizational knowledge. Both of these aspects are manifested in human relationships and are built up in atmospheres of trust, respect, desire, commitment etc. It is precisely for this reason that within such a context, it appears logical to assume that businesses firmly committed to ethics, in addition to knowledge management and lifelong learning, can easier develop to their full potential.

Ethical virtues of the members of the organization, such as humility or loyalty, are essential for a learning organizations to attain their goals, but also other virtues such as the audacity to conquer new ideas, goals and high standards; the courage to avoid difficulties; the constancy to overcome failures in the learning process and the benevolence, trustworthiness and reliability to share ideas.

In order to be able to build ethically healthy organizations, and in order to achieve ethical excellence, HR policies are required that consider this third type of knowledge, knowing how to live. However, having an interest in achieving stable, good behaviour among the members of an organization is insufficient. The ethical quality of organizational behaviour does not solely depend upon human resource policies. Top management must ensure that not only behaviour, but also the organization's aims and means are really designed to contribute to the common good, to the ethical welfare of the members of the organization and the people it serves. This constitutes a truly ethically healthy organization, and we propose that this is an essential facilitator of learning processes.

There is no question that the proposals made here call for future research. Empirical verification of the theoretical propositions made here is necessary. Furthermore, much deeper studies should be carried out to better understand unexplored fields such as the relationship between ethical and technical learning in organizations, its influence on other organizational outputs such as organizational trust and organizational commitment, or its relationship with economic results.

Logically, some practical implications follow from the proposals made here. Top management should be the first to set an example in terms of the moral quality of their behaviour, intentions and the means they use to facilitate learning in their organizations. Nonetheless, this does not reduce in the slightest the personal responsibility of each member of the organization in making it a place where everyone reaches personal fulfilment through the exercise of professional work.

Professionally, technical learning cannot be separated from ethical learning, precisely because we are free, responsible human beings. The final outcome of work in organizations combines the external or explicit (measurable) results with internal or tacit ones, such as the capacity to generate and construct trust between agents. The most suitable organizational climate for lifelong learning requires trust in its technical and affective dimension, but above all in an ethical one. It is a fact that humans learn whilst carrying out their work, and in that learning the most technical aspects live alongside the most human ones. We either become enriched by our work or debased by it. This is a personal decision, but one which the management of the firm can do much to influence.

Chapter 69

The Importance of Psychological Contracts in Human Resource Management within the New Global Economy

Inocencia M. Martínez-León
Technical University of Cartagena, Spain

ABSTRACT

Human resources are considered the company's most valuable resource. For that reason, organizations require a Human Resource Management (HRM) that provides the adequate work force within the new global economy. The psychological contract includes solid agreements between company and its employees, beyond the written contract, specifying their contributions, expectations, beliefs, promises, and obligations between both parties. Their management requires the definition of the concept of psychological contract, the analysis of its main characteristics and contents; and the identification of its stages of development. Electronic Human Resource Management (e-HRM) introduces a way of implementing HRM strategies through Web-based tools, improving the psychological contract management. Information phase, Intranet, and internal electronic mail have an important role in socialization stage. The consolidation of psychological contract (maintenance phase) is favoured by Intranet, business-to-employees, internal electronic mail, database, videoconference, and groupware. Finally, in breach phase, intranet, electronic mail, database, videoconference, and groupware are important E-HRM.

1. INTRODUCTION

In the global economy, human resources are considered to be the most important asset of an organization, but very few organizations are able to fully harness its potential. Human resources are also considered the most important component of a corporation's competitive advantage in global markets. As human resources are considered the company's most valuable resource, it is necessary to improve their management.

Human Resource Management (HRM) refers to all of the dedicated activities that an organization uses to affect the behaviours of all the people who work for it (Jackson & Schuler, 2003). HRM is defined as "the policies, practices and systems that influence employees' behaviour, attitudes and performance" (De Cieri and Kramar, 2005). Ideally, these comprise "activities undertaken to attract, develop, and maintain an effective workforce within an organization" (Daft 2000), who ensure the effective functioning and survival of the organization and its members. Organizations need to hire the right numbers of people, with the right qualifications, for the right jobs, in the right locations. Line managers' expectations are to attract and retain excellent employees from the workforce pool. The impact of HRM policies and practices on firm performance is widely accepted and become an important topic in the fields of HRM, industrial relations, and industrial and organizational psychology (Kleiner, 1990; Boudreau, 1991; Jones & Wright, 1992). For these reasons, organizations try to optimize their HRM.

2. MAIN PURPOSE

The classical employment relationship, open-ended as to both its task content and its duration, was tying stable rates of pay to indefinite duration jobs. Employers offered job security and internal career opportunity with little risk of exposure to their workers (Kluytmans and Ott, 1999; Rousseau & Schalk, 2000), because workers did not leave, and certainly not to the competitor (Kluytmans and Ott, 1999). Employees were obedient and disciplined when carrying out their function and when requesting reallocation; and provided maximum performance at present function (Kluytmans y Ott, 1999).

In return, employees expected the reward of loyalty through continuation of the labour relationships and job security (Hiltrop, 1995; Kluytmans and Ott, 1999), irrespective of eco-

nomic circumstances; the control of career by employer (Kluytmans and Ott, 1999) and payment of a guaranteed wage (Garud & Shapira, 1997; Rousseau and Shperling, 2003).

In the new global economy, increasing international competition, deregulation and globalization of markets have demanded greater flexibility and productivity of organizations. Firms have made the organizational structure change from a hierarchical to a flat form, accompanied by rapid reduction of the permanent core workforce, supplemented by a larger group of temporary contract and contingent employees, which has become a common employment staffing practice in today's modern organizations (Byrne, 1993; Allred *et al.*, 1996; Nicholson, 1996). New forms of labour contract has therefore emerged, such as fixed-term contracts, temporary contracts, etc (atypical contract). They are more short-term contracts and provide fewer career development activities (Pieters, 2009). Companies introduce new strategies, methods and techniques to attract and retain talented workers (Hiltrop, 1995, 1999; Ermel and Bohl, 1997; Rousseau and Shperling, 2003). Large companies had a core group of professional employees who were dependable, who would work hard and who would sacrifice the present for the future (Hiltrop, 1995).

For *organization*, new contractual forms provide greater flexibility and a good deal of enforceability (Marsden, 2004; Silla *et al.*, 2005). Instead of career paths and job security, a new kind of security, called "employability security" is established (Hiltrop, 1995; Schein, 1996). This is the promise that the employee's skills will be enhanced, and access to other tasks and assignments will be facilitated. Moreover, a new pay system is applied, based on flexibility bands to encourage the members to develop new skills (Hiltrop, 1995; Kinnie *et al.*, 1999; Silla *et al.*, 2005).

On the other hand, new contractual forms are getting *employees* to broaden their skills, by organizational learning and training programs, and identify the development of additional skills

as a prerequisite for advancement (Schuler and Jackson, 1987). Workers receive higher salaries linked to performance and skills, rewards linked to performance, absorbing risk and exposure to market volatility (Rousseau and Shperling, 2003; Silla *et al.*, 2005). They consequently assume more responsibilities, and take risks (Schuler and Jackson, 1987). Workers may also manage the organizational intangible resources (knowledge, culture and business reputation, etc.).

This important change in employment relationship has generated a radical change in the relationship established between employer and employee, which must be adequately managed. Today's organizations need, among other actions, (a) to reach solid agreements with their employees, beyond the written contract, specifying the contributions and inducement that each party will receive from the other; (b) careful consideration of expectations in order to overcome ambiguity with their employees (Sims, 1994); and (c) examining and exploring the changing employment relationship. This new approach affects the employees, because the new psychological contract assumes that employees are not automatically loyal to their company as a whole, but that, as professionals, they will be moved by a new kind of loyalty to their own disciplines and skills. It also assumes that people will care more about their own development and that their skills are highly transferable between companies and industries (Hiltrop, 1995).

For those reasons, the psychological contract has reached a great importance nowadays. It is necessary to define the concept of psychological contract, analyze its main characteristics, contents, typologies; and identify its stages of development.

Electronic Human Resource Management (e-HRM) has both a negative and positive impact on employment relationship. Certain jobs are becoming obsolete on the one hand, and new job opportunities are created. IT tools improves information management, sharing information and knowledge, communication and coordination among different organizational members.

Thus, these tools facilitate HRM, organizational memory, business management and a corporations' ability to compete in the global economy. These utilities have some important effects in psychological contract management.

As a strong importance of the psychological contract has been reported in the literature, the aim of this study is to examine the role of psychological contract in the actual HRM, and identify the facilitating role of e-HRM on its adequate management. This chapter has been divided into four parts. The first part deals with psychological contract term, analyzing its different subjects, conceptualizations, contents and typologies. Next, the state of psychological contract is examined, considering three different phases. Third, e-HRM and their positive influence on psychological contract are studied. As a conclusion, section 5 presents a discussion on the results of the study, and suggests fields in which further study would be fruitful.

3. DEVELOPMENT: PSYCHOLOGICAL CONTRACT

In reality, a written contract which is explicitly agreed between employee and employer may not exist. When a worker is asked "Is that (task, obligation or benefit) specified in your contract? The reply is more often that it is not. This situation suggest that employees rarely have detailed knowledge about what is included in their contract of employment, or they don't remember what was agreed at the outset of employment. In 2000, Cooke *et al.* demonstrated work and employment-related agreements are often made on an *ad-hoc* and on-going basis between the employer and the employee as and when it becomes necessary to do so.

Under these circumstances, a new concept has emerged: the "psychological contract", which refers to the relationship between employee and employer in terms of the unwritten expec-

tations (Rousseau, 1989), beliefs, obligations, promises, and perceived perceptions that exist, they are not in a formal written contract, but in implicit expectations, often covertly held and infrequently discussed (D'Annunzio-Green and Francis, 2005), which determine the employment relationship. This broad conceptual term is increasingly used as a framework to study the employment relationship. This concept also has various meanings and interpretations among different subjects and constituencies. It is important, therefore, to mention that the conceptual model of psychological contract that is emerging from the literature review requires us to analyze its subjects, main characteristics, content, state and the e-HRM tools' influence on it.

3.1. Written Contract and Psychological Contract: Main Differences

The labour and capital relation includes written contract relation and unwritten psychological contract relation. Gradually, the psychological contract becomes the core content of HRM (Guest, 2004), in detriment to written contract. The psychological contract emphasizes that apart from formal contents regulated by the written contract, there are hidden, unwritten and largely unspoken sets of congruent expectations (Herath and Kishore, 2007), beliefs, perceptions, promise and obligations in the mutual relation between the organization and employees, which (a) mediates the unwritten employment bargain between the individual employee and the organizational agent to satisfy stakeholder requirements (Bathmaker, 1999), and (b) constitutes the important factors to decide employees' attitudes and behaviours (Rousseau, 1995).

The written contract is generally understood and usually includes four key factors: worktime required and available knowledge, skills and psychosocial abilities, and a wage-effort bargain (Huiskamp, 1995). However, the psychological

contract fills the perceptual gaps in the employment relationship and shapes day-to-day employee behaviour in ways that cannot necessarily be discerned from a written contract (O'Donnell and Shields, 2002). Hence, employees weigh their obligations, expectations and norms towards the organization against the obligations, expectations and norms of the organization towards them, because they are not created by only an explicit agreement, and adjust their behaviour on the basis of critical outcomes. Although psychological contract is an unwritten contract it also has a central role in work behaviour by better specifying the dynamics of the employment relationship, and can be a powerful determinant of workplace behaviour and attitudes (van de Ven, 2004).

In this sense, Ring and Van de Ven (1994) saw this "informal and psychological contract increasingly compensating or substituting formal contractual safeguards as reliance on trust among parties that increases over time".

3.2. Development of the Concept of Psychological Contract

A considerable amount of definitions has been published on psychological contract. The development of this concept can be divided into two parts. The first part deals with the work of early theorists from 1930 to 1980, which is known as the so called "classical approach" to psychological contract. The second part deals with the "modern approach" to psychological contract, and begins with the publication of Rousseau's work in 1989.

The *classical approach*, arguably, the idea of psychological contract appeared in Bernard (1938), continuing with the seminal work of Argyris (1960), Levinson et al. (1962) and Schein (1965) (Robinson, 1996; Morrison and Robinson, 1997; Zhao *et al.*, 2007).

Bernard (1938) revealed the psychological relations between employees and employers developed as result of an explicit process of co-operative exchanges between them, which

covered employee's implicit expectations of both material and non-material rewards (March and Simon, 1958).

In connection to the previous theories of Bernard (1938) and March and Simon (1958), Argyris (1960) defined the psychological contract as "the expectations of employer and employee which operate over and above the formal contract of employment". He introduced two different aspects. First, he only considered the material or transactional inducement and ignored nonmaterial or relational aspect of inducement (introduced by Barnard, 1938). Second, his approach was somewhat more close to the relationship between groups of employees and their supervisors, rather than a two-way relationship between an individual employee and supervisor (Taylor and Tekleab, 2004).

Shortly after Argyris (1960), Levinson *et al.* (1962) focused on employee-organization relationship as a dynamic contracting process involving an individual employee and organization.

Then, Schein (1965) focused on the need to recognize that the contents of psychological contract between employee and employer could incorporate not only material and economic dimensions but also non-material benefits that would satisfy both parties (Taylor and Tekleab, 2004).

In summary, the concept focused on mutual and reciprocal exchange relations between employee and employer (Argyris, 1960, Schein, 1965). In this step, more exploratory and less empirical research on the concept of psychological contract was done.

The beginning of *Modern Approach to Psychological Contract* was Rousseau's (1989) article titled "Psychological and implied contracts in organizations" (Rousseau, 1989). Rousseau (1989) defined this term as "an individual's beliefs in mutual obligations that a person and another party such as an Employer have¨, (either a firm or another person). This belief is predicted in the perception that a promise has been made (e.g. of employment or career opportunities) and a consideration offered in exchange for it (e.g. accepting

a position, foregoing other job offers), binding the parties to some set of reciprocal obligations". This proposal introduced the cognitive-perceptual or individual's mental model to psychological contract, describing it as cognitive-perceptual process or mental model (Rousseau & McLean Parks, 1993; Rousseau, 1995; Rousseau & Tijoriwala, 1998; Rousseau and Schalk, 2000). Hence, the psychological contract represents a cognitive model existing at the individual level rather than an exchange model incorporating different parties.

Beside the significant contribution of Rousseau and her colleagues, some critics challenged the cognitive-perceptual framework of psychological contract of an individual's mental model of relationship with his or her organization and viewed it as a narrower approach to psychological contract that focuses only on an individual employee but doesn't cover the organizational side (Morrison & Robinson, 1997; Guest, 1998; Coyle- Shapiro & Kessler, 2000).

However, some researchers emphasized the need to include both parties in psychological contract (employer and employee) (Tekleab & Taylor, 2003; Guest 2004). Moreover, many authors agree that the psychological contract is based on expectations (Argyris, 1960), perceived promises (Conway & Briner, 2005), beliefs (Morrison & Robinson, 1997) or obligations (Rousseau, 1990).

Despite these ideas, scholars have reached a consensus about the nature of the psychological contract.

The Modern Approach of Psychological Contract is dominated by more empirical studies and less exploratory studies.

3.3. Subject of Psychological Contract

Traditionally, psychological contract is held by employees alone (Shore & Tetrick, 1994; Morrison & Robinson, 1997). However, the inclusion of the employer's perspective is already a reality. In this sense, Guest (1998) argues that neglecting

the employer's perspective may be misrepresenting the core of the psychological contract, and the reciprocal obligations between two parties. In this study, the employment relationship is considered as the exchange process between two parties. For both reasons, employee and employer should be considered as *subjects* of the psychological contract.

Usually, "organizations become party to the psychological contracts as principals who directly express their own terms or through agents who represent them" (Rousseau, 1995). However, they can not "feel" a psychological contract with employees and respond accordingly (Rousseau, 1989). As Rousseau (1995) and Morrison and Robinson (1997) acknowledge, the organization is comprised of multiple agents with whom the psychological contract is made, but the authors do not consider these as proxies for the organization as there may be differences in what each agent is offering or expecting. Indeed, the individual may have concurrent psychological contracts: one that is 'personal' with an organizational agent and one that is 'impersonal' with the organization. The discretionary actions of organizational agents are viewed as actions of organization by the workers (Rousseau, 1989) and may contribute to employees' perceptions of procedural fairness (Moorman *et al.,* 1998).

Hence, we set out to examine the characteristics, content and state of the psychological contract from the employer and employee perspective.

3.4. Main Characteristics of Psychological Contract

The psychological contract is the unwritten *implicit contract* (Argyris, 1960; Schein, 1965; Rousseau, 1989). Its content extends beyond the written contract and determines the bilateral and mutual relationship as a crucial factor in understanding the behaviour of both employee and employer in psychological contract in the work place (March and Simon, 1958; Schein, 1965). It forms in the

minds of both parties and its content is highly *personal* for them. Consequently, the creation of a psychological contract may result from implicit means relying on an individual's interpretation of actions and events within an organization (Coyle-Shapiro and Kessler, 2000).

Proper development of psychological contract requires a *social process* (Herriot and Pemberton, 1997), because the employment relationship is founded on social exchange[1]. The psychological contract includes an exchange of terms and conditions of the agreement, *reciprocal* (Rousseau, 1989; Morrison y Robinson, 1997; Tabernero *et al.*, 2005) and *balance* between both parties. Consequently, it contains reciprocal exchange agreement and needs to be well-balanced, to survive at the time.

The psychological contract is thus *subjective* (Schein, 1965; Robinson and Rousseau, 1994; Rousseau, 1995), because its content is open to interpretation. It comprises subjective beliefs regarding an exchange agreement between an individual and, in organizations, typically the employing firm and its agents (Rousseau, 1995). Employees and organizational agents may hold different views on the content of the psychological contract and the degree to which each party has fulfilled the mutual obligations of exchange (Coyle-Shapiro and Kessler, 2000). Psychological contract is consequently open to misunderstandings (Schein, 1965; Robinson and Rousseau, 1994).

All the previous characteristics justifying each subject possess a unique psychological contract based upon his/her own understanding of the reciprocal obligations in the employment relationship between employee and employer (Turnley and Feldman, 1999). As a result, psychological contract can reach an unlimited number of formats.

Thus, the psychological contract is *dynamic* (Rousseau, 1989; Thomas and Anderson, 1998; Reyes and Martinez, 2007), which means it changes over time during the employment relationship (Anderson and Shalk, 1998), as do the organization and the individual. The psychological

contract develops within a dynamic environment in which the individual is often interacting with multiple organizational agents who may each be sending a variety of messages, both verbal and non-verbal (Shore and Tetrick, 1994). The organizations operate in a similar environment, changing their organizational basis (structure, strategy, and culture), and their needs and goals. Subsequently, both reasons justify the changing relationships between constituent or configured parts.

Furthermore, the psychological contract is itself a *flexible* and still evolving concept (Guest, 2004), requiring it to undergo continual revision.

A psychological contract must constantly be *renegotiated and revaluated* (Rousseau & Parks, 1993; Conway & Briner, 2005), to be capable of adapting to the changing conditions. This is a fact that differentiates it from the formal contracts. Therefore, the nature of the perceived content could change.

Finally, the psychological contract is *obligatory* as expectations of perceived obligations must be fulfilled in order to prevent a breaching of the psychological contract which might result in adverse consequences.

3.5. Content of Psychological Contract

The content of the psychological contract includes different combinations of terms like perceptions, expectations, beliefs, promises and obligations (Kotter, 1973; Schein, 1978; Rousseau, 1989; Herriot and Pemberton, 1995). Schein (1965) highlighted the need to recognize that the contents of psychological contract between employee and employer could incorporate not only material and economic dimensions but also non-material benefits that satisfy both the parties (Taylor and Tekleab, 2004). This content can be analyzed from the worker's and employer's perspective.

The psychological contract is the *perception* of both parties of their relationship and the things they offer each other in this relationship (Herriot

and Pemberton, 1995). Later, Herriot and Pemberton (1997) define this term as "the *perception* of both parties to the employment relationship, organization and individual, of the reciprocal promises and obligations implied in that relationship". Slightly adapting a previous definition by Herriot and Pemberton (1997), Guest and Conway (2002) define the psychological contract as "the *perceptions* of both parties to the employment relationship, organizational and individual, of the reciprocal obligations implied in that relationship".

Levinson *et al.* (1962) develop the psychological contract as "a series of mutual *expectations* of which the parties to the relationship may not themselves be dimly aware but which nonetheless govern their relationship to each other". Building upon this work, McLean Parks *et al.* (1998) states that a psychological contract is the idiosyncratic set of reciprocal *expectations* held by employees concerning their obligations (i.e., what they will do for the employer) and their entitlements (i.e., what they expect to receive in return).

Rousseau (1989) defines the psychological contract as "an individual's *beliefs* regarding the terms of conditions of a reciprocal exchange agreement between the focal person and another party". This definition is apparently focused exclusively on the employee perspective. However, researchers tend to downplay the aspect of mutuality and introduce the employer perspective (organizational agent).

Turnley *et al.* (2003) stated that "specific, psychological contracts are comprised of the *obligations* that employees believe their organization owes them and the *obligations* the employees believe they owe their organization in return".

Building upon these previous works and conceptual background, the content of the psychological contract includes perceptions, expectations, beliefs, promises, and obligations (Anderson and Schalk, 1998). The core of it concerns the exchange of promises and commitments (Guest & Conway, 2002) and mutual obligations and expectations.

After this brief analysis, we can summarized that the psychological contract consists of a set of perceptions, expectations, beliefs and obligations, based on explicit or implicit promises exchanged, which should cover the viewpoints of both parties (employer and employee) to the employment relationship. Psychological contract only exists within the context of an exchange relationship, mutuality is an underlying feature of it. In addition, psychological contract is implicit and subjective because its content is open to interpretation. It is "obligatory" since its content must be fulfilled in order to avoid contract "breaching". Furthermore, the psychological contract is dynamic due to mutual bargaining and negotiation mechanisms (Conway & Briner, 2005). Finally, the psychological contract is of a highly personal, idiosyncratic and self-constructed nature (Rousseau, 1989) and, consequently, the psychological contract of each individual is unique, and can reach an unlimited number of formats.

The content of psychological contract is adjusting and changing along with an organizations' development in different periods and employees' extending apperception of psychological contract.

3.5.1. Main Content of Psychological Contract

The content of the psychological contract includes perceived terms or "clauses" of the employment relationship. However, both subjects currently have no consensus on what psychological contracts contain or what the psychological contract is or what it actually encompasses. Hence, Anderson and Schalk (1998) contended that most employees are able to describe the content of their contract, and every worker has one. On the contrary, the employer has a general psychological contract with all employees of the same professional level, with some specifications to each worker.

Psychological contract has varied in recent years due to economic, social and existing business changes, and organizational flexibility required in terms of temporal relations, downsizing or part-time labour, imposed by the current financial crisis (Kluytmans and Ott, 1999). Traditionally, loyalty, commitment and confidence of employees are rewarded with job security, promotion, training and professional development, and protection against any problems. Currently, employers require workers with high commitment to business objectives, shared responsibility of success, quality performance, flexibility, judgement, strategic skills and continuous improvement. Employer in turn provides employability, learning capacity, flexibility, a performance-based compensation, greater participation and involvement, wide tolerance of change (challenging work) and a job but not a professional career (Csoka, 1995; Silla *et al.*, 2005).

Many previous works indicate distinct content and dimensions of employee's and employer's psychological contract (Rousseau, 1990; Herriot *et al.*, 1997; Hutton and Cummins, 1997; Guest and Conway, 1999, 2002; De Vos *et al.*, 2003; Jannsens *et al.*, 2003; Cable, 2008). A thorough preliminary investigation of existing research, the most important employee and employer psychological obligations are included in Table 1.

For employee obligations, Table 2 shows several variables of the psychological contract content, based upon previous work. They are related to the main term of contract, loyalty, flexibility, other employee factors' and organizational support.

For employer obligations, Table 3 exhibits the different variables of the psychological contract content. They should be grouped in extrinsic and intrinsic rewards, employer obligations' to employee, arrangement, and employee obligation's.

The heterogeneous nature of the employee obligations and employer obligations warrant specific mention. Psychological contract differ across a number of factors, including employment level and personal culture of both parties. For this reason, the present research contributes to improve this situation, exhibiting the list of the psycho-

Table 1. Summary of employee and employer psychological obligations

EMPLOYEE OBLIGATIONS		EMPLOYER OBLIGATIONS	
Loyalty	An employee's perceived socio-emotional link and attachment toward their employing organization (for example, not accepting every job offer that comes along, working for the organization for at least several years).	Offering possibilities for development and/or promotion within the organization (such as possibilities for development, chances of promotion).	Career development
Flexibility	Willingness to be flexible in carrying out the work that needs to be done (for example, working overtime, taking work home).	Offering challenging, interesting job content (such as work in which employees can use their capacities, challenging tasks).	Job content
Ethical conduct	Willingness to conduct oneself ethically towards the organization (for example, not making confidential information public, dealing honestly with resources and budgets).	Offering respect and understanding for the personal situation of the employee (for example, flexibility in working hours, understanding of personal circumstances).	Work-private life balance
Honesty	The belief that one's partner stands by its word, fulfils promised role obligations, and is sincere.	Offering appropriate compensation (such as remuneration commensurate with the work, conditions of employment that have favourable tax consequences).	Financial compensation
Fairness	The perception by the individual that a particular activity in which they are a participant is conducted fairly by the organization.	Organization is characterized by high levels of distributive, procedural, and interactional justice.	Fairness
Trust	The mutual expectation that the other party will not behave opportunistically in future transactions of the employment relationship.		Trust
Availability	Willingness to keep one's availability status at an acceptable level (for example, taking training courses that become available, keeping up with trade literature).	systematic activities to develop and improve employees' skills, knowledge and behaviours to enable them to perform job-related duties, accomplish specific tasks and meet the quality requirements of HR for the future.	Training
Employability	The development of professional skills in general (such as e.g. language competence), but also to the acquisition of interpersonal skills, such as learning to cope with change.	Offering a pleasant and cooperative working environment (such as good communication among co-workers, good cooperation within the group).	Social environment
Job involvement	The extent to which people are psychologically attached to their jobs and the degree of importance that work holds in their life.	The perception that the job is more or less secure, whether or not there is objective evidence to support this.	Job security
Job satisfaction	The affective feelings toward the job. The extent to which employees gain enjoyment from their efforts at the workplace.	The belief that other people are generally well meaning and capable of positive interactions.	Humanity
Extra role Behaviour	The discretionary actions of workers that go beyond their existing role expectations and are not mandated by the organization.	The perceptions of justice and equality by individuals in an organization.	Organizational Justice
Personal congruence	The process of creating a balance between authentic cultural makeup and the organization.	Consistency between organizational values and actions.	Perceived consistency

logical contract contents' of the most representative research, considering different countries.

Understanding the content of psychological contract is key to understand the factors which lie behind employee turnover.

3.6. State of Psychological Contract

Compared to the traditional approach of Rousseau and colleagues, Guest (1998) advocates develop theoretical models and research that would allow researchers to go beyond mere description of the content of the psychological contract to an evaluation of its state, introducing consequently the concept of state of the psychological contract.

The dynamism and flexibility of psychological contract explains the existence of several states of its development. The state of the psychological contract refers to "whether the promises and obligations have been fulfilled, whether they are fair, and their implications for trust" (Guest & Conway, 2002). It involves a broader evaluation of the employment relationship, shaped by the content of the psychological contract, but going beyond them.

For Guest and colleagues, evaluation of the state of the psychological contract should represent a qualitative leap in research on the psychological contract, rendering it more explanatory and less descriptive, and making possible the prediction of diverse variables related to attitudes, behaviour and employees' health (Gracia *et al.*, 2007)..

The main phases of psychological contract development are: the process of the psychological contract formation, the development or maintenance, and breaking the psychological contract. A more detailed study is needed to accurately characterize each phase.

1st Phase: The Process of Psychological Contract Formation

Many of the psychological contract contents are explicitly or implicitly addressed during the re-cruitment and selection phases (Sutton and Griffin, 2004). The recruitment and selection are social processes with important informational qualities for both potential employers and employees. These stages have influence on the development of appropriate expectations and inform the early development of individuals' psychological contract with the organization (Herriot, 1984; 1989). Employers also make implicit and explicit promises during *recruitment stage* which obligate them to give certain things to their workers in exchange for their employees' contributions to the organization. Consequently, many terms of a psychological contract are established during recruitment (Rousseau & Greller, 1994; Shore & Tetrick, 1994).

In the *hiring stage*, the potential employee receives and analyzes an introductory letter spelling out conditions of employment. If both parties agree to the formal aspects of employment relationship (working hours, salary, type of contract, benefits and mutual obligations) (Dunahee and Wangler, 1974), the written contract is signed and established. However, new workers have a limited and incomplete knowledge in terms of arrangement that have been voluntarily involved. People "fill in the blanks" along the way, and they sometimes do so inconsistently (Rousseau, 1995). Therefore, a psychological contract is also created in this stage, beginning the formalization of its content.

When an employee is hired, the human resources department starts his/her *socialization stage*. Socialization is characterized by a process through which newcomers could receive a detailed job description and/or an employee handbook. Hence, employees start to understand, interpret, and respond to their new environment. At this moment, most newcomers have only limited or incomplete information about the terms of their employment relationship (Rousseau, 2001) and, consequently, the psychological contract contents. For that reason, organization facilitates all the learning that took place prior to a person's first day on the job. Worker receives instruction about the

correct execution of the job, and the organizational culture and strategy. This motivates newcomers to actively interpret their initial experiences as a basis for predicting future events and for changing their expectations, thereby making their psychological contract schema more complete. Nevertheless, this training is not sufficient to establish the definitive content of psychological contract. This in turn should help them to reduce uncertainty and make their experiences in their new work setting more predictable (Shore & Tetrick, 1994). Thus, the perceptions of promises are adapted based upon newcomers' interpretations of their experiences in the work setting (Rousseau, 2001).

During organizational socialization the psychological contract rapidly develops and becomes more stable. Empirical research demonstrates newcomers change their perceptions of what their employer had promised them based on their perceptions of the employer inducements actually received (De Vos *et al.*, 2003). They also change their perceptions of what they had promised their employer, based on their perceptions of what they actually contributed to their employer (De Vos *et al.*, 2003). Consequently, newcomers use their experiences and knowledge within the work environment as feedback about their initial expectations and they are flexible in adapting their initial expectations based upon this feedback. In the same line, newcomers adapt their promise based upon their interpretations of the employer's actions in the work setting (De Vos *et al.*, 2003). The main conclusion of the foregoing analysis is that the mutuality also operates during the stage of psychological contract formation and that it explains changes in newcomers' psychological contract perceptions (De Vos *et al.*, 2003).

It is important to note that in recruitment, selection and hiring stage, the contract is still an incomplete mindset (Topa and Palací, 2005), for employee and the employer (organizational agent). After the training and socialization stage, the content of the worker's psychological contract changes to introduce his/her feedback (Thomas

and Anderson, 1998; Topa *et al.*, 2002) as well as the employer. This adaptation is a result of gradual adjustment and mutuality, which it is more significant in employee psychological contract. Consequently, workers are more flexible in changing their perceptions of their own promises than in changing their perceptions of their employer's promises.

Finally, it is important to note that small and medium-sized companies (SMEs) can build the psychological contract in a different way, as SMEs make less use of formalized recruitment practices, provide less training to their employee, and are less likely to use formal performance based compensation systems (Carison *et al.*, 2006).

2nd Phase: Maintenance of Psychological Contracts

The development of the employment relationship involves a series of ongoing interactions that help to gradually reduce the uncertainty, generating and consolidating the contents of the psychological contract. The dynamism and mutuality of the psychological contract is confirmed in this stage, where the employees' and employers' perceptions, beliefs, expectations, obligations and promises are continuously changing, revaluating and renegotiating. However, our knowledge on the way in which psychological contracts develops, and on the conditions that initiate and influence changes in the psychological contract is still limited.

The constant change of the contract provides increased opportunities for misunderstandings and therefore causing contract breach (Robinson, 1996). The content of the psychological contract are subject to internal and external changes (Rousseau, 1995). The internal changes have their origin in both subjects. The internal changes generated by employee stems from his/her evolution during the employment relationship with the company (employment status, training, wage, work-life balance and promotion for other colleagues). The internal changes generated by the employer

are due to economic, productive, organizational and strategic changes. Both kinds of changes can modify the contents of the psychological contract.

When one party changes the content of psychological contract, a mutual feedback process is activated; which involves a continuous revaluation, renegotiation and implementation of newly required obligations to achieve the recent beliefs and expectations set.

Promoting employability is part of a new psychological contract between employer and employee, whereby both are responsible for maintaining the employment situation (Kluytmans and Ott, 1999).

This phase of the psychological contract depends on a balance between employee's and employer's obligations, and the congruence of both subjects' action. Consequently, it depends on the fulfilment of the arrangement. In this sense, Shore and Barksdale (1998) identified four types of psychological contract, on the basis of two dimensions: employee and employer obligations, and the level of obligations. The types of psychological contract are mutual high obligations, mutual low obligations, employer over-obligation and employee under obligations. In the first two situations, the psychological contract is balanced and both parties have high or low obligations, respectively. In this case, the psychological contract is frequently stable. The other types of contracts are not balanced and their breach has a stronger probability to happen, generating the following step.

The effects of the maintenance stage of psychological contract must be analyzed from two perspectives, the employee and the employer. The fundamental premise is that a fulfilled and healthy psychological contract will result in positive individual behaviour, and be associated with positive outcomes for the organization.

The maintenance of a psychological contract by the employee helps his/her professional development, the reduction of social distance between him/her and the organization, and reaches higher performance (Topa and Palací, 2004). Consequently, the worker has more opportunities for promotion, training and improved wage conditions (Topa and Palací, 2004).

For the employer, if employees maintain a satisfied psychological contract, they are more profitable in the performance of tasks, they work more efficient and with higher quality, yield and efficiency; and consequently, the company achieves greater productivity and performance (Topa and Palací, 2004).

The age of the subjects of the psychological is determinant in this phase. Some authors have suggested that employee age affects the breach of psychological contracts differently, and therefore its maintenance phase. Older workers usually provide more stable psychological contracts (Rousseau, 2001), and react to possible breaches of the psychological contract from younger ones.

3rd Phase: Breach of Psychological Contracts

Breach is a "subjective experience, referring to one's perception that another has failed to fulfil adequately the promised obligations of the psychological contract" (Robinson, 1996). Robinson and Morrison (2000) distinguished breach from violation of psychological contract. Breach of psychological contract is a cognitive evaluation of what is received compared to what was promised. Violation would better describe the emotional and affective state that may follow this cognitive evaluation. Breach is less serious and a cognitive appraisal of the event, while violation is more serious and initiating behaviour, attitude, or emotional response beyond the cognitive appraisal. Breach or violation of psychological contract was found to be related to a lot of negative work attitudes and organizational consequences (see below).

However, it is important to note that there are two intermediate stages in the process of breaking the psychological contract. The first, *reneging*, occurs when one party knowingly fails to meet an

obligation or recognize the existence of an obligation between two parties, but refuse to comply. The second, *incongruence* which can result when an employee has perceptions of a given promise that differs from those held by the organizational agent or agents responsible for fulfilling that promise (Morrison and Robinson, 1997). Incongruence is when a promise is established or it can develop as time elapses and perceptions of promises decay or become distorted in memory. Thus, incongruence relates to a gap in the shared understanding between an employee and the organizational agent (e.g., the employer has a different understanding of the promised outcome), as to whether an obligation exists. These different perceptions result because the terms of a psychological contract are inherently perceptual.

This situation comes from three interrelated areas: (a) workers and organizational agents take part in employment relationship with different cognitive schemata, (b) obligation incongruence and (c) insufficient communication (Morrison and Robinson 1997). The direct results of the incongruence are the lack of trust between the parties, reducing performance and prosocial behaviour, and in contrast, intend to stay in business. This is the most common situation in business area (Turnley and Feldman, 2000) and may progress to the next stage, depending on the interpretation of the damaged party and how the other party responds to these circumstances, trying to respect their commitments and therefore, correcting the failure or not.

The intensification of the two previous intermediate stages generates the psychological contract breach as evidence of non-fulfilment arrangement. Seven reasons justify their existence: (a) the "delay" or sense of procrastination on behalf of the party in providing the obligations, (b) the "magnitude of discrepancy" or degree of lack of obligation that the party feels he or she should be receiving, (c) "type/form", where one party's obligations represent different qualifying standards from those expected by the other party;

(d) the "inequity" or comparative analysis between what the participants are getting and what others of the same level in the same job type and/or organizational level are receiving; (e) the "reciprocal imbalance" refers to the sense of imbalance between what one party is receiving compared to what it is giving back to the other (adapted from Cassar and Briner, 2005); (f) the absence of "organizational responsibilities" for fairness and consistency; and (g) the incongruence between organizational culture and individual values.

Morrison and Robinson (1997) argued that the cognitive perception of a breach in a psychological contract will not necessarily result in the intense emotional reaction associated with the term psychological contract violation. These authors observe that explanations of the root causes of breach of contract may reduce the intensity of the emotional response.

The results of breach of psychological contract in behaviours, described by Rousseau (1995), are (a) the exit (termination of the relationship), (b) the voice (actions to remedy the violation), (c) the loyalty (silence, willingness to endure), and (d) the destruction (neglect, counterproductive behaviours). Herriot and Pemberton (1995) described those same behaviours as: 'get ahead' (voice), 'get safe' (loyalty), 'get even' (destruction), or 'get out' (exit).

The psychological contract breach has influence on some variables. Guest (2004) categorized the outcomes of non-fulfilment between attitudinal consequences and behavioural consequences. Attitudinal consequences are job satisfaction (Robinson & Rousseau, 1994; Gakovic & Tetrick, 2003; Johnson & O'Leary-Kelly, 2003), organizational commitment (Coyle-Shapiro & Kessler, 2000; Johnson & O'Leary-Kelly, 2003), trust in the organization (Robinson & Rousseau, 1994), emotional exhaustion (Gakovic & Tetrick, 2003) and cynicism (Johnson & O'Leary-Kelly, 2003). Behavioural consequences are job performance (Robinson, 1996; Turnley & Feldman, 2000; Johnson & O'Leary-Kelly, 2003), organizational

citizenship behaviour (Robinson, 1996; Coyle-Shapiro & Kessler, 2000; Turnley & Feldman, 2000; Lo & Aryee, 2003), absenteeism (Johnson & O'Leary-Kelly, 2003), turnover intention (Robinson & Rousseau, 1994; Robinson, 1996; Turnley & Feldman, 2000; Lo & Aryee, 2003) and actual turnover (Robinson & Rousseau, 1994; Robinson, 1996).

To reduce these negative effects of psychological contract breach is critical to the management of actual or perceived breaches or violations of the contract.

3.7. E-Human Resource Management: Information Management

Since last decade, technology and Internet development have had a profound effect on the field of HRM, promoting the implementation and application of electronic Human Resource Management (e-HRM). This concept is introduced as "a way of implementing HRM strategies, policies and practices in organizations through the conscious and directed support of and with the full use of web technology" (Rüel *et al.*, 2004). While a variety of definitions of the term e-HRM have been suggested, this paper will use the definition suggested by Strohmeier (2007) who saw it as "the application of information technology for both networking and supporting the interaction of a least two individual or collective actors in their shared performing of HR activities".

According to Strohmeier (2007), Information Technology (IT) has two different implications in e-HRM. First, IT is necessary to connect usually spatially segregated subjects and enable interactions between them irrespective of their working in the same room or on different continents, increasing their connection and integration. Second, IT supports subjects by partially – and sometimes even completely – substituting them in executing HR activities. Consequently, IT are tools for task fulfilment.

Both implications operate in a psychological contract management in several ways: (a) two internal subjects interact in order to perform psychological contract activities (employee and employer), (b) the connection between subjects becomes essential, independent of their location, and (c) the task fulfilment is crucial for both subjects, but especially by the employer. Therefore, e-HRM system provides some benefits, such as decreased transaction times, management of psychological contract content, administer compensation and benefit systems (Strohmeier, 2007). In addition, these systems increase the efficiency of HR processes, reduce administrative costs, give support to training and facilitate the information management between both subjects.

Information management is the management of the processes and systems that create, acquire, organize, store, distribute, and use information (Detlor, 2010). Its goal is to help people and organizations access, process and use information efficiently and effectively. The different state of psychological contract requires using and communicating information, as well as the correct establishment of psychological contract content.

A better study would examine a large group of selected Technology and tools that give support to e-HRM, especially on psychological contract management. Intranet, internal electronic mail, database, videoconference, groupware and business-to-employee are IT that help people carry out personal information management more efficiently and effectively (Jones, 2008). IT tools facilitate personal information management, improving communication, collaboration, knowledge acquisition and management. Now, a new need has arisen, the employees are required to develop and maintain professional networks, where they can exchange knowledge and skills, improving their professional efficiency (Surowiecki, 2004; Cross *et al.*, 2005). IT tools track down and contact co-workers and experts inside and outside the organization, keeping their interests, skills and role profiles updated at all times. Thus,

IT tools assist the establishment of organizational memory, its content can be used as a new source of organizational information by the workers. IT tools have consequently an important role in the professional activity and development of the employee and HRM.

Employees should be able to use IT tools to enhance their communication flow with the organization and its members. As it has been inferred previously, the communication process is a fundamental activity for both workers and organization agents, in the different psychological contract's phases. Consequently, if workers improve their skills and capabilities on managing IT resources, a higher degree or performance and job satisfaction will be achieved, leading to an improvement on their psychological contract.

Internet is not an e-HRM, but it is included in this study by its importance in some phases of psychological contract.

Another important factor to consider in the use of IT tools is the age of the staff (personal). It has been broadly demonstrated that younger people use these technologies more frequently, even in their personal environment. Consequently, the age should have a significant impact on the influence of IT tools in the psychological contract management.

In *formation phase*, e-HRM tools are very important to create the new psychological contract.

In *recruitment* stage, Internet is a relevant information source for any newcomer as information about the company's structure, services, target markets, quality certification or customer services can be made accessible through it. Large companies often include charts, news, social responsibility (policies and reports), organizational results, research and development activity reports, newsletters, customers', suppliers' and shareholders' spaces, and online services. Unfortunately, the abundant available information complicates the information search and the detection of interesting information (Martínez-León *et al.*, 2008). Although this tool is not an e-HRM, its great

importance in this stage justifies its inclusion in the study.

In another sense, some companies develop an intelligent Web portal to serve as service providers in recruitment tasks. This portal aims at helping people to find a job. When the potential employees find this e-HRM, they start the formation of the psychological contract.

In the *socialization* stage, Intranet and internal electronic mail are e-HRM which help to configure the initial psychological contract. Intranet includes word processing, spreadsheet applications, database management, data analysis, graphics, and communications. In definition, intranet has a wide range of information about organization in general, and its organizational culture, strategy and HRM in particular, which is very important for the newcomer. Intranet's data visualization software, data collection and its ability to provide real-time feedback, makes it far easier to implement training and development initiatives (Denton, 2007), which are essential for any new organizational member.

Moreover, intranet technology allows sharing information, enhancing the organizational communication in general by supporting collaboration across departmental, functional and regional boundaries (Bernard, 1996; Scacchi & Noll, 1997; McNaughton *et al.*, 1999). This tool also supports organizational learning (Martínez-León *et al.*, 2008) and knowledge management (KM) processes (Scott, 1998; Alavi & Leidner, 1999).

The available functionality on the Intranet depends on the level of IT investment, the use of IT tools, its configuration and contents, its updates and internal control, and previous employees' Intranet experience. This is not a "packaged" technology with fixed attributes, but it is moulded and shaped according to the social forces at play in the organization (Hughes, 1987; Williams & Edge, 1996). The computer networks incorporate more significant, private and extensive information than any webpage. Hence, Intranet usually includes community news, message boards, notices of

upcoming events and HRM policies and systems (Arnold *et al.*, 2003). When the private network is more developed, it has available collections of documents and relevant information about organizational culture, corporate government, production systems, strategic plans, forthcoming marketing campaign, classified advertising, IT emergency, project management procedures and project evaluation, and newsletters.

If the Intranet radically changes its unidirectional role for communication and information channel, and is configured in a bidirectional sense, a new working space is created (Corso *et al.*, 2009). This new working space is characterized by a creative environment, focused on employees, their needs, specific working conditions and interactions with others. There, workers can find what they need to work, to learn, to meet and to interact with others (Corso *et al.*, 2009).

Intranets, in their actual configuration, emphasize internal information, build important links among organizations and their employees and improve the employee's vision of the organization. Intranets therefore allow the worker to consistently adapt his/her psychological contract content to the real and changing organization's situation.

An Intranet can also facilitate an ad hoc workstation at home, where the employee could connect to the company's network via VPN technologies.

These different possible utilities justify why the same technology can manifest completely differently in different organizational settings and have different effects on psychological contract formation.

Another important point about e-HRM in the socialization stage of the psychological contract formation is internal electronic mail. Electronic mail facilitates the exchange of information between individuals or groups by offline messages, which can contain documents, programmes, graphics and texts (Martínez-León *et al.* 2008). It allows the users (both workers and organizational agents) share employment relationship's information, which improves their understanding of

psychological contract obligations and contents. Hence, this tool gives support to their employment relationships, improving the psychological contract management. However, it can create new problems, such as notably "information overload" or transmission of misleading messages, creating undesired confusion. These problems could make difficult the establishment of the initial psychological contract, so face-to-face contact is required to get a better result.

Thus, on the basis of above arguments we can assume that e-HRM tools facilitate the formation of psychological contract.

- **Hypothesis 1:** e-HRM tools have a positive effect on psychological contract formation.
  - ◦ **Subhypothesis 1a:** e-HRM tools have a positive effect on socialization stage as intermediate stage of psychological contract formation.
  - ◦ **Subhypothesis 1b:** Internet has a positive effect on recruitment stage as intermediate stage of psychological contract formation.

In Maintenance Phase, some e-HRM could help to consolidate the content of psychological contract, such as Intranet, business-to-employee, internal electronic mail, database, videoconference and groupware.

Intranet facilitates sharing, searching, exchanging and storing organizational, departmental and professional information in the organization, which can be exploited by both psychological contract subjects. The available information should be used to establish the definitive psychological contract content and, in the future, renegotiates their contents. In addition, if the computer network is highly advanced, new working space change employees' role (Corso *et al.*, 2009), varying the psychological contract. Consequently, Intranet is then already widely used as a managerial tool in the employment relationship during the maintenance phase of psychological contract.

A business-to-employee (B2E) system is part of a corporate Intranet (Huang *et al.*, 2004). This tool is an e-business initiative which if successfully implemented assists organizations in delivering useful services, information, or products to their disperse employees (Turban *et al.*, 2006). B2E provides mobile employees and organizational agent (managers and HR professionals) the freedom to access essential business services and data irrespective of location and technical infrastructure at hand.

Different typologies of B2E might support different aspects of maintenance of psychological contract: (a) Business-to-Employee (B2E) portal assists organizations in delivering useful information and services to their disperse employees/ organizational agent or with high geographical mobility which in turn creates productive employee relationships needed for psychological contract maintenance; (b) Business-to-employee messaging system is similar to an internal electronic mail, and refers a closed-loop message distribution system is disclosed for accepting documents from a variety or sources among two subjects; and (c) business-to-employee cooperation support proposes online interviews as a tool that allows subjects to gather interview information and assess cultural fit. Online interviews cannot replace the traditional face-to-face interviews, but can definitely provide the means to help disperse employees/ organizational agent or with high geographical mobility with interviewing challenges.

The internal electronic mail offers the promise of rapid communication of essential information (Pazzani, 2000), which should facilitate the adequate development of psychological contract. This tool also creates communication and cooperation channels with organizational people. These utilities improve the subject's vision about his/her employment relationship, favouring the concretion of psychological contract content. Nevertheless, communication is asynchronous, which does not allow both subjects to communicate in real time, reducing the capability of negotiation. For this

reason, face-to-face contact is required to get a better result.

The databases are deposits of past data, internal information and knowledge, which permits interchanging information and creates knowledge (learning) (Martínez-León *et al.*, 2008). Both internal information and knowledge should be able to use in the concretion of initial psychological contract content. Thus, this tool creates and maintains an organizational shared intelligence and memory (Ruggles, 1998), which should provide important and useful internal information for organizational members. Consequently, this information should be extremely valuable and important in the creation and maintenance of the psychological contract. Therefore, databases reflect current and changing situations, which should improve the psychological contract arrangements and renegotiation activities among both subjects.

Videoconference permits simultaneous dialogue through a virtual interaction among people (De Geus, 1997; Davenport *et al.*, 1998), and the exchange of documents, files and shows. Consequently, the videoconferencing technologies facilitate the frequent exchange of information between remote subjects, their collaboration and the creation of cooperative settings in a fast and flexible way (Martínez-León *et al.*, 2008). Thus, this tool should be able to create, diffuse and negotiate of psychological contract content through their synchronous interaction with remote employees, colleagues and organizational agents, which enable to overcome geographical and time barriers in extended organization. Therefore, videoconference helps to adequately manage the psychological contract.

The groupware encourages efficient and accurate sharing of information and knowledge across organizational boundaries. Groupware is able to hide the identity of the participant, which makes it easier to share information and improve communication in a much more free-flowing manner than databases or intranet allow (Martínez-León *et al.*, 2008). If both subjects of the psychological

contract work in dispersed geographical areas, groupware facilitates the remote communication and transference of useful internal information, making the concretion and renegotiation of psychological contract content easy. Therefore, this tool facilitates the psychological contract management.

Internet is not an e-HRM, but its utilities facilitate the psychological contract maintenance. This technology facilitates the search and exchange of information about customers, suppliers, competitors, target markets and own organization (community manager). Hence, the adequate management of information allows detecting external and organizational changes. These changes can affect the arrangement obligations between the parties. Therefore, actual information allows concreting the definitive psychological contract content and its continue revaluation and renegotiation.

Psychological contract is established at a certain point in time, and it is assumed to be revaluated and renegotiated. The perceptions, expectations, beliefs, promises and obligations of employee and/or organizational agent are able to change; generating misunderstandings. In this situation, all technological tools give an opportunity to get interesting and right information for psychological contract maintenance, and facilitate its exchange and communication; maintaining or facilitating a healthy relationship between two subjects. Hence, IT tools facilitate the necessary revaluation and renegotiation of the psychological contract, getting reciprocal and balanced obligations. Therefore, e-HRM is helpful tools to improve the psychological contract management.

These arguments suggest that:

- **Hypothesis 2:** e-HRM tools have a positive effect on psychological contract maintenance.
  - ◦ **Subhypothesis 2a:** Internet has a positive effect on psychological contract maintenance.

In Breach phase, e-HRM helps and improves the psychological contract management, reducing its breaching. These tools diminish the *reneging stage*, because they mitigate the information asymmetry about two parties, disappearance of alienation in favour of a maximum transparency between subjects. e-HRM tools also reduce different incentives for opportunistic behaviour by the contracting parties.

Thus, e-HRM reduces the frequency and intensity of *incongruence stages* between both subjects. Technological tools improve communication, reduce obligation incongruence, and diminish the different perception about contributions and inducements. The main conclusion of the foregoing analysis is that e-HRM generates and provides clear information which solves the main sources of incongruence and conflict. However, these tools do not always reduce the different cognitive schemata of subjects.

In *violation or breach stage*, some e-HRM (intranet, electronic mail, database, videoconference and groupware) could help to solve the differences between both psychological contract subjects'. These tools facilitate the acquisition and exchange of correct information and improve their communication. Consequently, one party can share with the other party any well-grounded non-fulfilment or variations in psychological contract content; reducing the time and negative effect of this situation. However, continuous non-fulfilment of psychological contract obligations from anyone generates many requirements, which could worsen the situation.

Obviously, groupware is the less useful e-HRM in this stage, because it does not always facilitate the direct communication between two parties. Sometimes, groupware is used to anonymously announce any non-fulfilment obligations, which alert all groupware's members about them; giving an opportunity to resolve the controversy. On the other hand, Internet is not an e-HRM, but facilitates acquire external information, which could be useful to avoid breaching the psychological contract.

The previous arguments can be summarized in:

- **Hypothesis 3:** e-HRM tools have a positive effect on psychological contract breach.
  - **Subhypothesis 3a:** e-HRM tools have a positive effect on psychological contract reneging stage.
  - **Subhypothesis 3b:** e-HRM tools have a positive effect on psychological contract incongruence stage.
  - **Subhypothesis 3c:** e-HRM tools have a positive effect on psychological contract breach stage.
  - **Subhypothesis 3d:** e-HRM tools have a positive effect on psychological contract violation stage.
  - **Subhypothesis 3e:** Internet has a positive effect on psychological contract breach.

Therefore, e-HRM tools improve human resources management, with special influence in their psychological contracts, which attract and retain talent in the organization. The breach of psychological contract is minimized, reducing the mentioned losses associated. Hence, HRM might be able to improve the organizational management. Then, the firm creates values and can generate and maintain a competitive advantage.

4. CONCLUSION

The findings of this study contribute substantially to the general view of psychological contract concept and the contribution of e-HRM tools in its adequate management. Recently, a new approach to employment relationship has emerged, where the psychological contract reaches wide importance in organizations as a determinant of the employment relationship. The psychological contract contains a set of perceptions, expectations, beliefs and obligations, based on explicit or implicit promises, exchanged and shared by employee and employer. Its content is reciprocal, subjective, dynamic, and derived from a social process. Hence, the psychological contract is an implicit contract, unique and can reach an unlimited number of formats.

This study also focuses on the different statements of the psychological contract: formation, maintenance and breach. Departing from the psychological contract *formation phase*, all stages and processes to create the psychological contract have been considered. Intranet and internal electronic mail are facilitating tools for the psychological contract formation, during socialization stage. Internet is a useful tool in recruitment stage. In a similar way, the *maintenance* of psychological contract includes some process and can be facilitated by different e-HRM tools (Intranet, business-to-employees, internal electronic mail, databases, videoconference and groupware). Finally, the *breach* of psychological contract has two intermediate stages, and numerous and important consequences. E-HRM tools can apparently reduce the number of incongruence and reneging, and decrease the number and effect of breach or violations of psychological contract. These findings suggest interesting and useful implications for future research and for organizational practice. Three main hypotheses about the role of e-HRM on psychological contract and subhypothesis have been proposed, which should be testing future empirical research carried out in the companies.

Consequently, E-HRM tools can not be viewed as a means of reaching higher levels of productivity and managerial results, without a way of providing basic information to organizational members, which plays a significant role in enhancing employment relationships and, consequently, human resource management.

Some limitations to this study must be noted with respect to future theoretical and empirical research. First, the age of the employees has influence on psychological contract management; whereas older employees have a more stable psychological contract than younger ones. Several

reasons justify this reality. First, older employees have more realistic expectations regarding the compensation. Second, they have fewer options to achieve real employment in other organizations (Hedge *et al.*, 2006). As a result, and thirdly, they better regulate their emotions to possible breaching of the psychological contract (Carstensen *et al.*, 2003). Fourth, in a near withdrawal, older workers strive to positively intensify all their experience to keep their job, because it may be the last one before retirement (Carstensen *et al.*, 1999). Fifth, they focus on more positive aspects of relations with the organization, seen as less affected by negative events (Bal *et al.*, 2008). And finally, these workers should receive higher satisfaction of other factors outside work, such as family, hobbies and community (Clark *et al.*, 1996).

However, younger employees should be able to adapt better than older ones in a rapidly changing environment, renegotiating their psychological contract. Thus, younger employees have higher computer literacy than older ones. The benefits of e-HRM tools in the psychological contract management also intensify the actual tendency to generate greater entry for younger employees relative to older ones. Consequently, when organization uses e-HRM tools, organizations are more reluctant to hire older employees and tend to favour younger ones (Aubert *et al.*, 2006).

Secondly, the size of a firm plays an important role in terms of HRM (Kotey and Sheridan, 2004) and the e-HRM tools investments. In fact, larger organizations have more sophisticated recruitment structures and process than smaller one. Barrett and Mayson's (2007) reveal that growth-oriented firms have more formal HRM practices. On the other hand, large organizations invest a lot in technology adoption and use, developing more e-HRM tools' functionalities and getting better HRM.

Thirdly, the efficient usage of e-HRM tools is closely related to a wider comprehension of information management and contribution to organizational performance. IT tools should be understood as a part of organizational information context and its usefulness is influenced by organizational culture, values and principles concerning strategic information management.

Despite these limitations, to our knowledge this research is the first to systematically examine the influence of IT tools on psychological contract management.

KEY TERMS AND DEFINITIONS

e-HRM: A way of implementing HRM strategies, policies and practices in organizations through the conscious and directed support of and with the full use of web technology.

Information Technologies: The broad range of technologies involved in information processing and handling, such as recording devices, communication systems, computer Systems (including hardware and software components, and data), and other electronic devices.

Psychological Contract: Includes the implicit and specific terms and conditions of the employment relationship, not regulated nor specified in a formal written contract, which has a central role in work behaviour and determine the relationship between employee and employer (organizational agent).

Psychological Contract Content: Refers to the unwritten expectations, beliefs, obligations, promises, and perceptions that are a powerful determinant of workplace behaviour and attitudes, determining the relationship between employee and employer (organizational agent) and, consequently, the employment relationship.

Psychological Contract State: Refers to a relatively stable base level from which changes in the nature of the employment relationship can be judged.

ENDNOTE

[1] Masterson *et al.* (2000, p. 740) observe, "…an employee is involved in at least two social exchange relationships at work: one with his or her immediate supervisor, and one with his or her organization."

Chapter 70
Understanding How Incentives Influence Motivation and Retention of Health Workers

Posy Bidwell

Silvia Stringhini
Trinity College Dublin, Ireland

ABSTRACT

A critical factor in addressing the human resources crisis in low and middle income countries (LMIC) is the ability to recruit, motivate, and retain health workers. Failure in this area is one of the main causes of decline in availability of services and quality of care. Various financial and non-financial incentives have been implemented and this chapter will explore available evidence to see whether they have influenced motivation. Additionally, Maslow's hierarchy of needs is used to determine if there is a hierarchy of how incentives are valued. While Maslow's model is a useful tool to classify themes of health worker needs, it would appear that workers are motivated without each level having to be fulfilled in turn. While financial incentives may help with retention, they can cause erosion of professional ethos, do not increase job satisfaction, or act as motivators to perform well. More research needs to be done in order to design more effective human resources strategies.

BACKGROUND AND CURRENT UNDERSTANDING

Efforts to improve access to health services across the world are being constrained by severe shortages of health workers. Without the appropriate number of health workers it is not possible to deliver services effectively and efficiently. The human resources crisis is particularly evident in sub-Saharan Africa, where triple the current number of health workers, or at least 1 million more, are needed if they are to come close to approaching the Millennium Development Goals (MDGs) for health (Chen et al., 2004).

There are three major factors affecting health workers, namely the AIDS epidemic, the migration of skilled labour (the "brain drain"), and a history of massive underinvestment in human resources. These factors are affecting the low and middle income countries (LMICs) the most and placing additional strains on already fragile health systems (Chen et al., 2004).

The AIDS epidemic is challenging capacity particularly in sub-Saharan Africa where services are being completely overwhelmed with people who need treatment, as well as by reducing the number of health workers, who are themselves dying from the disease. Health workers are directly impacted through increased workloads and increased exposure to the risk of contracting HIV through a work related injury. Morale is further reduced as health workers see increased numbers of their patients dying (Chen et al., 2004).

Health worker migration is not confined to international movement; internal migration is also widespread, with workers moving from rural to urban areas and from public to private practice. Rural areas have been worst hit by migration leaving many rural facilities understaffed, and this is affecting the morale of staff who remain there (Awases, Gbary, Nyoni, & Chatora, 2003). Despite evidence showing the detrimental effect of migration of health workers from LMICs, many high income countries have grown reliant on importing health workers from these countries (Hongoro & Normand, 2006).

Early responses to the shortage of skilled health workers in LMICs have focused mainly on issues of training capacity, but it has become increasingly clear that the more important issues are of incentives, retention, and motivation of those who remain. Until issues that are leading to "de-motivation" of health workers are addressed, high quality care cannot be provided (Agyepong et al., 2004). There is evidence, particularly in Thailand (Wibulpolprasert & Pengpaibon, 2003), of incentives that can retain and motivate health workers. Both financial and other incentives are important in motivating professionals, but such research also shows that the necessary financial incentives may involve very large increases in salaries. This is often not a sustainable option and so alternative incentives must be found and put into place.

It is important to note that the human resources crisis is a worldwide phenomenon and all countries, rich or poor, are affected by imbalances in their health workforce. It is estimated that by 2011 Canada will have a shortage of 78,000 nurses (Gagnon, Ritchie, Lynch, & Dronin, 2006). The shortage is being created by not enough people being attracted to the profession, in addition to the increased care demands created by an aging population. A study of nurse retention found that only 50% had a firm intention to stay in nursing. The main sources of dissatisfaction cited included lack of professional support and recognition, heavy workload, lack of equipment, and poor physical work environment (Gagnon et al., 2006).

While this chapter will focus mainly on the situation in LMICs, as they are affected by the greatest burden of disease, migration, and chronic underinvestment in health care, we will also look at challenges surrounding motivation and retention of health workers in high income countries. It is critical that all countries implement health plans to reflect the heath needs of their population and workforce strategies must be put in place to facilitate this. Furthermore, if issues surrounding motivation and retention were to be addressed in high income countries it may reduce their dependency on recruiting health workers from LMICs. Therefore, it is clear that a better understanding of the critical factors influencing human resources capacity is needed globally in order to deliver equitable, effective health care.

First the literature around motivation, incentives, and retention will be reviewed and it will be important to see how much of this is actually borne out in practice. In particular, the authors ask several questions:

- What incentives are being provided to retain and motivate people?
- What incentives positively affect the retention of staff and their motivation to do their job well?
- Are some incentives more important than others?
- Are incentives addictive and do some compete with others? Furthermore, can incentives that help retention impede motivation?
- Is there a sequencing of health worker needs as seen in Maslow's hierarchy of needs?

The remainder of this chapter seeks to draw together evidence to answer these questions and draw out some policy implications. There has been an explosion in human resources research over the last decade, however while not all the evidence exists in the published literature to definitively provide answers to all these questions, it is worth reviewing the available material. Furthermore, the raising of important questions is still useful, not least in identifying gaps and important areas for further research.

A Review of Current Understanding and Key Concepts

While recent research has had an understandable focus on retaining health workers in LMICs, retention is an issue that affects health workers globally. There is no guarantee that retained health workers will be productive or motivated to provide a high quality of care. Retention does not guarantee productivity and it is debatable whether retention even in rural and remote areas without productivity is better than no retention. Retained staff may simply be stuck for alternatives or apathetic about moving. Governments can hire health workers to improve the health system but governments must also ensure that these workers will act in the best interests of the health system and so make

the investment worthwhile. Given such concerns about both the retention *and* productivity of health workers it is worth reviewing some key concepts in the literature and theories about the importance of different types of incentives.

The authors take *retention* to be concerned with maintaining staff in post and not losing them to other organizations or to migration. This is one of the key objectives of managing human resources (Salaman, Storey, & Billsberry, 2005). Management needs to be particularly concerned about poor retention of highly skilled cadres because of the scarcity of such labour and the economic investment needed to develop staff with the right skills. Different dimensions of retention that health system analysts are typically interested in relate to:

- loss from public service,
- loss from rural/underserved areas, and
- loss from the country (emigration).

Motivation is a more debated concept and there are several streams of thought about what motivates people to action (Ramlall, 2004). Nevertheless, it is agreed that motivation can be seen as "as a psychological process that causes the arousal, direction and persistence of voluntary actions" (Mitchell, 1982) (pg.81). This has been adapted to a more practical definition within the health sector, with motivation being defined as "an individual's degree of willingness to exert and maintain effort towards organizational goals" (Franco, Bennett, & Kanfer, 2002, p.1). In this context motivation is job-specific and related to delivering mandated health services. Motivation is paramount to achieving higher productivity within the health sector, but is not sufficient by itself to ensure effective health care provision, as infrastructural conditions and other contextual factors may also have an impact.

A related concept to both retention and motivation is *organisational commitment* which represents an employee's attachment to the organization for which they work. Meyer and Allen (1991)

explore different components of this whereby the employee:

- Wants to belong to the organisation (they like it, desire to work there) – *Affective Commitment*
- Has to belong (through economic necessity, lack of alternatives, or has invested in the job) – *Continuance Commitment*
- Ought to belong (they feel a moral obligation – either through their own set of values or they feel the need to pay back the organisation) - *Normative Commitment.*

In a fascinating article, Meyer and Herscovitch (2001) explore how these different components of commitment impact on behaviour (i.e., in terms of staying in the organisation, doing what is required, and doing more than what is required). Affective commitment is the most important in terms of the probability of employees doing their focal work and going above and beyond their duties. High normative commitment alone leads to a high probability of employees exerting effort on key tasks and a lower probability of exerting effort on extra tasks. High continuance commitment alone suggests employees will, on balance, exert effort on doing what is required but will not exert effort on extra tasks. Consequently, health workers with continuance commitment will be retained, but their motivation is low and health system productivity will also be low.

Two different areas of motivation are often confused: motivation to be in a job and motivation to perform. Retention does not ensure job satisfaction and/or exertion of effort to achieve mandated goals. In this regard, Herzberg (2003) reviewed intrinsic and extrinsic factors which impact on levels of job satisfaction. Intrinsic factors relate to job content, e.g. achievement, recognition for achievement, the work itself, responsibility, growth or advancement. Extrinsic factors relate to features of job context or conditions and include company policy and administration, supervision,

interpersonal relationships, working conditions, salary, status, and job security ("job context").

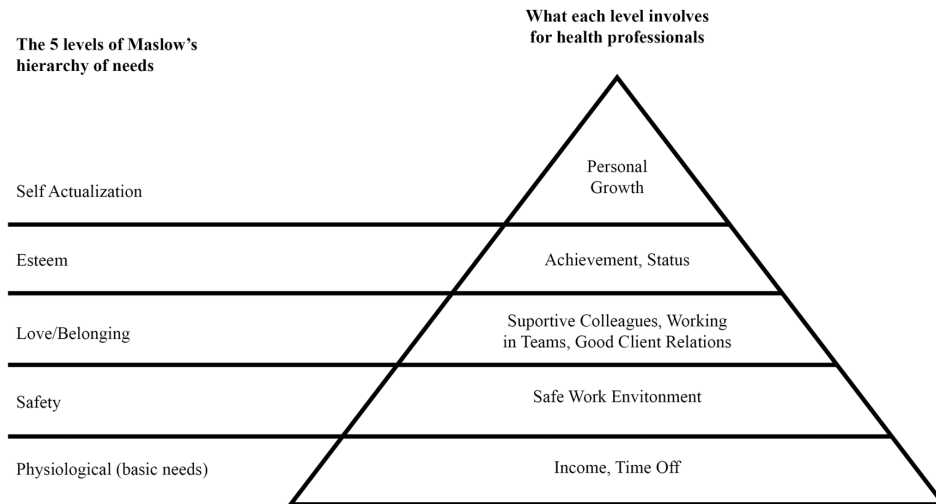
Herzberg maintains that if intrinsic factors are satisfied workers are encouraged to work harder and better. Extrinsic factors, in contrast, are more related to accepting and being retained in the post. In summary, salaries and working conditions are important to retain staff and produce continuance commitment, but alone are insufficient to lead to better staff performance. Recognition and feelings of achievement are more likely to influence staff motivation, effort and, therefore, performance.

A Hierarchy of Needs?

Maslow (1943) proposed a hierarchy of needs for individuals that has been an extremely influential paradigm for exploring behaviour and motivation. The model has five levels, or sets of needs. Each level must be fulfilled before the individual can progress or turn his/her focus to the next level. There is thus a natural sequence of needs; once needs have been met in the lower level these will no longer be prioritized.

The first level is associated with physiological needs which must be met for the human body to survive and include the need for water, air, and sleep. The highest level is self actualization, where there is a desire for self-fulfilment in order to reach personally set goals. Spear (2006) has translated these needs into a healthcare system setting, where the levels correspond to health worker needs. The lowest level corresponds to basic work needs, such as income and time off, level two is a safe work environment, level three is a supportive working environment, level four relates to achievement and status and the highest level is personal growth. All of these levels are outlined in Figure 1.

Spear (2006) conducted a study in Australia to determine what motivated mental health professionals using Maslow's hierarchy as a framework. It was found that esteem and self actualization were powerful motivators. Additionally, reasons

Figure 1. Maslow's hierarchy of needs and what is included in each level for health professionals


cited by health professionals for wanting to perform well in their work included "sense of achievement", "helping others", "contributing to the community" (esteem values) and "personal development and fulfilment" (self-actualization values).

Measures can be taken to ensure that Maslow's hierarchy of needs can be met in the workplace: basic needs through fair payment and reasonable working hours; security through having a safe and functioning workplace; social belonging through encouraging team work and formation of good relations with patients. Esteem can be fulfilled by providing training opportunities, career development, and celebrating success; and finally self actualization can be met by job variety (for instance, combining clinical work with research or teaching) and the ability to do meaningful work (Spear, 2006). The Maslow model and its adaptation present a means for understanding what health worker needs are irrespective of a developing or developed world context.

EVIDENCE ON INCENTIVES

Motivational indicators (both positive and negative), such as longer working hours, doing a second job (or private practice), lower absenteeism, provision of better quality of care and job satisfaction can be used to try and evaluate whether incentives are improving motivation.

Incentive packages have increasingly been introduced into many countries and there is growing literature on assessing the impact that incentives have had on the ability to recruit, retain, and motivate health workers (Bennett, Gzirishvili, & Kanfer, 2000). Additionally while health reforms are not generally designed with the goal of increasing motivation, the changes in overall organisational relationships and economic incentives which often go along with these reforms frequently do have an impact on motivation (Abzalova, Wickham, Chukmaitov, & Rakhipbekor, 1998).

Studies reviewing incentive packages have reported mixed findings on their impact on motivation. It is often found that where financial incentives have been introduced these have been unequally distributed and that inadequate opportunities for career development and training remain

(Awases et al., 2003). A review of non-financial incentives in East and Southern Africa found that there was widespread evidence that incentives are being used to address training, career development, and social needs (e.g. housing, provision of childcare, staff transport); improved working conditions; development of human resources management (HRM) systems; and workplace HIV programmes. However, there were no clear plans for monitoring and evaluating the incentives to determine the impact on motivation and retention. There is some evidence that training programs have encouraged workers back to the public sector, but information is limited and, as these incentives were in conjunction with financial incentives, it is difficult to attribute any success purely to the non-financial incentives (Dambisya, 2007).

A recent systematic review explored initiatives to promote motivation in LMICs and identified seven major motivational themes (Willis-Shattuck et al., 2008). These are: financial rewards, career development, continuing education, hospital infrastructure, resource availability, hospital management, and recognition/appreciation. It is clear that financial rewards are a core motivational factor; however, they cannot be implemented alone, as career development and management issues are highly influential motivational issues. Furthermore, recognition was found to have a powerful effect on motivation.

Management of health workers is an important determinant in health worker motivation and can significantly affect general satisfaction, organisational commitment, and indeed improve relations between management and other staff members. Health workers need to have a clear job definition that gives guidelines to the worker, as well as guidelines to the supervisor for assessing their performance (Bennett et al., 2000). For this reason supportive supervision, performance appraisal, career development, and transparent promotion have been prioritised in many motivational programmes (Manongi, Marchant, & Bygbjerg, 2006).

While this highlights the importance of financial and non-financial incentives, there is insufficient evidence on the impact that each incentive currently being implemented is actually having on motivation and retention.

The Importance of Financial Incentives

Remuneration has been cited by some analysts as the single most important intervention that can improve motivation (Bennett et al., 2000). If workers are paid a fair salary it means that they will not spend time looking for ways to increase their income either by searching for new jobs with higher salaries or through income generating activities to supplement their salaries such as drug stores, private practice, agriculture, and informal fees as is often the case in LMICs (Dieleman, Viet Cuong, Vu Anh, & Martineau, 2003; Kyaddondo & Whyte, 2003). Certainly virtually all initiatives in LMICs to increase health worker retention and motivation give a prominent place to financial rewards (Willis-Shattuck et al., 2008).

Maynard (2006) classifies incentives as implicit or explicit, both of which have internal and external components. Implicit incentives refer to issues around trust, for instance, with physicians seen internally through their Hippocratic Oath and externally through patient confidence that supports the belief that they are trusted. Explicit incentives revolve around regulation by authorities (internal) and payment (external). In the context of European health systems, Maynard (2006) documents the decreasing reliance on implicit incentives with the increased use of financial incentives to motivate providers.

Nevertheless, it is important to reflect on the precise financial incentives offered. The type of incentives available will affect the behaviour of providers and hence the quality of care received by the patient (McPake & Normand, 2008). In health care there are generally three methods of payment: salary (time rates), fee-for-service

(piece rates), and capitation (being paid for each person on a practitioner's patient list). Fee-for-service is a direct inducement to increase activity. It encourages physicians to see more patients and perform more procedures. Once a fee has been introduced it is difficult to remove it. Capitation and salaries may induce under-treatment and the shifting of tasks (i.e., junior doctors and nurses having to carry out complex tasks) (Maynard, 2006). In their systematic review, Chaix-Couturier, Durnand-Zaleski, Jolly, and Durieux (2000), note that providers paid on a capitation basis for their patients would supply up to 25% fewer prescriptions than those paid on a fee-for-service basis.

Maynard (2006) confirms that the method of payment can affect motivation, with fee-for-service acting as an incentive to increase activity, whereas other payment methods, such as receiving a salary based per unit of time worked or capitation may act as an incentive to decrease activity. Conversely, in Rwanda, capitation payments have created an incentive for health workers to focus on preventative health care and only provide necessary services (PHR*plus*, 2002). This in turn has motivated attention to patient satisfaction and quality of care. Capitation payment has been coupled with a performance-based payment to providers in Egypt, leading to decreased patient waiting time and delivery of preventative care being rewarded (PHR*plus*, 2002).

A more fundamental critique of the "finances first" approach is given by Bowles (2008), in his review of economic experiments. He argues that economic incentives may have unintended but counter-productive effects:

- when they promote selfishness,
- compromise an individual's sense of self-determination and degrade intrinsic motivation,
- or convey a message of distrust and disrespect.

Bowles claims that people act in a certain way so as to be perceived of as a certain type, i.e., a good person or one esteemed by others, and not just to acquire economic goods. Economic incentives may both undermine esteem and create a culture where economic incentives are more important than morals. In addition some may argue that if wages are increased that this will not act as a motivator to perform well, but will only motivate people to seek the next wage increase.

In Le Grand's important article (1997) on human behaviour and social policy he asks whether it is more effective to treat people as "knights" who will work altruistically, or as "knaves" who are solely devoted to self-interest. Certainly he notes a move toward people focusing on self-interest as part of social policy. He notes that by introducing incentive patterns which focus on self-interest these may effectively undermine more community-serving goals (see also Goodin, 1996; Pettit, 1996). In effect a culture of self-interest may follow that changes behaviour and the factors that impact on motivation. Hence financial incentives may well undermine other forms of motivation, and care is needed when using financial incentives, as rewards are often related to activity rather than to indicators of patient satisfaction or quality of care.

It can be argued that increasing pay is only a temporary measure in terms of satisfying the recipient. It may well be that the more providers earn the more they want. Increasing remuneration may wet the appetite for more and that creates a real challenge for policy makers as continual increases are not sustainable. Additionally, salary may be effective in terms of drawing people to facilities, but may not motivate health workers to perform well. Furthermore, salary increases are often not uniformly implemented across all levels of workers and this can lead to discontent

Professional Ethos

Health workers are not just interested in salary and career, but have often gone into the profession because they want to help others and they have an intellectual interest in medical matters. Professional ethos is particularly strong amongst health workers, as their main priority is the well being of their patient and this has a major influence in their motivation to perform their duties (Mathauer & Imhoff, 2006).

It has been found that health workers working in resource-poor areas are often "de-motivated" as they are unable to satisfy their professional conscience because they have not been able to provide the best standard of care (Mathauer & Imhoff, 2006). Often how health workers perceive their relationship with the community affects their job motivation and performance (Ssengooba et al., 2007). Nevertheless, lack of resources does not affect professional ethos and the desire to provide care for people. In countries where there are minimal resources, health workers have stated that they were encouraged by being useful to society and taking care of people (Dieleman, Toonen, Touré, & Martineau, 2006). Additionally in Zimbabwe, nurses working in the public sector were highly motivated to perform well despite increased pressures due to lack of resources and HIV/AIDS (Stilwell, 2001).

It is important to review whether professional ethos changes as incentives become more widespread. Is there evidence of a culture of incentives that ultimately de-motivates health workers and undermines their professional ethos? Experience in China has found that financial incentives have a powerful effect on the behaviour of physicians, leading to an erosion of their professional ethos. Bonuses are tied to revenues and profits so physicians over-prescribe drugs and expensive tests; for example 75% of patients suffering from a common cold were prescribed antibiotics when this was not necessary (Hsiao, 2008). However, in this review of physician behaviour in China there

is no information given about the motivational levels of the physicians and it is likely that they have resorted to being driven by profit because they are poorly paid and have not been set appropriate performance targets.

More Evidence of Incentive Conflict: Use of Informal Fees

Informal fees are unreported payments or unregistered illegal payments that are received, either as cash or gifts, in exchange for the provision of a service (or of a faster or better service) that was officially free (Balabanova & McKee, 2002).

There is growing evidence that use of informal fees for health care services are common place in many LMICs (Gaal, Belli, McKee, & Szocska, 2006). In fact, a relationship between inadequate salaries and the opportunities to raise income by charging informal fees has been strongly suggested (Ensor & Witter, 2001; Gaal & McKee, 2005; Lewis, 2007; Muula & Maseko, 2007).

Informal payments are reported to have a negative impact on equity and quality of care (Balabanova, McKee, Pomerleau, & Haerpfer, 2004; Falkingham, 2004; Maestad & Mwisongo, 2007; McPake et al., 1999); however, it has also been suggested that they may contribute to health worker motivation and retention (Ensor & Witter, 2001; Van Lerberghe, Conceica, Van Damme, & Ferrino,2002).

However, the relationship between motivation, retention, and seeking additional income in the form of informal charges may not be straightforward. The use of such a practice can cause rivalries among health workers due to competition, particularly among the lower cadres of workers who do not receive a high share of the payment (Maestad & Mwisongo, 2007). Furthermore there is evidence that this practice can de-motivate health workers more than motivate them through feelings of guilt and general discomfort from charging patients additional fees, especially in rural areas where patients are poor. Given the significance

of motivation and retention issues in human resources for health, a better understanding of the relationship between informal payments and motivation is needed. Consequently the authors explore associations between motivation, retention and informal payments using a case study from Tanzania.

Tanzania: A Case Study

The authors carried out a study in the district of Kibaha, Tanzania to investigate whether informal payments from patients to health workers were being used and, if they were, to determine if they had a motivational effect (Stringhini, Thomas, Bidwell, Mtui, & Mwisongo, 2009). Focus groups were conducted in three facilities and a total of 64 health workers, from different cadres, participated in the discussions. Ethical clearance was obtained to conduct the study.

The study confirmed the use of informal payments and interestingly it was found that these payments were more commonly patient-initiated, rather than provider-led. Informal payments were found to be used in order to obtain better or faster services, for example, by jumping the queue, or in order to access private health services.

It was found that in general, health workers were not satisfied with their jobs. The main source of dissatisfaction was low salary and difficult working conditions and it was felt that salaries were not adjusted according to risk and responsibilities.

Although informal payments provide additional income for health workers, it was found that they do not have an overall positive effect:

"I just want to say that for those who are engaged in informal payments they are not happy of that." (Health Worker, Dispensary of Mwendapole)

Health workers said that informal payments were a type of bribery, making them feel enslaved by their patients and resulting in loss of self-esteem:

"Bribery is a torture to health attendants, because even when you succeed to receive bribery from a person or patient then you will be locked to him for he won't allow you to serve anyone else than him."(Midwife, Tumbi Hospital)

Furthermore, there was a feeling of guilt and discomfort as health workers knew they were involved in a situation that has serious consequences on poor peoples' access to health services.

"On my side bribery is a trouble and a disturbance, and pity to those who are unable to give anything to be treated."(Midwife, Tumbi Hospital)

Informal payments appear to be contributing to an environment of corruption and dishonesty which in turn creates dissatisfaction, discomfort, and de-motivation among health workers. Fear of detection was another major de-motivating factor. All these factors appear to counterbalance the positive effect of receiving the additional income.

"When you receive bribery you become uncomfortable, even if you receive corruption from patient you become afraid, you become insecure in such a way that sometimes when you hear a knock in your office you become afraid or if one talks about bribery you become confused. We don't like this situation, really it's not good." (Midwife, Tumbi Hospital)

Informal payments were not found to be strongly related to retention of health workers. However in this setting there was not a great interest in moving from working in the public sector to the private sector. In fact, the private sector was not always viewed favourably.

"Some hate to be in private sector simply because there is no job security, people are offended, no job satisfaction, tyrannies, and you can even lose the job anytime."(Doctor Specialist, Tumbi Hospital)

In general, money was not found to be the most important factor in the decision to stay in the public sector. First of all, job security was mentioned as extremely important. Additionally, opportunities for further education and training were considered important by certain categories of health worker, such as nurses and midwives. Mid-level providers, namely the clinical officers, reported that due to their "non exportable skills" it meant they were not able to switch to the private sector or to migrate so easily, so they are being retained in their current jobs often because there are no other options.

This study showed that the practice of informal payments contributes to general de-motivation of health workers and negatively affects access to health services and quality of the health system. Policy action which not only provides better financial incentives for individuals, but also tackles an environment in which corruption is endemic is needed. In addition, this study shows that patterns relating incentives, motivation, and retention may depend on the local context. In the particular context examined in this study, financial incentives, when obtained in an illegal and uncomfortable manner, were counterbalanced by non-financial factors and contributed to de-motivating health workers more than motivating them. Moreover, in a context of high unemployment, health workers may respond to non-financial incentives, such as job security, in their decision to stay in the public sector, instead of switching to the private sector for higher salaries.

What Is An Effective Incentive Package?

It is widely agreed that financial incentives alone are not sufficient and any incentive package must include non-financial incentives. There is currently limited information about the effectiveness of incentive packages as there is little rigorous monitoring and evaluation being conducted. Furthermore it is often difficult to attribute outcomes to a specific element of a broad package. However, characteristics for effective incentive schemes have been identified (Weller, 2008) and these are:

- has clear objectives
- is realistic and deliverable
- reflects health worker needs and preferences
- is well designed, strategic and fit for purpose
- is contextually appropriate
- is fair, equitable and transparent
- is measurable
- incorporates financial and non-financial elements.

Success of retention strategies has been documented in Thailand, Uganda, Canada, and the U.K. (Baumann, Yan, Degelder, & Malikov, 2006). Each country has made considerable investments in health with a comprehensive health policy framework and a professional body in place to ensure strategies were being implemented. All strategies focussed on financial and non-financial incentives. Uganda, for instance, from 2001 to 2006 had several policies which included: increased numbers of nurses, upgrading of skills, harmonisation of posts, opportunities for professional development, increased salaries, housing allowances, lunch allowances, and special allowances/incentives for health workers in rural areas (Baumann et al., 2006). Although no data is available for the number of nurses currently retained by these interventions, Uganda has a relatively low number of health workers considering emigration (Awases et al., 2003). Furthermore there is no information about health worker motivation and how this has been affected by the retention strategies. However, it would appear that a similar, multi-faceted approach as used in Uganda could be applied in other settings.

REVISITING MASLOW

It is important to review the evidence and consider whether there is a hierarchy of needs for health workers. Maslow's hierarchy of needs has been used as a model for understanding motivation in business (Benson & Dundis, 2003) and, if this were to be the case for health workers, it would make sense that incentives to improve motivation would target each level in turn, starting at the basic level of fulfilling financial needs and, once this has been achieved, to progress to fulfilling needs of safety, and so on (see Figure 1).

There are arguments for and against the concept of a hierarchy of needs for health workers. It is evident that multiple factors are needed for a health worker to be motivated and clearly financial needs must be met first, particularly for those who work in resource poor settings. Conversely, in high income countries general practitioners are less interested in salaries, but more interested in job quality and opportunities of teaching medical students (Van Ham, Verhoeven, Groenier, Groothoff, & De Haan, 2006), thereby illustrating that they have fulfilled the first level of the hierarchy and are now looking to fulfil levels higher up in the sequence.

Issues of safety are a very real concern for many in LMICs where there are poor and often hazardous working conditions. Willis-Shattuck et al. (2008) note that health workers are working in conditions where simple protective measures, such as gloves, are not available to them. This is contributing to the risk of infection from HIV and other communicable diseases. Conversely in high income countries safety was not perceived to be an issue as work environments tend to be well resourced, thus minimizing the risk of hazardous incidents (Spear, 2006). Again, this shows that once safety needs have been met, it is possible to concentrate on fulfilling higher needs. Furthermore, there is overwhelmingly evidence that belonging and esteem are a major theme and effective human resources management strategies

are important to their fulfilment. It could be argued that once financial needs have been met and the worker is in a safe environment it is natural that the next needs which need to be fulfilled are those of belonging and esteem. What this means in terms of motivating health workers through incentives is that an approach would need to be taken to ensure that all needs are being fulfilled sequentially.

However, it can also be argued there are several sets of needs, as outlined in Figure 1, but these do not have to be fulfilled in sequence. A health worker can be motivated while not having satisfied each level in turn. Although financial interests must be met, we have presented evidence that there is a price to pay for using financial incentives and that increasing financial incentives may actually produce de-motivation. They also appear to have an eroding effect on some of the "higher needs" such as esteem and belonging. Furthermore, increasing financial incentives for some cadres or departments and not others may produce de-motivation for those who don't benefit. This is likely to create tension and result in difficulties within the work place environment. Hence, different incentives may not only de-motivate some, i.e., those who don't receive them, but may also produce a general malaise in the workforce.

The power of non-financial incentives used on their own without any financial influence has been demonstrated in Zambia. A study (Furth, 2006), in which one district had a financial incentive and the other had a non-financial incentive in the form of performance awards found that workers in the district with the financial incentive were frustrated and distrustful of the incentive and it had no impact on motivation. However, in the district with the performance awards, that were awarded to teams rather than individuals, workers were motivated and encouraged to do well and felt that they got better support from their supervisors (Furth, 2006). Nevertheless, the interpretation of this may be questioned. It may be claimed that Zambian staff had their basic needs (namely salary) met first and

so were more amenable to higher level pursuits. Nevertheless, given the systemically low levels of salary and remuneration in Zambia and the activation of additional financial rewards in one pilot, this is highly unlikely.

How an incentive is valued will also depend on the profile of the worker, with age, gender, number of dependents, stage of career, and professional background all acting as influential factors (Reid, 2004). There are suggestions that those with families place greater value on income and social factors, such as schools, and young workers place greater value on post-graduate training and career development (Reid, 2004). Additionally people will have their own set of personal values which may influence their decision to work in a rural or urban setting or in private or public practice.

There is limited information regarding how motivational factors are valued by different cadres. A recent study in Malawi (McAuliffe, 2008) has found that mid-level medical cadres are significantly more dissatisfied than nurses. Their main frustration is the lack of continuing education and career progression available to them, whereas nurses were more likely to cite income as the main reason for considering migration. This is consistent with other findings (Willis-Shattuck et al., 2008) which suggest that nurses rank financial rewards higher than other cadres. This is likely to reflect the fact that they are poorly paid and work long hours.

On balance, the required ordering and mix of incentives is more complex than portrayed by Maslow's hierarchy of needs, where a person will not progress from one level of need to the next without having fulfilled that level. Many workers in developing countries are motivated to help their patients despite receiving inadequate financial remuneration.

FUTURE RESEARCH

As it has been shown, there are strategies in place throughout the world to improve motivation and retention. As health professionals are a scarce resource, all countries need to implement plans for effective human resources management, targeting career paths, performance appraisals, clear job descriptions, and ensuring continuous training and education. However, there is still insufficient evidence to reveal the precise interaction between different incentives, context, cadres, and personal needs. Work needs to be done to bridge this gap and thoroughly evaluate the impact of both financial and non-financial incentives in different circumstances. There is limited information as to the extent to which motivational factors are valued differently by different cadres. It would be beneficial to improve understanding of the relative power that each motivational factor has for each cadre. In order to do this, discrete choice experiments (DCE) could be used to evaluate the relative importance of the different factors affecting where health workers choose to work and how productive they will be. In DCEs participants are asked to make a number of choices between packages of attributes, such as salary, work conditions, and career development opportunities, in a hypothetical work environment. While there are only few initiatives in this area at present, the potential is significant to help understand and develop incentive packages to fit each country's health workforce.

CONCLUSION

It is evident that motivational factors are complex and intertwined so that it is not desirable to focus exclusively on one motivational theme at a time, following Maslow's model. Rather, for an effective intervention to improve motivation and retention, it will be necessary to target several themes simultaneously. As health worker needs change,

how incentives are valued will also change and, consequently, interventions to improve motivation must also respond and constantly evolve. This is a key challenge for health system policy makers and human resources managers.

It is essential that health professionals are paid an appropriate wage. Yet financial incentives that may well help with retention do not generally appear to affect motivation and productivity (except when targeted at a specific activity, for instance through a fee-for-service payment). Financial incentives are crucial, but they need to be handled with great care. They can create competition and division, producing not only de-motivation in those cadres who don't receive them, but also tension in the entire workplace through financial competition between winners and losers. They can also promote a culture of personal financial reward over professional ethos. Ethos and esteem are vital motivators for many health professionals and their commitment to help their patients and their communities is often paramount, even in adverse conditions, and for this they should be highly commended. Poorly designed financial packages, that may erode this commitment, may do more harm than good.

Chapter 71
An Empirical Test of the Information Processing Theory

Honggeng Zhou
University of New Hampshire, USA

ABSTRACT

According to the propositions in the information processing theory, this study tests the relationship between task uncertainty and three organizational design strategies, i.e., creation of lateral relationships, investment in information systems, and creation of self-contained tasks. Data from 125 North American manufacturing firms are used and business environment uncertainty is employed to measure task uncertainty. Sourcing practice and delivery practice measure the creation of lateral relationships, while Information quality measures the investment in information systems. Also, just-in-time production and human resource management measure the creation of self-contained tasks. Regression analysis shows that business environment uncertainty has significant positive influence on sourcing practice, delivery practice, information quality, just-in-time production, and human resource management. While the information processing theory was proposed more than thirty years ago, this study empirically extends the relevance of information processing theory to today's supply chain environment.

INTRODUCTION

Galbraith (1973) proposes the information processing theory (IPT), which argues that the need for information processing increases as the task uncertainty increases. Among the four design strategies the IPT suggests, creation of slack resources and creation of self-contained tasks are

used to reduce the need for information processing. Investment in information systems and creation of lateral relations are used to increase the capacity of information processing. Creation of slack resources is not a preferred strategy, because it is usually costly. Therefore, this paper will focus on the relationship between the other three design strategies and task uncertainty.

Creation of lateral relationships can increase information processing capacity. Galbraith (1974)

mentions several ways to build up lateral relationships, which include direct contact, liaison roles, task forces, and teams. The purpose of the lateral relationship is to move the decision to the level where the information exists. Information does not need to move up to the higher level of the organizational hierarchy for decision-making. Therefore, a good lateral relationship can increase the information processing capacity. As firms have become more globalized in the past two decades, creation of lateral relationships has become more important in today's global supply chain management. Thus, this paper will study the sourcing and delivery practices that enhance the lateral relationships between supply chain partners. Sourcing practice links suppliers with manufacturers and is critical for the lateral relationships between manufacturers and suppliers. Delivery practice connects manufacturers with customers and includes processing inquiries, entering orders, consolidating orders, routing shipments, selecting carriers, transporting products, and so on.

Investment in information systems is used to integrate enterprise-wide information and formalize information. It makes all people share the same information, which can improve standardization and result in less misunderstanding and fewer conflicts. It allows for the processing of information acquired during task performance in a timely fashion. Therefore, having an integrated information system can increase information processing capacity. However, companies are usually not willing to reveal investment dollar amount in research surveys. Thus, this paper will use information quality as a surrogate for the investment in information systems because higher investment in information systems is usually associated with higher information quality. In this study, information quality measures nine aspects: accuracy, availability, timeliness, internal connectivity, external connectivity, completeness, relevance, accessibility, and information update frequency.

Creation of self-contained tasks is a way to organize operations. It is popular in lean manufacturing environments, which usually use just-in-time (JIT) production. One of the JIT production practices is cellular manufacturing, which promotes the creation of self-contained tasks. The advantage of this mechanism is that less information needs to be exchanged across functions, which helps reduce the need for information processing. Another source of information reduction is through a reduced division of labor. Lean manufacturing advocates flexible resources and promotes employee cross-training programs. Therefore, this paper will measure the creation of self-contained tasks with two aspects of lean manufacturing, i.e., JIT production and human resource management. JIT production includes cellular manufacturing, pull system, cycle time reduction, agile manufacturing strategy, and bottleneck removal (Powell, 1995; MacDuffie et al., 1996; Flynn et al., 1999). In lean manufacturing environments, the human resource management practices emphasize employee cross-training and teamwork (Ahmad et al., 2003; Shah & Ward, 2003).

Besides the design strategies, task uncertainty is another key element in Galbraith's IPT. Task uncertainty is directly related to the uncertainty in business environments. Business environment uncertainty refers to the changes in products, technologies, and demand for products in the market (Miller & Friesen, 1983; Dess & Davis, 1984). In today's supply chain environment, the rate of innovation in products and processes has increased significantly. Fine (1998) discusses product clock speed and process clock speed. The faster the clock speeds are, the more uncertainty the business environments and tasks have. In this study, the rate of innovation in products and processes will be used to measure the business environment uncertainty (as a surrogate for task uncertainty).

As the IPT was proposed more than thirty years ago, it is important to reassess whether the relationship between task uncertainty and design strategies suggested by the IPT is still true in to-

day's supply chain environment. Therefore, the focus of this paper is to empirically test whether business environment uncertainty (as a surrogate for task uncertainty) has significant positive impact on the creation of self-contained tasks, investments in information systems, and the creation of lateral relationships. The creation of lateral relationships is measured by sourcing and delivery practices. The creation of self-contained tasks is measured by JIT production and human resource management. Information quality is used as a surrogate for investment in information systems. Hopefully, this study will enhance our understanding of the IPT in today's supply chain environment.

The remainder of this paper reviews literature and proposes the research hypotheses, while presenting the research methodology and measurement scale development. Finally, an analysis of the results are discussed, followed by a conclusion.

LITERATURE REVIEW AND RESEARCH HYPOTHESES

This section reviews the literature in sourcing practice, delivery practice, information quality, JIT production, human resource management, and business environment uncertainty. Based on the literature review, the research hypotheses are proposed.

Business Environment Uncertainty

Task uncertainty in the IPT is directly related to the business environment uncertainty. Higher business environment uncertainty is usually associated with higher task uncertainty. Therefore, this study will use business environment uncertainty as a surrogate for task uncertainty. Pagell and Krause (2004) measure business environment uncertainty from the aspects of products, supply, customers, regulation, and public attitude. Vickery et al. (1999) measure the environmental uncertainty with marketing practices, competitor actions,

demand and customer tastes, and production processes. Ho (1996) measures the environmental uncertainty with customers, suppliers, competitors, social-politics, and technology. Ward et al. (1995) measure the environmental concerns with business costs, labor availability, competitive hostility, and dynamism. Ward and Duray (2000) measure the environmental dynamism with the rate of innovation in products and processes. Fine (1998) measures both product clock speed and process clock speed. The clock speeds measure the pace of changes in business environments and have significant impact on operations. In this study, business environment uncertainty is measured by the rate of innovations in product and process.

Business environment has been cited as one of the key antecedents to management practices (Vickery et al., 1999; Dasgupta et al., 1999; Shore, 2001). Shore (2001) uses a case study method and finds that the competitiveness of the business environment does influence the degree of data sharing. Dasgupta et al. (1999) find that companies facing more intense competitive business environment have a higher degree of information technology adoption rate than those facing less competition. Vickery et al. (1999) use a structural equation model to test the impact of environmental uncertainty on organization structures.

Sourcing Practice

Sourcing practice is one of the two aspects this paper measures for the creation of lateral relationships. Sourcing practice is important because manufacturing firms often spend a significant amount of revenue on purchasing raw materials. The sourcing literature has identified several sourcing practices as best practices. First, a designated purchasing team is important (Ellram & Pearson, 1993; Johnson et al., 2002). As Galbraith (1974) mentions, such a designated team is a way to build up lateral relationships. A designated purchasing team can organize firm resources effectively and facilitate the timely completion of

purchasing activities. It serves as a liaison between suppliers and manufacturers.

Second, a long-term supplier-buyer relationship and a reduced supplier base are good sourcing practices. A long-term supplier-buyer relationship plays a critical role in supply chain management (Choi & Hartley, 1996). Hahn et al. (1983) show that the benefits of using long-term contracts outweigh the costs. Another benefit of long-term supplier-buyer relationships is early supplier involvement in the buyer's new product development. Womack et al. (1990) suggest that Toyota's first-tier suppliers' involvement in its new product development reduced the length of the product development cycle. Hartley et al. (1997) also find a significant relationship between suppliers' involvement in product development and overall product development delays, i.e., suppliers' early involvement in the design process can reduce product development delays. Reducing the supplier base can realize economies of scale. It is also less costly to manage a smaller supplier base than a larger supplier base (Treleven, 1987). Meanwhile, it is easier to develop closer lateral relations with a smaller supplier base than a larger supplier base. Overall, a long-term supplier-buyer relationship and a reduced supplier base help foster better lateral relationships between suppliers and manufacturers.

Third, JIT delivery from suppliers is considered a good sourcing practice. JIT delivery requires close interaction between suppliers and buyers. The benefits of JIT delivery include reduced logistics costs, reduced order size, reduced lead-time, improved product quality, etc. (Dong et al., 2001; Hahn et al., 1983; Schonberger & Ansari, 1984).

Fourth, providing suppliers with performance evaluations and feedback is a good sourcing practice. Carr and Pearson (1999) show that supplier evaluation systems have a direct positive impact on buyer-supplier relationships, and an indirect impact on the firm's financial performance. Prahinski and Benton (2004) find that executives at buying firms need to incorporate indirect influence

strategy, formality, and feedback into supplier development programs.

When the uncertainty in business environments increases, suppliers and buyers need to have a closer working relationship. A designated purchasing team helps respond to the changes in the business environment faster. Long-term supplier-buyer relationships and reduced supplier bases make it possible to share more information between supply chain partners. JIT delivery can reduce the inventory in supply chains, allowing supply chains to better cope with demand changes from customers. Suppliers' performance evaluation and feedback help not only suppliers but also whole supply chains improve overall performance. Therefore, this study hypothesizes the relationship between business environment uncertainty and sourcing practice as follows:

Hypothesis 1: business environment uncertainty has significant positive impact on sourcing practices.

Delivery Practice

The extant literature and anecdotal evidence show that good delivery practices are crucial for effective supply chain management under uncertain business environments. Johnson and Davis (1998) show that poor ordering processes cost Hewlett Packard a million dollars a day; whereas, the cross-docking technique used by Wal-Mart reduces inventory holding costs and inventory spaces (Stalk et al., 1992). Gurin (2000) describes how an Internet-based delivery process jointly developed by Ford and UPS significantly improves Ford's delivery performance.

Best delivery practices also include JIT delivery and outsourcing of logistics services. Dell computer, which has its suppliers located near its manufacturing facilities, practices JIT delivery. Dell also outsources its logistics to Airborne Express and UPS, which serve as Dell's logistics department. This results in improved product de-

livery performance and higher customer satisfaction. Other best delivery practices include: a single point of contact for all inquiries, instant quoting capabilities to reduce customer confusion, and reduced lead-times (Supply Chain Council, 2000).

The use of different delivery practices is closely related to business environment uncertainty. When the changes in products and processes become more frequent, manufacturers need to have better visibility to the orders in progress. Manufacturers also need the ability to dynamically configure delivery routing as new orders come in. Tracking orders in real time is needed as customer requests might change after the orders are placed. Overall, the need for good delivery practices increases as business environment uncertainty increases. Therefore, this paper hypothesizes the following:

Hypothesis 2: business environment uncertainty has significant positive impact on delivery practices.

Information Quality

In this study, information quality is used as a surrogate for investment in information systems. A number of researchers have described various dimensions of information quality. Tushman and Nadler (1978) define quality information as accurate, timely, and concise data. DeLone and McLean (1992) and Seddon (1997) suggest that information relevance, timeliness, and accuracy are important for an effective information system. McCormack (1998) measures information by accuracy, frequency, and availability. Petersen (1999) measures information quality by currency, accuracy, and completeness. A recent study (Ge & Helfert, 2007) reviews the research in information quality and identifies similar information quality dimensions such as accuracy, relevance, and timeliness. According to the literature review, this study measures information quality from nine aspects: accuracy, availability, timeliness, internal connectivity, external connectivity, completeness,

relevance, accessibility, and information update frequency.

Many studies have shown the importance of high information quality. Sum et al. (1995) find that data accuracy has significant influence on operating efficiency and customer service. McGowan (1998) argues that the information system is useful only when the information is high quality. Chopra and Meindl (2001) suggest that information must be accurate, timely, and correct. Information quality is an important measure for an effective information system. Li and Lin (2006) empirically examine the role of information quality and information sharing in supply chain management. Forslund and Jonsson (2007) study the role of forecast information quality on supply chain performance.

The need for a high quality information system increases as business environment uncertainty increases. More information needs to be processed when the rate of innovation in product and process is high. Information accuracy and timeliness become more important when firms rely more on the information to make decisions. Information needs to be updated more frequently as well. Also firms need to have better internal and external connectivity when supply chain partners need to share real-time information and make decisions jointly. Thus, the relationship between business environment uncertainty and information quality is hypothesized as follows:

Hypothesis 3: business environment uncertainty has significant positive impact on information quality.

JIT Production

JIT production promotes self-contained tasks. It includes several practices: cellular manufacturing, pull system, cycle time reduction, agile manufacturing strategy, and bottleneck removal (Powell, 1995; MacDuffie et al., 1996; Flynn et al., 1999). Cellular manufacturing is used to identify

similar products or similar processes and group them together (Wemmerlov & Hyer, 1989). Using cellular manufacturing, tasks can be completed within the cell, which promotes the concept of self-contained tasks. In order for cellular manufacturing to be successful, other JIT production practices are important. Pull systems allow for meeting customer demand in a precise and timely manner (Blackburn, 1991). Reductions in cycle time allow for running smaller batches, which is necessary for cellular manufacturing. Reducing cycle time can also prevent the possibility of producing a large number of undetected quality problems. Agile manufacturing strategy allows production systems to cope with fast demand changes, which is important for today's supply chain management. Bottleneck removal balances resources and maximizes output of production.

JIT production becomes more important as business environment uncertainty increases. Pull systems and agile manufacturing help manufacturers respond to customer demand changes more quickly. Cellular manufacturing and cycle time reduction help reduce lead times, which is usually critical in uncertain business environments. While traditional push systems work well with stable demand, JIT production systems are usually a better choice for more dynamic business environments. Therefore, this study hypothesizes the following:

Hypothesis 4: business environment uncertainty has significant positive impact on JIT production.

Human Resource Management

In lean manufacturing environments, the human resource management practices emphasize employee cross-training and teamwork (Ahmad et al., 2003; Shah & Ward, 2003). Teamwork is important for improving production, because frontline employees working as a team can leverage the experience of all employees and create self-contained work environments. This greatly

contributes to process and product improvement. Hayes and Wheelwright (1984) recognize the important impact that workforce participation has on firm performance. Cross-training reduces the division of labor and thus reduces the information processing needs. Schonberger (1990) emphasizes the importance of cross-training and job rotation. Giffi et al. (1990) suggest that employee skills development needs to progress as technology evolves. Both teamwork and workforce capabilities are critical for effective supply chain processes, because firms cannot operate and coordinate with other supply chain members effectively if the firms do not have a capable workforce.

The importance of human resource management increases as business environment uncertainty increases. Firms need more flexible labor resources when customer demand and product mix change more often. The value of cross-training increases as labor resources need to be more flexible. Teamwork also becomes more important when business environment uncertainty increases, because information sharing and collaboration become more critical when tasks become more complex and dynamic. Therefore, the following hypothesis is proposed.

Hypothesis 5: business environment uncertainty has significant positive impact on human resource management.

RESEARCH METHODOLOGY

The Sample

This study uses a survey research method. A total of 745 surveys were mailed. Before the surveys were sent, four academic experts and three industry experts critiqued the research instrument to ensure its relevance and clarity. A total of 134 responses were received from manufacturing industries. Among the 134 responses, 125 are usable responses. The response rate was approximately 18%. The data

analysis is based on the 125 useable responses. The surveyed firms include Xerox Corp., Dow Corning Corp., Owens Corning, Nachi Robotic Systems, Windsor Mold Inc., and Minntech Corp.

The respondents were senior executives, who held titles such as CEO, President, Vice President, Director, and so on. The average number of employees in the respondents' firms was 4,991. Eight companies had more than 10,000 employees. The median annual sales value, as reported by the respondents, was between $100 million and $500 million dollars. Five companies had annual sales exceeding $5 billion. Regarding the manufacturing process, 41% of the companies used a make-to-stock strategy and 28% used a make-to-order strategy.

The missing values were imputed. This study had a missing value rate of 2%. The mean of each item was used to replace the missing data. To minimize the non-response bias, multiple contacts were used to maximize response rate (Dillman, 2000). After the responses were received, the early responses were compared with late responses to determine if there were any statistical differences (Lessler & Kalsbeek, 1992). There were no statistical differences between the early and late responses.

Measurement Scales

The survey questions for each measurement scale are in Table 1. The study has a total of 6 latent variables: business environment uncertainty, sourcing practice, delivery practice, information quality, JIT production, and human resource management. The mean and standard deviation of each survey question are shown in Table 1 as well.

The measurement scale development process supports the validity and reliability of the measurement scales. The content validity of the scales was established by the literature. In addition, both academic and practitioner experts assessed the survey questionnaire content validity before the surveys were conducted. Construct validity ensures that

the conceptual constructs are operationalized in the appropriate way. To ensure the construct validity, factor analysis is used. According to Carmines and Zeller (1979), the factor loadings need to be at least 0.3. Only one factor in each construct can have an eigenvalue that is larger than 1 and the variance explained by the first factor in each construct is at least 40%.

Reliability is defined as the extent to which the measures can yield similar results in other replication studies (Carmines & Zeller, 1979; Hair et al., 1998). There are four ways to measure reliability. The retest and alternative form methods require two repeat observations with the same group of people. Since the survey target was senior executives, the limited resources do not allow us to survey the same group of senior executives twice. The third method, split-halves method, has the critical limitation that the reliability results depend on how to subdivide the total set of observations into two groups. The reliability results can be significantly different if the approaches to splitting the observations are different. Therefore, the internal consistency method is used to measure the construct reliability in this study. Internal consistency in this study is measured by Cronbach's alpha. The lower limit of 0.7 is considered acceptable (Nunnally, 1994).

The results of the measurement scale analysis are in Table 2. Table 2 shows that all factor loadings meet the criterion of larger than 0.3 and all constructs satisfy the unidimensionality requirement. For all construct scales except "Delivery Process," only one eigenvalue is larger than 1.00 and the variance explained by the largest eigenvalue is larger than 40%. For the construct "Delivery Process," the second largest eigenvalue is slightly larger than 1.00. The largest eigenvalue explains more than 40% of the variance. The scree test suggests that one factor is the most appropriate for this set of items. Thus, "Delivery Process" is determined to be unidimensional. Table 2 also shows that all scales have Cronbach's alpha values of 0.7 or higher. According to Cronbach's alpha values, it is concluded that all measurement scales are reliable.

RESULTS AND DISCUSSION

Analysis Results

This study uses five regression models to test the influence of business environment uncertainty on sourcing practice, delivery practice, information quality, JIT production, and human resource management, respectively. First, the average of the measurement items for each factor is calculated. Second, the annual sales variable (as a surrogate for firm size) is entered into the regressions as a control variable. Third, the business environment uncertainty variable is entered into the regressions as an independent variable. Finally, the dependent variables (sourcing practice, delivery practice, information quality, JIT production, and human resource management) are entered into the five regressions respectively. As the control variable annual sales is not significant at the 0.05 level in any of the five regression models, this study reruns the five regression models without the annual sales variable and reports the results in Table 3. Table 3 shows that business environment uncertainty has significant positive influence on all five dependent variables, because all t-values are significant at 0.05 levels. Thus, it is concluded that Hypotheses 1-5 are supported.

Business Environment Uncertainty and the Creation of Lateral Relationships

Table 3 shows that business environment uncertainty has significant positive influence on sourcing practice. The standardized coefficient is 0.284. The R-square is 0.081, which means that 8.1% of the variance in sourcing practice is due to the variance in business environment uncertainty. This finding has several managerial implications. First, executives need to develop a long-term relationship with a reduced supplier base when the business environment uncertainty is high. Close collaboration such as supplier involvement in

Table 3. Linear regression analysis results

Dependent variables	Standardized Coefficient	R²	t-value	Significance level
Sourcing practice	0.284*	0.081	3.16	0.002
Delivery practice	0.193*	0.037	2.07	0.040
Information quality	0.288*	0.083	3.20	0.002
JIT production	0.329*	0.108	3.60	0.000
Human resource management	0.323*	0.104	3.59	0.000

* p value < 0.05
Independent variable: business environment uncertainty

new product development is important, because that can reduce the new product development lead time and lead to a quicker response to the market. Cousins et al. (2006) suggest that a close relationship between supply chain partners is an important differentiator of high and low performers in today's supply chains. According to Paulraj et al. (2008), long-term relationship orientation can improve inter-organizational communication, which directly affects the lateral relationship in supply chains. Second, suppliers need to develop JIT delivery capability. As products and services are innovated frequently, JIT delivery can reduce the inventory in supply chains and reduce lead times. Third, firms need to provide timely feedback to suppliers so that suppliers can adjust to changing market needs in a timely fashion.

For delivery practice, the regression coefficient is 0.193. The R-square is 0.037. These results suggest that among the five dependent variables, business environment uncertainty has the least impact on delivery practice although it does have significant positive influence on delivery practice. This finding shows that it is important to streamline the delivery process when the rate of product and process innovation is high. For example, having a single point of contact can reduce the lead time of acquiring market demand information. JIT delivery and order tracking allow fast and accurate delivery to customers. As Galbraith (1973) mentions, influence based on knowledge and information is important for the creation of good lateral relationships when uncer-

tainty is high. Real-time visibility and tracking of order status enable supply chain partners to make information-based decisions (Lee, 2008; Ozelkan & Galambosi, 2008).

Business Environment Uncertainty and Investment in Information Systems

The regression coefficient for information quality is 0.288. The R-square is 0.083, which more than doubles the R-square for delivery practice. This suggests that business environment uncertainty is more reliable for predicting information quality than for delivery practice. This finding shows that information quality needs to increase as the business environment uncertainty increases. As the changes in products and processes happen more often, firms need more frequently updated, real-time, and accurate information. This finding confirms the proposition in Galbraith (1973), which suggests that the need for information processing increases as the environmental uncertainty increases. Firms need to increase the investment in information systems when business environment uncertainty increases.

Business Environment Uncertainty and the Creation of Self-Contained Tasks

The regression coefficient for JIT production is 0.329. The R-square is 0.108. Both results suggest

that among the five dependent variables, business environment uncertainty has the largest impact on JIT production. As a component of lean manufacturing, JIT production has been studied in many previous studies (Balakrishnan et al., 2008; Shah & Ward, 2007; Shah & Ward, 2003). For uncertain business environments, JIT production systems work better than traditional push systems. Agile manufacturing strategy enables firms to respond to the changes in business environments quickly. Cycle time reduction, bottleneck/constraint removal, and cellular manufacturing reduce the production lead time, which allows firms to better cope with the changes in products and processes.

The regression coefficient for human resource management is 0.323. The R-square is 0.104. The results suggest that firms need a more flexible and self-directed workforce when business environment uncertainty increases. As a component of lean manufacturing, human resource management has been explored in several extant studies (Ahmad et al., 2003; Shah & Ward, 2003). However, we are not aware of any study that has empirically examined the relationship between business environment uncertainty and human resource management in lean manufacturing settings. Therefore, this study contributes to the literature by providing empirical evidence that business environment uncertainty has significant positive influence on human resource management.

The analysis suggests that the need for self-contained tasks increases as the business environment uncertainty increases. Self-contained tasks help reduce the need for information processing from two perspectives (Galbraith, 1973). First, it reduces the output diversity faced by a single collection of resources. JIT production typically minimizes the information flows across different production groups. Second, self-contained tasks reduce the need for information processing through a reduced division of labor. The human resource management practices such as cross-training help reduce the division of labor.

CONCLUSION AND FUTURE RESEARCH

With the data from 125 North American manufacturing companies, the regression models show that business environment uncertainty has significant positive influence on sourcing practice, delivery practice, information quality, JIT production, and human resource management. This study empirically tests the importance of the creation of lateral relationships, investment in information systems, and the creation of self-contained tasks in today's supply chain management. While the IPT was proposed more than thirty years ago, this study suggests that the concepts proposed in the IPT still hold true in today's businesses. Therefore, this study contributes to the literature by empirically extending the relevance of the IPT to today's supply chain management.

Future research can extend in several directions. First, Galbraith (1973) discusses not only four design strategies but also three organizational structures (i.e., coordination by rules or programs, hierarchy, and coordination by targets or goals). Future studies can test how different design strategies work with the three different organizational structures in today's supply chain environments. Second, future studies can test the relationships proposed by the IPT in service operations environments. Service operations typically have more task uncertainties than manufacturing operations as service operations have shorter lead times and more interactions with customers. Third, future studies can test the IPT in countries with different cultures. Compared to many Asian countries such as China, western countries usually rely more on formal information systems for information sharing and coordination. Asian countries rely more on informal methods such as personal connection to share information. Therefore, the IPT might need to be modified when it is applied to countries with different cultures. Finally, future studies can consider other aspects of business

environmental uncertainty such as social-political components (Ho, 1996).

Chapter 72

Analysis of Job Responsibilities of Association of Research Libraries (ARL) Human Resource Professionals

Gina R. Costello
Louisiana State University, USA

Alice Daugherty
Louisiana State University, USA

ABSTRACT

The purpose of this chapter was to convey the results of an exploratory survey given to human resource professionals working within the 123 institutional members of the Association of Research Libraries (ARL). The objective was to further define the role of human resource professionals in ARL libraries and reveal the nature and extent of human resource support for faculty and staff at ARL libraries. Respondents were recruited through email and asked to characterize their human resource functions by answering 35 open-ended and closed survey questions via an online proprietary survey tool. The response rate was 30% and provided data for the researchers to examine the experience level and education of human resource professionals, the role these individuals play in the day-to-day library operations, and the extent of interaction with the university human resource department.

INTRODUCTION

The role of human resource management within higher education reflects a vital yet complex function of leadership and management that affects organizational development. An integral area of

human resource management within academic organizations is a separate human resources department located within an academic library. Human resource personnel in academic libraries provide counsel and information to library administrators for decision making purposes, aid faculty and staff with human resource issues, and provide training and instruction to all library employees. In addi-

tion, library human resource personnel maintain contact with and follow regulations set forth by the institutional or university human resource department. The human resource personnel within large research libraries face the challenge "to establish a function that is affirming and highly relevant to the core of the library and to its strategic direction" (Simmons-Wellburn, 2004, p. xii) as well as support development between the library and university.

This paper reflects the results of an exploratory study of human resource professionals working within the 123 institutional members of the Association of Research Libraries (ARL). The researchers sought to gain an understanding of the role of human resource professionals in ARL libraries, gage the level of interaction between library faculty, library staff and human resource professionals, and examine the day-to-day activities of ARL human resource professionals. The objective was to illustrate the breadth of responsibilities of human resource personnel within ARL libraries and more specifically their impact on library faculty.

The researchers employed a variety of closed and open-ended questions via survey to discover more about the human resource challenges in libraries relative to the level of involvement in hiring and recruiting faculty, the number of individuals hired or processed per year, and the extent of their participation in library outreach and in-house training activities. Specific areas in which the researchers delved deeper included, what education or specialized training do the human resource professionals possess; what tasks or practices are performed within a human resource professional's daily job and duties; how the human resource department fits into the library organization as a whole; and the relationship between a libraries' human resource personnel and the institution's or university's overall human resources system.

BACKGROUND

The tasks of academic library human resource personnel are similar to human resource departments at the university level; human resource personnel at many levels are familiar with employment laws, engage in hiring practices, participate in evaluations and performance appraisals, deal with conflict resolutions, offer training and professional development, recruit and train new hires and work with diversity initiatives, among other tasks. Even with the depth of responsibilities held by academic library human resource personnel there is a lack of literature supporting their function and duties.

Library human resource professionals are effective and strategic elements in change management. Library employees in the new millennium are seeking change from hierarchical styles of administration, casual styles of training, unspoken policies, the overuse of stagnant committees, and other attributes that lead to an organization's character. Generally, employees want a clear focus of leadership goals and guidelines. The human resource representative is in a good position to mediate ideas and goals between all levels of administration and staff through assessment and accountability whereby identifying needed process changes and reinforcing behavioral changes (Kreitz, 2008, p. 104).

In his 2008 article, "Human Resource Administration in the Academic Library," Dennis R. Defa emphasizes the sometimes complex human resource challenges found in a university library and recommends that a trained *in-house* (emphasis added) human resources professional would be better suited to handle such responsibilities in the academic library because of their familiarity with university policies. Large research libraries have unique staffing needs that differ from other areas of the university. Not only are there a large mix of positions working together (faculty, staff, students, etc.) and several library departments collaborating on projects (reference, collection development, technical services, etc.) but the

operations and services of academic libraries stay open extended hours including weekends, holidays, and summers. The diverse staffing needs found in libraries coupled with the changing rules associated with federal and state laws, and the interaction between the library and the campus human resources department can present distinct challenges to library human resource professionals.

The human resource professional working in a library plays an active role in the entire process of hiring new employees, assisting with the logistical side of the hiring process as well as guiding the administration to successfully navigate through the sometimes murky legal waters. Oftentimes many individuals are involved in faculty hiring, and each need to be briefed on equal employment opportunity laws and the legal restrictions that govern the types of questions that can be asked of a candidate. The successful library human resource department works closely with both the administration and the faculty to ensure that all guidelines are followed during the hiring process.

Academic libraries are often challenged with attracting and retaining a diverse work force, especially in faculty and administrative ranks. The library human resource professional should play an active role in fostering an environment of diversity and participating in the recruitment of a more diverse work force. Cultural diversity among library employees brings new skills and ideas into a department, which is an essential component of today's academic research library. Diversity initiatives and programs help to establish mutual respect and mutual learning among different individuals working together. "Successful diversity is built from the often small, everyday actions taken by people at all levels of the organization… Changing how people act must [however] be reinforced by changing the organizational policies and procedures that define how people operate" (Kreitz, 2008, p. 103).

Giesecke and McNeil (2005) suggest building an inclusive workplace environment by building trust, treating everyone with respect, and promoting good communication (p. 34). The definition of an inclusive environment is one where differences among staff are recognized as strengths that can be built upon in order to further the goals of the organization (Giesecke and McNeil, 2005, p. 34). Leadership positions set the tone of the environment. Therefore, leaders need to communicate effectively and not leave members of the team out of the communication cycle, leaders need to give credit for other's work and ideas, and leaders need to listen to their staff.

Librarians in leadership often end up in these positions with little supervisory training, therefore they may need support from the administration and human resource professionals. Library faculty in tenure-track positions face unique challenges when they have management responsibilities in addition to research, service, and teaching expectations. Human resource personnel should consider motivational factors that directly tie into librarians' performance and job satisfaction. "Positive motivation not only leads to better performance, but also increases the employee morale, commitment, and emotional identification with the organization" (Mallaiah, 2008, p. 40). Cross-training or job rotation in order to develop employees' skills and potential in new areas may increase employee interaction and develop positive morale among the library employees. Human resources would play a part through motivational planning by developing new avenues where employees would feel valued.

Human resource management can help library supervisors and administrators develop their management styles as well as assist in creating a motivating work climate. Human resource personnel can clearly define what is expected of the employee and if these expectations are included in the job description and performance evaluation. Similarly, basic supplies and resources need to be provided in order for employees to achieve a higher standard of success (Giesecke and McNeil, 2005, p. 40).

The human resources department in research libraries should be structured to lead and develop to the changing employment needs of the individual workers and the tertiary learning institute. The role of human resources in the academic library should be as an initiator and transformational towards change, no longer holding to the traditional role of human resources as a responder to change with fragmented and reactive initiatives. Butterfield summarizes, "HR should plan with local leadership how to address and resolve issues of accountability, engagement, competency development, growth and reward" (p. 34).

The research presented focuses on the general responsibilities of ARL human resource professionals and includes university demographics, information about the libraries' human resource personnel, and job description detail. The specific functions of human resource professionals and their relationship to the library staff and faculty as well as to the university will be discussed.

METHODOLOGY

Survey Instrument

Academic library human resource professionals play an important role in the recruitment, hiring and retention of library faculty. Through the 35 question survey instrument "Analysis of Job Responsibilities of Association of Research Libraries (ARL) Human Resource Professionals" (Appendix A) the researchers sought to better illustrate the current role and responsibilities of these human resource professionals. The researchers chose an online survey to obtain information from a variety of respondents efficiently. The survey questions were organized into three sections, "About the University", "About Libraries' HR Department or HR Personnel", and "Questions for Libraries HR Personnel/Manager". The third section also included two subsections of questions, "What is your job?" and "Professional Development."

The first section, "About the University" asked participants to complete the questions using ARL statistics. The questions related to the number of full and part time students enrolled, the salaries and wage expenditures for the libraries and the number of full time Libraries professional staff, faculty, and support staff. The researchers hoped to gain an understanding of the size of the institution based on the numbers provided.

The second section, "About Libraries' HR Department or HR Personnel" contained one required question, "Does the Library employ either part or full time human resources (HR) professionals?" Questions in this section related to the way human resource matters are handled in the library, including the human resource professionals job classification, to whom the individuals report, the level of interaction between the university human resources department and the libraries human resource contacts, and how library human resource policies are adopted. The researchers hoped to find out more about the level of interaction between the parent or university human resources and the libraries human resources contacts.

Section three, "Questions for Libraries HR Personnel/Manager" and the two subsequent sections were designed to be completed by the Libraries primary human resource professional on staff. Questions in section three related to the number of hours the human resource contact devotes to human resource duties, the number and type of individuals he/she supervises, the salary range for human resource management and staff at the institution, the professional's educational background and other qualifications, and his/her years of service to the human resource profession and to the library. The questions provided a more complete picture of the general responsibilities and qualifications of the main human resource contact.

The two subsections, "What is your job?" and "Professional Development" further investigated the role of the library human resources professional in human resource responsibilities at the institution. The researchers asked the main human

resources contact to describe the role of the libraries' human resource professional(s) and the role of the institutional human resource department, and how many and what type of individuals are hired in the library each year. The researchers asked several questions about the library human resource contact's role in the recruitment and hiring of library faculty. To gage the level of involvement, questions about the human resource professional's role in promoting diversity in the workplace and participating in outreach activities were also included.

The final portion of the survey included questions about the library human resource contact's professional development activities. The questions related to the number and type of conferences and workshops attended, whether the human resource professional has given presentations or published in human resource or library journals, and what professional societies he or she is a member. From the questions in the two subsections, the researchers hoped to gain a better understanding of the library human resource contact's job as it relates to hiring faculty specifically and how active he or she is in the profession.

Participants

The survey subjects were identified by the researchers as human resource contacts working in ARL institutions. To compile the list of contacts the researchers created a list of ARL institutions and visited the libraries' websites to identify the responsible parties. Whenever possible, titles and department names were noted on the list.

The researchers attempted to identify the main human resources contact (i.e., the manager or department head), but when this was not possible, any individual associated with human resource issues was included on the list. When a library website did not include a specific page for human resources, the researchers attempted to find the contact by viewing any job postings and noting the contact names on them. If the website included

multiple human resource contacts, all names were noted, but only one e-mail to all contacts was sent to this institution.

The researchers sent 123 personalized e-mails to the ARL contacts. Institutions with multiple human resources contacts only received one e-mail, however, it was addressed to all identified contacts. This was done to make all the human resource contacts at the institution aware of the survey, but to hopefully avoid receiving multiple survey responses from the same institution. The researchers asked respondents to forward the e-mail to the appropriate contact person and/or to inform them of the contact person's name if the recipient was not the right person to complete the survey.

Many of the institutional contacts were not identified by title on the websites, however when title information was available the researchers made note. The individual titles varied, and the following chart shows some of the most commonly used titles for human resource contacts (see Table 1)

Other job titles included: Library Personnel Office Manager, Staff Human Resources Manager, Human Resources generalist, Director of Personnel and Staff Development, and Assistant Dean for Personnel and Planning.

Table 1. Titles for human resource contacts at ARL institutions

Title	Number
Administrative Officer	3
Associate or Assistant University Librarian or Dean	4
Director or Head of (Library) Human Resources	11
Human Resources Consultant or Advisor	3
Human Resources Librarian	3
Human Resources Manager or Officer	12
Human Resources or Personnel Coordinator	12
Human Resources Specialist or Assistant	9
University Librarian or Dean	5

Data Collection

The survey instrument was input into Zoomerang, a proprietary online survey tool. Using a format such as Zoomerang to display the survey questions and collect the results enabled the researchers to choose different types of question formats and gather data for collation and analysis more easily. The software does have some limitations, though. One respondent indicated that the question formatting in the software was confusing when it contained multiple parts.

The researchers provided the survey link (URL) to the human resource contacts via e-mail. All respondents received the same e-mail text asking for their participation and informing them of the survey close date, March 13, 2009. Respondents were given approximately two weeks to complete the survey.

The survey greeting, which respondents viewed after clicking on the Zoomerang link, but before beginning the survey included the statement "This survey has been approved by the Louisiana State University's Institutional Review Board, and any questions regarding subjects' rights or concerns can be directed to Robert C. Mathews, Institutional Review Board, (225) 578-8692, irb@lsu.edu, www.lsu.edu/irb. By submitting the survey, you are providing and documenting your consent." Other permission was not required or sought from the respondents.

When respondents completed the survey the information was recorded in the Zoomerang account. The software also recorded how many views the survey received (187) and the number of partial surveys (12).

Survey Results

A total of 40 individuals completed the survey instrument. The survey questions included closed, open-ended, and a combination of the two types of questions in which respondents were encouraged to provide further information after indicating their response (Appendix B). The researchers collated the data and have provided a breakdown of the question responses according to the order they appear in the survey instrument in this section of the paper.

About the University

The majority of the 40 survey respondents work at institutions with undergraduate and graduate student populations between 10,000 and 25,000. Twenty-six percent of the respondents are employed at universities in which the number of full-time undergraduate and graduate students enrolled ranges between 10,000 and 15,000. Twenty-three percent of the respondents are employed with universities with enrollments of 20,000-25,000 students.

Forty percent of the respondents stated the total salaries and wage expenditures for their library varied between five million and ten million dollars. An additional 24% indicated their expenditures fell between ten million and fifteen million dollars. While 12% reported expenditures of 15 to 20 million.

The number of full time professional staff or faculty working in the respondents' libraries ranged from 30 to 450. The median value of professional staff or faculty working within ARL libraries was 75. The number of support staff employed ranged from 18 at one library to 431 at another. The median value of full time library support staff at all institutions was 107.

About Libraries' HR Department or HR Personnel

Ninety-five percent of the respondents indicated that their library employs either full-time or part-time human resource professional(s). The respondents listed a total of 42 management positions, 23 professional staff positions, and 48 clerical or administrative assistant positions. At a single institution, the largest number of

Figure 1. Question 8: What is the university job classification for libraries' HR professionals?
positions reported were four in management, three in professional staff, and four in clerical or administrative assistant positions. The majority of the human resource positions were classified within the institutions as either management or staff positions with only a few listed as faculty positions. Figure 1 illustrates the breakdown of job classifications of human resource professionals at the responding ARL institutions.

None of the respondents indicated that Libraries human resource professional(s) report solely to a *university* human resources department. Eighty-two percent of the respondents stated that the Libraries human resource personnel report directly to a Dean, Director, or University Librarian. Only five percent of the human resource professionals responding stated that they reported to a combination of the university human resources department and a local administrator within the library. The remaining 15% of respondents who provided further comment to the question indicated that they reported to administrators such as the Associate Dean for Finance and Facilities, Associate Director for Administrative Services, Area Finance/Administrative Officer, Associate University Librarian for Administrative Services, Associate Dean for Finance and Facilities, and the President.

In response to survey question nine about the level of interaction between the University HR Department and the Libraries HR professionals, 80% of respondents indicated moderate to maximum contact. Additional comments indicated that the libraries human resource professionals are communicating regularly and some are maintaining close working relationships with the university or institutional human resources department.

The majority of respondents indicated that their library adopts human resource policies from the university or institutional human resource policies. Twenty-three percent of the respondents indicated that their libraries model policies after university policies, but do adopt some of their own. Finally, 18% stated that the libraries administration created their own human resource policies. Three respondents provided the following comments to the question "Libraries human resource policies are": "Collective bargaining agreements", "Some are adopted and some are modeled", and "Departments have some leeway in interpreting campus [policies]."

Question twelve, "Please provide any additional information about the relationship between the Libraries HR Professionals and the University HR Department", allowed the respondents to provide additional information about the rela-

tionship between the Libraries human resource professional(s) and the university human resource department. Nine individuals provided comments, including the following, "The Libraries have an assigned representative in the University's HR department. We work closely with her" and "HR Professional serves on HR campus-wide committees – Grievance Committee and Sexual Harassment Committee." One respondent stated that they have a decentralized structure in which the libraries has delegated authority to hire academic positions (Librarians), but staff hire approvals must go through the university human resources department.

Questions for Libraries HR Personnel/Manager

More than half, 63%, of the respondents perform human resource duties full time, forty hours per week. Twenty-four percent of the respondents may work full time at the library, but they devote less than 40 hours but more than twenty to human resource responsibilities. This statistic is supported by the number of people surveyed with titles that indicate they have responsibilities other than human resource matters. Only 5% of the respondents devote less than 20 hours a week to human resource duties.

Ninety-five percent of the respondents have some supervisory responsibilities of full time employees, part time employees, or student workers. No respondents indicated that they supervise graduate student workers. Fifty percent of the respondents supervise one or more student workers. Twelve respondents supervise more than three full time employees.

Human resource managers at 85% of the respondents' institutions earn a salary greater than $50,000, while staff handling human resource duties earn between $35,000 and $40,000 at 29% of the institutions represented.

The respondents' educational backgrounds and qualifications range from a Masters in Library and Information Science, Masters in Human Resource Management, undergraduate degree in Human Resource Management, a human resources certification, and a combination of two or more of the aforementioned. Four individuals commented that they have a masters in business administration (MBA). Nearly half of the respondents indicated having education beyond a bachelors degree.

Thirty-two percent of the respondents indicated that they have worked as human resource professionals between 15 and 20 years. Some (30%) of the respondents have more than 20 years of experience in the field. They smallest percentage, three percent, of the respondents indicated that they have been a human resource professional for 1-3 years, and 19% had been in the field for more than five years but less than ten. The respondents indicated working a variety of different time frames at their current ARL libraries. The largest representation (24%) fell in the category of working more than five years, but less than ten years at their present institution. If longevity in a position is a sign of satisfaction, this group does seem to be relatively happy. Over twenty percent of the respondents have been in their current positions for 20 years or more, as illustrated in Figure 2.

What Is Your Job?

This section of the survey consisted mostly of open-ended questions. The authors have analyzed the results and grouped the different responses into categories, which will be discussed in further detail in this section.

Only five respondents indicated that the hiring for the entire libraries is *not* done through their office. Some of the "no" responses included comments that they hire all faculty but not staff or students. One "no" response indicated that their office only handles student hires, and not faculty or staff. The majority of the respondents, though, handle all hiring in their offices.

When asked about the number of individuals in the categories "Librarians", "Library Associ-

Figure 2. Question 18: I have worked at this ARL library as an HR professional for _ years.
ates / Paraprofessionals", "Administration", and "Graduate Students" the library hires, respondents indicated that on average their library hired two librarians per year, ten library associates or paraprofessionals per year, one administrative position per year, and ten graduate students per year.

The respondents were asked to describe their role versus the university human resources department's role in the hiring process. The majority of the respondents included detailed information about the various duties of each. The respondents indicated that their library human resource department handles the majority of the duties associated with hiring faculty or professional librarians. Several respondents stated that the candidate selection, interview process, reference requests, and job offers originated in the library. A few respondents also listed recruitment efforts as a part of their responsibilities. For those that listed job postings and general paperwork, the majority stated that this was handled through the university or institutional human resource department. Several respondents stated that non-librarian (e.g., staff, paraprofessionals, and classified) employees are hired through the institutional or university human resources department.

The following individual responses provide further detail about the different roles of the library human resource professional(s) and the institutional or university human resource department:

I coordinate all academic hiring or recruitments. Design positions, advertise, post, create web sites, set up phone interviews, set up campus interviews, orient search committees, document search process, Affirmative Action Compliance, contracts and everything else related to hiring faculty.

Library HR does all interviewing and contact. University HR maintains online job posting system and does background checks. University HR does preliminary [sic] screening for applicants who meet/do not meet the minimum requirements.

I place all ads for professional positions nationally. University HR posts all jobs on the university job web site. All applicants must apply through the online university web site for each position. The university [sic] HR recruiter will forward me applicants who meet the minimum requirements for the position. I continue the rest of the recruitment and hiring process.

HR Department posts position, advertise positions, do background checks, if needed contact references, makes job offer to candidate. Library HR selects candidates to interview and makes decision on who to hire.

Question 22, "Please describe your role in the hiring of professional librarians (faculty). For instance, do you serve on search committees; oversee ingest of all applications, etc.?" asked the survey respondents to describe their role specifically in the hiring of professional librarians. In over 70% of the responses it is clear that the library human resource department is solely responsible for the hiring of librarians. Only two respondents indicated clearly that they have no involvement. One respondent stated that the hiring was done through the Dean's Office, however it was not clear whether this office is a part of the library. Sixteen respondents indicated that they serve on the search committees for faculty hires. The majority indicated that they play an active role in the entire hiring process.

The following responses provide further detail about the library human resource professional's role in librarian hiring:

I meet with each search committee when the Dean charges the committee in order to review the search process and answer any questions the members may have. I receive all of the applications. After the search committee makes its recommendation to the Dean and the Dean makes the decision to offer a position to a candidate, I ensure that all necessary paperwork is completed.

I prepare all of the forms, NOV, and place job ads. I meet with committees to provide them with procedural and EEO information. I receive all applications and make them available to the committees. I correspond with applicants. I schedule interviews and meet with candidates.

One of the professional HR librarians serves on the search committee as Affirmative Action Officer, manages all candidate contact and correspondence, provides guidance to committee on policies and procedures.

We meet with all applicants during their interview process. Negotiate offers and extend offers.

Respondents were asked to describe their role in the *recruitment* of librarians or faculty. Most of the responses included information about where job announcements are posted and by whom. Several respondents stated that they met with candidates during the interview process. None of the respondents included information about their library's active efforts to recruit new faculty. It is unclear why the respondents did not provide concrete examples such as recruitment fairs or other recruitment initiatives, although later responses to question 25 about outreach activities indicated that most libraries do not need to recruit because their applicant pools are already quite full. Example responses to question 23, "Please describe your role in professional librarian (faculty) recruitment:" are:

I manage the recruitment processes for all library faculty positions. This involves analysis of job descriptions, coordination of interviews, and placement of job postings. For faculty searches, I assist search committees, place job advertisements [sic], coordinate scheduling and interviewing logistics, and complete paperwork for various University offices and units including Affirmative Action and Academic Affairs. I ensure compliance with federal and University regulations and policies, including Affirmative Action guidelines.

I work with the Dean and the Associate University Librarians on all Job Specifications and review. These specs are reviewed by University HR for classification. All searches are done through me and I support the search committees as they inter-

view. I prepare a hiring proposal and submit [sic] this to University HR for their approval [sic] of the hiring plan. I work with the Budget Manager to apply the appropriate rates to positions within the pay bands of the University.

Approximately 40% of the respondents indicated that they do not participate in *university-wide* faculty recruitment strategies or strategies for promoting diversity in the workplace. The respondents who do participate in diversity efforts cited examples such as serving on a diversity task force or serving as an Equal Employment Opportunity representative for the libraries. A few respondents indicated that they participated in campus wide initiatives to promote diversity among faculty and one respondent stated that his/her library would foster two ARL fellows this summer.

The majority of the respondents do not participate in outreach activities to prospective employees. Several of the "no" respondents indicated that their libraries did not need to recruit because the applicant pools were adequate with minimal job advertisement. Respondents who do outreach work cited examples such as the American Libraries Association (ALA) conferences, both annual and midwinter, the Association for College and Research Libraries conference, and job fairs.

Question 26 asked the library human resource professional to indicate how often he or she conducts human resource related sessions and presents materials to the Libraries faculty and staff. Thirty percent indicated conducting sessions once a month or more, while twenty-four percent indicated conducting HR sessions about every six months. Respondents were then queried on what topics they had either given or sponsored in Question 27. Over 30% listed conducting performance evaluations as a topic covered. Other common threads in the responses included sessions on diversity awareness, university policies about leave and attendance, conducting effective meetings, interviewing, sexual harassment prevention, and goal setting.

The final question in this section asked respondents to indicate their interactions with professional librarians (faculty) beyond the hiring process (see Figure 3). Most human resource professionals (89%) interact with professional librarians by answering university or general HR questions, as well as committee work, and mentoring or support. The respondents commented that

Figure 3. Question 28: Beyond the hiring process, what interaction do you have with professional librarians (faculty)? Check all that apply.
they also served as a "general sounding board" for faculty, facilitated reviews, acted as a consultant to the library administration and others, assisted with goal setting and monitoring, and resolved employee relations or conflicts.

Professional Development

Forty-six percent of the survey respondents indicated that they attend three to four human resource related conferences or workshops per year, and thirteen percent do not attend any. The majority of respondents who do attend conferences or workshops do so at their institution or at a state or regional level. More than half, 57% of the respondents stated they do not give professional presentations outside of their perspective libraries regarding human resource related issues. Similarly 92% of Libraries HR professionals have not published in human resource or library journals concerning human resource related issues.

DISCUSSION

Results of the survey present a general view of library human resource professionals' relationships to the institutional or university human resource department, their relationships with library faculty from interview to daily interaction after hire, their supervisory responsibilities and reporting structure, and their level of involvement in professional development activities. Each of the survey sections has the potential to provide more research opportunities, and could be developed beyond the questions found in this instrument.

The survey results indicate that ARL libraries employ their own human resource personnel, usually an individual classified as management working 40 hours a week primarily on human resources duties. Many of the individuals responsible for human resource duties possess a degree higher than a bachelor's degree, and are compensated with salaries greater than $50,000 when in manage-

ment positions. Overall, this group of respondents have been human resource professionals and have worked at their current ARL institution for a more than 15 years. The researchers sought responses from as many individuals responsible for human resource duties at ARL institutions as possible without delineating between a library dean who handles human resources duties among his or her many responsibilities and an individual classified as clerical or paraprofessional who handles only human resource duties. This lack of differentiation is a limitation to this survey instrument and results could be further honed if more were known about the individuals. In addition, respondents were not required to leave their contact information, so there is a possibility that some institutions may have submitted more than one time.

Respondents indicated that overall they handle all responsibilities associated with the hiring process, especially of faculty or professional librarians. The library human resource professionals are integral to the hiring of faculty including some level of involvement in the recruitment process, involvement during the interview process, orientation, and some training. By and large the respondents indicated that they do not participate in organized recruitment of faculty. Many indicated that their library does not actively recruit because of adequate interview pools, however the researchers did not ask the respondents to specifically indicate why recruitment was not a part of their duties. It is possible that some institutions do not recruit because it is expensive and time consuming.

The human resource professionals provide a great deal of training and support to the library faculty and staff overall. Many respondents cited conducting sessions on performance evaluations. It was not clear from the responses if these sessions were designed for supervisors administering evaluations, employees completing evaluations, or both. Performance evaluation of library faculty specifically is a topic that deserves further research.

The survey responses indicate that overall the library human resource professionals are not very involved in diversity initiatives within their library or at the institutional level. This information may not imply a lack of diversity initiatives at the institution, but could be an indication that there are other offices in addition to the human resources department at a university that handle diversity work. The level of involvement within the library can also vary depending on the size of the library staff.

Overall the respondents did not seem to participate in professional development activities. This may not indicate a lack of interest on the part of these professionals, but could be explained by a lack of institutional support to attend conferences. Very few professionals had published in their field, but this is not surprising since the respondents vary from primarily clerical workers to library deans.

The survey instrument focused on ARL libraries at universities and most of the questions were tailored to this group, which is a limitation to the research findings. In addition, the overall return rate of the survey was around 30% of the total individuals surveyed. Even with the above limitations, the survey data provided information that can be further developed into future research about the role of library human resource professionals.

FURTHER RESEARCH

The research presented in this manuscript should be considered an initial step in future assessment of the effectiveness of human resource functions within the academic library. Further research could be done to evaluate library staff and faculty relationships with the library human resource personnel. Additionally, research about the library human resource professional or department as it relates to employee satisfaction, motivation, and the organizational climate within the library culture would be welcome. Further research could be done in the relationship between library human resource professionals and the university or institutional human resource department also.

Human resource professionals are in a position to effect change within the library's organizational climate. A possible strategy to assess the library's overall climate and how employees interact may be to administer the Myers-Briggs (personality) Type Indicator or another similar test to categorize personalities and temperaments. Voluntary testing of library employees could lead to more effective team building strategies or motivational plans. Library administration and library human resource personnel should engage their faculty and staff in discussions about workplace attitudes and atmosphere.

Since each job within a library is important, human resources should work with administrators to create a positive social environment. However, research into the intricacies of library administration, faculty, staff, and library human resources needs to be developed further. Specifically, researchers should delve into the academic libraries' environmental climate, motivational tactics, employee satisfaction, and performance evaluation.

CONCLUSION

Human resource professionals at ARL institutions share the responsibility with library administration to improve efficiency and productivity of all staff and faculty. In ARL libraries, human resource personnel assist with hiring, training, and evaluation of employees. They maintain paperwork, ensure that legal objectives are met, and follow institutional guidelines. In addition they are often tasked with improving organizational climate in the library and monitoring the general welfare of the employees. A majority of ARL human resource personnel are integrally involved in the hiring process of professional librarians, beyond the level of paperwork processing. They also facilitate performance appraisals and mediate workplace situations.

Human resource personnel in ARL libraries provide multi-faceted service to the library and parent institution for which they operate. They maintain institutional and library policies and regulations as well as keep current with all state and federal laws. The function of ARL human resource professionals, according to this research, is to serve in more traditional roles of human resource management. However, even with more traditional functions, human resource professionals within large research libraries provide necessary organizational operations fundamental to the mission of the library.

APPENDIX A: SURVEY INSTRUMENT

About the University (Answers Should Be Based on ARL Statistics)

1. Number of undergraduate and graduate students enrolled:
   Total Full time
   Total Part time
2. Total Salaries and Wages Expenditures for Libraries:
3. Number of full time Libraries Professional Staff and Faculty:
4. Number of full time Libraries Support Staff:

About Libraries' HR Department or HR Personnel

5. Does the Library employ either part time or full time human resources (HR) professional(s)?
   Additional Comment
6. If you answered "Yes" to question 5, please list the number of individuals in each HR related position and indicate their work status (part or full time):
   Management
   Professional staff
   Clerical or administrative assistant(s)
   Other, please specify
7. If you answered "No" to question 5, please indicate how HR matters are handled in the library:
8. What is the university job classification for Libraries' HR professionals?
   Management
   Staff
   Faculty
   Other, please specify
9. The Libraries HR Professional(s) report to:
   Dean, Director, or University Librarian
   University Human Resources Department
   A combination of the two
   Other, please specify
10. What is the level of interaction between the University HR Department and the Libraries HR Professionals?
    Minimal – only for information
    Moderate – regular contact with HR personnel
    Maximum – very close working relationship between departments and/or HR personnel is employed by university HR Department.
    Other, please specify
11. Libraries human resource policies are
    Adopted from University HR Department policies
    Different, but modeled after University HR Department policies
    Created by the libraries administration
    Other, please specify

12. Please provide any additional information about the relationship between the Libraries HR Professionals and the University HR Department

Questions for Libraries HR Personnel/Manager

The Following Sections Should Be Completed By the
Libraries Primary HR Professional on Staff.

13. Approximately ___ hours of my job are devoted to human resource tasks:
    40 hours (full time)
    Less than 40 hours, but more than 20
    20 hours
    Less than 20 hours
    Other, please specify
14. Are you the primary supervisor for employees, student workers, and/or graduate assistants?
    Yes, number of full time employees:
    Yes, number of part time employees:
    Yes, number of student workers:
    Yes, number of graduate assistants:
    No, I do not supervise.
15. The salary range for _____ at my Library is:
    HR Management:
    Less than $30,000
    $30,000 – $35,000
    $35,000 – $40,000
    $40,000 – $45,000
    $45,000 – $50,000
    Greater than $50,000
    N/A
    HR Staff:
    Less than $30,000
    $30,000 – $35,000
    $35,000 – $40,000
    $40,000 – $45,000
    $45,000 – $50,000
    Greater than $50,000
    N/A
16. Indicate your educational background and other qualifications (please mark all that apply)
    Masters in Library and Information Sciences
    Masters in Human Resource Management
    Undergraduate degree in Human Resource Management
    HR certification or training.
    Other, please specify

17. I have worked as an HR professional for __ years.
    1-3
    3-5
    More than 5, but less than 10
    10-15
    15-20
    Over 20
18. I have worked at this ARL Library as an HR professional for __ years.
    1-3
    3-5
    More than 5, but less than 10
    10-15
    15-20
    Over 20

What Is Your Job?

19. Is the hiring for the entire Libraries conducted through your office? (Space is available for further comments.)
    Yes
    No
20. Please describe your role as the Libraries HR professional and the role of the university HR Department in the hiring process:
21. On average how many people in each category below are hired per year:
    Librarians 1 2 3 4 5 6 7 8 9 10
    Library Associates/Paraprofessionals 1 2 3 4 5 6 7 8 9 10
    Administration 1 2 3 4 5 6 7 8 9 10
    Graduate Students 1 2 3 4 5 6 7 8 9 10
22. Please describe your role in the hiring of professional librarians (faculty). For instance, do you serve on search committees; oversee ingest of all applications, etc.?
23. Please describe your role in professional librarian (faculty) recruitment:
24. As a Libraries HR Professional, do you participate in university-wide Faculty recruitment strategies or strategies for promoting diversity in the workplace? Please specify these activities.
25. Do you participate in outreach activities to prospective employees (attend fairs, conferences)? Please include examples of these activities:
26. How often do you conduct HR related sessions and present materials to the Libraries faculty and staff?
    Frequently: 1 time a month or more
    Often: About every three months
    Less often: About every six months
    Infrequently: Once a year
    Never

27. If you answered a.-d. in Question 26, please list some topics covered in HR sessions you have given or sponsored:
28. Beyond the hiring process, what interaction do you have with professional librarians (faculty)? Check all that apply.
    Committee work
    Mentoring or support
    Answer university or general HR questions
    Other, please specify

Professional Development

29. I attend approximately __ number of HR related conferences and workshops per year
    1-2
    3-4
    None
    Other, please specify
30. If you answered a or b to the above, please specify how many conferences and workshops are
    National or international 1 2 3 4 5 6 N/A
    State or regional 1 2 3 4 5 6 N/A
    At my institution 1 2 3 4 5 6 N/A
    Other, please specify
31. I have given professional presentations outside of my Library about HR related issues. If yes, number of times:
32. I have published in HR or Library journals about HR related issues.
    If yes, number of times:
33. I am a member of the following professional societies:
    American Libraries Association. Name roundtables or sections of which you are a member:
    HR professional organizations. Please list
    Other, please specify:
34. Please provide any additional comments related to this survey.
35. Optional information
    Name:
    ARL Institution:
    Address 1:
    Address 2:
    City/Town:
    State/Province:
    Zip/Postal Code:
    Country:
    Email Address:
    Thank you for your participation in this survey!

APPENDIX B: SURVEY RESULTS

About the University (answers should be based on ARL statistics)

1. Number of undergraduate and graduate students enrolled:
    10,000-15,000: 26%
    15,001-20,000: 12%
    20,001-25,000: 23%
    25,001-30,000: 16%
    30,001- 35,000: 07%
    35,001- 40,000: 07%
    40,001 – 45,000: 02%
    45,001 – higher: 02%
    N/A: 05%
2. Total Salaries and Wages Expenditures for Libraries:
    0 - $5 million: 12%
    $5 - $10 million: 40%
    $10 - $15 million: 24%
    $15 - $20 million: 12%
    $20 - $25 million: 07%
    + $25million: 05%
3. Number of full time Libraries Professional Staff and Faculty:
    Lowest response: 30
    Greatest response: 450
    Median value: 75
4. Number of full time Libraries Support Staff:
    Lowest response: 18
    Greatest response: 431
    Median value: 107

About Libraries' HR Department or HR Personnel

5. Does the Library employ either part time or full time human resources (HR) professional(s)?
    Yes: 96%
    No: 4%
6. If you answered "Yes" to question 5, please list the number of individuals in each HR related position and indicate their work status (part or full time): ***
    In general respondents indicated full time employment.
7. If you answered "No" to question 5, please indicate how HR matters are handled in the library:***
    "Human resource matters are handled by the Associate Dean for Administration"
    "Library Payroll and Personnel Services has a manger [sic] and 2.0 FTE classified staff who deal with payroll and routine personnel recordkeeping."

8.   What is the university job classification for Libraries' HR professionals?
      Management: 50%
      Staff: 48%
      Faculty: 12%
      Other, please specify: 10%
      Other comments included: Administrative Professional and Professional Non-Faculty
9.   The Libraries HR Professional(s) report to:
      Dean, Director, or University Librarian: 83%
      University Human Resources Department: 0%
      A combination of the two: 05%
      Other, please specify: 14%
      Other comments included: Associate Dean for Finance and Facilities, Associate Director for Ad-
          ministrative Services, Area Finance/Administrative Officer, Associate University Librarian,
          Administrative Services, Associate Dean for Finance and Facilities, President
10. What is the level of interaction between the University HR Department and the Libraries HR
      Professionals?
      Minimal – only for information: 17%
      Moderate – regular contact with HR personnel: 52%
      Maximum – very close working relationship between departments and/or HR personnel is employed
          by university HR Department: 29%
      Other, please specify: 02%
      Other comments included: Not applicable – not a university or college
11. Libraries human resource policies are
      Adopted from University HR Department policies: 71%
      Different, but modeled after University HR Department policies: 21%
      Created by the libraries administration: 19%
      Other, please specify: 07%
12. Please provide any additional information about the relationship between the Libraries HR
      Professionals and the University HR Department ***
      "the Library is represented on a campus wide HR Liasian [sic] Committee"
      "The Libraries have an assigned representative in the University's HR department. We work closely
          with her"
      "The relationship varies depending on the nature of the exchange. Benefits information is more
          or less managed centrally, but Libraries HR supports our faculty and staff. We are very in-
          dependent on our own recruitment and collaborate closely with our Compensation Dept."

Questions for Libraries HR Personnel/Manager

The Following Sections Should Be Completed By The
Libraries Primary HR Professional On Staff.

13. Approximately ___ hours of my job are devoted to human resource tasks:
     40 hours (full time): 59%
     Less than 40 hours, but more than 20: 29%
     20 hours: 0%
     Less than 20 hours: 05%
     Other, please specify: 07%
14. Are you the primary supervisor for employees, student workers, and/or graduate assistants?

Table 2.

	1	2	3	4	5	6	7	8	9
Yes, number of full time employees	36%	21%	21%	4%	7%	0%	0%	0%	0%
Yes, number of part time employees	78%	22%	0%	0%	0%	0%	0%	0%	0%
Yes, number of student workers	50%	33%	17%	0%	0%	0%	0%	0%	0%
Yes, number of graduate assistants	0%	0%	0%	0%	0%	0%	0%	0%	0%
No, I do not supervise	0%	0%	0%	0%	0%	0%	0%	0%	0%

15. The salary range for _____ at my Library is:

Table 3.

	Less than $30,000	$30,000 – $35,000	$35,000 – $40,000	$40,000 – $45,000	$45,000 – $50,000	Greater than $50, 000	N/A
HR Management	0%	0%	0%	6%	6%	85%	3%
HR Staff	11%	20%	29%	20%	11%	6%	3%

16. Indicate your educational background and other qualifications (please mark all that apply)
    Masters in Library and Information Sciences: 23%
    Masters in Human Resource Management: 10%
    Undergraduate degree in Human Resource Management: 21%
    HR certification or training: 33%
    Other, please specify: 54%
    Other comments included: MBA, Experience, MA in Economics, BS in History, BS in Education,
       PhD in Library and Information Science
17. I have worked as an HR professional for __ years.
    1 – 3: 03%
    3 – 5: 0%
    More than 5, but less than 10: 18%
    10 – 15: 15%
    15 – 20: 33%
    Over 20: 31%
18. I have worked at this ARL Library as an HR professional for __ years.
    1 – 3: 18%
    3 – 5: 10%
    More than 5, but less than 10 22%
    10 – 15: 15%
    15 – 20: 15%
    Over 20: 20%

What Is Your Job?

19. Is the hiring for the entire Libraries conducted through your office? (Space is available for further
    comments.) ***
    "Yes, Hiring for all faculty, staff, & over 200 students"
    "No, Classified & Student Staff handled by other"
    "Yes, Also hire for all grant funded projects"
20. Please describe your role as the Libraries HR professional and the role of the university HR
    Department in the hiring process: ***
    "The University HR Department processes paperwork"
    "Selection, Interviewing, References, paperwork, job offers are handles by Libraries HR. The ap-
       plication process is coordinated through the university HR department"
    "The university department refers applications to us. We work closely with supervisors through
       the rest of the process"

21. On average how many people in each category below are hired per year:

Table 4.

	1	2	3	4	5	6	7	8	9	10
Librarians	3%	27%	24%	8%	19%	3%	3%	5%	0%	8%
Library Associates/ Parapro-fessionals	5%	8%	11%	14%	5%	11%	5%	0%	0%	41%
Administration	52%	17%	0%	9%	9%	9%	0%	4%	0%	0%
Graduate Students	8%	8%	0%	19%	19%	4%	4%	0%	0%	38%

22. Please describe your role in the hiring of professional librarians (faculty). For instance, do you serve on search committees; oversee ingest of all applications, etc.? ***
    "Oversee the entire hiring process, however I do not sit on all the search committees"
    "Oversee process, interview logistics, salary negotiations, relocation logistics"
    "I serve ex-officio on all search committees. All applications are directed to me and then shared with the search committee. All interview schedules, travel arrangements are handled in our office"
23. Please describe your role in professional librarian (faculty) recruitment: ***
    "I manage the recruitment processes for all library faculty positions. This involves analysis of job descriptions, coordination of interviews, and placement of job postings. For faculty searches, I assist search committees, place job advertisements, coordinate scheduling and interviewing logistics, and complete paperwork for various University offices and units including Affirmative Action and Academic Affairs. I ensure compliance with federal and University regulations and policies, including Affirmative Action guidelines"
    "Place advertisements in appropriate journals, online listservs"
    "All postings are done through our office and all contact with candidates is by our office"
24. As a Libraries HR Professional, do you participate in university-wide Faculty recruitment strategies or strategies for promoting diversity in the workplace? Please specify these activities. ***
    "No"
    "We work closely with university HR, EEO, and our diversity advisory council in promoting these strategies"
    "I serve on University committees that participate in forming diversity initiatives"
25. Do you participate in outreach activities to prospective employees (attend fairs, conferences)? Please include examples of these activities: ***
    "No – our applicant pool is usually very large just by advertising through our University website"
    "Actively participate in ARL Diversity Initiative conference. We have sponsored and staffed booths at ACRL conference"
    "Yes, I have traveled to other campuses to recruit new faculty"

26. How often do you conduct HR related sessions and present materials to the Libraries faculty and staff?

    Frequently: 1 time a month or more - 29%

    Often: About every three months - 21%

    Less often: About every six months - 24%

    Infrequently: Once a year - 21%

    Never - 05%

27. If you answered a.-d. in Question 26, please list some topics covered in HR sessions you have given or sponsored: ***

    A general summation of the responses include: diversity training, Fair Labor Standards Act, university personnel policies, behavioral styles in the workplace, safety training, FMLA, sexual harassment, new employee orientation, and performance appraisals

28. Beyond the hiring process, what interaction do you have with professional librarians (faculty)? Check all that apply.

    Committee work: 69%

    Mentoring or support: 56%

    Answer university or general HR questions: 90%

    Other, please specify: 28%

    Other comments included: "Facilitate reviews", "Employee relations, FMLA, mediation", "Consultant to Library Administration & all others"

Professional Development

29. I attend approximately __ number of HR related conferences and workshops per year

    1 – 2: 29%

    3 – 4: 47%

    None: 11%

    Other, please specify: 13%

    Other comments included: "I attend monthly HR-related luncheon (SHRM chapter)", "10+", "Monthly meetings of University HR"

30. If you answered a or b to the above, please specify how many conferences and workshops are

Table 5.

	1	2	3	4	5	6	N/A
National or international	33%	14%	5%	0%	0%	0%	48%
State or regional	62%	17%	0%	0%	0%	0%	21%
At my institution	14%	29%	14%	18%	7%	14%	4%
Other, please specify	0%	33%	0%	0%	0%	0%	67%

31. I have given professional presentations outside of my Library about HR related issues
    Yes: 43%
    No: 57%
32. I have published in HR or Library journals about HR related issues.
    Yes: 08%
    No: 92%
33. I am a member of the following professional societies: ***
    "SHRM – Society for Human Resource Management"
    "LLAMA – Library Leadership & Management" (a division of the American Library Association)
    "ACRL – Association of College and Research Libraries"
34. Please provide any additional comments related to this survey.***
    "The demographic numbers I reported on the first screen also include our law, medical and dental
        libraries that are treated as a separate entity at my university"
    "Survey question responses pertain only to Main Library"
    "The Center is a not for profit academic library consortium and not part of a university or college.
        Hence, I had to respond not applicable to several of the questions"
35. Optional information

Thank you for your participation in this survey!
    *** For complete responses to qualitative questions please contact the authors.

Chapter 73

Understanding Organizational Culture and Group Dynamics:
Reframing the Normative Orientation of the Role of Information Professionals within Organizations

Doralyn Rossmann
Montana State University, USA

ABSTRACT

The field of library and information science will benefit from a greater understanding of the function of individuals in relation to organizational culture and group dynamics, including how individual experiences underlie the culture of an organization. Understanding how these factors can shape successful human resources management will help today's information science and management organizations in their recruitment, development, and retention efforts. It is suggested here that, while MLIS curricula and library organizations have traditionally focused on leadership as a function of management, a reorientation towards development of leadership skills at all levels of the organization will have a positive effect on organizational culture and group dynamics. In development of this concept, this chapter provides an overview of traditional approaches to understanding organizational culture and group dynamics and how these are applied in the information and library science literature and curricula; explores an alternate normative orientation towards the understanding of organizational culture and group dynamics as a function of all individuals in an organization and not just management; identifies ways in which information professionals and organizations can use this knowledge to recruit, develop, and retain employees in the information sciences profession; and explores future research directions in these areas.

INTRODUCTION

The library and information science profession has a history of addressing organizational culture issues in its graduate curriculum, through the literature, and within organizations themselves. Understanding organizational culture is traditionally focused in the areas of management and leadership, as is evidenced in the literature and in the library and information science curricula. A shift in normative orientation – or the assumption of what ought to be the norm – from managers as experts to individuals as equally responsible for the work environment – will help create an organizational culture that encourages the recruitment and retention of employees who are well-matched to the needs, values, and goals of the organization. It is important to recognize the value for anyone, at any place in the organization to have an understanding of organizational culture. Ultimately, the culture of an organization has an effect on everyone in that organization, regardless of position or level of responsibility. Likewise, each individual has the potential to influence his or her organization. Several approaches exist which libraries should consider to reframe the understanding of organizational culture and group dynamics from a management function to a function of every individual in the organization. The approaches proposed here include *Distributed Leadership, Job Embeddedness, The Bad Apple Concept,* and *Positive Relationships at Work.* While the concepts in this chapter are just some examples of how to apply this different normative orientation, it is hoped that these concepts help merge theory with praxis – or practical application – for use in information organization settings.

BACKGROUND

Organizational Culture and Group Dynamics Defined

Understanding the field of organizational culture requires a background introduction into a broader field of study: organization theory. According to Tompkins (2005), "organization theory is the study of how and why complex organizations behave as they do. Specifically, it is the study of formal structures, internal processes, external constraints, and the ways organizations affect and are effected by their members" (p. 1). This broader field of study has three subsets: the branch of organization theory, the branch of organizational behavior, and the branch of management theory. The organization theory branch uses a macro perspective which looks at the organization itself and its structures. The organization behavior branch of study uses a micro perspective approach and looks at individuals and groups and how they interrelate. Management theory focuses on the subset of management in organizations (Tompkins, 2005). Each of these branches of organization theory provide different insights into how organizations and the individuals within them operate and mutually influence each other. The primary focus of this chapter is on the organizational behavior branch which emphasizes an understanding of how individuals and groups within organizations have an influence on each other and on how organizations function.

In addition to looking at organizational culture, this chapter addresses a closely-related concept: group dynamics. Macgowan (2009) defines group dynamics as "the internal and external forces that affect processes and outcomes in groups" and it consists of four groups: "(1) communication and interaction, (2) interpersonal attraction and cohesion, (3) social integration (power, influence, norms, roles, status), and (4) group development" (Macgowan, 2009). These aspects of group dynamics mutually influence organizational culture. Understanding these relationships helps inform

approaches information organizations can take in adjusting their practices to work most effectively within these cultures.

History of Organizational Culture and Group Dynamics as Areas of Study

Organizational behavior cuts across disciplines using ideas from such fields as the natural sciences, sociology, anthropology, business, economics, psychology, and public administration. In the field of library and information science, much of the study into organizational culture and group dynamics is found in the management literature (Stueart & Moran, 1987; Evans, 1983; Lynch, 1985). This section explores the focus of organizational culture and group dynamics as a management function in information organizations. The next section follows with a proposed different normative orientation towards organizational culture and group dynamics for the effective recruitment and retention of information professionals.

As has been noted, organizations are often analyzed from a management perspective. In the early 1900s, Frederick Taylor used his engineering background in application to organizations (1911). His theory of scientific management sought to shape organizational culture to maximize productivity and efficiency. This approach was adopted in many fields, including libraries and library literature, as is illustrated in Dougherty and Heinritz's *Scientific Management of Library Operations* (1966). In the late 1970s and early 1980s, the study of organizational culture as a subset of the management literature emerged with influences from the fields of anthropology and psychology. Social Psychologist Edgar H. Schein provided a conceptual framework of organizational culture. The three interrelated levels of this framework include artifacts, espoused values, and basic underlying assumptions (Schein, 1992, p. 17). Artifacts are observable organizational structures and processes such as mission statements, organization charts, and meeting membership and conduct. Espoused

values include the values of the organization such as annual goals, vision statements, and accepted norms. Basic underlying assumptions incorporate the underlying values in the organization which, while not expressly stated, set the guiding tone for how organizational members take action (Schein, 1992, p. 231). Schein (1992) suggests managers should use this awareness of the elements of the organizational culture framework as a tool for recruiting and retaining employees who have similar values and normative assumptions to the organization (p. 47).

Around the same time as Schein's work, interest in Japanese management techniques emerged in the U.S. management literature. The strength of the Japanese economy grew in tandem with U.S. interest in this phenomenon. William Ouchi's Theory Z compares Japanese organizational culture to American organizational culture. He describes Japanese culture as a clan culture which emphasizes trust and relationship building, while the American organizational culture tends towards bureaucracy with a basis of hierarchy rather than groups (Tompkins, 2005, pp. 369-372). This observation echoed the findings of German economist and sociologist Max Weber from decades earlier. Weber described organizations at the turn of the 20th century as being hierarchical and bound by rules with little regard for the human element (Tompkins, 2005, p. 54). Ouchi's Theory Z illumination of the rule-bound trends in American organizations led to new approaches with organizational culture and group dynamics which recognized the possibilities of addressing the individuals within those organizations, their needs, and their influences on each other and on the organization. The "Solutions and Recommendations" section of this chapter explores some of these other theories and examines how they can be applied in information organizations.

A large body of literature in library and information science focuses on the business application of understanding organizational culture. This approach has overtones of Dougherty and Heinritz's

(1966) applications of scientific management of library organizations mixed with more modern elements of business. Schachter (2005) and Adyoyin (2006) exemplify how understanding and shaping organizational culture in libraries is couched in terms of managerial duties. Adyoyin states: "Library managers live within the corporate culture. They must understand it as a basis for diagnosing and solving problems and for developing new policies or procedures" (2006, p. 1). While this is a valid perspective, the aim of this chapter is to reorient thinking of organizational culture to a study for all individuals in the organization. To truly understand and enact organizational change, there needs to be understanding and buy-in from everyone involved within that organization.

While the literature reflects the study of organizational culture and group dynamics as a function of management, the library and information science graduate curricula demonstrates this orientation, as well. The library and information science graduate programs orient, educate, shape attitudes, and provide a normative orientation for librarians for work in information organizations. Consequently, it is helpful to look at the graduate curricula for elements of organizational culture and the types of courses in which it is addressed. Currently, there are 62 American Library Association (ALA) accredited Master's programs in Library

and Information Studies (ALA, 2008a). The most recent requirements for accreditation highlight issues of current importance to the profession:

The most important issues at the time of the revision [of the accreditation requirements] included: diversity, systematic planning, student learning outcomes, definition of the field, interaction with other fields of study and other campus units, distance education, globalization, management, multiple degree programs, values, and ethics. (ALA, 2008b, p. 14)

Organizational culture and group dynamics are not named specifically, but "management" is listed as an important issue. As is seen in the following sample of ALA accredited programs, human resources issues such as organizational culture and group dynamics tend to be included in courses in management, if included at all, in the curriculum. These programs include a diversity of value placed in understanding organizational culture as a key component of librarianship; demonstrate the variety of perspectives of organizational culture as management function versus an organization-wide knowledge asset; and illuminate the viewpoints of organizational culture as the role of external forces in shaping organizations versus internal forces of organizational culture having an effect

Table 1. Library and information science courses with a focus on management in relation to organizational culture

- Administration of Information Agencies: This course focuses on the managerial role in information agencies. The purpose of the class is to highlight the core competencies necessary for information organization management, summarize some of the key theories behind management, and provide an opportunities [sic] for students to experiment with tools for improving managerial effectiveness. (University at Albany, State University of New York, 2009)
- Managing Information Organizations: Applies theories and techniques of management to libraries, information centers, and information enterprise, concentrating on political processes, leadership, communication, human resources, organizational structure, decision making, planning, and control. Also includes elements of project management. (Drexel University, 2009)
- Administration of Libraries: Addresses the general principles of administration and their application to the organization and management of different types of libraries. Core components include general management techniques and administrative procedures, budget preparation, human resources issues, and facilities and resources management. Students will learn how to apply standards for evaluation of libraries and how to develop functional library programs. Provides a forum for the discussion of the roles of different types of libraries in society. Includes a required field experience. (Clarion University of Pennsylvania, 2009)
- Organizational Management: Survey of management issues common to all information environments --understanding organizations, decision making, hiring and personnel, grant writing, and marketing. (University of Iowa, 2009)

upon how we serve our patrons. Many of these programs do not address organizational culture or group dynamics in any of the course description offerings. Of those that do, the majority are part of management or information organizations courses. This brief sampling (Table 1) covers the course descriptions of these programs and does not entail a review of the syllabi for these courses. It is assumed that the course descriptions provide a summary view of the normative orientation of the programs.

These courses, like the literature, reflect a traditional approach to organizational culture in library and information science curricula which emphasizes leadership as a function of management. Newer concepts and approaches to organizational culture issues may be of use in today's fast-paced information organizations, as is examined in the next section.

UNDERSTANDING ORGANIZATIONAL CULTURE AND GROUP DYNAMICS IN RELATION TO RECRUITMENT, DEVELOPMENT, AND RETENTION OF INFORMATION PROFESSIONALS ISSUES, CONTROVERSIES, AND PROBLEMS

As is seen from the review of the literature and the library and information science curricula examples, the focus of organizations and organizational culture is couched in the area of management or in the understanding of the role of information organizations in society. What is lacking in these examples is the value that understanding organizational culture and group dynamics at every level is a key component to effectively participating in organizations regardless of the type of organization or place within it. This is not just a management or an information organization issue, but it is about existence and living daily life in an organization of any sort.

Solutions and Recommendations

As noted earlier, the library and information science profession should consider alternate approaches to organizational culture which explore the role of individuals in organizations. It is useful to understand and appreciate an organization's culture and group dynamics when developing management strategies and techniques. Likewise, it is useful to recognize the value of such knowledge for anyone at any place in the organization. The culture of an organization has an effect on everyone in that organization, regardless of position or level of responsibility. Each individual has the potential to influence his or her organization. Libraries can reframe their understanding of organizational culture and group dynamics from a management function to a function of every individual in the organization. Some approaches proposed here include *Distributed Leadership, Job Embeddedness, The Bad Apple Concept,* and *Positive Relationships at Work.* A shift in normative orientation from managers as experts to an orientation of individuals as equally responsible for the work environment will help create an organizational culture that encourages the recruitment and retention of employees well matched to the needs of the organization and the orientation of the individual. The following examples of how to apply this different normative orientation help merge theory with praxis, or practical application, for use in information organization settings.

Concept of Distributed Leadership

To set the stage for this new normative orientation, it is useful to consider adoption of *Distributed Leadership* as a value. In Distributed Leadership, each individual has the potential to lead from within any point in an organization. West Chester University demonstrates this concept in the following statement:

Distributed Leadership is an attitude rather than a management technique. It means seeing

all members of the faculty and staff as experts in their own right – as uniquely important sources of knowledge, experience, and wisdom. Above all, the approach allows the University's vision for the future to be shared and implemented across the campus.

Under Distributed Leadership, everyone is responsible and accountable for leadership within his or her area. Good ideas come from throughout the University, and many people cooperate in creating change. With ramifications in virtually all areas of campus life, Distributed Leadership is an environment where everyone feels free to develop and share new ideas. A central goal of the approach is for individuals to succeed in a climate of shared purpose, teamwork, and respect – an atmosphere in which we can reach out to help one another and feel free to turn to ask for help. In other words, Distributed Leadership supports and strengthens already outstanding individuals (West Chester University, 2009).

Distributed Leadership informs organizational culture and group dynamics through an approach to investing in all employees' ability to shape the organization and lead from any position. This normative reframing of individuals' roles leads to the potential successful use of the related concepts described next.

Aquinas College in New Zealand serves as an example of a library employing the concept of distributed leadership (Blackwell, 2007). Their approach to distributed leadership seeks to encourage innovation, encourage professional debate and conversation, and demonstrate trust through shared responsibilities, participation in meetings, and professional development opportunities. In this instance, the organizational culture includes expectations that all employees participate fully and that there is a dedication of organizational resources to help individuals success in that regard.

Job Embeddedness Rather Than Job Satisfaction (Or Dissatisfaction)

Shifting the focus of understanding organizational culture to meeting an individual's needs rather than as an isolated function of management is the next step in creating a positive organizational culture. Indeed, Lee, Holtom, and Mitchell observe: "a person's perceptions about alternative job prospects combined with his or her job satisfaction and organizational commitment has represented the dominant approach to understanding voluntary employee turnover." (2006, p. 318). Instead, they suggest considering the approach of job embeddedness when shaping an organizational culture. This approach places responsibilities for that culture in the hands of the employees. The critical features of job embeddedness, according to Lee, Holtom, and Mitchell include: the extent to which the job is similar to, or fits with the other aspects in his or her life, the extent to which the person has links to other people or activities, and what he or she would give up by leaving – the perks, benefits and other aspects of the job they value, such as a safe or pleasant work environment. These dimensions are called fit, links, and sacrifice (2006, p. 319).

To gauge a good fit of employees and an organization, it helps to provide a clear picture of organizational culture up front and to ask employees pre-employment questions through surveys and interview questions which address the fit with this culture (Lee, Holtom, and Mitchell, 2006, p. 322). After hiring new employees, they need an introduction to their new environment. Anderson uses a gardening metaphor to illustrate this type of orientation process. If individuals are expected to play an active role in a successful organization, then they need to be equipped with information about organizational culture but not so much information that it becomes noise. Anderson states, "'Planting them too shallow' means not providing enough information, resources, or support. 'Planting them too deep' means over-

whelming employees with too much information or unrealistic initial expectations" (2006, p. 76). So, to help provide the organization culture context, Anderson suggests providing the employee with information needed to answer these critical questions:

- Who do I need to know? The people and relationships that will be most important to this person's success.
- How do things get done around here? The systems, procedures, and cultural 'rules' this person will need to understand and use.
- What's expected of me? The specifics about the performance for which this person will be held accountable, and how you'll stay in touch about those expectations (2006, p. 76).

To create links to the organization, an organizational culture which actively fosters healthy relationships can be used. For example, Lee, Holtom, and Mitchell (2006) suggest investing in technologies which keep mentors and mentees connected online when face-to-face meetings are not possible (p. 323). This could include permitting the use of instant messenger programs or wiki software to facilitate immediate feedback or knowledge building between individuals. At the author's institution, each library department holds "Getting to Know You" sessions every few years to educate each other about the roles and functions of individuals and the units in which they work. This exercise creates a link for individuals between how all parts of the organization fit together to achieve organizational goals.

A final way Lee, Holtom, and Mitchell (2006) suggest that organizations can control for job embeddedness is to create benefits which would be considered sacrifices if an employee were to leave an organization. While financial rewards are an obvious benefit employers can provide, other, less costly benefits can include an organizational cul-

ture which places value in other types of benefits. Examples may include treating employees with the normative orientation of distributed leadership as a positive value. Another example is for employees to have the opportunity to serve on committees or boards which make decisions about the roles and services of the organization. Training offerings and skill-building is another way to invest in employees and to invest in the organization at the same time. Returning to the Aquinas College example, all library employees receive membership into the regional library association to help with networking and professional development opportunities. Travel and professional leave, as is found in many libraries, is another such example of creating embeddedness. Using the distributed leadership model, organizations empower employees to decide or recommend the benefits offered to employees which are of most help and value to them; employees consider losing these benefits a sacrifice upon leaving.

Bad Apple Concept

While much of this chapter has focused on the concept of organizational culture, group dynamics has a very close relationship with organizational culture which can be seen through the research into the "Bad Apple" Concept. In their research, Felps, Mitchell, and Byington (2006) found that one negative group member can have a "powerful, detrimental influence on teammates and groups" (p. 175).

Effective groups "produce as individuals, which depends on having a team that is motivated, capable, and able to learn and change" (Felps, Mitchell, & Byington, 2006, p. 202). They also, as a group, "effectively coordinate and integrate individual action into a coherent whole constituting a group output" (Felps, Mitchell, & Byington, 2006, p. 202). In their research, they found that a negative group member, or "bad apple," can have a detrimental effect on group function. Three areas in which this type of individual can

cause problems in groups include problems with cooperation, conflict, and group outcomes (Felps, Mitchell, & Byington, 2006, p. 204). Problems with cooperation occur when a negative group member undermines trust in the group by spreading gossip or taking credit for others' work, resulting in diminished trust that cooperation is for the benefit of the whole group (Felps, Mitchell, & Byington, 2006, p. 204). Conflict situations differ depending on the type of conflict. If the conflict is about a person, or relational conflict, then this can disrupt group work, can result in retaliation, and can cause the disengagement of group members (Felps, Mitchell, & Byington, 2006, p. 205). In addition, it may be a damper upon the process of task conflict (a positive form of conflict which explores ways in which to do work) or brainstorming and constructive criticism. Ultimately, the bad apple can have a negative impact on group outcomes which result in "poor performance, low viability, and an unhappy team" (Felps, Mitchell, & Byington, 2006, p. 206).

It is suggested here that educating group members about the bad apple concept and making them aware of signs of bad apple behavior can help them mitigate the effects the bad apple can have on the group before the damage to the group dynamic is irreparable. The most important bad apple behaviors of which to be aware include "the withholding of effort, the demonstration of negative affect, and the violation of important interpersonal norms" (Felps, Mitchell, & Byington, 2006, p. 207). Usually, as groups try to address or adjust to these behaviors, defensiveness occurs in individuals across the group because of a lack of control over the situation and a frustration over the time and energy required to navigate around the negative behavior. Felps, Mitchell, and Byington (2006) suggest several implications from their work which help mitigate these behaviors. First, the selection of individuals into the workplace should, ideally, not include those with bad apple orientations. Second, those who already are in the organization should have as little group process

work as possible. Third, training for groups helps them become more attuned to handling destructive behavior. This last point should be highlighted as it emphasizes to the importance of empowering the group members in these bad apple situations (Felps, Mitchell, & Byington, 2006, p. 212). Individuals can work together to form coalitions or to establish unacceptable behavior in a group if they feel empowered and educated about the benefits of doing so. Organizations which have trusting groups which engage in productive behaviors rather than defensive and hostile ones will likely find increased job embeddedness and improved recruitment and retention. So, while management has some role in the hiring and training processes, the members of groups have the most control over creating positive group dynamics and in shaping an organizational culture that does not tolerate bad apples spoiling the barrel.

Positive Relationships at Work

Further commentary about organizational culture and group dynamics is couched in the context of positive relationships in the workplace. Kahn (2007) explores this in terms of positive relationships in groups and communities. Kahn (2007) presents a formulation of positive relationships in groups at work:

People simply act in positive ways towards one another, and are enabled to do so by communal structures, cultures, and processes. These actions create relationships among people that enable them to feel valued and valuable, seen and witnessed, cared for and appreciated, productive and engaged…Members are reasonably authentic, saying what they think and feel and acting in ways that feel real to them. To do good work together (p. 277).

The challenge, Kahn suggests, is figuring out how to create opportunities to make and foster these types of relationships. He suggests four conditions which, when all met, can help achieve positive work relationships. The first condition is

abundance, where people show acts of gratitude, concern, selflessness, and compassion which leads to job embeddedness and positive work engagement (Kahn, 2007, p. 278). The second condition, safety, "evolves from a series of repeated acceptances by group and community members of one another" and leads to trust, intimacy, and authenticity in groups (Kahn, 2007, p. 279). The third condition, boundaries, provides definition to groups and reinforces the second condition of safety. The final condition, positive spirals, is the constant reinforcement of positive acts being met with positive acts resulting in a momentum of positive energy within a group (Kahn, 2007, p. 281). As was found in workplaces which discourage bad apple behavior, positive relationships can increase retention and yield greater job embeddeness for employees.

Organizations can encourage positive relationships to form in a variety of ways including the creation of mentoring opportunities, retreats, and work community events such as parties and lunchtime seminars. They can also reward employees who show the courage to participate positively. Finally, assuming a model of distributed leadership is being used, every leader can help shape a positive work environment. This type of leadership includes recognizing negative spirals and interrupting their cycles, finding areas where positive spirals occur and feeding into those spirals to help them grow, and by being positive examples themselves whenever possible (Kahn, 2007, pp. 283-284). As Dutton and Ragins observe, positive work relationships "are generative in the sense of creating meaning about the self, about others, or about a collective, which in turn cultivates additional resources that make more likely other generative patterns of interaction" (2007, p. 393). If members of organizations are empowered to facilitate positive interactions, the results grow exponentially as positive experiences flow into other aspects of the organization with each related interaction. In the next section, these concepts,

along with other related concepts will be explored relative to the library science curricula.

Comparison of Organizational Culture as a Function of Management vs. Organizational Culture in Terms of the Role of the Individual in Library and Information Science Curriculum

In an earlier section, the ALA Accredited graduate programs were examined for aspects of organizational culture and group dynamics in their curricula. While many schools either ignore these concepts or couch them as a function of library management, some examples of these ideas are similar to a distributed leadership normative orientation. These alternate orientations are offered in comparison to the management-oriented curricula reviewed earlier in this chapter:

In Table 2, the two courses under the heading "Library and Information Science Courses with a Focus on Individuals in Relation to Organizational Culture" focus on the role of the individual. The tone of the first course focuses on empowering every information professional with the skills and abilities to become an effective leader, regardless of position within the organization and to help create a healthy organizational culture and group dynamic. The second course under that heading couches management from any point within an organization. These two courses serve as examples of how Library and Information science programs can reorient their curricula towards empowering individuals to understand their roles as leaders from any point in organizations.

FUTURE RESEARCH DIRECTIONS

What are the future implications for research into understanding the role of organizational culture and group dynamics relative to the recruitment, development, and retention of information professionals? It is suggested here that refram-

Table 2. Library and Information Science Courses: Normative Orientations Compared

Library and Information Science Courses with a Focus on Management in Relation to Organizational Culture	Library and Information Science Courses with a Focus on Individuals in Relation to Organizational Culture
• Administration of Information Agencies: This course focuses on the managerial role in information agencies. The purpose of the class is to highlight the core competencies necessary for information organization management, summarize some of the key theories behind management, and provide an opportunities [sic] for students to experiment with tools for improving managerial effectiveness. (University at Albany, State University of New York, 2009) • Managing Information Organizations: Applies theories and techniques of management to libraries, information centers, and information enterprise, concentrating on political processes, leadership, communication, human resources, organizational structure, decision making, planning, and control. Also includes elements of project management. (Drexel University, 2009) • Administration of Libraries: Addresses the general principles of administration and their application to the organization and management of different types of libraries. Core components include general management techniques and administrative procedures, budget preparation, human resources issues, and facilities and resources management. Students will learn how to apply standards for evaluation of libraries and how to develop functional library programs. Provides a forum for the discussion of the roles of different types of libraries in society. Includes a required field experience. (Clarion University of Pennsylvania, 2009) • Organizational Management: Survey of management issues common to all information environments --understanding organizations, decision making, hiring and personnel, grant writing, and marketing. (University of Iowa, 2009)	• Communication for Leadership: Theory, research and practice of interpersonal and group communications for collaborative leadership roles: facilitator, coach, catalyst, and leader. Includes using a variety of media for information transfer among groups; communicating a leadership stance, creating and enrolling others in your vision (advocacy), developing organization support for your vision (systems literacy) and building skills in interpersonal communications, groups dynamics, negotiations, conflict resolution and asserting influence. (Dominican University, 2009) • Management of Libraries and Information Services: Information practice demands knowledge of all aspects of management and service delivery. This course introduces selected theories, principles and techniques of contemporary management science, and organizational behavior and their application to libraries and information services. Students develop skills in planning, organizing, personnel management, financial management, leading, marketing, stakeholder management, and coordinating functions in libraries and information services. Students also have the opportunity to think critically about, and reflect upon, contemporary management practice in information organizations. Information professionals find that no matter whether they choose a career as a single entrepreneur, solo librarian, archivist, or whether they join a large organization, they become managers -- of themselves, of clients or staff, and sometimes of substantial systems and services. Through classroom instruction, workshops on specific management skills, assignments, readings and discussion, and guest lecturers, this course prepares students to assume managerial responsibilities in their work. (University of Michigan, 2009)

ing the normative orientation in library and information science curricula, literature, and in organizations themselves from focusing on these areas as functions of management to functions of any member of an organization is a useful starting point. Empowering individuals to take ownership for organizational culture and group dynamics increases job embeddedness, facilitates "good-apple" behaviors, and encourages positive relationships in the workplace. Furthermore, job embeddedness, the bad apple concept, and positive relationships in the workplace are just some examples of how organizational culture can be understood; the organizational culture and group dynamics literature offers many other potentially applicable approaches which should be considered. Given the generational differences in expectations of roles in the workplace, further research into how distributed leadership might be approached differently depending on

generation should be considered. Also, research into the bad-apple concept and into distributed leadership is relatively new and could be more rigorously considered relative to the information and library science profession. Additional distinctions between types of information settings, particularly considerations for public agencies should be considered and would benefit from greater integration of the public administration literature into the library and information science areas of study. While not provided here, case studies into how these concepts might be applied could help shape theory into practical application for use by the information science practitioner.

CONCLUSION

Organizational culture and group dynamics shape the world within which individuals do their work.

As information organizations in the 21ˢᵗ century seek to recruit, develop, and retain employees, it is important for these organizations and the people they hire to be equipped with the knowledge, skills, and abilities to shape this work environment for success. This knowledge, skill, and ability can start with required offerings in the information and library science curricula and should extend into the normative orientation of information professionals within organizations themselves. It is proposed here that this normative orientation take on the approach of distributed leadership to empower information professionals to use an understanding of ideas such as job embeddedness, the bad apple concept, and positive relationships at work to influence organizational culture. Information professionals who are empowered with this information will be better equipped for successful, rewarding careers in healthy workplaces which are prepared to take information organizations forward in the 21ˢᵗ century.

Chapter 74

"We Don't Have the Key to the Executive Washroom":
Women's Perceptions and Experiences of Promotion in Academia

Jessica Guth
Bradford University Law School, UK

Fran Wright[1]
Bradford University Law School, UK

ABSTRACT

This chapter reports on a pilot study looking at the progression of academic women at one UK University. The chapter focuses on the promotions process and criteria as one important issue emerging from that research. Earlier research has shown that women are less likely to break into institutional networks which allow them to access information not only on formal and objective promotion criteria but also on hidden criteria and the way the 'academic game' is played. One result of this is that some academic women may have an inaccurate view of promotion criteria and processes. At the university studied by the authors, the Human Resources department has sought to make the promotion process more transparent and, officially at least, it no longer depends purely upon research achievements. However, these changes will not necessarily result in easier progression for women academics. The authors' study confirms that there is still a mismatch between what women think the criteria for promotion are, what the formal criteria are and how those criteria actually operate. Reliance on incomplete or inaccurate information about promotion criteria, coupled other factors, such as women's reluctance to promote themselves actively and traditional barriers to promotion such as caring responsibilities, puts women at a disadvantage when they attempt to progress into more senior positions within universities. Reform of promotions procedures needs to look beyond re-writing the substantive criteria for promotion and look to improving understanding of what is involved.

INTRODUCTION AND BACKGROUND

This chapter is based on the findings of a small scale research study carried out in 2008. The study considered the progression of women in higher education and focused on academic staff at the University of Bradford in the United Kingdom. The research outlined the European and national law relevant to this area before examining the university's own policies in detail. The majority of the study then focused on the lived experience of academics at the University exploring issues around promotion and progression, work life balance, mentoring and perception of policies amongst others through in-depth empirical work comprised of semi-structured interviews with male and female academics employed at the University (n=30). In addition to the interviews, some basic analysis was also made of statistics provided by the university. While the study did not specifically concentrate on the SET (science, engineering, and technology) disciplines, many of our respondents did in fact fall in that category. We interviewed academics in the engineering design and technology department as well as colleagues from life sciences, informatics, psychology and the school of health. Out of a total of 30 respondents, 17 were from SET disciplines while the others came from disciplines such as law, management, social sciences and languages. However, the analysis of our data showed no differences in responses by discipline.

This chapter focuses on one of the key themes emerging from the research: the promotions process in Higher Education. The emphasis is on promotion within and between the Lecturer and Senior Lecturer grades. This is partly because it was those promotions that most of our respondents talked about and also because these decisions are made internally, whereas assessors from other universities are involved with promotions to Reader and Professor. Promotions criteria in Higher Education are supposed to be transparent and clear to those employed in relevant institutions. The Higher Education Role Analysis (HERA) used to define roles within universities in the UK is supposed to allow "employers [] to ensure their pay and grading structures are designed to recognize the value of roles and ensure equal pay for work of equal value" (Educational Competencies Consortium Ltd 2007 (ECC)). A national role analysis was carried out, resulting in the development of national role profiles in UK Higher Education. These can be mapped onto a single national pay spine to ensure fairness and equality across the sector as a whole. The University of Bradford has adopted the single pay spine and the associated role descriptors. However this research casts doubts on the transparency of criteria and role profiles and the extent to which they are made explicit to university staff and/or applied consistently. In addition, as Deem and Morley (2006) note "although this methodology may deliver equal pay for equal work, […] it may also restrict promotion opportunities since these often now depend on moving to a new job rather than upgrading an existing one" (p190).

The move to a single pay spine might also explain why we detected no disciplinary differences within our data. Academics working in SET disciplines are subject to exactly the same promotions criteria as those working in the social sciences and humanities and as such they have very similar views of those criteria and processes. Nonetheless the empirical work presented here takes as its focus those interviews conducted with colleagues in the SET disciplines.

The chapter first considers academics' perceptions of what the promotion process involves and their experiences in planning for and applying for promotion. It then turns to the university administration's own explanation of what the promotions process requires and involves. These are discussed, along with some "hidden" criteria for promotion. We then consider the implications of some significant differences we found between participants' and managers' understanding of the promotions process. We will conclude that it is

unclear whether these differences have their roots in a failure to properly educate women academics about what they need to do in order to achieve promotion or whether the perception of women academics is correct but not accurately reflected in the university's formal criteria. Another factor is that this study was carried out at a time when the university had only just implemented some major changes to the procedures for promotion (including re-naming it as regrading) and this may have impacted on participants' knowledge of the process and criteria. Whichever of these explanations is correct, our findings suggest that attempts to reduce the imbalance between male and female academics at senior levels within the university are unlikely to succeed.

METHODS

The research strategy of this project employed a qualitative socio-legal methodology. It involved the analysis of law and policy from institutional to European level. This analysis was then complemented with in-depth empirical work comprising of semi-structured interviews with male and female academics employed at the University.

The empirical work sought to gain in depth knowledge and understanding of women academics in the University of Bradford. Qualitative semi-structured interviews were carried out with male and female academic staff at the University of Bradford at all levels of an academic career (n =30). The interviews covered areas such as

- Background Data
- Career trajectory
- Reasons for choosing to work in academia
- Advantages and Disadvantages of life as an academic
- Future plans
- Perceived barriers to career progression
- Views on promotions criteria and processes
- Public perception of women academics
- Institutional culture

In order to protect the confidentiality of our respondents we are unable to provide a full profile of our sample. However, the details in Table 1 and Table 2 may be of interest.

We did not find any striking differences according to seniority in the answers given and the gender differences were also minimal with male and female respondents identifying similar issues in women's progression.

Analysis of the empirical data was carried out using the software package Nvivo7. Interviews, which mainly took place in the staff's offices and ranged from 45 minutes to 2 hours, were recorded and the recordings were transcribed and entered. The data was split (or coded) thematically as the

Table 1. Respondents by gender

	Male	**Female**
Number	5	25
Percent	16.7%	83.3%

Table 2. Respondents by seniority

	Numbers			**Percentage**		
	Total	**Male**	**Female**	**Total**	**Male**	**Female**
Lecturer or below	16	1	15	53.3%	3.3%	50%
Senior Lecturer or equivalent	3		3	10%	0%	10%
Reader/Professor/Senior position	11	4	7	36.7%	13.3%	23.3%

themes arose from the interview data and was then analysed in accordance with those themes.

As a qualitative study this work did not seek to make representative claims or present statistics or statistically significant data. The figures highlighting the lack of senior academic women are well rehearsed elsewhere. Instead this study aimed to understand the experience of academics at the University of Bradford and then situate that experience within the wider literature. It provides a detailed case study which highlights areas for future qualitative and quantitative research.

WOMEN ACADEMICS AT THE UNIVERSITY OF BRADFORD

The Equality Act of 2006 places a general duty on all public authorities in England and Wales, when carrying out their functions, to eliminate discrimination and harassment that is unlawful under the Equal Pay Act 1970 and the Sex Discrimination Act 1975; and to promote equality of opportunity between men and women. The university appears, on paper at least, to take this duty seriously. 'Confronting inequality: Celebrating diversity' is one of The University of Bradford's strap lines. The university's equality policies and schemes reflect a formal commitment to promoting equality. The policies examined as part of this study were found to be comprehensive and well thought out. The main gender equality policy and scheme is well supported by a number of other policies dealing with issues such as harassment and bullying as well as maternity, paternity and adoption leave and flexible working.

However, this does not translate into equal number of male and female academics in senior positions or indeed into a perception of equality within the institution (Deem and Morley 2006). Perhaps unsurprisingly, statistics we were provided with by the University show that the most marked gender differences arise at the more senior level. Out of the 444 members of academic staff

below professorial grade 43% (189) are female. At professorial level, however, 76% are male. At Senior Lecturer level the proportion of men is 65%, and at Reader 88%. At Lecturer level however the genders are almost evenly split with men making up 51% of the total. The figures broadly match those of other studies (Forster 2000). Ackers and Oliver (2005) note that "[an] inverse relationship exists between the level of feminisation and seniority as women fail to progress in science careers at an equivalent rate to their male peers" (p3).

In spite of Fisher's proclamation 17 years ago that "[n]o organisation these days can afford to waste valuable brain-power simply because it is wearing a skirt (Fisher, 1992, p. 46) the figures suggests that women are less successful than men in achieving promotion, first to Senior Lecturer level and then to more senior grades (Forster 2000; AUT 2004). The university supplied us with the figures for the promotions round held in 2007. More men (87) applied for promotion than women (59) and men were more likely to be successful. 74% of men who applied were granted a promotion whereas only 66% of women were successful.

The main purpose of this study was, however, not to conduct detailed statistical analysis but rather to gain an insight into the experience of staff at the institution. While it must of course be recognised that there are disciplinary differences even within the SET disciplines and that different factors are likely to affect people differently as they progress through their life course and career trajectory, a number of common themes emerged.

In order to get a picture of the attributes and characteristics that women academics valued in their colleagues and the standards they were measuring themselves against, we asked respondents about their 'ideal' academic. It is clear that there was no single picture of an ideal academic, and different people placed their emphasis on different skills. We also asked respondents about their own decision making around promotion and about their experiences of applying for promotion. We got a strong sense that academics across the university

felt daunted by the complexity of the promotions process; although information is available, our respondents did not find it easy to understand and to navigate. The difficulties were possibly increased because of the recent introduction of new promotions systems and criteria. We also found significant differences in respondents' perception of what the promotions criteria are – these varied not just from school to school but also within schools and departments. We detected an apparent mismatch between what people thought the criteria were, what the criteria actually were and how the criteria then operated on the ground.

The next sections in this chapter will explain in more detail what academics said about promotion in their interviews. We have dealt separately with views about what is needed in order to be promoted, and with what happened when our respondents actually tried to get promoted.

WHAT WOMEN TOLD US ABOUT PROMOTIONS CRITERIA

Researchers have found that lack of information about promotions procedures and criteria are not confined to new academics (Metcalf et al 2005). Our study also found confusion about the criteria for promotion. This confusion was not limited to junior academics but can be found across the seniority spectrum. Many respondents expressed anxiety about what exactly was expected of them. Our respondent Andrea for example commented *"No, I don't [know what I need to become a senior lecturer], I know that's where I want to be, but I don't know what I need to do to be there…"'*.

Many interviewees felt that there was a mismatch between the work the university expected them to carry out and the work that they were actually rewarded for in terms of promotion and progression. So while the university's focus was on teaching, widening participation and student engagement and these activities generally took up a substantial amount of academics' time, the

reward and promotions structure was thought to be focused mainly on research activity. This focus on research in itself has been seen in previous studies to put women at a disadvantage (Forster 2000) but most academics still regard research outputs as the most important criteria for promotion. The quotations given below illustrate the point.

Researcher: What do you think it is in your discipline that gets people promoted, what's the key thing that has to be on the CV?

Interviewee: Undoubtedly, papers in peer reviewed, excellent, well-read journals. [Michelle, Lecturer, Female]

What does the institution reward? It rewards researchers who can bring in big research grants. It doesn't particularly reward teachers for good teaching […] because if you want a promotion to senior lecturer then you have to have a research track record [Shannon, Lecturer, Female]

Debate about progression in academia is ongoing particularly in the context of recognising and rewarding teaching and learning (Parker 2008, Young 2006, Collins and Palmer 2007 Gibbs and Habershaw 2002). This debate was not lost on our respondents and some mentioned that promotions criteria were beginning to change or that the emphasis or weighting of them was shifting; some thought towards teaching, some towards managerial skills and others to a more rounded approach:

So at Professorial level I've no doubt that we have to move from a focus on research. Now we have changed […] some of the criteria, we've changed it so it's more about teaching excellence, it's about knowledge transfer, KTs, consultancy, it is wider [Daniel, Senior, Male]

However, even though a shift in emphasis and the availability of different career paths through

academia was recognised at very senior level and welcomed at the lower levels of seniority, it appears that few believed that this shift in emphasis was actually being translated into practice. Three crucial issues emerged. Firstly, managers, most often academics themselves, do not necessarily have up to date and reliable information about how to apply promotions criteria in individual situations and are thus unable to give clear and constructive advice. Secondly, academics who are unsure of what exactly the criteria are and cannot get clear guidance from their managers, are unable to work strategically towards achieving those criteria or may believe they do not meet the criteria when in fact they do. Thirdly, as well as the criteria set down in HERA or those identified at departmental or school level, there are additional hidden criteria which operate in parallel with the formal criteria but which are far less transparent. These issues are explored further below but the quotation below highlights the problem women academics face:

There's a phenomenal repeat message from the females about how they went for promotion and they have the most research and you know, everything else they outperform guy X and guy X got the job and they asked for feedback and none of them got feedback. So I think the criteria might be different or the experience of the criteria might be different between the male academic and female [Nicole, Junior, Female].

What Women Told Us about their Experiences of Preparing for and Applying for Promotion

Researcher: How did you find the criteria?

I think it's still written in gobbledegook, I'm a plain speaker. I just find it really interesting that on the one hand the institution is saying that they want people to apply for a promotion, they advertise that this is going to happen. The information session

run by the institution was a week before submission. So those 2 things do not go hand in hand. So they're saying one thing, when they actually mean something totally different. And that's my impression. If you really, really want to support people to do something you don't give them the information a week before, the amount of evidence that they want needs to go in, even down to when you've got to write your list of publications. We use Harvard referencing here, that's not Harvard referencing, so I had to redo it all. [Shannon, Lecturer, Female]

The personnel website of the University of Bradford devotes quite a significant amount of web space to matters related to promotions. Staff can access detailed information about the pay and grading structure, role descriptors and the promotions process and timetable. Nonetheless our respondents did not necessarily feel that they were well informed about the process and the applicable criteria, nor did they feel confident in going through it. There was a common perception that the promotions process was time consuming and involved complex paperwork. A number of our respondents actually felt unable to spare the time from the 'day job' to complete the required paperwork and those who did often found the process stressful. Sarah's comments encapsulate the feedback we received on the process: "*It was hard work, bureaucratic, lots of box ticking*". [Sarah, Lecturer, Female]

Michelle touches on a further issue which many respondents raised:

I don't want to want to be knocked back; I don't want to put a lot of time into something that I can see is going to be knocked back because I know I haven't got the quality publications recently [Michelle, Lecturer, Female]

She highlighted that she did not want to just 'have a go' at going for promotion but rather

wanted to be sure that she met the criteria and would be successful when she applied. She did not want to go through being rejected or knocked back. Two related points emerge. In the view of some respondents, there was a gendered dimension to reluctance to submit a speculative application, and that men were less concerned about rejection and more comfortable with self-promotion (Bagilhole and Goode 2001). ' *I do think women are less willing to put themselves forward maybe because they're afraid of being hurt, you know'* [Stephanie, Lecturer, Female].

Further, those who were aware of the promotion criteria, for the most part felt it difficult to relate them to the work that they did or were frustrated with the application paperwork because it did not allow them to accurately portray what they felt was important. The criteria, said our respondents, are based on process and form and are *"a very traditional way of looking at it"*. [Elizabeth, Senior Lecturer, Female]. The application form used applied a restrictive view of the promotions criteria and thus did not allow applicants to portray *"a full enough or a round enough description of [themselves] and all the things [they] were doing"*. [Sarah, Lecturer, Female]

THE UNIVERSITY'S FORMAL PROMOTIONS/ REGRADING CRITERIA

The University has two distinct procedures for promotion, one applying to promotions within and between the Lecturer and Senior Lecturer roles and one applying to promotions to Reader and Professor. The focus of this section is on the former.

The University of Bradford has recently overhauled its promotions procedures. All staff have been placed on a single pay spine, over 260 role at the university evaluated, and new role descriptors introduced. This is part of a national initiative for pay modernisation. The new system was used for the first time in 2007. Most of the respondents interviewed for this research had not yet applied for promotion under the new system, but some had and others commented on it more generally. Given that one of the themes we detected in our interviews was lack of awareness of promotions procedures, the fact that many respondents failed to comment on the new process was instructive in itself.

The new procedure is initiated when the academic and their manager agree, at an annual Performance Review meeting, that the academic's "role" has undergone significant development, i.e., the academic has taken on additional responsibilities or developed new skills. (Regrading is not concerned with *potential* to perform at a higher level: unless that higher level has already been achieved, the position cannot be regraded.) The academic and manager then agree a new job description for the role. If the manager feels that the role has developed to the level of a higher grade, as defined by the HERA role descriptor, the new job description is forwarded to the Dean/Head of Planning Unit for approval and the manager submits an application to the School/Planning Unit Annual Promotions committee.

As can be seen, the academic's line manager has a central role in the promotions or regarding process. This is the person who carries out annual Performance Reviews, at which targets for further development are set. The line manager is also often the person who allocates administrative responsibilities. This is important because not all criteria for regrading can be satisfied simply by doing one's existing role well. If the role descriptor for a higher grade requires evidence of successfully completing a particular task, then the academic needs the opportunity to take on that task. However, in setting targets or planning an individual's future development, the manager is not concerned purely with the personal and career development of the academic: according to the document "Promotions Exercise 2008",

It is for management to determine how roles are to be developed in the context of strategic and operational requirements within Schools/Planning Units and across the institution. The potential development of any role, along with any associated development plans, should, therefore, be discussed in that context during the performance review (University of Bradford 2008 p1 emphasis added).

While formally there is no "rationing" of regrading, the operational needs of a particular school or planning unit are likely to have this result. If there is no need for more staff to carry out the higher level tasks required for the higher grade, then a staff member will not receive the opportunity to work at that higher grade and therefore will not be regraded.

The support of the manager is also required for any application to reach the School promotions committee: "All evidence submitted in support of a case must be verified by the appropriate line manager. No case for promotion will be considered unless the supporting evidence submitted has been verified" (University of Bradford 2008 p2). If the School committee approves the application, it is put forward by the School to the University committee. Self-submission to the School/Planning Unit committee is not possible but self-submission to the University committee is permitted where the School/Planning Unit committee does not approve the application.. The final decision on promotion is made by the University committee. The manager is therefore a gatekeeper for development and promotion opportunities.

Our findings echo those of Deem and Morley (2006) one of whose respondents articulates well what many respondents told us:

My experience of going through the promotion process... flushed out an awful lot of issues to do with gender... if you wanted to be promoted... you needed... managerial profile roles which were significant... the head of department decided who was going to get those roles... and that... operated

as a way of blocking women from being promoted unofficially (Female academic, Cityscape) (p191).

Our respondents regarded publication of research as critical to promotion but it is not clear that the formal criteria in the role descriptors actually give research this central role. There are different HERA role descriptors that are intended to capture different academic career paths – that is, research focussed, administration focussed and all-rounders. However, all role descriptors are written in a very general way and are not discipline specific, let alone lecturer-specific. The result is language that seems strained as a description of what a lecturer or senior lecturer actually does. One of the elements in the HERA role descriptor for grade 9 (lecturer) and grade 10 (senior Lecturers) academics is "service delivery". At grade 9, the "[m]ain focus of role is responding to the needs of others and delivering an agreed service", with the academic "on occasions exploring the needs of students and others and adapting services to meet them." At grade 10, the focus changes to "being proactive in developing the service by approaching customers, exploring needs, developing new services" and the academic "will have responsibility and may be the lead role, for contributing to setting standards or determining the quality of the service to be provided". There are references to research, but there is no reference to *publication* of research at all. The closest that the grade 9 description comes to the perceived all-important requirement of publication, is that "Role holders will be conducting individual and/or collaborative research or scholarly projects and applying knowledge from projects to teaching/external activities." At grade 10, "role holders will be generating new approaches, developing new insights and contributing to the development of knowledge and practice in own field/educational strategies". If their focus is research, they will also be "principal investigator or collaborating on research projects and contributing to the development of research strategies". This language is far

removed from the descriptions of what is required we heard from our respondents.

This suggests either that the respondents were out of date in their perception of what promotion involved or that the "official" criteria did not tell the whole story and that, in reality, research remained the main route to advancement, regardless of what the documentation stated. In either case, doubt is cast upon the transparency of the promotions process.

HIDDEN CRITERIA AND OTHER BARRIERS TO PROMOTION

As well as the formal criteria there are informal or hidden criteria which seem to be influence reward and promotions within the university. These criteria are subtle and relate to issues around expected workloads, value attributed to certain approaches to work and the importance of networking. We will consider these issues in turn.

Working Time and Work Life Balance

The long hours culture is a health and safety issue and is not consistent with a work life balance. It may also impact on progression: if conventions about how much work is required in order to advance within the university assume that long hours will be worked, employees who are either unwilling or unable to work long hours may be less likely to progress their careers.

Work load and the difficulties of achieving a satisfactory work life balance concerned our respondents, most of whom felt that it was impossible to carry out an academic job in a standard working week of around 40 hours.

I'm not sure it is possible, not if you want good research and good teaching. Ones got to give if you stick to 40 hours a week [Andrea, Lecturer, Female]

Studies looking at SET disciplines have long noted the high number of hours worked by scientists (Ackers 2003, Ackers and Oliver 2005) and a long hours culture was also prevalent within the institution studied. This was felt most keenly by those respondents with caring responsibilities. Respondents who managed to work a "standard" working week were few and far between. Moreover, many failed to take all the annual holidays or statutory holidays to which they were entitled. A number referred to coming to work when sick, in order to keep up with their workload. These findings are consistent with those of other studies. Ackers and Oliver (2005) make the point succinctly: "Scientists with children and mothers in particular, are less able to commit these kinds of hours and achieve an equivalent level of productivity" (p3). Caring responsibilities, either in relation to children, partners or other family members clearly do have an impact on how academics can manage their work and family life and as Forster (2000) points out "[t]he arrival of young children often coincides with the age when [scientists] are still expected to make an impact in their chosen fields through high quality research and a regular output of publications" (p319). Their interviews also confirmed "[t]he persistence of gender differences in the proportion of time spent on forms of unpaid/family work in the home restricts the ability of scientists with families, and women in particular, to devote a similar amount of time to their research"(Ackers and Oliver 2005 p3). While things are clearly better than they were in the past and caring responsibilities are being recognised more, it seems there is some way to go before academic institutions can be considered a family friendly place to work.

Gendered Approaches to Work

As various theorists have noted, there is a normative masculinist culture within academia that can disadvantage women (Wolffensberger,1993). Forster (2000) talks of a 'deeply ingrained male

view of performance' (p316) and Bagilhole (1993) notes that 'Universities are prime examples of Lipman-Blumen's (1976) ``homo-social'' institutions, being established and run by men. From this it follows that the rules pertaining to appointment are male driven and are evaluated according to male standards' (p 447). We were therefore interested in comments about a gendered approach to career planning

Many respondents agreed that it was too much of a generalisation to say that men viewed work and progression in a certain way while women did so in another. At the same time, many identified a gendered dimension in the way that the way academics approach their career:

I mean I don't want to make universalising statements about anything you know, but I think, I think men just tend to be more career focused and are having to think the next 2 or 3 steps ahead really, and I'm not saying that no women do that but I think women perhaps tend to be more invested in the job that they're doing at the moment and have perhaps more of a sense of responsibility. I know have a huge sense of responsibility towards students. [Karen, Lecturer, Female]

Some respondents commented that men were generally better at protecting their research time and were less likely to spend significant amounts of time devoted to pastoral care and the 'caring side' of teaching and learning (Martínez Alemán 2008). The quotation below gives an indication of the value assigned to these kinds of roles by the institution.

Women are much more open to doing that pastoral role, naturally, than men, they are perceived as sympathetic, etc, and again the loading there is not advantageous… [Julie, Senior, Female]

Given that the respondents also thought that research was the key to promotion, they were likely to regard this as an approach to work

that helped men obtain promotion and hindered women's efforts.

When asking the questions about gendered approaches to work and promotions we were very aware that we were inviting respondents to generalise and draw out stereotypes and we were surprised to find that in many cases these stereotypes seemed to still be translating into practice. Overall respondents agreed that there were male and female characteristics and that we all had both to a greater or lesser extent.

I still think there is maybe a masculine style and a feminine style and it doesn't matter whether you are a man or a woman, it's whether you adopt those things and there is probably a sliding kind of scale [Crystal, Senior, Female]

The question of male and female characteristics and approaches to work often led on to a discussion about management styles and the value of having more women at the top level. This is relevant to the question of promotion in various ways: it provides an indication of whether women academics were motivated to progress to senior positions, what that motivation was, and what they thought had helped other women achieve promotion. Our respondents were overwhelmingly of the opinion that just having more women in more senior positions was not the answer; the key was having the right women there. There was a feeling that those women who had made it to the top level had to act in what was considered a 'male' way to get there.

I think in order to get on you have to take on that patriarchal role. The majority of the senior management are still men which has an impact on who is employed.[…]. I think that you do have to prove yourself more than your equal male. You have to be better at being a man than they are. [Elizabeth, Senior Lecturer, Female]

The answers we received in response to this set of questions were interesting for a number of reasons. They highlight the importance of different approaches to working and the operation of stereotypes or perceptions of skills and approaches which may determine which roles are allocated to certain members of staff. These roles then in turn may impact on progression. The interviews also highlighted that there are different approaches to work and that these may be gendered to a certain extent. The value then assigned to these approaches is what impacts on progression (Martínez Alemán 2008; Lapointe Terosky et al 2008). Roles perceived as 'female' such as pastoral care, personal tutoring, representation on equality committees or heavy first year teaching loads were assigned less value for promotions purposes than roles perceived as 'male' such as research committee memberships, links with outside organisations/industry or postgraduate teaching roles. It seems, the more prestigious the role, the more likely it is to be seen as and thus filled by a male. Or conversely, if a role is seen as female and mostly filled by women it will lack recognition and prestige. This is clearly problematic if promotion truly is based almost entirely upon research, but it is still problematic if it is wrongly thought that it does. Women academics who believe their involvement in teaching and pastoral care is irrelevant to promotion may not apply for promotion. Line managers who share the view that teaching and pastoral care are unimportant may not support promotion applications by women who spend a lot of their time on teaching and pastoral care. Members of promotions committees looking at applications for regrading may be less willing to accept strong performance of a pastoral or teaching-related administrative role as evidence of the competencies required. The pervasiveness of gender stereotypes therefore has the potential to influence the operation of promotions criteria quite independently of the content of those criteria themselves.

The Old Boys Networks: Alive and Well?

The importance of networks as a factor in career progression cannot really be overstated. It appears crucial for two reasons. Firstly networking increases the profile and visibility of the academic concerned both within the institution and further afield; "The main currency...is reputation" (Becher 1990 p. 52). Academics who are well connected within their institution can rely on support from colleagues and those with networks outside the institution 'look good' for the university. The university's formal promotions criteria do include criteria that are outward looking - for example, networking is mentioned in both grade 9 and 10 academic role descriptors - and our respondents showed some awareness of the importance of this. Rebecca makes the point below in relation to promotion to professorial level but similar views were expressed in relation to moving from lecturer to senior lecturer

I actually think that the thing that does you well for being promoted is being a known face and sitting on committees, networking. Of course you have to have enough research to be seen as valid but I actually think that the networking, [...] probably counts more than the research career, up to the chair level. [Rebecca, Senior, Female]

Secondly there is some evidence to suggest that many positions are awarded on the basis of informal networks even where departments go through the seemingly objective process of advertising and interviewing for a position (Gardiner et al 2007). Bagilhole and Goode (2001) claim that men and women rarely relate to each other as equals in professional circumstances and without access to networks and senior mentors, female academics have little chance of progressing in the same way men do. Networks provide access to information about promotions rounds, available positions and importantly to the way the academic game

is played. It is common for academics to use job offers from other universities to fast-track internal promotions applications (retention report) and so developing networks outside an academic's own institution might be relevant to promotion even if there are no formal criteria relating to national or international reputation. Talking to 'the right people' at the right time can significantly increase the chances of a successful promotions application.

It does still so often come down to a kind of old boys network and sort of dodgy handshakes under toilet doors and stuff. … there are cliques in the place and if you're in then you're ok, but if you're out then you're not [David, Senior, Male]

This culture of cliques or networks is seen to disadvantage women who are less likely to have access to these networks. Ackers and Oliver (2005) suggest that "To the extent that networks play an important role in the career progression in science, differential access to and ability to generate such networks is a factor shaping the career progression of scientists with family/personal responsibilities and of women in particular"(p8). Handley (1994) has argued that women often find themselves on the periphery in organisations including universities and continues "[g]iven this situation it is not surprising that women are often excluded from the informal network and hence may not have immediate access to relevant information or the decision making network within the organization" (p12). She further notes that "The woman who is not part of the informal network does not receive information vital to understanding organizational life "(p12). According to Thanacoody et al (2006) "White (2003) claims that Australian universities continue to be "boys clubs" and that the skills needed for a successful academic career is part of a socialisation process that some men and virtually no women participate in" (P539). It would appear from our research as well as other studies (Bagilhole and Goode 2001) that this is not a phenomenon peculiar to Australian universities.

Our respondent Jamie sums this idea up succinctly in the quotation below from which the title of this chapter has been taken:

We don't have the key to the executive washroom, which is critical [Jamie, Senior Lecturer, Female]

The importance of networks lies not only in the visibility they give those within them or in the rather sinister idea of dodgy handshakes and deals made in 'executive washrooms' but also in the support and leadership they can provide. Many of our respondents talked about the importance of having support, strong and positive leadership, mentoring, role models and the management of staff. One of the perceived problems with the promotions criteria and process was the lack of transparency as discussed above and there was a sense that some of that could be overcome if the academic was well managed and supported. If the applicant cannot find out for herself what is required, a good mentor should assist and guide. Networks then are key to progression not only because there seems to be a hidden promotions criteria of 'being well connected' but also because networks allow academics to access information about procedures, processes and expectations that are not captured in any policy or formal document. It allows them to form a more accurate perception of what is expected to gain promotion regardless of what the formal criteria say. Women at all levels are not naturally part of these networks reinforcing what Lapointe Terosky and colleagues (2008) call the "Plexiglas room", making it hard for women to break into male dominated senior positions and forcing them to learn the 'academic game' by themselves.

While networks can provide some of these functions there is no guarantee that they will or that those excluded from them will have access to alternatives. In order to fill this "gap", many universities have introduced a more formalised mentoring scheme (Gardiner et al 2007). Mentoring was seen as having the potential to play a

big part in helping staff make the most of their careers at all levels (Gardiner et al 2007; Thanacoody et al 2006, Joiner et al 2004, Heward et al 1997). Thanacoody et al (2006) in their study of Australian and Mauritian contexts suggest that "Senior male mentors act as the gate-keepers in both cultural contexts providing female academics with access to resources and networks that enable them to move up the university hierarchy" (p550).

The University of Bradford operates a mentoring system, and we asked respondents both about their experience of it and about more informal mentoring they may have received. As our respondent Karen as well as a variety of scholars (Gardiner et al 2007; Thanacoody et al 2006, Joiner et al 2004, Heward et al 1997) have noted "*If the university seriously wants to address the issue [of gender equality] then the mentoring process is key*" [Karen, Lecturer, Female] Gardiner et al (2007) note that emotional and personal support is important but "they are not sufficient in terms of a large investment in time and money in a well-run mentoring scheme. As such, positive career outcomes also need to be established" (P429) Most respondents felt that they were well supported emotionally but other types of support were not so forthcoming. Sylvia highlights the problem, saying "Oh, *my mentor was lovely but my mentor didn't have the right skills and lacked the expertise to support me* [Sylvia, Lecturer, Female]

The mentoring role could be much better used by women and our respondent Rachel considered why there is not the same mentoring network amongst women as there seems to be amongst men. In other words, if there is an 'executive washroom' for men why is there not an equivalent for women?

I think often getting to the top in a historically male dominated position, women have to go through things that change them in order to fit in and get promoted and get up there and by the time they get up there and they have that autonomy or a possibility, they've become changed, they've denied

themselves. You kept hidden all the things in you that might help other women get there, in order to get there yourself and by the time you get there you're so changed and these things are so hidden, you don't think to do any backtracking to make it a little bit more appropriate for women to come up after you, which is not what the men do. The men do the old school thing, that's why the other men climb up, but when women get there they don't do it, so they don't because that's the very thing that they don't like about men, they don't do that because they are women, nothing is changed on the way up for the next woman who has to climb up that way. I can understand why women do it, but if we don't make changes, it's like rebuilding the wheel every time. Every woman who breaks through that ceiling, it's not like it gets a little bit weaker, it's like we are closing the door behind us and putting all the same locks back on it instead of using that influence to consider how we might make things different and more enabling down that chain [Rachel, Lecturer, Female]

The HERA role descriptors give no indication that research takes primacy over other skills in applications, and this might suggest that the problem of a research focus perceived by Forster (2000) has in fact been removed. However, the reality is more complex, because the HERA role descriptors do not capture the way in which the reward and promotion system is perceived by academics working in the institution. There is a prevalent perception that research is the key to promotion and that long hours and less of a focus on pastoral care and teaching and learning are therefore a necessity. Being in the right networks or "having the key to the executive washroom" were also seen as important in helping academics achieve promotion. In the next section of this chapter, we will look at the implications of this apparent mismatch between perceptions and reality for the efforts of women academics to achieve promotion.

PROMOTIONS CRITERIA AS A TOOL FOR PERSONAL CAREER PLANNING

The preceding sections highlight the problems faced by academics seeking promotion and draw attention to the fact that some of these problems are likely to affect women and men differently thus putting women at a disadvantage when seeking career progression. Confusion about what the criteria are and how they operate is however worrying for another reason. In order to undertake any meaningful career planning academics need to plan strategically, taking on those roles and responsibilities which will assist them in promotion while avoiding those that will hinder them. A lack of transparency or a misunderstanding of what is required to progress can therefore have disastrous consequences for academics. If for example a new lecturer with a particular strength and interest in teaching and learning believes that they can achieve promotion on the basis of excellence in that area with less emphasis on research activity, they are likely to focus their attention on teaching and learning matters. If the criteria in their department are then interpreted and applied in a way that emphasises research, the new lecturer is likely to have to spend a significant amount of time and energy changing the focus of their activities, if indeed this is possible or desirable on a personal level.

As the section above on networks has highlighted, women are likely to benefit less from mentoring and networks within the institutions which could help them to work strategically towards achieving both the formal and hidden criteria for promotion. In order for a promotions system to eliminate bias against particular approaches to an academic career, it has to have criteria which allow for career paths with different emphasis through academia and those criteria then have to be internalized by women academics; for them to be able to internalize the system, it has to be transparent and clear and unconflicting guidance

from managers has to be given. Given the gate keeping role of line managers, it is not sufficient for academics themselves to fully understand the official criteria and their application as line managers may be interpreting them differently or be applying some of the hidden criteria discussed above. In other words managers themselves need to internalize the criteria and the extent to which line and senior managers have truly embraced the official transparent criteria which should allow for various pathways through an academic career remains questionable. In Bagilhole's (1993) words "…appraisers often reflect prevailing social expectations and attitudes which reinforce stereotypical expectations and assessments of women" (p. 435).

TRANSPARENCY AND FAIR PROCESS

An explicit goal of the new promotions process at the University of Bradford was to improve transparency. Lack of transparency in university systems has been criticised in earlier studies. Metcalf et al (2005) found that "The transparency of the procedures varied. It was clear that stated procedures and criteria were not universally followed and that staff had varying ideas on what these procedures and criteria were. …Many staff who had not yet considered promotion were unaware of the procedures and criteria. However, some other staff appeared not to know the actual procedure or criteria. A head of department in a new university thought this was, in part, the fault of the university, saying 'The criteria are not always clear" (p180-181). It was hoped that the adoption of HERA role descriptors, a system of performance reviews and greater scrutiny of what happened at promotions committees would result in greater transparency and fairness at Bradford: our study suggests that this may not yet have happened

In one respect, the Bradford procedures are fair and transparent: the role descriptors used for the

regrading process are available to all through the university's intranet. This study did not interview line managers about how they decided whether to recommend a candidate for promotion, nor did it consider the decisions made by promotions committees at School or University level. It is not possible to say, therefore, whether line managers and committees themselves followed the formal criteria. However, some of our respondents doubted whether they did.

It's a bit disturbing that there are areas where there are quite staggering differences in practice, I'm not thinking particularly of personnel, but quite staggering differences in practice across the university schools. [Julie, Senior, Female]

Another respondent mentioned a committee making use of a department-specific checklist:

April: [The promotions panel] literally have bullet points and if you meet them all, they have to think of a really good excuse not to give you it […] if I meet each of these bullet points then I have a really good chance [April, Lecturer, Female]

This checklist was shown to the panel member: it was not the HERA role descriptor and was not a document available on the Faculty's own website. The respondent then added that she herself only received a copy when she attended the promotions panel meeting.

But in any event, publication of job descriptors and transparency at the point when a decision is made about promotion are not the only requirements for a system that is genuinely fair or transparent. Promotion in academia is slow and many years may pass between each promotion: there are seven increment points in the Lecturer B band on the Bradford pay structure, and four further optional increments above that, suggesting it would not be unlikely for promotion from Lecturer B to Senior Lecturer to take seven or more years. Decisions made over a number of

years are crucial to whether that promotion will occur. The belief, whether correct or not, that the true criteria differ from the formal criteria, adds to the complexity of individual academics' career planning.

Transparency and fairness therefore require an academic to have access to and a clear understanding of promotions criteria throughout their career, not just at the moment when a decision is made about whether they now satisfy them. A decision to reject an administrative post in favour of retaining research time, or a decision to focus on teaching rather than research, may not at the time be clearly a decision that is about promotion, but if those decisions are made without adequate information or support, then no amount of fairness in the University promotions committee will rescue the application. Many of our respondents lacked this kind of information; as indicated earlier in this chapter, they were not very familiar with the HERA job descriptors, did not know much about what promotion involved or required, and their picture of what they needed to do was often incomplete or at odds with the university's formal criteria. The authors themselves completed the university induction process in, respectively, 2006 and 2007: promotion was not covered during the two day induction. Whether the problem is that that the formal and informal criteria are different, or that there is widespread ignorance of the formal criteria, this points to a lack of transparency.

The other way in which our findings cast doubt upon both transparency and fairness is embedded in the whole idea of 'regrading' rather than promoting academics. As noted earlier, regrading is a retrospective process, and in order for an academic to be regarded they need to have already taken on new responsibilities or developed new skills, above those they possessed on appointment. The new promotions procedure is closely allied to an annual performance review system, but there are various ways in which this aspect of promotion lacks transparency and can result in unfairness. The university's guidance to staff preparing for

annual reviews contains a number of things "to think about"; these do not include reviewing the role descriptor for the next role and considering what might be done to develop the skills not currently demonstrated. Academics are asked about their own perception of the previous year's performance, their objectives for the forthcoming year, and any training they need. There is no overlap in the language of performance review documents and those of role descriptors. As a result, the performance review system is a haphazard method of educating academics about what promotion requires, and assisting them to meet it, and yet it is through this system that decisions are made by line managers about whether to recommend a particular academic for promotion.

Another source of potential unfairness lies in the way in which line managers and Heads of Schools allocate administrative roles. Our respondents were clear that not all administrative jobs were equal: some were seen as the key to advancement, others as the "kiss of death". Given that regrading requires a lecturer to be performing the job of a senior lecturer, and that administrative responsibilities are central to this (at least, according to the job descriptors), lack of transparency in the allocation of these jobs is a precursor to a lack of fairness in the eventual promotions process itself. One respondent said about her appointment to a senior position in her School, that a senior manager just "put his arm around me" and said that she should be given the position. "*So in terms of getting that job, it wasn't fair and it wasn't open, but he wanted me urgently to play that role, to have some authority.*" [Amber Senior, Female]

Finally, our respondents often commented on their reluctance to put themselves forward, to take the risk of failure or rejection. This is not solely a problem at the time when a promotions application is made: an aversion to risk, will also mean that some women academics do not volunteer for the very tasks that they need to be doing in order to be promoted. This is also the point at which

difficulty with taking on additional workload, because of caring responsibilities, may impact. The promotions committee may be gender blind, but gendered decisions both by women academics and their line managers filter out many cases for promotion before they ever reach those committees.

FUTURE RESEARCH DIRECTIONS

This chapter has attempted to highlight a further aspect of women's progression in academia by drawing attention to the way in which formal and hidden criteria operate in promotion in a UK institution and highlighting the impact the perception held by academics of criteria can have on their chances of gaining promotion. In order to fully understand how to address the continuing underrepresentation of women in senior positions in academia more work needs to be done on understanding how promotions criteria are perceived. The mismatch we detected between what the criteria are, what they are perceived to be and how they are applied needs to be understood fully so that it can be addressed. Our research indicates that the issues raised in this study are fundamental to promotion in academia. Other studies cited in this chapter would suggest that ours is not the only institution to face these issues but further research in this area would increase our understanding of how inequalities can be better addressed.

CONCLUSION

Our study reinforces the results from previous work on women in academia. It also however goes further by considering how academic staff perceive promotion and rewards processes in one institution in the UK.

We found a mismatch between what academics think the criteria for promotion are, what the criteria actually are and how the criteria then operated on the ground. This mismatch can have particularly

serious consequences for women academics for a number of reasons. Research shows that women are less likely to break into institutional networks which allow them to access information not only on formal and objective promotions criteria but also on hidden criteria and the way the 'academic game' is played. This results in female academics having a perception of promotions criteria and processes which may actually not be accurate or which is formally accurate but which operates differently in their schools or departments. This, coupled with women's reluctance to promote themselves actively and traditional barriers to promotion such as caring responsibilities, puts women at a disadvantage when attempting to progress into more senior positions within universities.

The effect of the HERA role evaluations on the promotions process is to create a one-size-fits-all job description for academics. There are two ways in which this may impact on women in SET disciplines. The first is SET specific. The nature of an individual academic's job in reality may differ across academic disciplines: for instance, not all disciplines have a culture of collaborative or inter-disciplinary work. If concepts of the academic role that are not actually universal are embedded in role descriptions, those working in academic disciplines that do not conform may be disadvantaged. The second impact of the process is that it may potentially discriminate against women more generally. The difficulties our respondents encountered with balancing home responsibilities with work and their general risk-averse approach to promotion may mean that they are even less likely to pursue regrading. If taking on a major administrative role is a precondition of regrading, rather than something that follows promotion, women who are uncertain about their promotion prospects may conduct a personal risk assessment and choose not to take on that role, because the cost is too high when eventual regrading is so uncertain. It is not possible to conclude whether the move to a single spine will have these effects as yet, as the process is in its infancy, but it is something that should be studied in more detail in the future.

Technology Career Spotlight: Developing a Dynamic Environmental Calibration Technology for Cost Effective Online Water Quality Monitoring

Shoshana Fogelman, South East Queensland

Figure 1.

©2008 Queensland Government Office of Women. Used with permission.

Shoshana Fogelman is a research academic staff member at the Advanced Water Management Centre, The University of Queensland. She has over six years research experience in the area of developing intelligent on-line water quality monitoring sensors and tools for water and wastewater systems. Her PhD was undertaken at Griffith University, which focused on developing a new analytical method specifically designed for continuous and field based water monitoring applications. It was an interdisciplinary project that combined the areas of science and artificial intelligence. A range of intelligent water quality monitoring sensors for the water industry were developed, that were capable of dynamically responding *in situ* to their environments negating the need for calibration, reagents or strictly controlled measurement conditions. Shoshana previously worked as a Research Fellow on the Urban Water Security Research Alliance Project – Water Quality Information Management Program and was the Acting Program Coordinator for Water Quality and Diagnostics, at the Smart Water Research Facility. Shoshana is currently working as the Project Manager on the Anaerobic Digester Stability Sensor Project. She is currently the president of the Australian Water Association (AWA) Queensland Young Water Professionals special interest network and was recently elected to the AWA Queensland Branch Committee. Through her

involvement in AWA, she actively promotes and supports the needs of the next generation of water professionals within Queensland, through her involvement on committees including branch, conferences and professional/technical workshops and other related activities. In addition she has published over 10 peer-reviewed journal and conference publications and has served on several international and national conference committees.

INTRODUCTION

I was born and grew up in Papua New Guinea, in the eastern highlands before moving to Australia with my family in 1985. I believe my experiences as a child with no television and living in a very small town, in an isolated, undeveloped area really developed my passion and love of the environment. In addition, as a child my father always promoted and exposed me to the science and technology area, so it seemed important to me to develop technology to better protect the environment. In 1999, I enrolled at Griffith University in a Bachelor of Science and met Dr Michael Blumenstein, who worked then as a lecturer in the School of Information and Communication Technology. Dr Blumenstein introduced me to this exciting field of artificial intelligence and pattern recognition, which was getting computers to "intelligently" think like the human brain. I thought this could really be applied to environmental field to better manage our water systems and consequently approached the university to do an interdisciplinary honours research project in the water quality area and my career blossomed from there.

I have currently worked on three projects aimed at developing more reliable and cost effective water quality monitoring technology for the water and wastewater industry.

Project 1: Developing a Dynamic Environmental Calibration Technology for Cost Effective Online Water Quality Monitoring

This innovative project develops a range of new online water quality monitoring sensors using a dynamic environmental calibration technology that can enable conventional sensors to intelligently respond insitu to dynamic matrix conditions, without the need for conventional calibration, reagents or sample pretreatment.

The project outcome pertaining to my PhD has been the development of a new generic technology that can enable a traditional laboratory based sensor to be converted into a direct insitu online sensor. The technology developed employs a combination of software and hardware to environmentally calibrate a traditional water quality monitoring sensor so that it is capable of autonomously and intelligently responding to its environment irrespective of sample matrix conditions. The applications of the technology have been successfully demonstrated for the online monitoring of Fluoride, Ammonia, Ammonium and pH.

The success of the project was based on the innovations that were created through a multidisciplinary project that combined the main areas of Science and Information Technology, in addition to a small engineering component. The environmental calibration technology incorporated the areas of analytical and environmental chemistry with ecology principles, combined with computationally intelligent techniques, such as artificial intelligence to instruct the sensors how to respond insitu to their environments. Once the selective sensors were environmentally configured using the technology, they were capable of intelligently responding to their environments, without ideal measurement conditions, calibration or reagents being required.

The project was designed to respond to the needs of the Australian water industry by developing simple to use, accurate, real time online water quality monitoring tools that are economically feasible to implement in rural as well as urban environments. This is so continuous information can be reliably and simply obtained by authorities to ensure the continued safe supply of potable freshwater to the Australian consumers. This is because currently, accurate and cost effective online monitoring of various water quality parameters has proven difficult to achieve, as direct sensor deployment often means sensors are unavoidably exposed to a wide range of measurement conditions. As the majority of current online monitoring technologies employed are direct adaptations of traditional laboratory based analytical methods, they are not originally designed for field based monitoring purposes. Hence they require frequent calibration, maintenance and large quantities of costly reagents to maintain their reliability in the field. The costs associated with maintaining the instruments based on this measurement principle has greatly reduced their wide spread application, especially for large scale environmental water quality monitoring in places like the European Union. Therefore technology that can improve the accuracy and economic costs associated with online monitoring such as maintenance and reagent consumption would be of great benefit to industry, government and research organisations.

An outcome from the intellectual property developed in my thesis was that it gained commercial attention, as I was approached in my final year of my PhD by an Australian Venture Capital Company. As I was successful in being offered a term sheet, this lead to negotiations with Griffith University to determine a potential venture capital investment. A paper describing the work has also been drafted to submit to Science.

Project 2: Western Corridor Recycled Water Project
Urban Water Security Research Alliance

In 2008, through the development of my expertise in the area of intelligent water quality monitoring sensor design and tools, I received an appointment by invitation that was approved by the Vice Chancellor of Griffith University to work on a research project related to the Western Corridor Recycled Water Project. The project seeks to develop new online water quality monitoring technology and tools to enhance operational monitoring strategies in barriers 1 and 2. The technology and tools developed will be designed specifically for a closed loop purified recycled water system and are designed to assist operators and grid managers with the maintenance and management of barrier integrity.

Project 3: Anaerobic Digester Stability Sensor Project

In 2009, I commenced employment at The University of Queensland to begin work on the development of an on-line Anaerobic Digester Stability sensor that was part of an ARC linkage project in conjunction with Gold Coast Water and Brisbane Water. The sensor is designed to improve process stability of the treatment process and regulate renewable energy for the biogas waste stream, thereby decreasing green house gas emissions. The sensing system has been designed, built and we have installed two on-line monitoring systems and are currently validating and verifying the accuracy of the system.

Also during my PhD candidature and employment I have also been involved in industry and community services activities pertaining to my research that have aimed at promoting the area of water quality monitoring, in addition to encouraging and supporting younger people to pursue careers in the Queensland Water industry.

COMMUNITY BENEFIT OF RESEARCH

Through my PhD and work I have also been actively communicating the need for innovative, multidisciplinary research in the water industry, through my involvement in student supervision, international and national reviewing of research, conference organisation and through workshops and forums.

STUDENT SUPERVISION

In addition to my research I have engaged and mentored younger undergraduate students to get involved in water quality technology developments, through undertaking research projects which encompass the new concepts developed in my thesis. This can be demonstrated by my supervision of a third year project student, Wade Button, Chris Carney and Nicolas Brodu. Through their experiences, most of them have pursued a career in the water industry

INTERNATIONAL AND NATIONALLY RECOGNISED RESEARCHER

I have also been internationally and nationally recognised for my expertise in the field of sensor development and computational intelligence. This is evidenced through being a regularly invited to review research papers for science and IT journals and conferences in my respective research fields. In addition I have published a number of peer reviewed journal and conference papers in the area.

FOUNDING AUSTRALIAN WATER ASSOCIATION (AWA) QUEENSLAND YOUNG WATER PROFESSIONALS (YWPS) SPECIAL INTEREST GROUP

To attract, support and retain YWPs in the Queensland Water Industry, I was a founding committee member who developed the first YWP Special Interest Group in Queensland in July 2005. This was developed after the success of the AWA Queensland YWPs Forum in 2004. Since its inception in 2005, the group has gained momentum, members and strong industry support. The technical and career develop sessions cover new and relevant issues that affecting YWPs working in Queensland.

I also served on the organising committee that first developed and launched the National Australian YWPs conference in Sydney in 2006. The aim of the biennial conference was to provide a national platform for YWPs working in the water and wastewater fields where they can engage, network and share their experiences and research outcomes in a relaxed environment. It also provided opportunities for YWPs to interact with senior industry professionals through mentoring and professional development activities. Since the launch of the 1st conference, the YWP group has gained in strength and numbers with active committees being developed in most states in Australia. We have developed our own logo, website and mentoring program and are continually gaining strong industry support.

In 2008, I Co-chaired the 2nd National Australian YWP Conference in Brisbane. Through my involvement with the committee, we highlighted the role that YWPs play in the water industry and encouraged a national insight into areas such as indirect potable reuse, desalination, sustainability, as well as new infrastructure and technology developments. Through my involvement as Co-Chair we were able to gain

government support for the group with the Premier of Queensalnd Anna Bligh MP endorsing the conference. The conference was a great success bringing 150 of the brightest young minds to Queensland, representing all facets of the Australian Water Industry.

DEVELOPED NATIONAL MENTORING PROGRAM
FOR THE AUSTRALIAN WATER INDUSTRY

To ensure YWP have the skills necessary to become the next generation of leaders, I developed, launched and convened a national mentoring program for the Australian Conferences IWA/AWA 1st and 2nd National Australian YWPs Conference Water Industry.

This was to support YWPs in developing their managerial and technical skills, in addition to providing them with an opportunity to engage and build mutually beneficial relationships with senior industry and research professionals. Initially the mentoring program was developed in Queensland for the YWP group in mid 2005. However in late 2005, I was invited by the International Water Association (IWA) and AWA to expand the program nationally. In 2006, in conjunction with AWA members the program was launched nationally at the 1st YWP Conference in Sydney. Since then the program has gained strong industry and AWA support.

Section 8
Emerging Trends

This section highlights research potential within the field of Human Resources Management while exploring un-charted areas of study for the advancement of the discipline. Introducing this section are chapters that set the stage for future research directions and topical suggestions for continued debate, centering on the new venues and forums for discussion. A pair of chapters on human resource flexibility makes up the middle of the section of the final 11 chapters, and the book concludes with a look ahead into the future of the Human Resources Management field, with "Anonymous Workblogging and Organizational Coping Strategies." In all, this text will serve as a vital re-source to practitioners and academics interested in the best practices and applications of the burgeoning field of Human Resources Management.

Chapter 75

Innovations in Technology for Educational Marketing:
Stakeholder Perceptions and Implications for Examinations System in Rwanda

John Rutaisire
Rwanda National Examinations Council, Rwanda

EXECUTIVE SUMMARY

This chapter highlights the importance of educational marketing through modern innovative technologies. It explores how teachers who mark Rwandan primary and secondary examinations perceive the Rwanda National Examinations Council and what the implications are for the effective management of the examinations system. The chapter highlights the Rwandan context in which before the 1994 genocide, the education system was characterized by nepotism, corruption, discrimination and victimization based on ethnicity, regionalism, and gender. Thus, after 1994, the task of the education system was to reverse the imbalance in favor of equity, transparency, accountability and responsiveness in public service. In terms of national examinations, this demanded, among other things, a vigorous marketing strategy through innovation and technology. In spite of the relative success, however, the chapter acknowledges challenges associated with post-conflict educational reconstruction focusing mainly on human resource capacity development and management, and highlights some lessons learned as Rwanda looks forward to the future.

ORGANISATION BACKGROUND

The Rwanda National Examinations Council (RNEC) referred to as the 'Council' throughout this chapter was established in 1998, and law No

19/2001 of 12.3.2001 outlines its major responsibilities as follows: (i) to be responsible for national examinations for primary and secondary school (ii) establish rules regulating the conduct of national primary and secondary school examinations (iii) uphold transparency and justice in examinations'

administration and other related issues (iv) award certificates or diplomas to successful candidates (v) place successful candidates in different secondary schools and higher education institutions.

The education system in Rwanda before 1994 had been guilty of discrimination, injustice and sowing seeds of division based on ethnicity, sex, regionalism (home background) and religion; and this form of injustice was mainly implemented through examinations (Rutaisire, 2007). Before 1994, entry to all government and assisted schools and tertiary institutions was determined mainly by "Ethnic and Regional" quotas. The results of primary and secondary schools were never published. Also, students' personal identification files known in French as *'fiches signeletiques'* were used to identify them as 'Tutsi, Hutu or Twa.' The purpose was to identify individuals and, or groups for discrimination and victimization (Rutaisire, etal, 2004). Thus after 1994, there was urgent need to redress this imbalance for purposes of promoting national reconciliation and healing the nation. This entailed reforming the examinations system by considering performance standards which are considered to be the obvious measures of outcome (Gipps and Storbart (1993). As a result, 'since its establishment, the Rwanda National Examinations Council has been improving transparency, accountability and responsiveness in the Rwandan public service' (United Nations Public Service Awards, 2009:174). The establishment of the Council after the 1994 genocide was in line with international best practice. For example, West et al (2000) argue in favour of the importance of self management because of the possibility it offers eventually to increased control over policies and resources and expanded scope for leadership. This has implications for effective management of the examinations system in Rwanda.

Management Structure

The recently revised law number 36/2007 of 02/09/2007 determines responsibilities, organization, functioning and powers of the Rwanda National Examinations Council for primary and secondary education. The law designates the Council as an autonomous institution supervised by the Ministry in charge of primary and secondary education. The Council is composed of a Board of Directors (policy making) which has full powers and responsibilities to take all decisions; and an Executive Secretariat (management) which runs day today affairs of the institution. The responsibilities of the Board of Governors are to: adopt the internal rules and regulations of the Council which shall be approved by the Order of the Minister in charge of primary and secondary school; provide a strategic vision and programme of action for the Council; consider and approve the annual draft budget before it is transmitted to relevant authorizes; monitor the performance of the Council in accordance with the plan of action and the budget; approve the activity and financial reports of the previous year; offer advice to the Council management and staff; participate in determining an effective general policy relating to primary and secondary examinations; institute directives on how examinations are to be conducted and on those relating to similar issues; and take decisions on persons who act contrary to this law and those who do not respect the directives relating to examinations.

The Executive Secretariat (management) has five professional units/departments namely: (i) Preparation & Administration of Examinations (test development); (ii) Orientation, Selection, Training and Documentation; (iii) Planning and Research (iv) ICT; and (v) Administration and Finance. It is responsible for the management of daily operations of the Council and has 69 members of the professional staff. Its responsibilities are to: coordinate and conduct all daily activities of the Council; represent the Council in everyday activities and take administrative decisions; establish relations and cooperate with other national and international agencies carrying out similar responsibilities; allocate successful candidates in

secondary schools, universities and other Higher Education Institutions; ensure measures of effective staff management according to competence, the nature of the work and the required numbers; make a report of the Coincil's activities and that of budget management; sign certificates and diplomas; issue certificates and diplomas to successful candidates who pass examination; sign contract with employees; and determine equivalence between certificates and diplomas issued abroad and those issued in Rwanda.

Candidates registering for national examinations come from a wide spectrum of primary and secondary schools. Some are government owned, government supported, while others are, private. We also have private candidates aspiring to complete high school diploma. Trends show that the number of candidates for examinations has been steadily increasing over the years and it will certainly go on increasing considering that Rwanda implemented a fee- free and compulsory 9 years of basic education in 2009. Additionally, there exists a strong government drive to promote Public-Private-Partnerships (PPP) as an incentive for entrepreneurship in the education sector which will certainly result into the creation of new schools ready to receive students at all levels of secondary and higher education.

Financial Considerations

Today's quality service delivery imperatives demand innovative strategies and reinforced inputs to be invested in the process. A number of measures that Council has been putting in place not only to improve the quality of services, but also generate some income include: speedy candidates' registration where forms are correctly filled out; properly done printing of registrations forms; timely availing of examination sheets for all the candidates throughout the country; comprehensive training of teachers on evaluation methods for all subject matters, in all primary and secondary schools, throughout the country; hiring the entire

required staff and cutting down on outsourcing needs to preserve confidentiality of examinations; expanding logistic resources during examinations periods; availing to the staff opportunities to access knowledge development sources; investing in technology to take advantage of the most advanced ICT software and equipment; running its own printing press in order to cut down on costs of having examination questions and answer sheets printed outside the country while ensuring more security and confidentiality of documents; training of staff in a variety of subjects including evaluation methods and computer skills; compiling and disseminating old examinations syllabuses; and developing and disseminating models of answers. The following Table 1 shows the council's budget allocation from 2007 to 2011 in United States Dollars.

Against this background, the Council is determined to supplement the current budget funding mechanisms with its own income generating activities which include, but are not limited to the following: Online registration and publication of results where by the Council would share benefits with the service provider; increased candidate registration fees to match the Council's unit cost of running national examinations; operating Council's own printing press for income generation purposes; availing examination syllabuses and past papers for a fee; research and consultancy on assessment issues; and other service charges. The Council makes use of a financial management and accounting software known as SAGE Pastel which will soon be replaced by the "Smart Government" (SMART GOV) to harmonize with other government agencies. SMART GOV is a Ministry of Finance Accounting Software

Table 1. Budget allocation from 2007 to 2011 in US Dollars

2007	2008	2009/2010	2010/2011
2,567,638.6	4,032,487.6	5,402,619.3	6,617,534.9

designed to manage government expenditure across all government public institutions including central ministries, autonomous agencies, provincial, districts and other local administration budget institutions. Staff trains on the job or takes advantage of various opportunities presented and organized by the Council, or the Ministry of Public Service and Labor. Budget preparation and execution, supply and logistics, office furniture, transport, etc are also executed in strict respect of government procedures and regulations. Requisition forms have been issued to facilitate and put order in the procurement process, while facilitating units and individual staff members' involvement in the execution of the budget. The Council works very closely with the Rwanda Public Procurement Authority (RPPA) to train the Internal Tender Committee (ITC) in procurement and tendering procedures and regulations. Also, the Council has a full-time internal auditor who ensures compliance with the national finance and procurement laws.

SETTING THE STAGE

The Council deals with an array of both internal (staff) and external stakeholders most notably schools whose relationship is the focus of this chapter. Therefore, it should be able to communicate to them its mission and activities to ensure they are fully aware of and understand the importance of working together for effective service delivery. Thus it is important that the Council examines its relationship with its stakeholders especially schools from a marketing perspective. One of its stated aims is to inform all the stakeholders especially schools about its mission and priorities and enable them to be involved in future direction, for networking, for dissemination of the Council's operations, and crucially for consulting with them about the way forward. For example, during the marking exercise, teachers can identify weaknesses and errors in student scripts. The Council

can then use teachers' feedback to improve on the management of the examination process and marking as part of the overall management of the examinations system. In this way they have contributed immensely to its future direction.

Communicating the Council's mission and priorities is important because as Bush (1999) points out, the increased emphasis on external relations and the 'permeability of boundaries means that education managers cannot ignore the need for marketing their institution'. In the case of the Council, marketing is used here to mean the process through which it communicates and in fact, tries to 'sell' its reforms (products) to the teachers who should in turn communicate 'sell' the reforms to their communities. This is important if the reform is to be accepted and implemented. Thus the fact that the Council already has a relationship with schools is not in itself sufficient to create an environment in which schools feel comfortable with the post genocide examination products or packages. It is therefore important to improve the partnership and collaboration with schools. However, accepting change goes beyond improvements as it entails new ways and patterns of thinking (perceptions) by teachers which requires effective communication (marketing) on the part of the Council to 'sell' the reforms.

The Council regards schools as its customers, clients, partners or stakeholders. Anderson, et al (2004) distinguish between customers and clients; partnership and stakeholders. According to them customers and clients are people who seek a service, and they may be internal to the institution or external. Partnership involves 'a working relationship that is characterized by a shared sense of purpose, mutual respect and the willingness to negotiate.' This implies sharing of information, responsibility, skills, decision making and accountability. According to Warring (1999), stakeholders refer to 'all those who have a legitimate interest in the continuing effectiveness and success of an institution.' This implies that all clients and all partners are stakeholders, together

with others who may have 'a legitimate interest'. Stakeholders may be internal (staff) or external, in this case, schools. However, Anderson, et al, (2004) argue that external stakeholders are said to 'rely to a very large extent, on past experience, or on information communicated to them by internal stakeholders' for their information about the institution.

The relationship between the Council and the schools which it serves may be analyzed within the context of institutional openness and what it regards as marketing to serve their needs. Anderson, et al, (2004, p. 58) cite Hoy and Miskel (1987) who argue that the open system concept highlights the 'vulnerability and interdependence of organizations and their environments'. I find this observation relevant to the Council because it implies that the environment is important as it affects the internal structures and processes of the Council. For example, in 2009, there were about 2700 primary and secondary school teachers involved in the marking of national examinations. Their views and perceptions regarding the way examinations are run are important because the Council should consider them during the process of organizing, coordinating and managing the examinations system. This is so because those who do the marking are the ones who can see and identify areas for improvement, for example in the way examinations are set, packaged, administered and graded. Teachers are on the front line of the examinations processing.

This process may be analyzed through the lens of the match between the institution and its environment and this phenomenon is not only limited to the Council. Viewed from a wider perspective especially from that of schools, Anderson, et al (2004) assert that schools and colleges may 'respond to external demands through planning and forecasting where likely changes and future pressures may occur'. They argue that 'the move towards having an institutional development plan may be seen in part, as a response to the demands and influences from outside the institution'. This

argument holds for the Council as well because the impetus and urgency for its effective management has been dictated mainly by external circumstances. For example, in Rwanda, the recent financial law (2006) requires public institutions to design within their strategic plans income generating activities outside government budget. Thus the Council needs to generate income to cater for about 2700 teachers who participate in marking primary and secondary school national examinations each year. This requires a substantial amount of innovations in technology to enhance the marketing strategy.

Before 1994, institutional planning was minimal in Rwanda. Foskett (1999) argues that in the past 'building an external relations component into institutional planning or strategy was simply a matter for professional judgment'. In fact in Rwanda it was nonexistent. Even today in many institutions in Rwanda, its presence or absence depends on the management's view of the value of the relationship it wants to develop with its external stakeholders. In the case of the Council, it would seem inconceivable to ignore the significance of about 2700 teachers involved in its work. From this perspective, stakeholder perceptions of the Council's management of the examinations system become crucial. As Farnham (1993) observes, political and social change embedded in a commitment to 'the ideology of the market and of consumer choice in pursuit of economy, efficiency and effectiveness' has been steadily absorbed into the 'educational culture and given statutory authority through legislation.' However, in Rwanda as in many developing countries, this is for most educationists an imported, even alien concept.

Although the Council seeks to market itself, Foskett (1999) points out two important issues which complicate marketing in education. First, service industries, even in the private sector, have not traditionally taken a strong marketing perspective because service products are inherently intangible which makes their promotion

difficult, particularly where the 'product' is long term in its rewards, such as education; services in the professional sector may see marketing as unethical, compromising the objectivity of their relationship with their 'client'; some service sectors experienced demand far in excess of their ability to provide it, such as in higher education, so promotion was unnecessary; most educational organisations have enjoyed monopoly power; and little professional guidance or training on adopting a marketing perspective has been available. Secondly, Foskett argues that traditional concepts of professionalism and public service in education do not sit easily with the notion of marketing; and that the view of the professional as 'expert' and the monitor of quality may be interpreted to mean that responsiveness to the market is unnecessary.

Gray (1991, p. 25) has suggested that 'the purpose for which public sector institutions such as schools were established goes far beyond mere customer satisfaction'. According to this view, educational institutions have 'public service duties and responsibilities to tackle real needs which may not be appreciated by these customers'. The argument here is that educational institutions have many different external links which go beyond transactional or exchange relationships and that while managing external relations is of great importance to the institution, each is embedded in its internal processes. However, Foskett (1999, p. 36) quotes Worcester (1985) who asserts that "no organization can sustain a good reputation that it does not deserve". This is relevant because in this case, it implies that each member of the Council, for example, ought to have a role.

Effective external relations will probably require significant internal marketing to support it and staff are key players within this process since their activities define the quality of the organization and they represent a key stakeholder group with whom management must manage relationships with great care. Earlier research by Foskett (1992) points out that external relations management relates to those aspects of an

organization's activities that in any way cause it to relate to an audience beyond its own boundaries. This includes both processes with an overtly external connection and those processes which, while largely internal to the organization, have a direct impact on some external stakeholders. The implications are enormous because such processes need effective management. Johnson & Scholes (1993) argue that the whole concept of effective management comprises three components namely; strategic analysis, strategic choice and strategic implementation. Although a detailed discussion of each is beyond the scope of this chapter, suffice it is to say that each one of these may be identified with stakeholder relations components at the Council. For example, establishment of effective internal quality assurance systems in the Council should ensure that the service or product meets school expectations. It is also important to develop mechanisms for collecting external data using available technology on how the examination system in Rwanda is perceived as part of its marketing strategy.

The objective of attempting to gauge teacher perceptions is by all intents and purposes to establish an audit of the effective management of the examinations system which relates to how far the Council has been communicating its mission to teachers. From a schools' perspective, Knight (1993, p. 19) defines and illustrates educational effectiveness as 'the fullest possible attainment of the goals and objectives of the school'. Examples include improved performance, possibly against performance indicators such as improved examination results or test scores; improved student attitudes and behaviour; better parent and community relations and improved school environment. It may be reiterated that effectiveness is concerned with maximizing the benefits due to educational provision within the constraints of cost or resource availability. Mortimore et al (1994, p. 23) do not necessarily disagree but instead put it in another way by suggesting that 'cost effectiveness is concerned with selecting

the least cost alternative for securing the desired outcome'. However, Thomas (1990) disagrees. He argues that the most cost-effective will be the 'least costly of the alternatives compared, but this is not necessarily the cheapest possible method of obtaining the objective'. In any case, the limits of experiences, knowledge and attitudes one is able to draw upon limits the decision.

To effectively manage the national examinations system in Rwanda, the Council will have to deal with organizational and institutional dilemmas if it has to develop and improve its own ratings by teachers. To improve teacher perceptions of the Council, the management should address crucial issues as highlighted by Middlewood & Lumby (2003) to include: Appropriate and effective communication process, full integration of all stakeholders, positive resolution of conflict, a code of conduct which reflects the organization's culture and appropriate degrees of stakeholder involvement in decision making. It should be acknowledged that the critical success factors in terms of the effective management of the examinations system in Rwanda is the linking together of the work of different operating units and stakeholders. Bush & Coleman (2002) argue that the coordination of such factors and the establishment of a culture which promotes them lies with the over all management and ethos of the institution. This is relevant to the Council considering that its stated goal and purpose is to support learning and teaching in Rwanda schools. Other researchers such as Briggs & Sommefeldt (2002) are of the view that the placing of different interest groups is open to debate according to the factors at play in a particular cultural, social and political situation and those external influences are said to impact on organizational effectiveness. Indeed with about 2700 teachers involved in the Rwandan examinations processes, the significance of their perceptions cannot be underestimated.

CASE DESCRIPTION

Experiences and Expectations: Players Involved and Their Roles within the Council

In April 2007, I was about to start my second year of the Doctorate in Education (EdD) at the University of Sussex, Brighton, (United Kingdom). The last assignment of year 1 of the Doctoral Programme required students to research or evaluate an educational institution. I decided to research my own institution. I selected three secondary schools in Kigali city whose medium of instruction is English. I did this because my previous experience with non –English speaking schools had proved problematic in terms translation from French or Kinyarwanda (mother tongue) into English. I had requested head teachers of each of the schools to select four teachers, where possible both male and female who mark national examinations. The combined number of teachers in the three schools was twelve. One school is a girls' school, another is a boy's only school and the third school is mixed sex. The girls' school is government supported (*libre subsidie)*, the boys' school is public and the mixed school is private. The intention was to create a variety in the hope that responses would be varied as well as to reinforce the trustworthiness of results.

Below, I summarise the findings according to each question:

To what extent has the Council marketed itself to ensure stakeholder understanding of its mission?

This question challenges the Council's identity which must be perceived and evaluated against societal needs and aspirations. The Council needs a clear sense of purpose that people understand. Here purpose and belonging are the two facets of identity. The Council's identity must spring from the organisation's own roots, its personality, its strength and weaknesses. It must be so clear that it

becomes the yardstick against which its products, behaviour and actions are measured. Here, teacher perceptions put this identity through a magnifying glass. According to this lens, teachers in the sample stated that the mission of the Council was to set and mark examination and that they identified with it.

There were some common responses concerning how schools could contribute to the mission of the Council. They indicated that schools could contribute in a number of ways such as: (i) analysing student performance in national examinations (ii) covering the curriculum so that students do not fail national examinations (iii) each school having a secretariat that communicates to teachers about examination updates and issues (iv) evaluating students periodically before they seat national examinations in order to meet the Council's mission and providing feedback to the Council. Perhaps more intriguing was the teachers' suggestion that teachers should start examination departments in their respective schools. These departments would come up with mission statements that eventually lead to formulation of the Council's mission statement. This suggestion implies that school mission statements related to examinations should be integrated into the Council's own mission statement which has implications for the relationship between the Council and the schools.

Notwithstanding the teachers' declaration of their awareness of its mission and potential contributions to the Council's work, the same number also reported that although they have been marking national examinations for an average of five years, they were not aware of its plans and only responded when called upon to mark national examinations. If this had been a larger sample, it would have said much to the Council's identity as a national organisation. And in fact, it did since such a big number of the research sample said that the Council has had no formal ways of communicating its plans and activities to the very stakeholders who say they identify with it and have clearly indicated the roles they

can play in contributing to its mission, then there exists a weakness on the part of the Council for its inability to tap into such a reservoir of knowledge and experience – the teachers.

There is therefore a need for a vigorous marketing (communication) strategy especially at this crucial time when the Council is in the process of transforming itself in the context of Rwanda's entry into the East African Community and now the British Commonwealth of Nations. The search for a marketing strategy cannot be ignored because marketing in this sense is seen as a means of enhancing the position and value of the Council as a whole. In this way, the institution begins to make a more proactive attempt to develop a reputation within the wider community especially with the teachers. Marketing here is measured through improving the image of the Council. It becomes a clear task of communicating information that will lead teachers to develop a better and more accurate picture of the Council.

What are the teachers' perceptions of the Council regarding its present management of the examinations system?

Analysis of the responses showed that teachers are an invaluable source of knowledge on the examinations system. They raised issues concerning timing of papers during setting. They said that three hour papers are too long and tiresome suggesting that two or more papers be introduced in future. This would give room for few hours' examinations and room to examine the whole subject content as in the curriculum of the particular course. What the teachers implied was that shorter time papers can examine students better. This raised the question of training not only for teachers but also for student's in attempting national examinations. Respondents wondered whether one paper per subject (current practice) could cover a whole syllabus. In fact, this seems to be a legitimate observation considered against the earlier concern about a three hour paper, which is long and given

more time supposedly to ensure wide coverage of the curriculum. Respondents argued however, that shorter, but more papers would cover the syllabus better than one long one. This seems to be a legitimate argument since the examination is meant to measure skills rather than just how much knowledge one has acquired.

In terms of the examination papers and examiners, respondents pointed to some major weaknesses in the system. For example, there was constant reference to some questions not coming from clearly indicated topics of the subject curriculum and that the curriculum did not show clearly the examinable areas. This has implications for an examinations syllabus which is a responsibility of the Council. Here again considerations of a 'fair and transparent' system matched against practical and professional considerations become a challenge in terms of management of an examination system in conflict affected societies. I make this observation because it seems that the system might have concentrated its effort on the more 'political' concerns of justice, equity and reconciliation of a post – genocide educational reconstruction and less on practical and professional issues raised by the teachers in the study.

Another area of concern raised by the teachers was that of training. Again there was a general concern about examiners who should be trained teachers and experts in their area. Scoring was raised as an issue of concern in which respondents felt that depending on the technicality of the questions, scoring should be done professionally so as not to underscore or over score. Thus examiners require in service training on regular basis to set and mark to the expected standards. This issue relates to the one on coverage of syllabus content where a balance needs to be exercised during the setting of examinations so that some curriculum content is not over examined or under examined.

The issue of educational materials seemed to revolve mainly around those items used during examinations such as scientific calculators. Some teachers complained that there were many

models nowadays of scientific gadgets. Many were unfamiliar to most students. This called for the need of specifying the models to be used in national examinations. I consider this to be a relevant observation. For an institution that prides its self of being fair to its stakeholders, it is a major weakness to set examinations without spelling out the relevance of different scientific models to the questions on which the models are to be applied or used, the availability of the models on the Rwandan market and the cost of the model, with considerations of whether or not it would be affordable to the common student considering the poverty levels of the country. This also means that teachers should be required to be conversant with the model and to train students accordingly.

What are the teachers' future expectations of the Council in terms of its management of the examinations system?

Responses here were mixed. The teachers thought that there was plenty of room for the Council to improve its image and services to schools. They referred to the Council's management of the examinations system as satisfactory and fair, but also pointed out that there were some areas which needed to be improved. They said that the Council should address the issues of the link between the curriculum and national examinations so that questions are not set outside the syllabus. The Council should ensure that examinations follow the order and sequence of the curriculum. Teachers also stressed the need for introduction of practical examinations especially in the natural sciences and setting application and other higher order questions covering the rest of the curriculum; and regular in service training of teachers involved in examination work. A majority of the teachers said that only teachers should set examinations and should be trained to become experts in their respective areas.

Secondly, the research revealed that Rwandan teachers were increasingly becoming aware of and

making connections between their own school works with that of other educational institutions. The fact that teachers were able to link teaching and learning issues in the classroom with assessment at national level places a challenge to the Council as awareness of the interests of the teacher's demands a place in its policy and strategic plan. This is so because any reputation the Council attempts to present to external stakeholders must be based upon the reality of the situation. As a matter- of- fact, respondents in this research came out quite clearly by holding the Council 'accountable' through their perceptions which not only reinforces the need for creating partnership with them, but also puts new pressure on the Council to do so sooner rather than later as the institution transforms itself to meet the 21st century challenges.

What are the implications for effective management of the examinations system?

The research highlighted some interesting features. For example, the teachers wanted the Council to involve them more and more in its activities. That school perceptions happened to point to this direction is in itself a wakeup call for further investigation regarding how examinations are organised and managed, by whom and with what impact, and what relationship it has with the schools. The research revealed that teachers were seeking further involvement and participation in the life and activities of the Council which is an expression of a strategic partnership. This kind of partnership should be managed strategically and should be characterised by a shared sense of purpose, mutual respect and a willingness to negotiate. This implies sharing of information, responsibilities, skills, decision making and accountability. Here, the concern for the Council should be how such information might be shared and how the Council may gain respect from the schools and vice versa. The Council should be waking up to the reality that educational institu-

tions, even in a developing country context like Rwanda can no longer work in isolation.

From this perspective, Anderson, et al (2004) argues that although the reputation of an institution may vary from a stakeholder group to another, it will always be based on the perceptions they hold. These perceptions may have very little basis in fact, or may be out dated and biased, but they must still be recognised as the views these particular groups hold. Thus the Council should as a matter of urgency develop a clear appreciation of the experiences, expectations and perceptions held by the different stakeholders especially teachers who are directly involved in its work. The Council should learn what various stakeholders are saying, what it wants them to say and how it can get them to say that.

Following that experience, I organised some in-house workshops in my institution to discuss the results of my research with all the 69 members of the professional staff. Consequently, in 2008, we were able to reform the way we set our examinations to make them more practical and skills oriented. We focussed especially on the science related examinations and since then laboratory and other practical work is a compulsory and major component of the examinations system. We also designed a table of specifications (Blue print) based on Benjamin Bloom's taxonomy of instructional objectives, so that in the humanities, we determined the number of questions per paper that demand recall of information, comprehension, application, analysis of a situation, synthesis and evaluation of outcomes. We also reviewed the way we mark and score and reformed the national grading system.

Guiding Questions

1. What do you think is the mission of the Council? Is this a mission you identify with? Why?
2. How can schools contribute to the mission of the Council?

3. How would you evaluate the way in which the Council manages the marking of secondary school national examinations? In your opinion, is it doing so fairly and accurately?
4. From your experience of marking national examinations, do you see areas where it can improve? How?
5. What is your opinion of the ways in which the Council places successful candidates in different schools?
6. From your experience, what do you see as some of the challenges the Council faces in managing the examinations system?
7. What should the Council do to improve its image and services to schools?
8. How can schools play a supportive role to the work of the Council, especially in improving the management of examinations?

Technology Concerns

In the national examinations process, the Council undertakes various massive tasks of registration of candidates, preparation of examinations, conducting of examinations, marks processing, grading and publication of results and then orientation of successful candidates to the next level of secondary and university education. These tasks involve processing of large databases and message exchanges through internal communications; and interaction with students, parents or guardians, teachers, heads of institutions and district education officers through announcements, rules and regulations governing the conduct of examinations. Engaging this array of stakeholders demands innovations in technology for educational marketing, in this case of national examinations reform products, such as the recently introduced 'Conveyor – Belt' Marking System, the new grading system based on the new curriculum, the introduction and emphasis on practical science examinations and the new changes in the content and format of certificates and diplomas. These products need relevant technology for effective and efficient marketing to various stakeholders. The next section describes the technologies that the Council has been trying to put in place to enhance not only service delivery, but the actual marketing of its products.

Technology Components

ICT Project (i)

The Council has a number of ICT equipment including two server machines, a fully wired computer network with fibre optic back borne, and an Optical Mark Reading Machine. In 2005, the Council signed a contract with HAMLET COMPUTER GROUP LTD, a United Kingdom based company to develop an examination processing application called FAIM running on SQL server and windows 2003 server. This has facilitated the RNEC to develop its ICT capability in order to deliver its services to the public much more efficiently and effectively. This also is necessitated by the fact that the number of candidates increases every year, hence ICT capability to deliver and meet the long term needs and expectations of Rwandan primary and secondary schools is essential. As a result of this initiative, the Council is able to carry out the following functions with relative efficiency.

Registration of Candidates

The ICT system captures candidate's surname, first name, sex, date of birth, father's name, mother's name, district name, district number, sector name, sector number, school number, subject combination, student number, language of examination, (candidates have been allowed to write their examinations in either English or French), disabilities, choices (candidates have 3 choices of schools and 3 choices of subject combinations). These data are usually collected in MS Excel and have to be integrated in the database. Marks are entered against the candidate details already

in the data base and provision for marks entry is designed into the system.

As part of the process, lists and reports are produced which include lists of all registered candidates by school and by district with their full details for typing error corrections; list of candidates by sex; lists of grades for each candidate based on the weights of the subjects and the raw marks obtained, list of candidates by school and by district indicating marks in every subject and the average mark, list of first 20 candidates by their average mark, list of the first 20 candidates in each subject by their mark, list of the first 20 female students in the country, list of the first 20 female candidates in each subject by their mark, list of the first 20 schools by the average mark of all candidates in that school, list of the bottom schools by the average mark of all candidates in that school, the first 20 public schools by the average mark of all candidates in that school, the first 20 private schools by the average mark of all candidates in that school, the best candidate overall by average mark and his/her school, the best female candidate overall by average mark and her school, total number of candidates at registration, total number of candidates at registration by sex, total number of candidates who attended examinations in that year, total number of candidates who attended examinations by sex, total number of candidates who obtained a pass mark, total number of candidates who obtained a pass mark by sex, percentage of candidates who obtained a pass mark and percentage of candidates who obtained a pass mark by sex.

In this process, the ability to do selection of candidates to the Advanced Level of the secondary school cycle based on the available vacancies and the candidate choices that were recorded at registration is paramount. After this selection process, a number of lists and reports must be generated. These include lists of selected candidates by choice and allocated school, lists of selected candidates by district of the allocated school and lists of selected candidates by sex.

The Ministry of Education and other stakeholders require different kinds of statistical data and the Council must have a facility to produce such data. The Council's success may be attributed in part to having generic report templates which are completed by providing input parameters and redefining the display layout which is very important for effective service delivery.

ICT Project (2)

In 2008, the Council signed a contract with AGILE LEARNING TECHNOLOGIES, an American company (which has acquired a licence to operate in Rwanda), to develop a web -based tool to enable the Council to improve the coordination and managements of high stake public examinations processes. The system / Project is known as the 'Rwanda Examinations Coordination and Management Information System' (RECMIS). As a result of the support emanating from this Public-Private-Partnership, AGILE LEARNING TECHNOLOGIES has helped develop local capacity at the Council through technology transfer and the Council was able to achieve the following targets in record time:

1. *Online registration of candidates, publication of results and SMS cell phone based system*

A highly secure online system for checking results was installed where students and parents or guardians can access Council's databases by providing their registration number and then their results are displayed in non modifiable format through web based application or SMS. The candidates can also register online through an interface that is linked to our data base. The Council has built an Online- Based- Results Information System that has been used to provide primary and secondary school leaving candidates with online access to their results through cell phones by SMS text and the Internet through the Web

and provides other services such as registration verification by SMS text.

The Council has installed and configured the system to enable students query its databases by SMS text for their results as well as through the Web and also to verify their registration status. The Council has built all the necessary capacity needed to run, support and maintain the developed system. The system includes querying of examination timetables for all sets of examinations. We have developed a database that enables the collection of statistics on the traffic and usage of the SMS and Internet system. This is important for SMS service provider (a local company called MTN Rwanda) with which the Council signed a separate contract; and for monitoring purposes.

The Council has trained staff to develop a strategy of implementation for the marketing and public awareness of the system to ensure sustainability. One of the important features of the system is to conduct system requirements analysis, design and development, deployment, testing and providing a clear maintenance plan of the system comprising of both client and server system components and staff have been trained on its use. No effort has been spared to ensure effective and efficient server configurations including the implementation of SMS and Internet interfaces (gateway configuration) between the system and the selected mobile telecommunications operator. We have established a central database and server software for storage and retrieval of examination results information. This information has been correlated and aggregated in the manner required by the Council and its stakeholders.

An enhanced website has been in place for use to publish examination results and student registration details and additional promotional information about the system including but not limited to basic information about the Council. There exist built-in reporting mechanisms to support statistical analysis of examination results data. Data collected are summarized and made available through the website and other media formats (Tables, Graphic Charts, PDF, Spread sheets, GIS Maps, etc). Candidates are able to query the database using specific student codes such as registration numbers or other pin numbers to be determined in order to retrieve examination results either by SMS or directly from the website. Users, who use SMS to receive examination results, are charged a premium rate for the SMS messages by the service provider and the fee is shared with the Council equally. Queries are also made directly into the database through a web interface. Information retrieved from the website is also available for downloading. The system has the ability to create historical trend reports (annual reports on primary and secondary schools examination results) using the electronically stored data, to use in planning and reporting on the activities of the sector.

2. *Collaboration tool*

The RNEC has developed a collaborative tool to enhance marketing and communication amongst stakeholders. Below are some of the data/message elements collected by the RNEC which is utilized by this application. They include list of registered students, list of withdrawals from examinations, rules, regulations and guidelines to conducting examinations in centers and districts, announcements, reports on administration of examinations, lists of students selected for the next level of study, list of transferred candidates, urgent messages to centers and districts, internal messages by Examinations Council staff, where possible voice and video chats for virtual meetings and video conferencing and general chat. The content format is designed in such a way that the lists are either word processing documents or spread sheets, reports, rules, regulations and guidelines are word processing documents; *a*nnouncements, urgent messages and live text chat are in text or html formats; and there is also some voiceXML and MPEG or Avi for video chats.

The user categories include *s*ystems administrator, regular user and moderator. Every district officer, Head of department and Chief Executive Officers can be upgraded to moderate their group chats. In addition a user may access the application by providing a user name and password that was previously set at registration by the system administrator. Then users are authenticated and only information related to their duties is made available to them. This means that (a) officers who head examination centers are now able to upload or download their own lists of students and reports, view rules and regulations, announcements, urgent messages, district and the Council's reports and also join chat sessions of their group or the general chat; (b) District officers are now able to upload or download their own lists of students and reports, view rules and regulations, announcements, urgent messages, district and the Council's reports and also join chat sessions of their group or the general chat and posting announcements and urgent messages; and the Council staff are now able to upload/download rules and regulations, lists of students and reports, view rules and regulations, announcements, urgent messages, also join chat sessions of their group or the general chat.

3. *Selection process*

This module enables the Council to gather important statistics as indicated below. Schools or institutions can now submit these vacancies online into the server indicating number of places available at Ordinary (lower secondary) and Advanced (upper secondary) school levels and at the University level; and the number of places available at A' level by option for candidates completing O' level. Very high degree of security and privacy is required.

4. *Examiners tracking system*

This module covers the following items using online interfaces that are well designed which make use of appropriate technology concepts: Registration of examiners, giving their personal details; the examinations an examiner sets and also the examination he/she marks; examiner/teacher's qualifications; the class a teacher teaches and the subject that he/she teaches including the team leader's comments. Very high degree of security and privacy is required

5. *School performance*

The Council is now able to track the results and examine the performance of schools. This system generates statistical data on the performance of each school.

Benefits

Owing to these technological innovations, the Council received media attention for a while for having gone 'high tech.' The leading and influential daily English news paper 'THE NEW TIMES' had on 26th January 2009 as its front page caption: 'EDUCATION MINISTRY REFORMS THE EXAMINATION SYSTEM'; and on 28th January 2009, the same paper carried an article on page 7 titled: 'THANKING THE EDUCATION MINISTRY FOR EXAMINATIONS REFORM'. Consequently, during the budget process in June/July 2009, in the midst of a global economic crunch (recession), the Council still received an additional six hundred million Rwandan francs equivalent to one million two hundred thousand United states Dollars for reforming the science examinations in that year. The funds came from '*internal re-allocations*' within the ministry of education in recognition of the Council as change agent in the Rwandan educational system.

CURRENT CHALLENGES

The Issue of Human Resource Development and Management

The main challenge facing the Council is the lack of sufficient human resource capacity. The Council has been struggling to develop and build a human resource base as a basis for spurring institutional growth and development. The Council needs to acquire such values as to enable them to be more effective and challenging in changing situations. They need to recognise that the Rwandan society and the Council in particular is under pressure to provide higher levels of quality service and value and that experience alone does not count anymore as the environment in the "global village" is changing fast. Middlewood & Lumby (2003, p. 5) are of the view that the quality of staff in an educational organisation "is an issue of both specification and development, and that quality is about much more than appointing the most suitable candidate". Professional development is an imperative. Bush and Bell (2002) also believe that this entails ongoing process of education, training and learning in either external or work based activities, proactive engagement and promotion of learning and development of professional knowledge, skills and values.

Recently, the focus has included learning to be able to influence, motivate and work in closer working relationships, in teams with vision that aligns with and contributes to the achievement of the overall vision of the Council. However, the whole concept of 'teamwork' presents a dilemma not only at the Council, but also in Rwandan educational institutions as a whole. At the Council, in spite of all the effort to create a team work environment, work ethic and a changed mindset, the results have not been as forthcoming as expected mainly owing to human resource capacity considerations. Wallace & Hall (1994) have suggested that team working can be fraught with difficulties over the balance between equity and hierarchy, meaning

that not everyone wants to work in a team, yet the joint work that teamwork represents depends on the commitment of all involved. The challenge facing the Council therefore, is to analyse the effectiveness of its staff development provision in terms of its impact upon a 'learning organisation' that the Council aspired to be. This is no easy task as there is an urgent need for change and the Council cannot change unless the its staff develops an attitude to change of both mind and heart to enable them to see, make informed choices and take the opportunities that change brings (Middlewood, 1997c). This is fundamental to the improvement of organisational performance and therefore as a core task of the Council.

From this perspective, the Council needs to be careful not to take educational marketing for granted in terms of its impact on a learning organisation because of the challenges associated with developing the people responsible for such marketing. Bush & Middlewood (1997) suggest that such a programme has to be devised in the context of attempting to meet the varying and sometimes conflicting needs within the institution. Whatever the programme, the effectiveness of its components depends in part, upon the extent to which there is recognition of those factors which affect the learning of adults. Southworth (1984) sees the whole process as essentially adult education and warns that educational institutions need to be aware of the technological developments and organisational change which has gradually led some employers to realize that success relies on the skills and abilities of their employees. This has also been underscored by the rise in human resource management with its emphasis on the importance of people and the skills they possess in enhancing individual, team and organisational performance and efficiency (Armstrong, 2003; Beardwell & Holden, 2001; Summons, et al, 1995).

Educational marketing involves providing structures, resources and support which will help staff learn how to learn and all staff need to be involved in the collaborative learning. Never-

theless, external pressure, particularly financial pressure limits the scope of strategic planning in educational marketing. Thus the Council will need to create an environment in which people continually expand capacity to create the results they truly desire, where new and expansive patterns of thinking are nurtured, where collective aspiration is set free, and where people are continually learning how to learn together (Senge, 1990; 1993). Thus, if the speed of innovation means that the problems and solutions of the past are no longer an adequate basis on which to plan, then new ways of coping with change are imperative. New forms of learning are needed and the concept of the learning organisation appears an enticing goal (Burgoyne, 1994).

To do so, the Council has to overcome the challenge of developing the skills for identifying needs, designing activities, deciding on monitoring and allocating resources and this depends upon the evaluation of previous activity and includes consideration of the monitoring and subsequent review processes (Anderson, et al, 2004; Bush &Coleman, 2002; Briggs & Sommefeldt, 2002). In the prioritisation process, the opportunities that will be foregone will need to be considered in terms of their educational and resource impact. For example, Middlewood & Burton (2003) advise that the act of reprioritising the acquisition of one multi-media computer over the purchase of text-based reference materials for the same cost is one that needs to be judged in terms of the overall educational impact. This in fact, seems to be a leadership challenge because leaders are designers, stewards, and teachers. They are responsible for building organisations where people continually expend their capabilities to understanding complexity, clarify vision and improve shared mental models –that is, they are responsible for learning since they need to ensure that the learning is moved to those parts of the organisation which need it, valuing and rewarding learning and transforming the organisation through the application of its learning (Garret, 1994; Senge,

1990). This remains a challenge for educational marketing and technology development.

SOLUTIONS, RECOMMENDATIONS AND LESSONS LEARNED

Anderson, et al (2004) quote Beare, et al (1992, p. 235) as saying: 'image begets public esteem; esteem creates public support; public support begets political attention; and political influence begets finance and staff numbers and governmental priority.' I find this argument quite valid for the Council. For example, created in 1998 to redress injustice and discrimination that prevailed before the 1994 genocide, the young institution has seen public support grow from year to year largely due to the public image as a transparent, fair and accountable organisation. From the experience of the Council, education can win tangible public support and finance when respect for its operations and out puts is high; but as Anderson, et al (2004, p. 79) observe, 'kill community regard and in the same process one kills the supply of resources.' This means that stakeholders should be proactively engaged and their importance should not be underestimated.

Another consideration is that the Council has to change the way it does business with schools which requires regular communication so that they are not only aware of its new 'products', but support and feel they are co-owners for effective implementation and service delivery. According to Bush (1999, p. 4), educational institutions can no longer 'operate in isolation' and expectations of society whether expressed by individual parents, identifiable groups, or government legislation, mean that educational institutions need to be aware of views being expressed by stakeholders. Citing Bagley, et al (1996, p. 125), Bush points out that educational institution must take account of public perceptions of 'how well they are performing and be prepared to respond to those articulated concerns which are genuinely representative.'

There is therefore a need for closer stakeholder partnership and collaboration.

A lesson learned here is that once the Council has developed a clear concept of such a relationship, then the management of the examinations system will be clear. Also, there ought to be a change in the relationship between the Council and the schools. This calls for renewed power relations and a pragmatic approach has to be taken to work out more effective teacher participation beyond marking examinations. This implies an effective co-learning relationship with the teachers involved in its work.

KEY TERMS AND DEFINITIONS

Discrimination: This was a state of affairs in which the Tutsi and other social groups were systematically excluded from participation in the education system. Social discrimination included the exclusion of girls in favor of boys, and others based on religion and place of origin.

Education System: This refers to the Rwandan education system which provides for six years of primary (elementary) education, three years of the lower secondary education, known in East Africa and the British Commonwealth as the 'Ordinary Level', three years of the upper secondary education, known as the 'Advanced Level', and four years of University education (6+3+3+4).

Effective Management: Refers to the results oriented post-genocide paradigm shift in attitude and management practices in which the Council implements its policies and decisions to assist in directing its activities towards its specified goals and objectives. This includes monitoring and controlling of its activities, how we make our decisions, and how we control our resources.

Innovation and Technology: This refers to the improvements and changes in technology that the Council has instituted to assist in the effective management of the national examinations system for more cost-effective and cost-efficient delivery of its reform packages. It applies to the way candidates register for national examinations, in test development, marks processing, grading, and publication of results and in orientation of successful candidates to Ordinary and Advanced Levels of secondary schools, and to Universities and other Higher Education Institutions.

Marketing the Council: Refers to the efforts that the Council has been taking to communicate its vision, mission, goals and activities to its stakeholders. The last ten years have marked a series of reforms in the national examinations system which demanded among other things stakeholder consultation and making sure that they felt part of the ownership of the reform packages.

Nepotism: This refers to a phenomenon in which before 1994, for a learner to proceed from one level of the education system to another, they had to be related to, or be friends with the president of the republic, a government minister, or other government and political party officials regardless of performance at school.

Rwanda National Examinations Council: This institution was created after the 1994 Tutsi genocide in Rwanda to address the imbalances that obtained in the education system. These were based on inequities in the system related mainly to nepotism and discrimination which affected upward mobility of learners from the lowest level of the education system to the highest.

Chapter 76

Toward Understanding Ethical Decision Making:
A Redefined Measure of Intent to Act Ethically

Jennie Johnson
The University of Texas at Brownsville, USA

Tom Coyle
The University of Texas at Brownsville, USA

ABSTRACT

This paper proposes a step-wise methodology for the development of a scale measuring intent-to-act ethically, which is a step forward in the ethical decision-making process. To test the robustness of the methodology, data from two different populations gathered from 75 students and 181 professionals were examined to ensure reliability in ethical workplace scenarios. This research is relevant to recent issues like the current economic crisis lead by the sub-prime banking failures. The failures of Enron and Tyco are extreme examples of failure of societal members to act ethically. The construction of scale-measuring items was based on a theory of intent, and issues identified from the human resource management literature related to reasons employees do not report perceived unethical behavior in the workplace. Tested for social desirability bias, the results show that the proposed scale offers an improved reliability for assessing behavioral intent related to ethical decision-making. With these findings, this paper provides a tool for research that relies on a measure of ethical intent as a proxy for ethical behavior.

1. INTRODUCTION

Organizations are concerned with two types of behavior – organizational citizenship and dysfunctional behavior. Organizations want to encourage citizenship, which refers to behaviors that provide a positive overall contribution to the organization, and they want to discourage dysfunctional behaviors detracting from contributing to organizational performance (Moorhead & Griffin, 2004). Measuring behavior however, relies on observation and/or retrospective reporting. Observation has many practical implications and limitations in the workplace, and retrospective reporting relies on memory and accuracy of those providing the information. Consequently, another measure, intent or intention to behave, has served as a proxy for behavior in several disciplines interested in predicting behavior under certain conditions.

Recent issues such as the current economic crisis lead by the sub-prime banking failures (Terhune & Berner, 2008) and the failures of Enron and Tyco are extreme examples of failure of societal members to act ethically. The value of this research is to develop a construct which measures ethical intent which fills a gap in this portion of ethics research. This is important because intent is considered a proxy for behavior. Better understanding of ethical intent may aid academicians in improving education in this area of societal behavior.

The rest of the paper is made up of six sections. Section 2 reviews the pertinent literature, Section 3 identifies the problem, Section 4 suggests the methodology and explains the data used, Section 5 analyzes the empirical results, Section 6 recognizes the limitation of the findings, discusses the implications for future research, and concludes the paper.

2. LITERATURE REVIEW

One area of research, ethical decision-making, relies on conceptual models that describe the steps that are antecedents to ethical or unethical behavior. One model is the four component ethical decision-making model attributed to Rest (1986), which includes (1) awareness, (2) moral judgment (Kohlberg, 1969), (3) moral intent and, (4) moral behavior. This constellation of components forms the basis of most ethical decision-making studies (Barnett & Vaicys, 2000; Jones, 1991; Kelley & Elm, 2003; Trevino, 1986; Trevino & Youngblood, 1990). This model is displayed in Figure 1. The first component, awareness, provokes the initial step in ethical decision-making. Highly nuanced, complicated, or ambiguous situations of individual experience must first be identified as having ethical relevance in order to activate the decision-making process. Pardales (2002) refers to making this first step as the capacity to perceive moral issues, exhibited as an issue enters individual awareness.

The second component in this model of ethical decision-making process is moral judgment, an unconscious and cognitive evaluation made by individuals depending on the level or stage of their moral development. Theories of cognitive moral development, described by Kohlberg (1969) and Rest (1986), explain how levels of moral reasoning evolve over a lifetime and have been found to be linked to education level and age.

The interaction between moral judgment and moral development has been studied variously, with authors attempting to measure the level of moral judgment by identifying hierarchical stages of development of the individual. The results of this research, called stage theory, are questionable, as

Figure 1. Four component ethical decision-making model

| Awareness | ⟹ | Judgment | ⟹ | **Intent** | ⟹ | Behavior |
the findings correlate level of moral development with age and education. According to Krebs et al. (1991), the explanation that the level of moral development increases with education fails to explain variation in judgment among educated, mature adults, demonstrating how research on the level of moral judgment seems to have limitations.

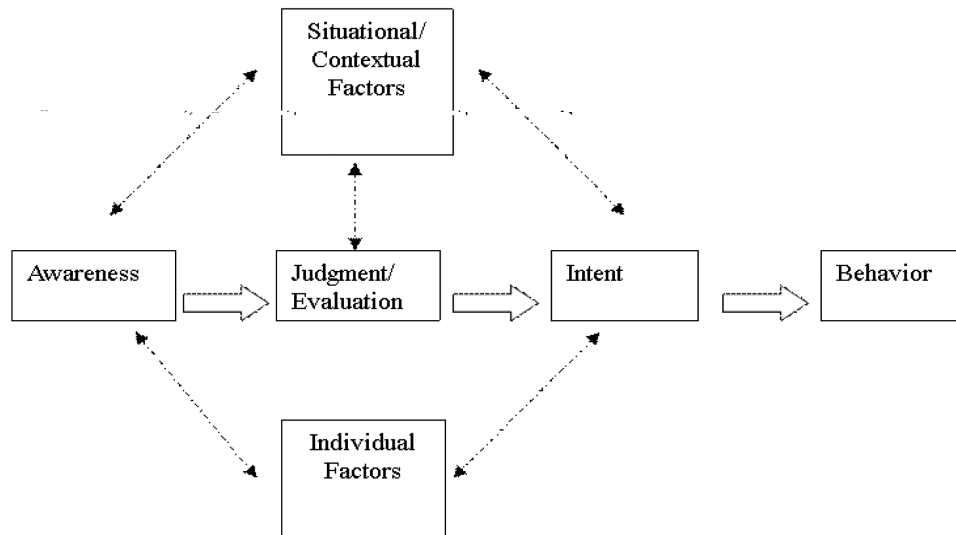
Wark and Krebs (1997) examined stages of moral judgment comparing individuals' projected behavior in hypothetical situations with real life situations and found that in real life situations these people exhibited significantly lower judgment levels than in those projected hypothetically. Critics of Kohlberg (1984), Krebs et al., (1997) demonstrated that when students were asked to consider philosophical dilemmas similar to the ones used in Kohlberg's (1984) test, they generally exacted the highest stages of moral judgment available to them. However, when faced with personal, real life situations they found that the students used different forms of moral judgment, suggesting that the type of moral issue acted differently in context despite fixed cognitive structures available to the person. These and other limitations suggested by Robin et al. (1996a) indicate that alternatives to measuring the judgment component of the ethical decision-making process must be found. Consequently, research in ethical decision-making in the last decade has started to use moral evaluation (Reidenbach & Robin, 1988, 1990) as the individual's context specific response to an ethical dilemma based upon individual organizational and situational factors.

The third step in the ethical decision-making process, moral intent, directly precedes the actual ethical or unethical behavior. A very difficult area to assess, this component has largely been overlooked in the relevant research (Low et al., 2000) or somewhat superficially handled. Essentially, intent can be described as the individual's internal decision in relation to the issue (Meiland, 1970), and the most immediate determinant of behavior (Ajzen & Fishbein, 1980).

The final step in the four-step decision-making model is the expression of intent, the resulting behavior either ethical or unethical. Specifically, the behavior of the person is expressed in ethical terms as the commission or omission of action. The ethicality of the behavior is subjective, determined by the actor and/or observer of the behavior.

An interactionist model expands the four-component ethical decision-making model by including individual differences (individual factors), organizational factors, and issue-specific factors. Several variations of this model exist (Jones, 1991; Kelley & Elm, 2003; Trevino, 1986). Individual factors such as decision style (Pennino, 2002) and religiosity (Barnett et al., 1996) have been studied together with parts of this ethical decision-making model. Organizational factors, such as hierarchy (White, 1998) and organizational climate (Barnett & Vaicys, 2000; Flannery & May, 2000; VanSandt et al., 2006), have also been studied. Also appearing in the research are issue-specific factors, referred to by Jones (1991) as moral intensity factors, including magnitude of consequences or benefits, probability of effect, temporal immediacy, proximity, concentration of effect, and degree of social agreement on the morality of the issue. While the direction and the relationship among these factors and ethical decision-making has been the interest of researchers for 20 years, numerous contextual and individual factors could be identified and related to the ethical decision-making process. The interactionist model can be found in Figure 2.

The theory of planned behavior (Ajzen, 1991), an extension of the theory of reasoned action (Ajzen & Fishbein, 1980) has its foundation in social psychology. It is based on the belief that when faced with a behavior decision, individuals make a systematic, rational use of available information to form intent. Azjen and Fishbein suggested that the most immediate determinants of behavior are the individual's behavioral intention, a result of the individual's attitude toward the behavior and subjective norms, which represent the social pressure

Figure 2. The interactionist model of ethical-decision making


put on the individual to perform or not perform the behavior in question. Intention, according to Ajzen, also depends on the individual's perceived behavioral control; that is, the individual must find the behavior in questions under volitional control. This concept affecting intent to act corresponds to Rest's (1986) claim that the first component of his model, awareness, has to do with the individual realizing that "she/he can do something that would affect the interests, welfare, or expectations of other people" (p. 5).

The theory of planned behavior model has been used primarily in social psychology to examine individual intent particularly related to participating in self-improvement behaviors such as weight loss, exercise, and smoking cessation. Intent therefore has become a principle construct in understanding and predicting behavior in ethical decision-making research and social psychology. A model of the theory of planed behavior can be found in Figure 3.

3. STATEMENT OF THE PROBLEM

Both models, the interactionist model and theory of planned behavior, include intent as a step in

the decision making process. As a concept, intent is often confused with belief, expectation, desire, or decision-making (Meiland, 1970). Intent refers to a *determination to act in a particular way.* Presumably, the greater one's intention is to act, the more likely that action would be to occur. This is the primary reasoning used in research to consider intent a valid proxy for behavior.

Most studies that have attempted to measure intent to act have either used two to four very similar items, a semantic differential scale, or measured ethical intent with one item. The majority of the research studies examined for the studies referenced here were related to ethical decision-making; others were related to the theories of planned behavior. Some of the measures used in these studies came from the consumer behavior literature in studies examining consumers' likelihood to make a particular purchase. Table 1 displays ethical decision-making studies in management, marketing and accounting which have relied on one item to measure ethical intent.

The use of one item to measure intent calls into question the reliability of the measure. Obviously, internal consistency cannot be calculated. Some studies have been conducted using multiple

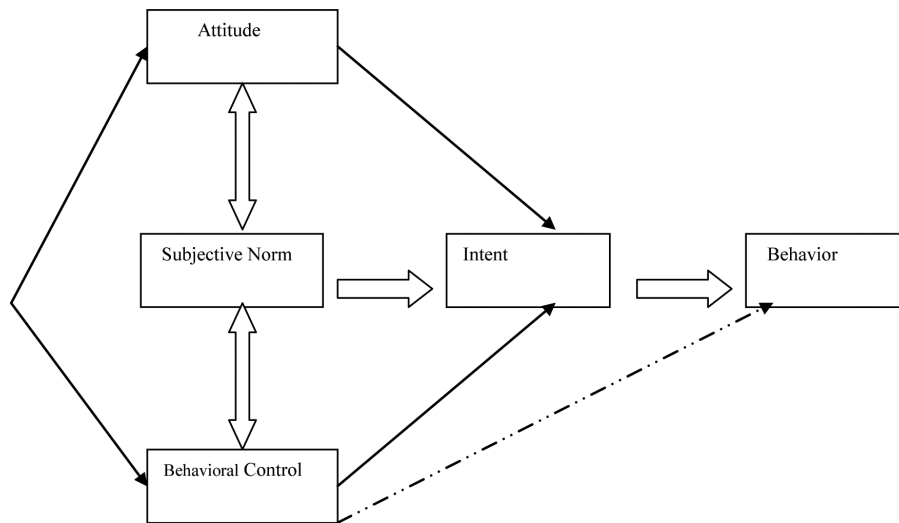
Figure 3. A model of the theory of planned behavior


Table 1. Ethical decision-making studies measuring intent with one item

Authors	Single Item Questions
· Chia and Mee, 2000 · Dubinsky and Loken, 1989 · Flannery and May, 2000 · Flory, et al., 1992 · Robin, et al., 1996a · Robin, et al., 1996b · Beekun, et al., 2005 · Paolillo and Vitell, 2002 · Karande, et al., 2000 · Singhapakdi, et al., 1996 · Singhapakdi, el al., 1999	· How likely is it you would … · What is the likelihood that you would … · What is the probability that you would … · The probability that I would take this action is … · I would likely … · I would act in the same manner as XXX did in the scenario

item scales comprised of questions that are almost identical to each other; consequently, any reliability analysis is suspect. A. Singapakdi (personal communication, March 31, 2006) indicated that he and other researchers that have used primarily one item to measure intent acknowledge its limitations, and that this has been a common criticism by journal reviewers. At least for the ethics literature in marketing, this criticism has become a "*reviewer's mantra,*" repeatedly suggesting the need to use more items. Although acknowledged as a problem, the questionable reliability and limitations of items used in previous research have not been dealt with effectively.

4. METHODOLOGY AND DATA

This paper proposes a step-wise methodology for the development of a scale measuring intent-to-act ethically, which is a step forward in the ethical decision-making process. To test the robustness of the methodology, data from two different populations gathered from 75 students and 181 professionals were examined to ensure reliability in ethical workplace scenarios.

Item Construction. The items developed to create a scale for the two different populations presented here were based on an analysis of reasons why employees in the workplace do not report ethical wrongdoing (Joseph & Esen, 2003), and incorporated the conditional approach to intention discussed by Meiland (1970) in *The Nature of Intention.* Meiland delineated two important characteristics of intent: purpose and condition. This theory accepts that intent is always conditional, revealing a cognitive structure of the type: "he intends to do X if C obtains" (Meiland, 1970,

p. 16), where C stands for some circumstance. Further, every intention is conditional even if no condition is expressed. Meiland explains, "For it is taken for granted that the act in question will be performed if and only if certain conditions obtain" (p. 16). Since intention is subject to influence by the particular conditions that surround the activity, items for these studies were constructed to contain qualifiers or explanations about the respondent's inclination to indicate how they would behave in a particular situation. These qualifiers or explanations were derived from Joseph and Esen's (2003) Business Ethics Survey.

When asked what prevents employees from reporting a behavior they perceive to be unethical, reasons were cited such as fear, a belief that retribution would occur, the possibility that harm (such as job loss) would come to the reporter or those involved, nothing would be done about it, no one cared, or ethical conduct was not rewarded. The rationale for the item construction for these two studies was based upon an analysis

of reasons why employees in the workplace do not report ethical wrongdoing, together with the conditional nature of intention. The rationale for the construction of eight items is based upon an analysis of Joseph & Essen's (2003) work and can be found in Table 2.

Testing of Ethical Intent Scale. Scenarios in research allow the researcher to change variables of interest within the scenario while keeping other variables constant. Ethics researchers have frequently used scenario-based research methods. In their review of several scenario-based ethics studies, Cavanagh and Fritzsche (1985) found that the majority of the studies used scenarios containing constant variables; however, several manipulated variables within the scenario. Taylor (2005) advocated that appropriate variables to vary are those derived from a qualitative study or a review of the literature. In these studies the variable of interest is referred to as the actor/ observer perspective. Saltzstein (1994) indicated that the self and observer perspectives are an

Table 2. Rational for moral intent items

Conditional Moral Intent Item: If I were Pat, …	[1]Background Behind the Development of the Items
I would not choose the same course of action because of the potential negative consequences.	Employees reported potential negative consequences associated with reporting unethical behavior: they feared that it would not be kept confidential, retribution by peers and/or manager would occur, they would be labeled a whistle-blower, and/or they wouldn't be viewed as a team player.
I would choose the same course of action if there was no rule against it.	Employees thought that although unethical behavior occurs, most employees follow the organization's code of ethics, policies and procedures.
I would choose the same course of action if no one will be harmed in the situation.	Employees reported that they did not want harm to come to themselves or others (particularly job loss) and that unethical behavior was sometimes required to save jobs, and ensure the organization's survival (prevent harm to the organization).
I would choose the same course of action because everyone does it.	Employees reported that the behavior of co-workers on the job influenced their own on-the-job behavior.
I would choose the same course of action because there is nothing wrong with doing this.	Employees reported that they believe many employees rationalize unethical behavior as normal workplace behavior.
I would choose the same course of action because no one cares.	Employees reported that nobody cared about business ethics in their organization and/or no action would be taken if instances were reported, and there was no commitment to ethics in the organization.
I would choose the same course of action because of the benefit to me.	Employees reported that ethical conduct was not rewarded and participating in unethical behavior advanced their own career interests.
I would not choose the same course of action because it is not right.	Employees reported that they believed in the values and standards of their organization.

[1] Source: Joseph and Esen, 2003

important distinction that has been largely over-looked in scenario-based research. Cavanagh and Fritzsche (1985) reported that responses to these two perspectives can provide valuable and quite different information. In organizations we see the actor/observer phenomenon at work when individuals tolerate behaviors in others that they view as wrong and would not engage in themselves. The scenarios in these studies were based upon scenarios previously used in research by McMahon (2002). McMahon's research was an analysis of the factor structure of the Multidimensional Ethics Scale, a measure of moral evaluation. The scenarios were work-related and considered to be easily understood by individuals with workplace experience.

The proposed newly developed items to measure ethical intent were applied to two separate populations. The scenarios used in each of the studies are presented in Appendix A. To achieve maximum information, the more robust statistical method is to use a multistep approach to improve reliability and validity (Anderson & Gerbing, 1988; Tukey 1991; Hair et al., 1998; Kline, 1998), Internal consistency of the scale was measured using Cronbach's alpha (Nunnally, 1978), and to better assess the reliability of the newly developed intent scale both explatory factory analysis and confirmatory factor analysis were used.

In the following paragraphs, the co-authors will discuss the measures (social desirability and intent-to-act ethically), subjects, and procedures adopted in implementing the new intent scale to the two populations used in this paper.

Population One

Social Desirability Measure. In addition to the scenarios and newly created ethical intent scale, a measure of social desirability was used. The Marlowe-Crowne 2 (Strahan & Gerbasi, 1972) was included to determine if either the newly developed scale or the previously established semantic differential scale were influenced by social desirability. This measure consists of 10 true and false questions. Five questions of this scale were reverse scored.

Social desirability is a style of responding to questions in a way that is socially acceptable so that the respondent can manage impressions of him/herself. A measure of social desirability is a recommended control in studies of self-report data, particularly data that may be considered sensitive in nature (Nederhof, 1985), such as responses about one's ethicality. A measure of social desirability is used in the first population as a statistical control because social desirability bias could influence the questions being researched. It controls for lying or less than truthful answers. A strong correlation between the social desirable measures and ethical intent measure could distort or contaminate the ethical intent measure. A social desirability scale was included in the first population to determine if it should be included, or could be eliminated in subsequent research using the intent scale.

Intent-to-Act Ethically Measure. The intent items were measured on a seven-point Likert scale, ranging from strongly disagree to strongly agree, anchored at each point. Three items were reverse scored. These items can be found in Table 3.

Subjects. One hundred senior and graduate-level business students and 60 human resource development graduate students were invited to participate in this study. The business students attended a regional university located in the Mid-Atlantic region of the United States. The students were at the university's main campus and in five distance learning centers that are within a five-hour radius of the main campus. This university has an extensive distance learning capability, with classes originating from, and broadcast to, various sites. The human resource development graduate students were from a different university in the same general area. There was a 47% response rate (n = 75). Males represented 32% of the respondents.

Table 3. Intent scale items

1. I would choose the same course of action.
2. I would not choose the same course of action because of the potential negative consequences.
3. I would choose the same course of action if there is no rule against it.
4. I would choose the same course of action if no one would be harmed in the situation.
5. I would choose the same course of action because there is nothing wrong with doing this.
6. I would choose the same course of action because everyone does it.
7. I would choose the same course of action because no one cares.
8. I would choose the same course of action because of the benefit to me.
9. I would not choose the same course of action because it is not right.
10. I would not choose the same course of action.

Procedures. Classroom participants included students from the authors' classes. Other instructors teaching business courses invited their classes to participate. The author went to the classes and gave a brief description of the purpose of Population One and told students their participation was voluntary. Afterwards, all the students were sent an email which explained the survey's purpose and procedures with a link to the electronic survey. Some students were provided with optional extra credit for their participation. At the end of the survey data were uploaded into SPSS.

Population Two

Social Desirability Measures. Unlike the situation in the first population, the Marlowe-Crowne social desirability scale was not used in this study based upon the outcome of Population One which found no social desirability bias.

Intent to Act Ethically. The intent items were measured on a seven-point Likert scale, ranging from strongly disagree to strongly agree, anchored at each point. Three items were reverse scored. These consist of the same items used in Population One previously discussed and found in Table 3.

Subjects. The subjects for Population Two were drawn from the membership list of a professional association and represented a sample of convenience. Females dominated the responses with 60% female and 40% male responding. A total of 70% of all responders worked for a university and the remaining 30% were employed by business organizations or consulting firms. The mean age of participant was 43 years and they were with their organizations an average of 7 years.

Procedure. An announcement about the survey was sent to potential participants via email three days prior to an electronic distribution of the questionnaire. Two versions of the questionnaire were used, differing only by the scenario presented. A total of 319 actor questionnaires and 321 observer questionnaires were distributed. These groups were determined through a randomization procedure in Excel which did not divide the groups equally. Thirty-five (21 actor and 14 observer) email addresses were eliminated because the emails were returned as undeliverable due to incorrect or outdated email addresses present on the membership list. As a result, of the 605 actual questionnaires were distributed electronically; 298 contained an actor perspective scenario and 307 contained an observer perspective scenario. After one week and two weeks, a reminder email was sent to non-responders. The overall response rate for this study was 37%. Randall and Gibson (1990) in their review of 94 empirical articles related to ethics found that ethics research suffers from low responses, due to "the nature of the research" (p. 464). In a review of 17 more recent ethical decision-making studies, it was found that response rates averaged 24.8% and ranged from 12.4% to 62.8%, with the majority under 30%.

Additional cases were eliminated due to missing data. This reduction in the number of cases resulted in a total of 181 valid responses used in

the data analyses. At the close of the survey, data were uploaded into SPSS and analyzed.

5. EMPIRICAL RESULTS AND ANALYSIS

Results on Population Two

Descriptive statistics and correlations among the scales and items, and reliability were computed. This information appears in Tables 4, 5, and 6. The means and standard deviations for the ethical intent scales and semantic differential items were fairly consistent and not greatly skewed to one end of the rating scale. They all were somewhat in the direction of disagreeing with the action depicted in the scenario.

Correlations among the ethical intent scales were high, as would be expected. The Marlowe-Crown 2, social desirability scale, was not statistically significantly correlated with the ethical intent measures, except for one weak but statistically significant correlation (r =.25) with the ethical intent scale for the second scenario.

A correlation matrix for the ethical intent items is shown for the first scenario in Table 6. The result for the second scenario was very similar. A range of moderate to high correlations among the items was indicated. These range from a low of.35 to a high of.86.

The correlations demonstrate a moderate to high degree of homogeneity between the ethical intent items and suggested that the items measure the same phenomenon.

Internal consistency (Cronbach's Alpha) was examined for the ethical intent items. The obtained alphas (including when single items were deleted) were above.93, suggesting a very reliable measure (Nunnally, 1978). Additional reliability coefficients were calculated for a smaller number of items, eight, six, and four. The alpha coefficients decreased slightly, but not below.90.

Similar results were found for the ethical intent measures from the second scenario. There were no statistically significant differences between the two scenarios for the ethical intent items or

Table 4. Descriptive statistics for population one

	N	Min	Max	Mean	Std. Dev.
Intent (Actor)	74	1.00	7.00	2.6	1.3
Intent (Observer)	71	1.00	7.00	2.7	1.3

Item 7	.76	.51	.60	.74	.68	.80	1.00			
Item 8	.74	.54	.65	.75	.59	.72	.83	1.00		
Item 9	.79	.72	.60	.85	.57	.58	.63	.67	1.00	
Item 10	.75	.61	.55	.69	.52	.60	.62	.67	.75	1.00

the semantic differential items based on a paired t-test comparing the two sets of scores.

A principal component factor analysis performed on the 10 ethical intent items (one for each scenario) produced one factor, accounting for 68 to 69% of the variance. Two additional factor analyses using Varimax rotation were conducted on the data from both scenarios. Tables 7 and 8 display the factor loadings for the ethical intent items.

Factor loadings above .40 are meaningful (Hatcher, 1994). In the actor perspective scenario, seven items loaded on one factor and three loaded on a second factor. This indicated that the items potentially represented more than one construct. In the observer perspective scenario, all 10 ethical intent items loaded on one factor, giving an indication that the items are essentially measuring one construct. When two factors were forced, 65 to 68% of the variance was explained.

The confirmatory factor model is shown in Figure 4 and the data from the confirmatory factor analysis (CFA) for this study is shown in Table 11.

The data from this analysis suggest that this is an acceptable construct. All path coefficients were statistically significant (p<.001). Also, the fit measures for the CFA are all within acceptable ranges (Hair et al., 1998). In addition, the construct reliability and the variance explained were simi-

lar to the results of the exploratory factory analysis (EFA) and are acceptable for CFA analysis as recommended by Hair et al. (1998), which are 0.70 for construct reliability and 0.50 for variance extracted.

Results on Population Two

Analyses were conducted to determine how the scale performed. Descriptive statistics, intercorrelations among the items, and reliability were computed. The means and standard deviations for the intent scales were fairly consistent and not greatly skewed to one end of the rating scale. (Actor perspective: M = 2.7, SD = 1.4; Observer perspective: M = 2.8, SD = 1.3). They all were somewhat in the direction of disagreeing with the action depicted in the scenario. A T-test for the two groups (actor scenario and observer scenario) revealed no statistically significant difference between them. Correlations among the intent items were high, as would be expected.

A Cronbach alpha score was used to examine the reliability of the scale. The obtained Cronbach alpha was .93, suggesting a reliable measure. A minimally acceptable level of reliability based on Nunnally's (1978) recommendation is .70.

A principal component factor analysis conducted on the 10 ethical intent items produced one factor that accounted for 66% of the variance. The factor loadings for each ethical intent item are listed in Table 10. According to Hatcher (1994), factor loadings above .40 are meaningful. All items loaded on one factor with loadings ranging from .71 and .91 with the exception of Item 2. This item loaded below .40 at .37.

Correlations were computed on the ethical intent items and with the exception of correlations with Item 2 all ranged between .45 and .86. This

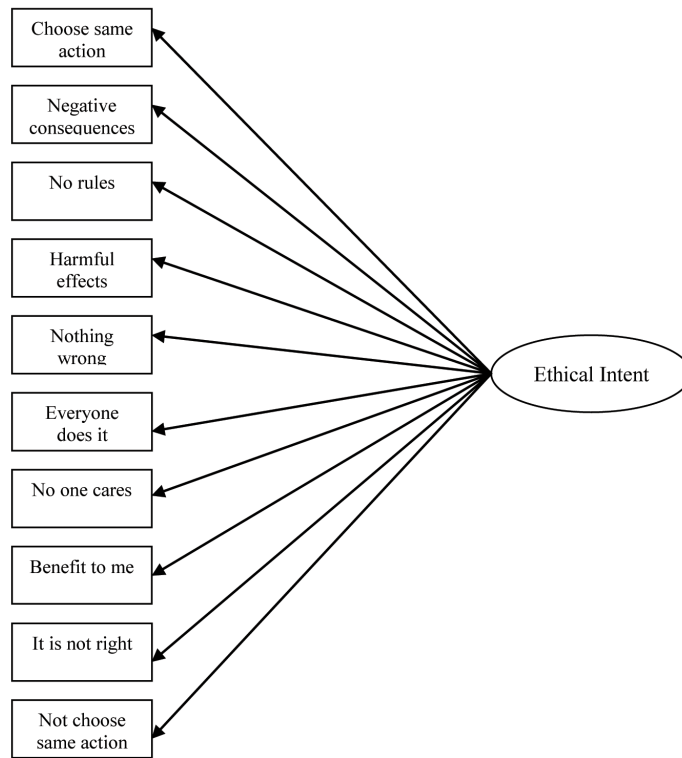
2=Variance Explained

Figure 4. Confirmatory model for ethical intent


demonstrated a moderate to high degree of homogeneity between the items suggesting that the items measured the same phenomenon. All correlations were statistically significant at the .01 level. These correlations are seen in Table 11.

Item 2, "I would not choose the same course of action because of the potential negative consequences", did not perform as well in this study. Based upon the results of the factor analysis shown in Table 9 and the correlations in Table 10, Item

Table 10. Factor loadings for ethical intent items for population two

Item If I were XXX, I …	Factor Loading
Item 1: would choose the same course of action	.91
Item 10: would not choose the same course of action	.90
Item 6: would choose the same course of action because everyone does it	.89
Item 8: would choose the same course of action because of the benefit to me	.88
Item 7: would choose the same course of action because no one cares	.85
Item 4: would choose the same course of action if no one would be harmed in the situation	.83
Item 5: would choose the same course of action because there is nothing wrong with doing this	.83
Item 9: would not choose the same course of action because it is not right	.80
Item 3: would choose the same course of action if there is no rule against it	.71
Item 2: would not choose the same course of action because of the potential negative consequences	.37

Table 11. Ethical intent item correlations for population two

	Item 1	Item 2	Item 3	Item 4	Item 5	Item 6	Item 7	Item 8	Item 9	Item 10
Item 1	1.00									
Item 2	.35	1.00								
Item 3	.58	.11	1.00							
Item 4	.76	.24	.71	1.00						
Item 5	.64	.24	.51	.62	1.00					
Item 6	.74	.29	.55	.65	.69	1.00				
Item 7	.69	.27	.57	.65	.65	.76	1.00			
Item 8	.78	.31	.59	.71	.66	.78	.78	1.00		
Item 9	.70	.38	.45	.57	.63	.61	.60	.61	1.00	
Item 10	.86	.35	.56	.70	.71	.71	.66	.74	.81	1.00

2 should be removed from the scale when used again. The Cronbach alpha for the scale with this item removed changed from .93 to .95.

The confirmatory factor model previously shown if Figure 4 was again tested using CFA and the data from this study is shown in Table 12.

The data from this analysis also suggest that the construct is acceptable. All path coefficients were statistically significant (p<.001). As with the results of Population One, the fit measures for the CFA are all within acceptable ranges (Hair et al., 1998) as were the construct reliability and the variance explained.

6. CONCLUSION, LIMITATIONS AND IMPLICATIONS FOR FUTURE RESEARCH

This paper proposes a step-wise methodology for the development of a scale measuring intent-to-act

ethically, which is a step forward in the ethical decision-making process. However, the co-authors are cognizant of the following limitations, which would be addressed in future research papers. First, it depended on self-report responses to the questions based upon their own personal ethical beliefs. Second, although the first study did not indicate a need to use a social desirability scale, it is possible that participants in this study may have responded to questions in a certain way to enhance traits they deemed desirable. Third, the scale demonstrated sufficient reliability, however it has not come under the scrutiny of psychometricians. Fourth, some researchers have found that developmental levels related to ethics are greater for persons with more education and with increased age (Kohlberg, 1969; Rest, 1986). The sample of 70% university employees is likely to have been more highly educated than other populations. Perhaps the outcome would have been different with less educated and younger populations or with

2=Construct Reliability

other types of organizations such as government, nonprofit and for-profit organizations. Finally, qualities related to the scenarios may have also presented limitations in this study.

A plethora of research exists on ethical decision-making and many empirical studies have relied on a single measure of ethical intent. Moving forward, research in the arena of ethical decision-making should concentrate on arriving at a common conceptual understanding and framework that includes creating a clearer conceptualization of ethical intent which may lead to improved approaches to measurement. Other recommendations for future research are:

- This study could be replicated within other contexts. This could mean other ethical decision-making scenarios with different magnitudes of intensity, or other contexts such as conflict behavior which is another important behavior in organizations and a management concern.
- Similar studies need to be replicated with samples other than one dominated by university employees.
- Similar need to be replicated in other cultures to determine if it is reliable in a global environment.
- A validation study of the intent scale needs to be conducted.
- The intent scale can be further refined. A modified scale with a smaller number of items may prove to be sufficiently reliable for certain research.

Although much more needs to be done, these studies provide us with a useful step in the right direction toward a reliable measure for this important construct which has been missing in the ethical decision-making research, which often relies upon ethical intent as a proxy for ethical behavior.

This paper proposes a construct to measure ethical intent and tests its robustness by applying it two different populations (students and professionals). This paper tries to bridge a research gap in business ethics. Specifically, this line of research has become timely and relevant to recent issues such as the current economic crisis lead by the sub-prime banking failures (Terhune & Berner, 2008) and the failures of Enron and Tyco are extreme examples of failure of societal members to act ethically.

The findings are preliminary in nature but promising. The co-authors argue that additional items could be created to measure intent-to-act ethically that could demonstrate sufficient reliability. The co-authors suggest that the scale (or some refinement of it) may be useful for research related to intent to act ethically. The items appear to be sufficiently distinct to provide variance in measurement, yet form a consistent scale measuring a single factor.

APPENDIX A

Scenarios

Population One

Actor Perspective Scenario. Pat decided to buy a new laptop computer. Pat was able to purchase a state-of-the-art computer at a very affordable price, but the trade-off for getting the low price was that it came with a very limited amount of pre-loaded software. One day at work Pat decided to install the software licensed exclusively to the workplace onto the new laptop computer recently purchased for personal use.

  Observer Perspective Scenario. Chris and Lee share the responsibility for ordering and distributing supplies for their department. In this week's shipment of supplies, Chris discovered a package containing several laser printer ink cartridges that did not appear on the invoice. Chris asked if Lee knew anything about the ink cartridges that were included in the week's order, and mentioned that they looked like the same type that fit Chris' printer at home. Both Chris and Lee concluded that the office supply store sent the cartridges in error. At the end of the day, Lee saw Chris put the cartridges into a bag and take them home. Lee decided not to say anything to Chris about it, and not to tell anyone about what occurred.

Population Two

Actor Perspective Scenario. Pat decided to buy a new laptop computer. Pat was able to purchase a state-of-the-art computer at a very affordable price, but the trade-off for getting the low price was that it came with a very limited amount of pre-loaded software. One day at work Pat decided to install the software licensed exclusively to the workplace onto the new laptop computer recently purchased for personal use.

  Observer Perspective Scenario. Pat's co-worker decided to buy a new laptop computer. Pat's co-worker was able to purchase a state-of-the-art computer at a very affordable price but the trade-off for getting the low price was that it came with a very limited amount of pre-loaded software. One day Pat saw the co-worker in the office installing software, licensed exclusively to the workplace, onto the new laptop purchased for personal use. Pat decided to ignore the situation.

  Jennie Johnson earned a Ph.D. from Virginia Polytechnic Institute and State University. Currently she teaches management at The University of Texas at Brownsville. She has twenty-five years of experience in human resource management, organizational development, and performance improvement prior to entering academia. Her research interests are ethical decision making, organizational justice, and conflict in the workplace. Dr. Johnson can be reached at jennie.johnson@utb.edu.

  Tom Coyle teaches management at The University of Texas at Brownsville. He received his Ph.D. from The University of Texas Pan American. He has thirty years industrial experience in international operations, manufacturing and engineering. His research interests include business ethics, supply chain management and business sustainability. Dr. Coyle can be reached at tom.coyle@utb.edu.

Chapter 77

Toward a Unifying Framework for Defining Internal Human Resource Flexibility:
A Proposal Based on the Resource-Based View Approach

Inmaculada Beltrán Martín
Universitat Jaume I, Spain

1. ABSTRACT

A flexible workforce is emerging as a critical success factor to counteract certain organizational rigidities and to guarantee organizational competitiveness in challenging environments. This chapter provides a review of the relevant definitions and classifications of human resource (HR) flexibility that have appeared during recent years. Furthermore, the chapter presents a definition of internal HR flexibility based on the resource-based view approach. From this perspective, HR flexibility is defined as a multidimensional concept. Specifically, this chapter assumes that employees are flexible when they show intrinsic flexibility (i.e. they can easily move between tasks and roles), modification flexibility (i.e. they alter their skills and/or behaviors to adapt to new circumstances), and relational flexibility (i.e. they participate in collaborative activities).

2. INTRODUCTION[1]

Tendencies such as the increasing spread of market globalization, new technological developments, the reduction of product life cycles and aggressive competition, are generating high levels of environmental changes and uncertainty for organizations of all types (Volberda, 1996; Sanchez, 1997). These circumstances require rapid responses through adaptations of organizational attitudes and capabilities, which lead to innovative management approaches and organizational methods (Bueno, 1996: 262).

Traditional sources of competitive advantages are changing and it is imperative to deploy new strategies to successfully compete under changing external conditions. In this context, flexibility is emerging as a competitive weapon that allows organizations to counteract current market evolution and competitive levels (Ahmed et al., 1996; Volberda, 1996). Flexibility is a broad concept that can refer to operational issues such as manufacturing flexibility, or to strategic decisions such as alterations in the organization's product-market combinations. All these factors are associated with the organization's efforts to adjust available means to external challenges. Regardless of the specific response adopted by organizations, it is broadly believed that environmental dynamism forces managers to pay increasing attention to the management of the organization's social issues (Wright and Snell, 1998).

Nowadays, organizations require a new type and level of contribution from their workforce. In order to successfully compete under dynamic conditions, people's performance of a fixed set of prescribed tasks is no longer considered adequate. Instead, competitive advantage comes from employees who are engaged in broad open-ended and interdependent roles (Campbell, 2000; Parker, 2000). The recognition of the importance of employee flexibility for modern organizations has led to a body of research on labor flexibility or human resource flexibility[2]. Broadly speaking, HR flexibility refers to the possibility of varying the quality and quantity of personnel to suit changes in the environment (Gouswaard et al., 2001; Peiró et al., 2002). Interest in these questions arose in the early 1980s and has expanded during recent decades, as can be seen from the development of large-scale studies (e.g. Brewster et al.'s, 1994 study of labor flexibility strategies in Europe) or from the appearance of academic journal special issues on human resource flexibility[3].

Due to the growing interest in people as a source of flexibility, it is worth analyzing whether HR flexibility has the same meaning for every-

one. Literature on HR flexibility has generated a large number of definitions of this term and is sometimes difficult to have a full picture of these contributions. The first purpose of this chapter is to provide a review of the relevant definitions and classifications of HR flexibility that have appeared during recent years. In this vein, researchers have emphasized two distinct strategies of HR flexibility: external and internal HR flexibility. On the one hand, external HR flexibility refers to alterations in the volume of labor employed, and it coincides with the use of "flexible employment contracts" (Storey et al., 2002) such as short-term temporary workers, temporary help agency or part-time employees (Kalleberg, 2001). On the other hand, internal HR flexibility refers to the flexibility manifested by the pool of human resources in the organization at a certain point of time. From this point of view, higher flexibility can be attained when managers develop and encourage employees to adopt permeable and expandable work roles (Tsui et al., 1997).

Of these two strategies, recent studies have recommended to increasingly rely on internal HR flexibility strategies, which are assumed to result in mutual gains for both the organizations and their employees (Valverde et al., 2000: 650; Kalleberg, 2001: 482). The relevance of internal HR flexibility in modern organizations demands a clear definition of the concept. In this regard, some recent studies have attempted to advance the conceptualization of internal HR flexibility, by delimiting employee features that may contribute to develop organizational responses to external challenges (e.g. Pulakos et al., 2000, Shafer et al., 2001). However, a review of these studies shows a lack of congruence among the dimensions and variables that the previous literature has considered as components of this concept, mainly for two reasons: first, because existing studies belong to a variety of different research fields, and second, because some of these studies lack a clear theoretical basis to guide the definition of the internal HR flexibility components (Breu et al., 2001).

Therefore, it is important to address the study of internal HR flexibility with a well-delimited theoretical approach that provides a structured logic for the conceptualization of this concept.

In line with several scholars (Dyer and Shafer, 1999; Chadwick and Cappelli, 1999, 2002), I believe that the Resource-Based View (RBV) provides interesting insights for developing a definition of internal HR flexibility that complements prior conceptualizations of the term. The RBV, critical for the development of Strategic Human Resource Management (SHRM) research, seems appropriate to address the conceptualization of the internal side of HR flexibility due to its organization-focused orientation that emphasizes the contribution of the internal resources of the firm to the organization's success and the consideration of human resources as one of the key resources of a firm (Wright et al., 1994). In particular, some authors have taken the RBV approach to identify a set of criteria that define flexible resources (Sanchez, 1995, 1997), which provides a systematic framework to delimit the features that define a flexible workforce. Thus, the second purpose of our research is to apply these criteria to the analysis of internal HR flexibility, thus providing a definition of this concept from the RBV premises.

3. BACKGROUND

The purpose of this section is to provide an overview of the HR flexibility concept, given the relevance of employees' flexibility for modern organizations and the lack of agreement in the literature regarding its meaning. In doing so, I first introduce different modes of conceptualizing HR flexibility starting with the model of the flexible firm and following with the dimensional interpretation of HR flexibility, based on the distinction between internal and external HR flexibility. Following this, in the second section I propose a general framework for the definition

of HR flexibility based on the RBV premises and in the third section, I apply this framework to the definition of HR flexibility.

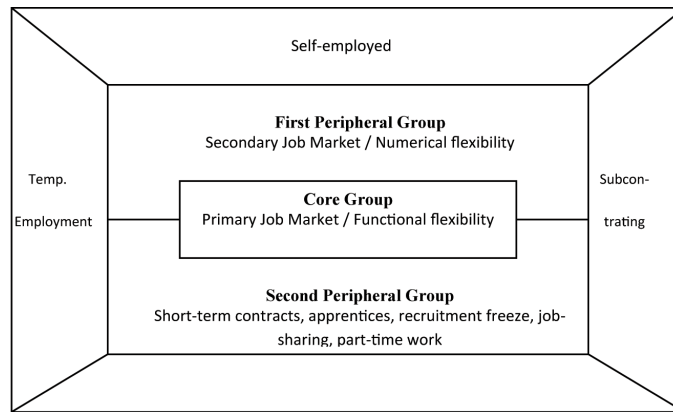
3.1. Modes of Conceptualizing Human Resource Flexibility

HR flexibility emerges as a key aspect in organizations operating in uncertain environments and whose efforts are oriented towards the development of rapid and diverse responses. It is believed that neglecting social issues in favor of technological and cost variables can lead to the failure of flexibility initiatives in organizations (Upton, 1995; Karuppan, 2004). The *Model of the Flexible Firm*, formulated by Atkinson (1984), Atkinson and Gregory (1986) and Atkinson and Meager (1986) is the most well known framework on HR flexibility and one of the first studies to deal with the multidimensionality of HR flexibility. Other recent studies coincide with the idea that human resource flexibility is a multidimensional concept and complement the Atkinson et al. framework.

3.1.1. The Model of the Flexible Firm

One of the most popular models of HR flexibility is the *Model of the Flexible Firm*, developed at the Institute of Manpower Studies (Atkinson, 1984; Atkinson and Gregory, 1986; Atkinson and Meager, 1986). According to this model, different groups of employees provide the organization with different sources of flexibility, as depicted in Figure 1.

First, there is a core group of employees ("primary job market") who are full-time, manifest high levels of commitment towards the organization and possess a broad pool of skills. Employees within this group are usually managers, designers or technicians and due to their attributes, they can easily move between functions and roles, accepting responsibilities that go beyond their job descriptions (Valverde et al., 2000: 651). In other words, they manifest "functional flexibility".

Figure 1. The model of the flexible firm (Source: Atkinson (1984))


Second, organizations can also obtain flexibility from peripheral groups of employees, by altering the size of the workforce according to organizational needs (i.e. "numerical flexibility"). In this regard, Atkinson distinguishes between a first and a second peripheral group of employees. The former group – secondary job market – is made up of full-time employees who do not perform activities others than the duties specified in their job descriptions. The second peripheral group comprises fixed-term or part-time employees, among others. Organizations can reduce or increase the number of peripheral employees without incurring high costs because these employees do not belong to the central activities of the organization (Mayne et al., 1996).

Despite the popularization of the *Model of the Flexible Firm* in studies on HR flexibility, several authors concur that the work of Atkinson and his colleagues suffers from a lack of solid theoretical underpinnings (Pinch et al., 1991; Blyton and Morris, 1992; Kalleberg, 2001). Kalleberg (2001) considers that this model does not provide a clear definition of what constitutes the "core" and the "peripheral" workforce. Kalleberg (2001) also points out that the *Model of the Flexible Firm* assumes that core and peripheral employees belong to completely separate parts of the organization, thus ignoring the potential interrelationships and

collaborative processes that can emerge between core and peripheral groups.

These weaknesses do not prevent Atkinson's model from representing an important advance in disentangling the meaning of HR flexibility. The distinction between functional and numerical flexibility has been adopted by a number of studies in the literature since the publication of the model (e.g. Gooderham and Nordhaug, 1997; Creagh and Brewster, 1998; Friedrich et al., 1998) and it constituted a critical step in the multidimensional interpretation of HR flexibility. In line with this framework, a further set of studies has contributed to the multidimensional definition of human resource flexibility. In the next section, I provide a more detailed review of the dimensions of HR flexibility.

3.1.2. A Multidimensional Interpretation of HR Flexibility

The *Model of the Flexible Firm*, together with other studies within the SHRM field, introduced classifications of HR flexibility types based on two interrelated dimensions: a) scope of the analysis and b) nature of variations in the workforce.

In terms of the *scope of the analysis*, HR flexibility can be interpreted as the flexibility that can be attained from the external labor market, beyond

Figure 2. A multidimensional view of HR flexibility (Source: Adapted from Looise et al. (1998) and Peiró et al. (2002))

	External	Internal
Quantitative	Modifications in the number of employees. Contract flexibility (e.g. short-term contracts)	Modifications in the number of hours worked by current employees. Time flexibility (e.g.
Qualitative	Modifications in the content of work carried out by external employees. Contract flexibility (e.g.	Modifications in the content of work of the existing workforce. Functional flexibility (e.g. job rotation)

organizational boundaries and current workforce (external HR flexibility) or as the flexibility manifested by the pool of human resources in the organization at a certain point of time (internal HR flexibility) (Looise et al., 1998; Arulampalam and Booth, 1998; Kalleberg, 2001). The *nature of the variations in the workforce* can involve qualitative modifications in the tasks performed by the workforce or quantitative modifications in the number of employees or in the number of hours worked (Figure 2).

External HR Flexibility

External HR flexibility focuses on the set of potential employees available to the organization and refers to the improvements in organizational flexibility as a result of alteration in the volume of labor employed. It usually coincides with the use of the external labor market when the organization needs it (e.g. with temporary employees). External HR flexibility has been the subject of numerous studies, which associate HR flexibility with atypical working practices, broadly called flexible employment contracts (Storey et al., 2002) or flexible working patterns (Volberda, 1998). This type of flexibility resembles the "quasi spot contract" in Tsui et al.'s (1997) model, which rests on a pure economic exchange model and attempts to create a market-like flexibility so that

the employer is free to hire and fire employees. According to this model, the employer offers short-term, purely economic inducements in exchange for well-specified contributions by the employee.

Much of the literature considers that external HR flexibility is related to *quantitative* modifications in the amount of work available to organizations, providing the organization with a higher or lower number of employees according to its needs (e.g. with seasonal employment to cover "peaks" of work demands) (Peiró et al., 2002). It corresponds with the notion of numerical flexibility introduced in Atkinson's model. Numerical flexibility[4] entails flexibility "on the extensive margin" (Beatson, 1995; Michie and Sheehan-Quinn, 2001) and refers to the ability to adjust the volume of work to changes in environmental forces.

From this quantitative interpretation, organizations can attain higher numerical flexibility through a set of non-standard employment relations or atypical working patterns, whose aims are to limit either the duration of the employment relation or the number of hours worked (Mayne et al., 1996). First, the organization has greater freedom to adjust the volume of work to changing circumstances when contracts have a predetermined duration. This can be achieved through temporary workers hired for finite periods, or through temporary help agency employees. These employees may be highly skilled (e.g. consultants, independent professionals) or low skilled (e.g. food service) (Kalleberg, 2001). Second, organizations can alter the number of hours worked in the organization by recruiting part-time workers.

Qualitative external HR flexibility only appears in specific cases, such as when the organization uses independent consultants that assume responsibility for more than one task in the organization (Looise et al., 1998).

Internal HR Flexibility

When referring to *internal HR flexibility*, attention centers on the current workforce of the organiza-

tion and it is defined as the extent to which existing employees contribute to the organization's flexibility. Several authors have interpreted HR flexibility from this point of view (Table 1), such as Molleman and Slomp (1999), who associate labor flexibility with the responsiveness of a fixed team of employees (referred to as the "labor system" in their study). Molleman and Slomp's (1999) study is formulated under the constraint of the "autonomy of the labor system". This refers to the extent to which the organization can deal with external challenges through its current set of employees, without employing outer-system capacity (i.e., without recruiting new employees). Similarly, Chow (1998) and Karuppan (2004) adopt an internal vision of HR flexibility, as both scholars propose that flexibility depends on employees' adjustments in the development of their tasks according to the organization's needs (Table 1).

Internal flexibility is similar to the "mutual investment" approach in Tsui et al.'s (1997) framework[5]. According to these authors, higher flexibility can be attained when managers develop and encourage employees to adopt permeable and expandable work roles. Managers adopting this approach care about employee well-being and professional careers and, in exchange, the employee's obligations and contributions include working on job assignments that fall outside prior agreements or expertise. Employees managed through this approach easily accept job transfers when requested by the employer to do so.

The meaning of internal HR flexibility can also be examined by analyzing its nature. To this end, I include the concepts of quantitative and qualitative HR flexibility in the analysis of internal HR flexibility (Figure 2).

On the one hand, *quantitative* internal HR flexibility is related to "time flexibility" (Peiró et al., 2002), and implies that the workforce of the organization is willing to enhance the number of hours worked (e.g. overtime work or variable working time).

On the other hand, *qualitative* internal HR flexibility entails modifications in the content of work in accordance with employee qualifications, and is usually associated with the ease with which employees move between tasks, for instance through job rotation or multi-tasking (Looise et al., 1998). This is the most commonly adopted definition of HR internal flexibility, and it corresponds with the idea of functional flexibility in the *Model of the Flexible Firm*. That is, qualitative internal HR flexibility refers to the adaptability of the internal workforce to face non-routine circumstances and events that demand creativity and initiative (Huang and Cullen, 2001: 34). It is usually associated with the employee's ability to undertake a range of tasks and/or employ a variety of skills (Blyton and Morris, 1992). For this reason, functional flexibility has also been termed "flexibility on the intensive margin" (Michie and Sheehan-Quinn, 2001).

Functional flexibility involves the processes of increasing employees' range of skills in such a way

Table 1. Definitions of internal human resource flexibility

Study	Definition
Molleman and Slomp (1999)	Responsiveness of a *labor system* (fixed team of employees) to variation in the supply and demand of labor, without resorting to outer-system capacity
Chow (1998)	Organizational abilities to constantly motivate employees who possess multiple and firm-specific skills so as to adjust their tasks to the needs of the organization
Karuppan (2004)	Job enlargement, i.e. the number of tasks or operations performed, the number of machines operated, intradivisional jobs that a worker can perform, and intradivisional workstations at which an operator can work

that they acquire the capacity to work across traditional occupational boundaries (Cordery, 1989; Cordery et al., 1993). In this regard, functional flexibility is linked to the human capital of the organization (i.e. employee collective skills). This strategy allows organizations to quickly respond to changes in products, production methods and technology since it enables the firm to allocate employees where and when needed easily and without extra costs (Atkinson and Meager, 1986). Consequently, the operational concept that underlies functional flexibility is *labor substitutability* or the extent to which one employee in a job can be substituted by another. This substitutability can be complete, when employees carry out other jobs as required (e.g. a waiter is transferred for the whole day from the restaurant to the bar), or incomplete, which comprise "boundary loosening approaches" oriented towards the combination of certain aspects of different jobs (e.g. the restaurant hostess helps in the bar in the early evening before she gets busy or goes into the kitchen) (Riley and Lockwood, 1997).

The conceptualizations of HR flexibility presented in this section on the whole adopted a practice-oriented perspective. That is to say, previous studies on HR flexibility included a set of recommendations for managers that strived to attain high levels of flexibility in their organizations. While this *managerial perspective* of HR flexibility offers helpful recommendations for daily practice in organizations pursuing flexibility, from a theoretical perspective they are to some extent incomplete. According to Looise et al. (1998), the analysis of HR flexibility has ignored relevant frameworks in the human resource management field. For this reason, the connection between the HR flexibility field and SHRM research has been weak, thus preventing researchers from analyzing either the antecedents of HR flexibility (including the role of HRM strategies) or the consequences that HR flexibility strategies have for employees (e.g. satisfaction, commitment, etc.) and organizational outcomes. The model of the flexible

firm formulated by Atkinson and the subsequent studies on the concept of HR flexibility can be considered as suitable starting points for developing a more comprehensive definition of HR flexibility. I coincide with Looise et al. (1998) in considering that greater efforts should be made to define HR flexibility from a more solid theoretical framework. In the following sections, I focus on the conceptualization of HR flexibility based on the RBV.

3.2. A Framework of HR Flexibility from a RBV Approach

The RBV approach is a prominent framework in the SHRM literature. The RBV, with its emphasis on the internal workings of organizations, conceives employees as sources of sustainable competitive advantage, and it has enriched theoretical and empirical research on the influence of human resource-related issues on organizational performance (Lado and Wilson, 1994; Wright et al., 1994; Boxall, 1996).

In line with several scholars (Dyer and Shafer, 1999; Chadwick and Cappelli, 1999, 2002), I believe that the RBV provides interesting insights for developing a definition of HR flexibility that complements prior conceptualizations of the term. Others scholars, such as Wright and Snell (1998), Lepak et al. (2003), Bhattacharya et al. (2005) and Beltrán et al. (2009) have adopted the RBV perspective to analyze HR flexibility.

In this section I present a general framework that can serve as a guide to adapt the RBV to the definition of HR flexibility and to identify the features that characterize a flexible workforce. In doing so, I try to clarify two questions that should be taken into account when applying the RBV premises in the field of HR flexibility. First, I discuss the internal focus that the RBV posits on the study of HR flexibility and that differentiates it from previous definitions of the term. Secondly, I introduce the concept of flexible resources from a RBV approach.

3.2.1. The Internal Nature of HR Flexibility: A Review of Prior Studies

The RBV has been proved to be a valid framework in the field of SHRM, and it provides a theoretical basis for moving knowledge about HR flexibility forward. The RBV has an organization-focused orientation, as it considers that sources of competitive advantage come from the internal resources of the firm. Resources are stocks of available factors that are owned or controlled by the organization (Peteraf, 1993). Thus, the application of the RBV in the conceptualization of HR flexibility means that the level of analysis lies in *internal human resource flexibility*. By focusing on internal HR flexibility, a longer-term perspective on organizational competitiveness is adopted. As Murphy (1999) states, organizations that rely too heavily on contingent workers (i.e. external HR flexibility) run the risk of depleting the pool of available high-quality workers and are likely to fail to develop the core workforce they need. Although short-term gains might be realized by replacing permanent employees with contingent workers, the long-run implication of an over-reliance on contingent workers can be fatal to organizations.

Thus, from the perspective of the RBV, it is important to examine which features of the organization's current workforce are relevant in achieving higher levels of organizational flexibility. Specifically, the conceptualization of human resources from the RBV highlights the consideration of employees as "cognitive and emotional beings". Thus, from this theoretical model, the definition of HR flexibility should be based on the employee attributes that can best contribute to generating flexibility in organizations. By focusing on the skills, attitudes and behaviors of employees, the RBV assumes that individual members are the important resource in organizations, rather than the practices and procedures used by the firm (e.g. use of temporary work contracts) (Wright et al., 1994). Consequently, a further benefit of the RBV as the guiding framework is that it examines HR

flexibility from the point of view of the variables that may be influenced by organizational human resource decisions and practices (Wright et al., 1994; Dyer and Shafer, 1999). Defining the dimensions of HR flexibility in terms of employee characteristics is important in order to make advances in the activities that best promote them. For example, it is important to know what kind of skills are necessary to promote flexibility in order to design training activities that encourage them or staffing practices that select employees with these skills (Pulakos et al., 2000: 614).

Some recent studies have attempted to advance the conceptualization of internal HR flexibility by delimiting a set of employee attributes (skills, attitudes, behaviors, etc.) that best contribute to the generation of flexibility in organizations. For example, Wright et al. (1994), by adopting a logical-incremental perspective (Quinn, 1980), suggest three ways by which employees can contribute to the organization's flexibility. According to these authors, to be flexible employees should manifest a proclivity to detect external changes and appropriate responses, together with the abilities to implement the required activities.

Pulakos et al. (2000) develop a taxonomy of "adaptive job performance" from an organizational behavior point of view. These authors, through a review of previous literature on adaptability at the individual, team and organizational levels[6], offer a conceptualization of flexible-related aspects of employee performance that differentiates between eight dimensions (handling emergencies or crisis situations, handling work stress, solving problems creatively, dealing with uncertain work situations, etc.).

Breu et al. (2001) review several conceptualizations of HR flexibility and introduce an operationalization of workforce agility based on twelve attributes, such as responsiveness to external change, speed of skill development, knowledge sharing, virtual team working, implementation of collaborative technologies, etc.

Shafer et al. (2001) carried out an exploratory study in a healthcare organization that allowed them to extract a set of agile attributes, in terms of people's flexible competencies and behaviors. Dyer and Shafer (2002), following the conclusions of Shafer et al.'s (2001) exploratory study and focusing exclusively on employee behaviors, suggested their own conception of HR flexibility, which (as the same authors affirm, pp.15) is a *tentative list* of requisite flexible attributes. These authors group flexible behaviors into three categories: 1) proactivity (includes initiative and improvisation), 2) adaptiveness (includes assumption of multiple roles, rapid redeployments and spontaneous collaboration), and 3) generativeness (referring to willingness to learn and share knowledge and information). Similarly, Kara et al. (2002) carried out an exhaustive review of previous literature on flexibility and proposed four human resource flexibility indicators, namely, keenness to improve skills, functional flexibility, work group and willingness to change.

In Table 2, I offer a summary of the abovementioned flexible variables. In elaborating this table, I have attempted to establish correspondences between the concepts considered by these studies in order to identify common themes and differences among researches.

A review of these studies shows that some limitations still exist regarding the conceptualization and operationalization of internal HR flexibility. On the one hand, as regards the conceptualization of this term, there is still much debate over what constitutes internal HR flexibility. A review of previous studies reveals that definitions of this concept are dispersed across various literatures (Breu et al., 2001: 23), such as strategic management (Wright et al., 1994; Shafer et al., 2001; Bhattacharya et al., 2005), quality management (Verdú, 2002), psychology (Pulakos et al., 2000), information technologies (Breu et al., 2001) or manufacturing flexibility (Kara et al.., 2002), which makes it difficult to draw unequivocal conclusions about which aspects to include as

components of internal HR flexibility. In addition, some of these studies employ an exploratory methodology (Breu et al., 2001; Shafer et al., 2001; Kara et al., 2002) to elaborate tentative lists of flexible employee characteristics, rather than relying on a theory that delimits the dimensions of the concept and their interrelationships. Finally, studies differ in their focus when defining these dimensions, with some studies emphasizing employee attributes and characteristics (Wright et al., 1994; Pulakos et al., 2000; Breu et al., 2001; Shafer et al., 2001; Kara et al., 2002; Bhattacharya et al., 2005) and others combining this employee-focused definition with organizational activities associated with the improvement of internal HR flexibility, such investments in training (Volberda, 1998; Verdú, 2002).

For these reasons, there is no agreement on the dimensions that integrate the internal HR flexibility concept, as can be seen in Table 2. For example, while employee willingness to share information and knowledge is considered a dimension of internal HR flexibility by Breu et al. (2001), this question is ignored by other scholars. A similar discrepancy appears with regards to employee keenness to change or organizational commitment, among others. The lack of consensus over the internal HR flexibility concept presents a hurdle to the understanding of the meaning of this term as well as to the analysis of its antecedents and consequences in the organization (Breu et al., 2001). Therefore, a clear theoretical perspective must be introduced to define this concept that will help to integrate previous approaches and clarify the meaning of the construct (Looise et al., 1998).

I seek to bridge these gaps by applying the RBV premises in order to offer a systematic theoretical analysis of internal HR flexibility. In doing so, I apply the features of flexible resources to the definition of internal HR flexibility to extract the dimensions that integrate this concept from the RBV point of view. The next section provides an overview of the features of flexible resources from the RBV that will guide the rest of the chapter.

Table 2. A review of internal human resource flexibility characteristics

Wright et al. (1994)	Pulakos et al. (2000)	Breu et al. (2001)	Shafer et al. (2001)	Dyer and Shafer (2002)	Kara et al. (2002)
Detection of environmental changes			Capacity to pursue new business opportunities and threats	Initiative to spot threats and opportunities in the market-place	
Capabilities to identify strategies in response to the detected changes					
Implementation of strategies according to environmental changes		Responsiveness to external change	Take action to minimize potential effects of threats		
		Benchmarks for skill assessment			
	Learning work tasks, technologies, and procedures	Speed of skill development		Abilities to learn	Craft (increasing labor skills)
		Speed of adaptation to new work environments		Assumption of multiple roles Rapid redeployments	Functional flexibility
		Speed of information access			
		Speed of information systems change			
		Use of mobile technologies			
		Workplace independence			
	Demonstrating interpersonal adaptability	Collaborative technologies		Spontaneous collaboration	Group work
		Virtual team working			
		Knowledge sharing		Knowledge and information sharing	
		Employee empowerment			
			Commitment		
				Improvisation	
			Accountable		
			Efficacy		Willingness to change

3.2.2. Resource Flexibility Dimensions

The RBV has formed an integrating ground for most of the work in SHRM in the past decade. As Wright et al. (2001: 703) affirm, "the RBV has become by far, the theory most often used within SHRM, both in the development of theory and the rational for empirical research". The RBV provides a rich and integrated approach that helps focus and organize research efforts in the strategic human resource management field and enables the practice of this field to become a truly strategic discipline (Ulrich, 1997; Colbert, 2004). The RBV has provided a rationale for how a firm's human resources could constitute a potential source of sustainable competitive advantage, but its premises have been also considered central to address flexibility issues (Sanchez, 1995, 1997). The novelty and speed of external challenges that characterize dynamic environments recommend the analysis of flexibility from the point of view of the firm's strategic choices and actions that are appropriated to those challenges, with researchers considering flexibility as an organizational property (Evans, 1991; Volberda, 1998). Firms improve flexibility and therefore, their chances for being successful in an uncertain environment, by having access to flexible resources that allow them to create a range of strategic options (Sanchez, 1997; Wright and Snell, 1998). Therefore, the RBV has been applied to study the flexibility of different resources -flexible production technologies, information systems, etc.- and how they provide the organization with strategic alternatives to counteract external pressures. (Parthasarthy and Sethi, 1993; Garud and Kotha, 1994; MacDuffie, 1995). If we consider that people are critical resources in today's organizations, the RBV provides as well an interesting framework to address the study of their flexibility (Wright and Snell, 1998; Dyer and Shafer, 1999; Bhattacharya et al., 2005).

Similarly to the role that value, rareness, durability and inimitability play in the generation of sustainable competitive advantages (Barney,

Table 2. Continued

Wright et al. (1994)	Pulakos et al. (2000)	Breu et al. (2001)	Shafer et al. (2001)	Dyer and Shafer (2002)	Kara et al. (2002)
	Handling emergencies or crisis situations				
	Handling work stress				
	Solving problems creatively		Focused		
	Dealing with uncertain and unpredictable work situations		Comfortable with ambiguity		
	Demonstrating cultural adaptability				
	Demonstrating physically oriented adaptability				
			Business-driven		

1991), the RBV suggests a set of criteria that define flexible resources, which can be applied to the analysis of HR flexibility. The RBV approach considers that flexible resources, when managed through appropriate organizational activities and in accordance with information about external events, provide the organization with a "strategic option bundle" (i.e., with access to various viable paths for both exploration and exploitation of the environment) (Helfat and Raubitschek, 2000; Mathews, 2002; Sanchez, 2004).

According to the RBV, organizational resources are flexible when they are suppliers of *novel services*. This is possible when resources 1) can be used in several ways or 2) can be easily transformed so as to be valid under novel circumstances (Penrose, 1959; Galunic and Rodan, 1998; Sanchez, 2004). Drawing from these studies, it is possible to extract the dimensions that define resource flexibility. The first question (use of resources in various ways) corresponds to the intrinsic flexibility of resources. Concerning the second question (transformation of resources), the organization can obtain new resources from existing ones so long as they are easily modifiable or combinable with other resources.

Therefore, from the RBV approach, resource flexibility is a multidimensional concept, whose components are: a) *intrinsic flexibility*, that is, resource applicability to different situations, b) *modification flexibility* or the extent to which a resource can be easily transformed (with low costs and time) in order to be used in new circumstances, and c) *relational flexibility*, which facilitates the combinability of one resource with others.

Resource Intrinsic Flexibility

The intrinsic flexibility of a resource refers to its applicability in multiple situations. Intrinsic flexibility corresponds to resource versatility, which refers to the number of alternative uses to which the resource can be applied without being modified. Examples of versatile (or multiple-use)

resources are: cash, general-purpose machines, mail order and internet-based marketing channels, information technologies, flexible production systems, a group of engineers with capabilities valid for a range of products, etc. (Sanchez, 1995, 2004; Ghemawat and Del Sol, 1998). All these resources are valuable in situations characterized by high resource obsolescence, rapid technological changes or uncertainty about future technology, among others factors (Wernerfelt and Karnani, 1987; Sanchez, 1997).

In contrast, non-versatile resources are called specialized or specific resources (Sanchez, 1997; Ghemawat and Del Sol, 1998) and are only highly efficient in limited uses. This kind of resource constrains the options available for the organization to increase or decrease production volume or to change from one product to another. For instance, Friedli et al. (2004), when exposing the obstacles to becoming flexible faced by a manufacturing organization (*Fashion Inc.*), detected that specificity of implicit and explicit knowledge required for the smooth working of production sites imposed constraints on the relocation of such facilities. As a result, when the need to expand the product range arose, costs of switching production facilities forced the firm to outsource production or to adjust its internal structure.

The relevance of resource intrinsic flexibility derives from the fact that the firm can apply these resources to a variety of situations (e.g. Sanchez, 1995, 1997). When the organization detects specific environmental contingencies that require rapid responses and when it activates the appropriate resource allocation routines (Burgelman, 1994; Malone and Crowston, 1994), intrinsic flexibility guarantees that internal resources are applied in different situations according to organizational needs, and at the right moment.

In summary, resources that manifest high intrinsic flexibility guarantee their application by the organization to a wide range of alternative uses. Consequently, the firm can face new situations with its existing resources, without the need to

acquire, develop or modify them. In other words, the organization has a great number of paths or degrees of freedom to adjust its strategy (Evans, 1991; Teece et al., 1997).

Resource Modification Flexibility

Apart from their general applicability, "resources also differ in their flexibility to be incrementally improved" (Sanchez, 2004: 526). Thus, the second dimension of resource flexibility corresponds to modification flexibility. This refers to resource malleability, or the amenability of resources to change and their capacity to accommodate multiple transformations (Johnson et al., 2003). Modification flexibility involves changes in the nature of the resource that make it valid for application to new uses (i.e. resource extendability), without incurring high costs that offset the benefits obtained from the new resource (Sanchez, 2004).

For instance, machines equipped with electronic controls are highly malleable, since the organization can easily add new functionalities by, for example, adding a fax card to the computer. Other examples of malleable resources are certain organizational techniques, such as management by objective systems, whose evaluation criteria can be easily adapted to each employee and position within the organization (Wright and Snell, 1998). Nonetheless, the degree of malleability of a resource is dependent upon its nature, and is higher in knowledge-based resources (Galunic and Rodan, 1998). Thus, employee know-how, organizational learning or commitment are highly malleable resources that are easily modified and improved with suitable organizational activities.

The possession of malleable resources enables the organization to easily transform (with low costs and time) available resources in order to guarantee their appropriateness in novel situations. Thus, the impact of modification flexibility on organizational responses is similar to the benefits provided by intrinsic flexibility, but in this case the focus is on the longer term, and organizations

need to identify potential improvements in current resources that can make them suitable for different uses. In this regard, firms should analyze internal knowledge, extend existing resources with the accumulated organizational knowledge and leverage knowledge into new applications (Mendelson, 2000; Pavlou and El Sawy, 2004).

To continue with the example used previously, when analyzing the transformation process of *Fashion Inc.* to become a more flexible organization, Friedli et al. (2004) observe that the success of this process was greatly due to the transformation of internal production facilities. Specifically, this organization divided its production sites into three sub-units, each of them providing flexible responses to the specific demands of a group of customers.

Resource Relational Flexibility

The final dimension in my analysis of resource flexibility is relational flexibility, which facilitates the emergence of a new combination of resources. Combinable resources can easily be reconfigured, that is to say, linked to each other so that they can jointly achieve a broader objective (Galunic and Rodan, 1998). While modification flexibility implies resource transformations, relational flexibility only requires altering linkages between resources. These new combinations do not necessarily involve changes in the nature of the resources (Mathews, 2002).

Resource relational flexibility has received attention from a variety of fields. In the innovation literature, Henderson and Clark (1990: 12) state that the essence of architectural innovation is the reconfiguration of an established system to link together existing components in a new way. In the field of production management, modular product designs constitute an alternative to traditional design systems, which can increase a range of product model variations, the creation of new families of derived product models and the development of new products through the

substitution of upgraded components of previous products (Sanchez, 1995). Resource combinability (or "relatedness") has also received attention in studies analyzing relations between industries, organizations or organizational segments (Fan and Lang, 2000). For instance, in territorial agglomerations of organizations, firms share some knowledge-based resources that are combined with each organization's specific knowledge. This can result in the generation of new resources that represent a source of flexibility. On the other hand, cooperation agreements favor resource combinability and enhance the likelihood of a wider pool of knowledge being generated. In such cases, intangible resources are more easily combined with others such as organizational cultures, information and communication technologies, managerial processes or customer base.

In summary, the range of strategic options that organizations can develop in order to respond to environmental changes is dependent upon the availability of flexible resources. Resource flexibility is a multidimensional term, including intrinsic, modification and relational flexibility (Table 3).

The above resource characteristics play an important role in organizations operating in chang-ing environments, allowing them to develop appropriate responses in light of external challenges. These dimensions have appeared in studies on the flexibility of different resources (e.g. flexible production technologies, information systems, etc.), but their application in the field of HR flexibility is still scarce. I believe that the reasoning employed by the RBV to study the features of flexible resources can also be used to advance the conceptualization of HR flexibility.

In conclusion, the definition of HR flexibility from the point of view of the RBV should take into account two questions:

1. HR flexibility is an internal characteristic of the organization, and it is defined in terms of employee features.
2. The flexibility of organizational resources can be assessed by attending to three dimensions, namely intrinsic, modification and relational flexibility.

Since human resources are one of the most important resources in current organizations, they can be considered flexible when they fulfill the criteria of flexible resources. To date, practically no study has clearly delimited these requirements

Table 3. Summary of resource flexibility dimensions

Dimension	Definition	Examples
Intrinsic flexibility	Extent to which resources are versatile, i.e. they can be employed in a number of alternative uses without high costs and time	• Cash • General-purpose machines • Mail-order channels • Information technologies • Polyvalent employees
Modification flexibility	Extent to which characteristics of resources can be easily altered (malleable resources)	• Machines equipped with electronic controls • Employee know-how • Organizational learning • Employee commitment • Organizational reputation • Organizational culture
Relational flexibility	Extent to which resources can be easily combined, i.e. linked to each other so that they can jointly contribute to common goals	• Modular production systems • Organizational culture • Managerial processes • Customer base • Information technologies

(Peiró et al., 2002). I aim to fill this gap in next section by defining the characteristics of human resources that meet the requisites of flexible resources.

3.3. Definition of the HR Flexibility Dimensions from the RBV

In this section, I apply the concepts of internal, modification and relational flexibility to the analysis of HR flexibility in order to provide a more systematic definition of HR flexibility from the employee perspective. Following the premises of the RBV approach, I argue that HR flexibility is a multidimensional construct, as depicted in Figure 3.

3.3.1. Human Resource Intrinsic Flexibility

The first dimension dealt with in my discussion of resource flexibility in the previous section was the adaptability of resources to different uses; in other words, their versatility or intrinsic flexibility. HR intrinsic flexibility implies that employees are able to work on different tasks and under diverse circumstances and that the costs and time needed to mobilize employees into new duties or jobs are low (van den Berg and van der Velde, 2005). This kind of employee usually possesses a wide repertoire of competences[7] (MacDuffie, 1995; Riley and Lockwood, 1997) or a set of general abilities such as leadership skills, problem-solving

abilities, etc. that allow them to carry out a high number of tasks easily and without high costs.

The conceptualization of HR intrinsic flexibility under the RBV is similar to that of "functional flexibility" in the *Model of the Flexible Firm* (Atkinson, 1984; Atkinson and Gregory, 1986; Atkinson and Meager, 1986), as it refers to changes in the nature of work that allow the organization to respond to novel contingencies. Human resource intrinsic flexibility is manifest in the organization either through employees accepting responsibilities with a similar level of complexity to those in their everyday job (i.e. cross-functional movements), or when they perform duties belonging to different organizational levels such as administrative or leadership activities (i.e. vertical movements). For instance, in research by Rosenblatt and Inbal (1999) among schoolteachers, employee intrinsic flexibility involves teaching more than one subject and performing school roles other than their lessons, such as implementation of databases. Furthermore, as discussed above, the labor substitutability implicit in functional flexibility can be complete (when employees move between jobs) or incomplete (when they assume certain tasks belonging to other jobs).

In summary, organizations with a versatile workforce can easily assign employees to the appropriate tasks, in accordance with their knowledge of environmental challenges and demands and their consequences for organizational processes (Tüselmann, 1996; Sparrow, 1998; Storey et al., 2002). This type of employee provides the

Figure 3. Dimensions of the HR flexibility concept
organization with the freedom to modify its strategies, thus reducing the need for the alternative forms of extended labor supply, such as casual or short-term labor (Riley and Lockwood, 1997: 418).

3.3.2. Human Resource Modification Flexibility

The second dimension considered in the analysis of resource flexibility from the RBV was resource malleability. A resource is considered malleable when its characteristics can be modified without difficulty. In terms of HR flexibility, and following the same reasoning, employee malleability indicates the extent to which the workforce's characteristics are easily modifiable. Since the RBV conceives human resources as the pool of skills possessed by employees and the behaviors they exhibit, malleability should be analyzed in terms of both skills and behaviors. That is, employees will manifest modification flexibility when they innovate their skills or modify their behaviors ahead of need (Boudreau and Ramstad, 1997; Wright and Snell, 1998; Breu et al., 2001). While HR intrinsic flexibility corresponds to immediate employee features (i.e. people perform tasks in accordance with their possibilities), modification flexibility entails changes in individual traits. In order to advance the conceptualization of HR modification flexibility, I propose the differentiation between "skill malleability" and "behavioral malleability".

Skill malleability refers to how easily and quickly employees obtain the abilities needed to carry out new tasks (Maurer et al., 2003). In this sense, employees manifest skill malleability when they train and retrain as necessary, anticipate future skill requirements, demonstrate enthusiasm for learning new approaches to conduct their jobs and perceive every event in the organization as an opportunity to learn something significant for the future (Arulampalam and Booth, 1998; Pulakos et al., 2000; Dyer and Ericksen, 2005). For instance, in environments characterized by rapid technological innovations, employees must continuously learn new ways to perform their job and try to keep their skills as up-to-date as possible in order to make valuable contributions to the organization's goals. According to Ilgen and Pulakos (1999), employee abilities or willingness to engage in continuous learning and actually learn effectively should be a formal aspect of performance definition and assessment.

Indicators of skill malleability should reflect the processes of development planning, learning, and applying new knowledge and skills to changing organizational conditions. People who are committed to continuous learning search for new information about themselves and about emerging performance requirements that suggest a learning gap. Moreover, they are willing to devote the time, energy, and financial resources to gain the education needed to close the gap and improve their performance.

The concept and definition of *behavioral malleability* has received relatively little research attention in the human resource management field. However, useful contributions stemming from the organizational behavior literature can help researchers to understand this term[8].

As the starting point for my reasoning, I adopt the analysis of employee behavior in organizations provided by Wright and Snell (1998). These authors conceive employee behaviors as *scripts,* which are sequences of routines adopted by employees in their jobs. Behaviors are considered rigid (or non-malleable) when employees who have applied a particular script in the repetitive handling of situations, select the same script to deal with a novel situation. In contrast, if employees look for new sequences of actions with which to perform their daily activities or to face new circumstances, their behaviors are malleable. Thus, behavioral malleability refers to adjustments in the routines usually followed by employees. An employee with malleable behaviors adapts his or her responses to new circumstances, based on improvisation and not on fixed patterns of action.

Several concepts in the organizational behavior literature bear a similarity to the idea of behavioral malleability, such as proactivity, improvisation, initiative or role innovation, among others. These terms broadly refer to change-oriented employees who are willing to face novel problems through innovative solutions (Dyer and Ericksen, 2005). In my opinion, one of the concepts that best represents the notion of behavioral malleability is that of *taking charge* (Morrison and Phelps, 1999), close to the idea of individuals' *initiative* at work (Frese et al., 1996). These concepts refer to employee efforts to alter the way they perform their duties in the context of their jobs, work units or organizations.

In their study of employee initiative, Frese et al. (1996) used an interesting example that may clarify the meaning of behavioral malleability. These authors introduced the example of an accountant who does not receive the information required to calculate the salaries of the organization's employees on time. This accountant decides to work overtime in order to finish the salary calculation in time to pay the staff salaries. Furthermore, the accountant takes steps to ensure that this situation does not happen again in the future, by introducing changes in his or her job. In this case, for example, he or she may decide to install new computer software that captures the required information immediately. This example shows that one of the features of behavioral malleability is employee ability to manage changing conditions by providing immediate solutions to job problems. The decisions adopted by this accountant (i.e. working overtime and introducing new software) involve alterations to his or her work routines. Employees show behavioral malleability when they take decisions to avoid further mistakes or introduce changes in the way daily activities are performed.

In short, HR modification flexibility indicates the ease with which employees demonstrate change from previous states (Ilgen and Pulakos, 1999). Two concepts make up this second dimen-sion of HR flexibility. First, skill malleability indicates improvements in employees' abilities and knowledge, and is linked to the keenness of employees to continuously master their skills and to avoid specialization in only one area of knowledge. Second, behavioral malleability refers to changes in the way of acting when faced with novel situations.

3.3.3. Human Resource Relational Flexibility

The final dimension in the analysis of flexible re-sources considers that available resources provide the organization with a higher number of strategic options when they can be easily combined. In terms of HR flexibility, this latter dimension indicates how easy it is to coordinate individuals to work together, and resembles the idea of *collective mind* or *social capital*[9] (Weick and Roberts, 1993; Youndt and Snell, 2004). According to Haiyang and Yan (2002) some employees have better team capabilities than others, as they can easily under-stand their role within the group and possess suit-able abilities to engage in mutual interaction with other employees. When this happens, members of the organization or an organizational unit can easily be integrated into some form of higher-order systems or clusters of resources, such as in technological areas (e.g. printed circuit board assembly) (Teece et al. 1997; Galunic and Rodan, 1998), resulting in the combination of different sources of expertise. Thus, relational flexibility refers to employee mobilization into cooperative tasks (Forsythe, 1997; Breu et al., 2001).

In this regard, Shafer et al. (2001) demonstrated that flexible organizations follow the principle of "reliance on each other", based on the respect for the ideas and work of others, on expressing appreciation for other's contributions, and on giv-ing support and cooperation, making each other stronger. This dimension of HR flexibility can also include cooperative activities with external employees, such as employee collaboration with

customers or suppliers. The existence of HR relational flexibility is manifest in the organization through specific employee actions, which can be used to operationalize this concept. Employees with higher levels of relational flexibility may a) converge with their colleagues and share the same opinions, b) assist others when needed, and c) supplement the actions carried out by others (Weick and Roberts, 1993). Broadly speaking, these indicators of HR relational flexibility are linked to employees' organizational citizenship behaviors (Organ, 1988; Shore and Wayne, 1993) and include their efforts to spontaneously collaborate with and help colleagues, to communicate and to affiliate with others.

In summary, human resource relational flexibility includes collectivistic actions among employees in order to jointly work towards common goals. Collectivist employees emphasize the link between themselves and the group to which they belong and as such, they pursue the well-being of the whole group, even if this sometimes requires that their personal interests be disregarded (Van Dyne et al., 2000; Man and Lam, 2003).

3.3.4. Interrelationships between Human Resource Flexibility Dimensions

A review of the literature on RBV and HR flexibility provides several theoretical arguments that sustain the existence of interdependencies between the dimensions of HR flexibility. In this section, I suggest a broader interpretation of the HR flexibility concept, by discussing how HR intrinsic, modification and relational flexibility are interrelated.

For instance, some authors hold that versatile employees (i.e. manifesting intrinsic flexibility) are likely to be better prepared to engage in collaborative activities (relational flexibility) (Motowidlo and Schmit, 1999). Collaboration between employees entails an extension of employee job responsibilities, since team members need to understand others' responsibilities so as to effectively contribute to the group's goals. Since employees showing intrinsic flexibility can perform several activities beyond their job descriptions, they will probably also be prepared to engage in collaborative activities, which entail combination of tasks within the same unit (Motowidlo and Schmit, 1999). In this vein, scholars such as Horwitz and Townshend (1993: 919) or Molleman and Slomp (1999: 1838) assert that that the attainment of high and diverse qualifications by employees increases their performance in team activities. Similarly, Zammuto and O'Connor (1992: 708), when studying a specific type of compartmentalization (incorporation of manufacturing and staff functions associated with producing a product or component in the same unit) highlights the fact that employees in such work units needs to be multiskilled because of the variety of tasks performed.

However, at the same time, employees manifesting higher relational flexibility may also show a greater tendency to alter their skills and behaviors (modification flexibility). The participation of employees in teams or groups and, in general, the collaboration with other members of the organization extends the employee vision of their own role in the organization. Employees manifesting higher relational flexibility develop a "team-oriented mindset" (LeBlanc and McInerney, 1994), oriented towards the attainment of common goals and the coordination of individual efforts. That is to say, employees with higher relational flexibility will be likely to assume as part of their jobs a broader set of activities and competencies than those that form part of their everyday job, leading to a flexible role orientation (Parker et al., 1997). As a result of this flexible role orientation, employees assume that in order to be efficient in these activities, they need to continuously develop their pool of competences, which favors the malleability of employee skills. Furthermore, when collaborating with others, behavioral scripts often change in order to face diverse and unpredictable situations, which are the result of the social interaction within the group.

Still other authors support the existence of interrelations between the two components of HR modification flexibility (skill malleability and behavioral malleability). According to Simon (1993), continuous learning processes associated with employee skill malleability demand the adoption of new cultural values and structural mechanisms, which eventually change the viewpoint and the role of the individual in the organization. Organizational learning values create an environment in which people widen the focus from the immediate outcomes of their performance to continuous learning by the organization as a whole. Hence, organizational learning values might foster extra-role behaviors, because by promoting strategic thinking, individuals develop an organizational system approach, which expands their perspectives beyond their formal role (Senge, 1990, 1993). This approach may thereby lead them to invest extra efforts in the organization as a whole by making innovative suggestions to improve the organization and volunteering for roles and tasks that are not obligatory, i.e., by showing higher behavioral malleability (Somech and Drach-Zahavy, 2004).

In conclusion, HR flexibility dimensions are interrelated and the interpretation of HR flexibility should be made from a wider point of view. Employees with a higher level of flexibility in one dimension are also likely to manifest better flexibility levels in other dimensions.

4. CONCLUSION

In today's organizations employee performance should no longer be assessed in absolute terms, but rather according to people's responsiveness to changing work demands. The rapid pace of change in job requirements places employees in a situation where they constantly need to demonstrate a capacity to engage in new learning and cope with change. Hesketh and Neal (1999), when referring to this broader conception of employee performance, introduce the term "adaptive per-

formance", also adopted by Murphy and Jackson (1999:345) and Pulakos et al. (2000). Other authors such as Lau (1999) refer to this term as "flexible performance". Regardless of its designation, it is clear that more attention should be paid to the flexibility of the workforce, by considering not only the staff's efficacy levels attained in the daily tasks that their jobs comprise but also employee's ability to cope with change. Flexibility is thus a critical component of employee performance at work, and is separate from task performance.

The purpose of this chapter was to develop a conceptualization of human resource flexibility based on the RBV premises. In doing so, I followed the same logic used in the SHRM field to justify the competitive relevance of the organization's workforce. Research from the SHRM literature (e.g. Wright et al., 1994) assumes that human resources contribute to the organization's sustainable competitive advantages when they satisfy the requirements of strategic resources.

HR Flexibility as a Multidimensional Concept

I considered that human resources are flexible when they fulfill the features of flexible resources. Drawing from this reasoning, I concluded that HR flexibility is a multidimensional concept. Specifically, I assumed that employees are flexible when they show intrinsic flexibility (i.e. they can easily move between tasks and roles), modification flexibility (i.e. they alter their skills and/or behaviors to adapt to new circumstances), and relational flexibility (i.e. they participate in collaborative activities). Furthermore, I defended the existence of interrelations between these dimensions.

The proposed definition complements previous studies on the internal side of labor flexibility. On the one hand, by considering questions such as skill malleability or behavioral malleability, the RBV perspective introduces a proactive element into the HR flexibility concept, focused on the change-initiating role of employees that allows

organizations to anticipate rather than simply respond to external changes. That is, from the RBV, labor flexibility depends not only on what employees can do now, but also on what they will be able to do in the future (for example, by improving their skills). This definition differs from initial conceptualizations of HR flexibility, which emphasized the relevance of functional flexibility (e.g. Molleman and Slomp, 1999; Karuppan, 2004) and therefore, of employees' abilities to move or reallocate once a triggering episode has occurred.

On the other hand, the RBV provides a systematic approach for the definition of HR flexibility that complements the absence of clear theoretical underpinnings in the field of labor flexibility, therefore allowing the dimensions of this concept and their interrelationships to be identified. The RBV pays greater attention to the underlying dimensions of HR flexibility, therefore presenting a framework for integrating previous conceptualizations of the term. For instance, questions such as learning of work tasks, technologies and procedures (Pulakos et al., 2000), benchmarks for skill assessment (Breu et al., 2001) or willingness to change (Kara et al., 2002) can be considered as integrants of a broader concept corresponding to modification labor flexibility.

Several studies have developed measurement scales based on this conceptualization of HR flexibility (Bhattacharya et al., 2005; Beltrán et al., 2009) which may be useful in empirical researchers on HR flexibility. Furthermore, these scales provide value to managers, given that these measurement instruments can be used in the HR audit processes aimed at evaluating the efficacy of the human resource function when promoting workforce adaptability. In addition, managers could use the HR flexibility scale to separate the highly flexible groups of employees from their less flexible colleagues, which can help to detect strengths and weaknesses according to the nature of the environmental challenges. This can provide valuable information for firms, enabling them to more easily identify where improvements may

be needed in the workforce when novel circumstances emerge.

HR Flexibility in the Knowledge Society

Organizational learning and knowledge management are gaining increasing significance in the knowledge society. Knowledge Management (KM) helps to create learning organizations that are able to cope with the continuous changes in the environment. Defining KM is not easy, and multiple definitions and KM schools have provided diverse dimensions and meanings of this term. The notion of Organizational Knowledge Management Systems (OKMS) helps to integrate the wide-ranging perspectives surrounding KM. OKMS is the system that enhances organizational learning in the firm through facilitation of knowledge exchange and sharing (Yahya and Goh, 2002). The technical aspect of OKMS comprises an advanced assembly of software and hardware in the firm that supports knowledge and organizational learning through free access to and increased sharing of knowledge. However, authors such as Meso and Smith (2000) have proposed a socio-technical view of OKMS, by assuming that these systems are made up of a combination of technologies, organizational infrastructure, culture, knowledge and people. This perspective considers the core element of OKMS to be people, and in particular employees. While much of the early KM literature focused on technological issues, the importance of human and social factors has since gained recognition. Thus, if HRM refers to the management of people, and if people are the most valuable resource in KM, then HRM and KM are closely interrelated (Hislop, 2003; Svetlik and Stavrou-Costea, 2007). Consequently, HR flexibility can be also linked to KM.

On the one hand, external HR flexibility (i.e. short-term temporary workers, temporary help agency or part-time employees) has been posited to affect KM because employee turnover affects

the balance and location of experience in the organization and, therefore, the organization's ability to learn (Carley, 1992). When a firm relies on external HR flexibility (i.e. when members of the organization leave and are replaced by new personnel) the firm loses the expertise and experience of the departing employee and gains the experience of the person joining the organization. Firms can benefit from external HR flexibility by obtaining gains from specialization in knowledge acquisition and storage, as long as the organization is able to coordinate the efforts of many specialists (e.g. through rules, routines, group problem solving, etc.) (Grant, 1996). However, external HR flexibility may imply certain risks to KM, because without proper mechanisms for transferring experience among old and new employees, knowledge may be lost. An empirical study by Carley (1992) demonstrated that organizations learn less and more slowly the higher their employee turnover rate, since portions of the organization's memory leave with the departing personnel. Other authors have posited that organizations with a high usage of temporary employees risk losing valuable knowledge (Alvesson, 2000), especially when explicit and tacit knowledge is created within the firm and is firm specific (Grant, 1996). Furthermore, the use of external HR flexibility based on short-term contracts makes it difficult to build stable relationships among employees and with the firm (Díaz-Mayans and Sánchez, 2004) and negatively affects employee involvement and commitment in the firm (Amuedo-Dorantes, 2001). According to the norm of reciprocity, if employees perceive that the firm is not concerned about their well-being or labor conditions, they will not make the effort to benefit the firm (Davis-Blake et al., 2003). This lack of commitment on the part of temporary employees will threaten the success of KM in the firm, given that for KM initiatives to be effective, employees must be *willing* to share their knowledge and expertise (Hislop, D., 2003).

On the other hand, internal HR flexibility (i.e. intrinsic, modification and relational flexibility)

provides many advantages for the success of KM in the firm. Internal HR flexibility helps to enhance employees' organizational commitment. Committed employees are more likely to be highly motivated, and will probably be more willing to provide extra discretionary effort and share their knowledge within the organization (Hislop, 2003). Furthermore, Grant (1996) suggested that a necessary condition for the success of KM in the organization is the existence of common knowledge, that is, those elements of knowledge that are common to all organizational members or the intersection of their individual knowledge sets. Intrinsic flexibility facilitates the creation of this common knowledge, by assuring that individuals are able to invade one another's functional boundaries. Thus, intrinsic flexibility sustains the idea of redundancy posited by Nonaka and Takeuchi (1995) in that it builds links between individuals. Other benefits of internal HR flexibility for the success of KM stem from the fact that modification flexibility facilitates knowledge accumulation. In Grant's (1996) framework, knowledge absorption depends upon the recipient's ability to add new knowledge to existing knowledge (Grant, 1996). Finally, relational flexibility assures the cooperative behavior required to increase the organization's ability to learn by increasing the ambiguity inherent in the organization (Carley, 1992).

KEY TERMS AND DEFINITIONS

External HR Flexibility: Flexibility that can be attained from the external labor market, beyond organizational boundaries and current workforce.

HR Intrinsic Flexibility: Employees are able to work on different tasks and under diverse circumstances and that the costs and time needed to mobilize employees into new duties or jobs are low.

Internal HR Flexibility: Flexibility manifested by the pool of human resources in the organization at a certain point of time.

Modification Flexibility: Employees innovate their skills or modify their behaviors ahead of need.

Relational Flexibility: How easy it is to co-ordinate individuals to work together.

ENDNOTES

1. Work Supported by the Bancaixa Foundation (Grant ref. P1.1A2008-06) and by the Generalitat Valenciana (Ref. GVEPRE/2008/047).
2. Other authors (e.g. Arulampalam and Booth, 1998) use the term *labor market flexibility*.
3. See, for example, the *Canadian Journal of Administrative Sciences*, vol. 18, No.1, or the *European Journal of Work and Organizational Psychology*, vol.7, No.1.
4. As Kalleberg (2001) states, numerical flexibility has been referred to as "flexible staffing arrangements" (Houseman, 2001), "market-mediated work arrangements" (Abraham and Taylor, 1996), "contingent work" (Polivka and Nardone, 1989) and "non-standard" work arrangements (Kalleberg et al., 1997).
5. Tsui et al. (1997) in a further development of a previous study (Tsui et al., 1995) suggest four approaches for the employee-organisation relationship (i.e. employer's expectations of employee contributions). The first two approaches are associated with the creation of distinct types of flexibility for organisations.
6. The development of this taxonomy is based on the job performance model developed by Campbell et al. (1993), which treats alternative models of content and structure of job performance. According to Campbell et al.'s (1993) model, job performance is synonymous with behaviour and can be classified into the following components: 1) job-specific task proficiency, 2) non-job-specific-task proficiency, 3) written and oral communication, 4) demonstrating effort, 5) maintaining personal discipline, 6) maintaining peer performance, 7) supervision/leadership, 8) management/administration. The concept of adaptive performance is considered by Pulakos et al. (2000) as a performance component not included in the previous eight dimensions.
7. Human resources versatility has been given different terms, such as, "multi-skilling", "ability extension" and "polyvalence" (Cordery, 1989).
8. Crant (2000) offers a review of this literature.
9. Social capital is broadly defined as an asset that inheres in social relations at different levels (individuals, communities, networks, societies, etc.) (Coleman, 1988; Shaw et al., 2005). At the organizational level, Leana and Van Buren (1999) proposed a definition of *organizational social capital*, as a resource reflecting the character of social relations within the firm. It refers to individual's levels of collective goal orientation and is comprised of associability (i.e. employee willingness and abilities to engage in collective actions) and trust.

Chapter 78
Re–Theorizing Human Resource Management and Human Resource Management in Context

Margitta B. Beil-Hildebrand
Independent Scholar, Germany

ABSTRACT

In this chapter an attempt is made to focus on the ideological and practical implications of the new people-oriented forms of healthcare management variously described as strategic human resource management, high-performance management, human capital management, or high commitment management. The chapter details the managerial and academic claims concerning the management of human resources and goes on to emphasize the impact that the literature of Human Resource Management (HRM) has had on healthcare employees and healthcare organizations. The restrictions of the applied research approaches are also highlighted and the author argues that the managerial and post-structural literature is limited in that its conceptualization of HRM and changing performances is incomplete. Also considered is a range of literature that has been used to study individual and organizational change with a labour process perspective and explains why an approach based upon the study of the disparity between the "HRM rhetoric" and the day-to-day practice, as well as how people experience and respond to that disparity within a wider frame of social, political, and economic relations, is to be preferred. As a basis for further contextualization, the powerful and privileged positions of healthcare professionals and the distinctive character of their employment relationship are considered. The chapter concludes that a more critical analysis is necessary to challenge the way in which the concept of HRM is examined by healthcare management academics and practitioners.

THE HUMAN RESOURCE MANAGEMENT (HRM) NARRATIVE: THE CAREER OF THE HRM CONCEPT

During the early 1980s a central theme around the new management of human resources emerged when a number of large companies began to search for the *Competitive Advantage through People* (Pfeffer, 1994), which has changed the rules of the game with regard to personnel management and labour relations[1]. Along with other contributions from management academics and commercial management consultants, new concepts, new strategies, and new policies emerged within organizations that were essentially employee and customer-oriented as well as enabling, innovative and productive organizations. What sparked off the enormous interest was that the employed human resources could actually be managed towards achieving greater organizational effectiveness, and a number of key criteria were identified as "best practices" that could be used as an instrument for obtaining competitive advantage and organizational success. The HRM tradition, which emerged following the publication of a number of success stories from the U.S. and the U.K. (Armstrong, 1987; Beer, Spector, Lawrence, Quinn Mills, & Walton, 1985; Fombrun, Tichy, & Devanna, 1984; Foulkes, 1986; Fowler, 1987; Huselid, 1995; MacDuffie, 1995; Pfeffer, 1994, 1998; Walton, 1985; Walton & Lawrence, 1985), was to promote the concept of HRM in a way unprecedented in personnel theory and administrative labour practice. Managing human resources as the greatest asset of an organization was seen to engage directly with people's sense of self, securing an "exchange that is more than economic" (Kunda, 2006, p. 209). What is important to note is that – irrespective of organizational, sectoral, and national contexts – the management of people's self is working in mutually consistent ways. Here, as Thompson and Findlay (1999, p. 163) note, people "are acted on, but they also

have to pick up the cultural cues and construct an organizational self."

Anyone who reads Kramer and Schmalenberg's (1988a; 1988b) investigation of life in 16 magnet hospitals is able to discern the plausible stories of how the new management of nursing resources began to permeate the everyday perceptions and language of employees. Other researchers followed the attributes and practices[2] described by Kramer and Schmalenberg (2002; 2003a; 2003b; 2004; 2005) and searched for what it takes to attract and retain well-qualified nursing staff within hospital organizations that had the reputation of being good places to work and giving good nursing care (Buchan, 1994; 1999; Havens, 2001; Havens & Aiken, 1999; Havens & Johnston, 2004; Lewis & Matthews, 1998; McClure & Hinshaw, 2002). The results were manifold as these magnet hospitals dealt effectively with the personnel shortage by creating administrative conditions and value-oriented HR practices which go beyond accepted standards. As the popularity of the magnet hospital approach spread within the healthcare arena, more authors joined the bandwagon of HRM, trying to emulate the magnetized examples of organizational effectiveness and success (Aiken, Havens, & Sloane, 2000; Aiken, Clarke, Sloane, Sochalski, & Silber, 2002; Cimiotti, Quinlan, Larson, Pastor, Lin, & Stone, 2005; Joyce & Crookes, 2006; Laschinger, Almost, & Tuer-Hodes, 2003; Pastorius, 2006). With respect to human subjects and organizational interests, the magnet hospital proponents seek to achieve two objectives to create enabling environments and to put development at the heart of their organizational worlds: first, to convince the potential reader or practitioner that particular "bundles" of labour management strategies and policies associated with HRM are more likely to offer organizational advantage than others; and second, to provide evidence of the link between academic studies and the prescriptive literature on organizational conditions by applying content

analysis or appropriate metrics and statistical measurements, generating empirical proxies as data.

Recent debates on HRM in healthcare organizations do not really differ from the attributes and practices held by magnet hospital promoters; i.e. they make an attempt to identify and measure HR practices, systems, and policies that generate increased individual, organizational, and financial performance and/or can even be associated with better outcomes such as decreased patient mortality, nurse burnout, and job dissatisfaction with contributions from government, academic and practitioner bodies, the mass media, and consultancies (Buchan, 2004; Hogan, Moxham, & Dwyer, 2007; Khatri, 2006; Khatri, Baveja, Boren, & Mammo, 2006a; Kathri, Wells, McKune, & Brewer, 2006b; McHugh, Johnston, & McCelland, 2007; West et al., 2002; West, Guthrie, Dawson, Borrill, & Carter, 2006). Within the British National Health Service (NHS), for example, key indicators focus on performance management and centre on waiting times, financial management, and cleanliness. However, as documented by Harris, Cortvriend, and Hyde (2007), HRM indicators are now included; e.g. improving working lives accreditation, sickness absence rate, junior doctor hours, health, safety and injuries, views about employee appraisal, personal development plans, access to training, team-working, staff attitudes toward their job and their intentions to leave. In effect, primary and secondary trusts within the NHS are now required to implement several HR practices to improve patient care and staff satisfaction. Taken as a whole, the above studies, like the ones on magnet hospitals, highlight the importance of the de-contextualized practices by which HRM is implemented in healthcare organizations and demonstrate an association between HR practices and improved organizational outcomes in the healthcare sector.

However, as Bolton and Houlihan (2007, p.1) maintain, a growing body of literature bears testament to the fact that "HRM has failed to deliver on many of its early promises and been unsuc-

cessful in its attempts to achieve status as either a strategic partner or an employee champion." For example, Hanlon (2007, p. 263) provides the evidence that "[a]lthough HRM makes a range of claims such as enhancing the human, enhancing the individual and the collective; satisfying customer and producer needs and allowing the space to improve and learn, in reality it misses some of the key points of change in the twenty-first century and certainly misses the human." What many researchers have also discovered by in-depth and longitudinal fieldwork was an attempt by various healthcare organizations in different cultural and national contexts to undertake a generalized change program, wrapped up in new language and practices (Beil-Hildebrand, 2004, 2006; Bolton, 2002, 2004; Cooke, 2006; Kirkpatrick, Ackroyd & Walker, 2005; Weinberg, 2003). Further, it is within the more critical reviews that a number of problems with HR practices were identified with regard to their precise meaning, their consistency with each other, and their universal applicability (Bolton & Houlihan, 2007; Hesketh & Fleetwood, 2006; Legge, 2005; Marchington & Grugulis, 2000; Marchington & Zagelmeyer, 2005; Storey, 2001). Moreover, Harley (2005, pp. 44-45) challenges the claims of high-performance work systems in that the evidence on the diffusion of "coherent systems" of HR practices is limited and fragmentary as most scientific studies involve simple "analyses of cross-sectional data using multivariate regression techniques to test hypotheses" which signify – even with good predictive but without robust explanatory power – that "the available evidence tell us nothing about causal processes."

However, there are less prescriptive scholars such as resource based and contingency analysts[3], who maintain that there must be an "internal consistency" between particular HR practices and surrounding contexts to develop distinctive competencies and refined organizational performances (Boselie, Dietz, & Boom, 2005; Boxall & Purcell, 2003; Paauwe & Boselie, 2006; Fombrun,

Tichy, & Devanna, 1984). This is explained by Hesketh and Fleetwood (2006) with the configuration mode of the Rubik's cube[4] or with the metaphor of "a Russian doll in which the outer doll of enhanced organizational performance is contingent on the 'fitting together' of the inner dolls of different HR practices" (p. 680). From this point of view, as Legge (2005) maintains, organizational performance is not improved by "best practice" HRM, but from knowledge about how to combine and implement HR policies and practices to suit the organization's characteristic contingencies. However, in other empirical studies the link between HRM and performance at an individual and organizational level appears to be rather conclusive (Edgar & Geare, 2005; Guest, 1999; Ramsay, Scholarios, & Harley, 2000). For example, Guest (1999) demonstrates survey results from an employee perspective which shows how HR practices and high involvement relations result in employees reporting a more positive psychological contract and in turn, greater satisfaction, job security, and motivation, as well as lower levels of pressure at work. Building on insights from labour process scholars examining the underlying continuities and constraints of high performance work systems within the capitalist employment relationship, Ramsay, Scholarios, and Harley (2000) also reveal a positive association between the investment in human resources, superior performance, and mutual gains. Although the latter study points to the difference between rhetoric and reality and brings the agency and subjectivity of employees back into analysis, it might be argued that promoting the concept of HRM towards this end would be worthwhile in the pursuit of better employee outcomes and improved performance.

Paying attention to employees and not working conditions per se, the management of human resources should lead to high commitment employees – not simply as a means to employer objectives of improved productivity and profits, but because the fulfillment of many employee work-related needs is taken as a goal rather than merely a means to an end (Walton, 1985; Walton & Lawrence, 1985). The route to strategic HRM is also seen through recruitment, reward and retention strategies, team organization, strategic performance management, performance related-pay and incentives, staff training and development, quality and knowledge management, and/or empowerment initiatives (Leary-Joyce, 2004; Peters & Schrage, 1999; Reeves, 2001; Ulrich & Beatty, 2001). The same HR strategies and policies are also promulgated by academics, practitioners, and prescriptive writers on high-performance work systems (Huselid, 1995; Lawler, Ill, & Mohrman, 2003; MacDuffie, 1995); e.g. self-managed teams/teamwork, lean management and employee participation reinforced by enhanced investment in selection, training and skill formation, as well as mutual-gains industrial relations as the interlocking elements of the successful management of the modern organization. This is also apparent in the ideas of the human capital management literature: managers should place an emphasis on people's knowledge, abilities, and skills as a discretionary source of sustained competitive advantage in place of command and centralized control. A more recent attempt of prescribed HR practices (Ellinger, Ellinger, Yang, & Howton, 2002) relates learning concepts to improved organizational outcomes which means that the conclusions are nearly always the same. For such commentators, the social and economic advantages and implications of a set of universalistic or of contingent HR practices are immense and such emphases are applicable to all re-organizations in the world, both to those in the private and public sector, and to those within the service and production industries.

The extent of the functionalist and contingent frames of reference underpinning mainstream HRM was considerable because "it reminded managers what they were supposed to be doing" (Colville, Waterman, & Weick, 1999, p. 131). This is said to take place chiefly with HR managers who are constantly searching for more effective ways to manage employees to gain maximum organi-

zational performance, while employees are keen to enhance the benefits (feelings of satisfaction, competence, self-esteem, accomplishment and inspiring autonomous work patterns) from the employment relationship. The same perspective holds that the senior management of an organization has "a directive role in developing the collective consciousness" by changing artifacts and espoused values, and that the well-motivated and resourceful employees are both reflective and active in organizational adaption and growth (Legge, 1995, p. 186). Given this epistemological perspective, it is not surprising that Fiske and Taylor (1991) and Klein, Conn, Smith, and Sorra (2001) can claim that the role of key organizational decision-makers, such as senior managers, in developing a consensus and agreement among principal HR messages is critical to developing a strong HR system and subsequent organizational performance.

What is to be concluded from such complex HR ideas? They are taken seriously – not only by commercial management consultants, chief executive officers, and management writers, but also by management academics – as management theories. Accordingly, HRM is theorized as having diverged along two paths: according to Walton (1985), one based on imposing "control" and the other based on eliciting "commitment". This distinction is similar to that made by Truss, Gratton, Hope-Hailey, McGovern, and Stiles (1997) when they refer to the "hard" (the Michigan School) and "soft" (the Harvard Model) strategies and policies, respectively. However, as documented by Storey (2001), both models are contemporarily used by managers because those who subscribe to the above schools of thought are fundamentally driven by the objective of achieving both the control and consent of employed people. In contrast to the perspective that organizational change towards improved performance is emergent and fuzzy, the practitioners and prescriptive writers appear not to comprehend that there is a fundamental economic objective at the core of contemporary

HR practices. In addition, as Legge (2005, p. 227) notes, they also neglect the various stakeholders to, and societal, historical, cultural, institutional, and even financial influences on, organizational directions. Similarly, as Marchington and Zagelmeyer (2005) claim, in order to achieve a more realistic assessment of how HRM actually works in practice, it is essential to ask employees themselves what they think and how they perceive HR practices in their day-to-day working lives as these perceptions are ultimately crucial to the success of any HRM system.

This is not to suggest that HR techniques never contribute to positive employee outcomes, nor that they might in some cases generate performance gains via employees. As discussed, the examples noted by magnet hospital researchers[5] enable the potential reader to attribute causes and processes other than HRM to both success and failure. That is, the success of these institutions lies largely in a variety of combined elements and conditions (e.g. the beneficial broader context of an organization; the creative, ingenious, and imaginable power of human actions and their interactions) to change the social and economic structures and processes, rather than in any particular HR style or approach. The purpose of referencing here is not to defend the attributes and practices of magnet hospitals but to illustrate that one part of the HRM idea is, both practically and theoretically, strongly related to social commitment and shared understanding within work-based relationships that require an acceptance and endorsement of values to enhance performance. The other part is used to signify a set of organizational practices and/or human assets (e.g. the recruitment, reward and retention strategies and/or the skills, attitudes and knowledge of people) which embody where the organization is now and where it wants to be in the future. This latter usage does not require that employees are tied into the local values of particular organizations and may provide an answer (e.g. through long-term commitment, reciprocal obligations and/or joint regulation) to the perennial question

of what accounts for qualitative and calculative business success. This should be borne in mind and will be discussed further in subsequent sections[6].

THE DISCIPLINED WORKER THESIS: THE POST-STRUCTURAL PERSPECTIVE

So far the concept of HRM as a means to becoming a model of organizational effectiveness and success has been introduced. However, diverse and contradictory considerations exist in respect of HRM as a concept and its style. In other words, not all intellectual HRM researchers follow the same lines of thought. Recent decades have seen a resurgence of interest in the potential contribution of HRM to critical management and organizational studies. This view goes back to a broader base and trend in cultural theory in which Ray (1986) distinguishes between different types of managerial control in history. She refers to the regulative and integrative sociology of Emile Durkheim and notes that the organization is "the appropriate site for moral order" (p. 287). She then argues that the attempted management of an organization's culture is simply an addition to "bureaucratic" and "normative" forms of control which organizations have tried to implement (Etzioni, 1978, p. 271). However, the tendency, Ray (1986) goes on to explain, is to subjugate the individual to the collective because human subjects are viewed as "emotional, symbol-loving, and needing to belong to a superior entity" (p. 295). In the long term, she argues, this new form of ideological control could be cheaper, avoid resentment, and build employee commitment to the organization and its goals.

By promoting this form of devotion, the management of human subjects was suddenly not just another managerial strategy but the supreme form of managerial and individualized control. What is new about it is, according to Willmott (1993, p. 523) "the *systematising* and *legitimising* of a mode of control that purposefully seeks to shape and regulate the practical consciousness and arguably, the unconscious strivings, of employees." Here the task of managers is no longer restricted to bureaucratic and normative forms of control but determines and manufactures how employees should think and feel about what they do in their day-to-day practice at work. Or, as Willmott (1993, p. 520) goes on to argue, employees are concurrently required "to recognise and *take responsibility for* the relationship between the security of their employment and their contribution to the competitiveness of the goods and services that they produce." In this way, the productive person is systematically invited, and legitimately induced, to become "tied to his [sic] own identity by a conscience or self-knowledge" (Foucault, 1982, p. 781).

Here is the basic departure of concepts like HRM from humanistic management theories towards the "disciplined worker thesis" even though both share the understanding that "self-determination" is the basis both of "labour power" and of the characteristic nature of "human action" (Willmott, 1993, p. 525). The realization of this mutual understanding makes it clear that an organization's performance can not only be optimized by exploiting this, but also by respecting it. Unlike the Human Relations discourse which holds that the needs of the individual and the organization are fully integrated, and, indeed share the same identity (e.g. Maslow, 1954; McGregor, 1960), the management of human resources encourages the development of a mechanism of control which harnesses the forces of personal independence and self-determination for the purpose of realizing the desired values and performance. Reviewing this kind of analysis, Sayer (2007, p. 25) reminds the reader that these researchers "emphasise 'subjectification' and disciplinary power and hence the ways in which organizations, through both discursive and material means, 'construct' and discipline workers and inculcate appropriate behaviours."

The post-structural power within corporations is best illustrated by Willmott (1993) who demonstrates that there is something alarming about the effective mechanisms that no one owns. Initially, he follows the standpoint of ethnomethodological and social action researchers in order to make a powerful critique of "soft" HRM policies and practices as they create "monocultures in which conditions for the development of value-rational action, where individuals struggle to assess the meaning and worth of a range of competing value-standpoints, is systematically eroded" (p. 518). Here, Willmott (1993) seeks to replace the rhetoric of control and coercion by that of "surveillance", "leadership", and "seduction" (Calás & Smircich, 1991). In this seductive search of organizational effectiveness and success, modern organizations construct what Casey (1995, p. 5) labels "designer employees" through the production of self strategies and discursive practices. Similar conflict-free themes emerge throughout post-structural analyses which present "a new form of 'manufactured morality' that makes up humanity in different ways" (Bolton & Houlihan, 2007, p. 6). That is, the familiar theme of managerial intervention into people's soul and the construction of self-disciplining, productive selves also emerges from the critique of contemporary information technologies and somewhat different elements of totalitarian technique, particularly just-in-time, corporate culture, teamwork, total quality management, and other management practices (Ezzy, 1997; Knights, 1997; Sewell, 2005; Sewell & Wilkinson, 1992; Sosteric, 1996).

However, there are now some sincere disagreements about the likely feasibility of these arguments in which "an image of emotionally anorexic social actors" (Bolton & Houlihan, 2007, p. 7) is produced to directly lead to a veritable "asphyxiation by society" (Archer, 2000, p. 18) that downplays the varying responses available to employed people. Writers like Thompson and Findlay (1999) have also argued that many of those studies mentioned previously simply infer

local effects on employee subjectivity from processes of re-structuring without even presenting their "subjective inputs or responses to the transformation of work" (p. 169). This response to post-structural analyses can be further elucidated by reference to Thompson and Ackroyd's (1995) framework of organizational misbehavior. They note that "no actual accounts of resistance can normally be found in such studies" (p. 624) because post-structural research usually neglects active agency and resistance, and replaces a concern with the employed subject with a concern with identity needs to the extent that "the labour process is just part of the scenery" (p. 627). Further, Thompson and Findlay (1999, p. 173) argue that even where qualitative data is collected in organizational studies[7], they are often simply linked to the "respondent's concerns with identity" such as individual needs that are seen as different and incoherent with traditional fields of management and work. For an illustrative account see Brown and Crawford (2003) where mental health team members point to a lack of management direction from senior colleagues, even though some of them participate in the managerial process themselves. Consequently, the nature and significance of this collective engagement often remains unexamined in the post-structural research literature, which means that the employed subjects simply disappear from view.

MANAGING PEOPLE: THE LABOUR PROCESS PERSPECTIVE

The above review of the post-structural literature illustrates how the current widespread use of the construct of HRM can be problematic because "*labour* as a subject has gone missing" (Thompson & Findlay 1999, p. 174). Efforts to put the human subject back into the analysis of organizations have been made after the first stage of labour process theory (Bravermanm, 1974). According to Smith and Thompson (1998) the subject was

re-/inserted in three main ways (p. 560): First, as a source of opposition to capital which has created the well-known "control-resistance paradigm" (Edwards, 1979; Friedman, 1977; Littler, 1982). Second, the subject was re-/inserted as a resource of creativity and productivity, without which modern management could not successfully transform "labour power into profitable labour" (Cressey & MacInnes 1980). Third, labour as a subject was introduced as a source of consent and integration which has created an approach that puts an emphasis on the relative autonomy of the labour process in the context of specific structural pressures to accumulate and reproduce capital (Burawoy, 1979; Thompson, 1990[8]).

Though many of the subsequent post-structural and theoretical HRM debates are critical of their Marxist categories and realist epistemology (O'Doherty & Willmott, 2001a; Storey, 1985), some researchers have been attracted by this sort of framework for analysis that focuses on managerial attempts to engineer human subjects and their performance and demonstrate how these concepts make "a strong contribution both to the understanding of work and employment trends and to the new forms of labour politics that are generated from them" (Thompson & Newsome, 2004, p. 156). Adopting a structuralist viewpoint that moves beyond the dualism of paradigmatic closure, they investigate in detail which conflicts between different interest groups are acted out at a local level while taking the various levels of influence offered by the historical, organizational context, the national as well as international trends, and the forces of global capitalism into account. In other words, the labour process analyses not only serve to highlight how organizational reality is constructed through the wider context of, and consent over, the labour process but also to show how managerial control over workplace relations is a *Contested Terrain* (Edwards, 1979). It is worth stressing again, that contemporary labour process analysts deserted the post-structural perspective and seek to analyze human subjects in

the workplace as "knowledgeable agents" who draw on "symbolic resources" in their relations of "contestation and cooperation" (Thompson & Findlay, 1999, p. 176). However, according to Thompson (2009, p. 105), labour process analysts explicitly criticize and reject "conceptions inspired by 'negative' labour process theory, as such studies reply on an oppositional (and 'dualistic') conceptualization of resistance as the outcome of structural relations of antagonism between capital and labour."

Particularly available are detailed analyses of blue-collar, white-collar, and managerial workers, among whom the trend of HRM as management strategy is supposedly most pronounced (Delbridge, 1998; Graham 1995; Rhinehart, Huxley & Robertson, 1997; Sandberg 1995). These rich, qualitative and rarely quantitative analyses from across sectors, corporations and nation-states have shown how, especially when combined with participatory and skill-enhancing schemes, HRM within an organization can discourage employees, or encourage their resistance, by strengthening managerial control and increasing effort intensification in the name of enhanced organizational performance and the more effective management of human resources. For example, Graham's research (1995) of day-to-day life *On the Line at Subaru-Isuzu* unwrapped the all-embracing dimensions of management control under the new lean regime, demonstrating a pervasive "invisible iron cage" of control over employees (p. 98). The above studies also demonstrate that employed people are resistant to many forms of attempted change, but that they can also be amazingly dynamic and active. For example, almost all studies indicate that managers do not actually have to achieve commitment and shared understanding among their employees to successfully implement their change initiatives. In the light of research, this seems pessimistic because the new armories of managerial control and remuneration measures are sufficient to change employee behavior. Such pessimism is based upon the deployment of two

models of HRM - the normative and strategic dimensions of HRM - that were outlined earlier. It is therefore important to pay attention to illustrating the disparity between the HRM rhetoric and the day-to-day practices and to add an understanding of how people experience and respond to that disparity within "distinct institutional patterning of work within a given country" (Thompson & Newsome, 2004, p. 152).

There is another reason that the focus on value internalisation may hinder an understanding of the relationships between contemporary HRM initiatives and subjectivity. As the research of Burawoy (1979), Cressey and MacInnes (1980), and Ramsay, Scholarios, and Harley (2000) indicate, the participation of people in work practices can generate creativity and active consent to existing structures and strategies rather than their commitment and shared understanding. That is to say, they construct alternative accounts which hypothesize that while HRM entails increased employee discretion, this can also be understood in terms of management ceding control in so far as it is necessary to acquire the consent of employees and to tap into their creative as well as knowledgeable capacities (Harley, 2005). It is therefore quite plausible to claim that innovative HR policies and practices can work if there is "a combination of localised consent to the specific change process and support mechanisms in the sphere of reward systems, decision-making and industrial relations which prompt and reward 'appropriate' behaviour" (Thompson & Findlay, 1999, p. 179).However, as Thompson (2007, p. 87) notes, "there is also a need to recognise that external conditions are making it ever more difficult for that investment to be either a corporate priority or sustainable, or both." That is, the problem is not only "divergent interests, but the diminished capacity of management to produce sustainable mutual gains from them" (ibid, p. 95). Such themes are present in contemporary labour process analyses as they highlight that co-operation and the generation of consent can be systematically built into the

labour process within a changing context and the comprehensive results are a continuum of possible and overlapping employee responses, from "resistance, to accommodation on temporary common objectives, to compliance with the greater power of capital, and consent to production practices" (Thompson & Bannon, 1985, p. 99). Does the prevalence of accommodation, behavioural compliance, and consent without commitment and shared understanding matter? Perhaps this underestimates the distinctiveness of the labour process in the healthcare sector where the traditions of professional autonomy and an ethic of service are shared by the occupational groups employed there.

THE HEALTH CARE SECTOR: MANAGEMENT CONTROL AND PROFESSIONAL AUTONOMY

The healthcare sector is a critical case for labour process analysis because of its historically necessary legitimizing role within all capitalist societies (Habermas 1976a, 1976b; Offe, 1976a, 1976b). According to Cousins (1987), healthcare organizations operate and are embedded in an environment with its own mode of "rationality" and complexity (p. 50). This trend is reflected in the imperfect coordination of healthcare systems and on account of their deficient capacity for perception and planning, their continued growth and cost – although at different rates (OECD Health Data, 2009). Although the state as legislator or the market as enabler[9] is the main force acting to restructure the healthcare sector, it cannot always be the "direct agent" (Thompson & McHugh 1995, p. 88). Healthcare organizations in capitalist societies and forms of administration and organization in socialist and post-communist ones such as those in China, North Korea, Vietnam, Nicaragua, Cuba, and the former U.S.S.R. also show evidence of executive authority, hierarchical control, and work fragmentation. For Salaman (1979, p. 22)

bureaucracy is not a feature of capitalism only, but is "a key feature of the modern world dominated by rationality." This shows that the dynamics of bureaucratization are partly independent of capitalist and other class-divided form of work organization, and that the analytical framework needs conceptions that enable potential researchers to focus on that particular problem. This is where Max Weber (1984) enters the scene, for he has defined a series of features that are a necessary part of explaining these complex processes. For example, he anticipated that state socialist systems would be more bureaucratic than capitalist ones because of the absence of countervailing power structures between the socialist state and competitive markets. In such an economy, "the power of bureaucratised management" would continue and advance, as would the autocracy or "dictatorship of the official" (Sayer, 1991, pp. 145-146).

Both public and private sector organizations operate on the basis of a hierarchy of offices in a pyramid of authority, and in most cases, formal control and co-ordination procedures are important to define people's responsibilities, rights, and duties as well as to govern the conduct of their work. As Littler and Salaman (1982) have identified, a Weberian lineage is central to an understanding of the employment relationship and the career system of economically powerful groups in particular. More generally, calculable rules and set-down organizational procedures are prevalent in the analysis of "those structural conditions which surround the appointment, promotion and dismissal of individuals" (Littler, 1982, p. 37). Such an analysis is important to the explication of the labour processes within a particular context, such as healthcare since these various aspects of organizations are based upon consensual rules and emphasize "the continuity in social relations" in, and beyond, private sector organizations in modern or capitalist society (Thompson & McHugh 1995, p. 378). Hence, the introduction of a more powerful general management and administrative infrastructure can itself be a "disciplining force"

(Thompson & McHugh, 1995, p. 88). This has been recognized by influential managerial thinkers who have demonstrated how HR managers seek to engineer people's consent within particular milieus in order to operate more successfully; whether through formal-rational means or ideological rhetorics. Hence, Thompson and Newsome (2004, p. 154) could argue that labour process analysis is not merely making a critique of the limits of HRM but trying to connect workplace practices to a changing big picture, because "the domains of workplace relations, employment policy, and governance increasingly operate according to contradictory dynamics."

Nevertheless, despite the legitimacy and interests arising from bureaucratic and normative systems, it is in the healthcare sector that the professional provider groups have developed a particular distinctive role and high social status. Without clear parameters to assess their complex activities, it has been the medical, nursing, and other emerging professionals, to a greater and lesser degree, who have been responsible for determining and controlling the priorities of healthcare. To some extent, as Dent (1993) notes within the British National Health Service, the relation between the state and healthcare professionals would appear to parallel Friedman's concept (1977, p. 6) of "responsible autonomy." On the surface, there are a number of corresponding similarities between the responsible autonomy of employees and healthcare professionals. However, the central role of the former is different in that its extent and nature is determined by managerial strategies within a context of prevailing labour market conditions and employee resistance. By contrast, the autonomy of the latter, i.e. the autonomy of healthcare professionals, derives from their occupational strategies and technical competence that historically predates the emergence of capitalist labour markets and different forms of organizational control. Moreover, professional autonomy characterizes the outcome of negotiations between organized occupational groups and the state and

not directly the outcome of class conflict at the workplace.

Yet professionalism is not unaffected by the principles of the state and certain professional groups have been promoted by the state to unequivocally meet the requirements of the state within capitalist society. For example, Dent (1993, p. 247) argues that the concept of responsible autonomy, though inaccurate in terms of describing the actual relations, has long been "the preferred strategy of the British state towards the medical profession." It has been the ability of the medical profession to protect their occupational interests, maintaining socio-economic privileges and a monopoly of theoretically grounded knowledge. Hence, the medical profession has been able to exercise power in the production of certain bodies of knowledge and in definitions of satisfactory types of diagnostic processes and therapy. It is this enormous power over both state policy and the personal affairs of individuals that underpins what Freidson (1994) has conceptualized as "professional dominance" (p. 31). He distinguishes between the well-established professions (such as law, medicine, and architecture) and the technical professions - those with more education and complex skills than most workers (e.g. teaching, social work, and nursing). Freidson's influential distinction of professions, however, misses the significance that the autonomy and dominance of the division of healthcare labour are by no means the only ways of ordering expertise. For example, Johnson (1972) has argued that accounts which focus on the qualities of professions have never been able to agree to a list of "traits" or "attributes" that are typical of all professions in all circumstances (Etzioni, 1969). Similarly, the proposition that professions serve central social needs is also problematic because the alleged intrinsically altruistic service of professionals has often been the base of exaggerated claims about their ethical and progressive role. As Johnson (1972) demonstrates in his critique of such a functionalist approach, this falls into "the error

of accepting the professionals' own definition of themselves" (p. 25) and he described this deficiency as a conceptual "straight-jacket" (p. 89).

Instead of regarding professionalism as an inherent characteristic of a few selected occupations, according to Becker (1970), Bucher and Strauss (1960), and Hughes (1958), it is best regarded as a form of occupational strategy and development, whereby ideologically powerful groups attempt to gain recognition as professions in order to reap the rewards of the older classic professions. The analytical scope moves here to the indispensable process of occupational groups attempting collectively to control and upgrade their purpose and standing. Consequently, the professionalization of medicine, nursing, and other emerging professionals is considered primarily as a self-seeking strategy and development by these groups of people. The purpose of it is self-government, quality control, and, with the support of the state, the legal monopoly over recruitment, training and certification. Nonetheless, this perspective neglects that the occupational groups of health care are powerful groups in society and their power and practices are based upon particular roles and functions carried out with professional autonomy and control. Their demands for autonomy, according to Armstrong (1986, p. 25) "may express not so much a desire for independence, but an ambition to be numbered amongst the controllers rather than the controlled." As a result, radical Weberians and orthodox Marxists have not followed a phenomenological or hermeneutic direction (Hanlon, 2007; Johnson, 1972; Muzio, Ackroyd & Chanlat, 2008), rather they developed their arguments and reached the conclusion that professionals are "not so much public-spirited altruists serving the common good, as powerful groups in society in pursuit of their own, and more abstract 'capitalist', interests" (Crompton, 1990, p. 154).

Nevertheless, despite the assaults from these theoretical movements, the dependence of the patient clientele on professional expertise and the impossibility of their acquiring such special-

ist knowledge explain why, in respect of these healthcare groups "*noblesse oblige*, not *caveat emptor*, is the rule, though far from being the behavioral fact" (Merton, 1982, p. 117). In other words, given the nature of professional expertise and the vulnerability of the patient clientele with respect to expert service, interactions between professionals and their dependants could not function in the absence of some kind of ethic of service. Indeed, according to Crompton (1990, p. 155), a degree of "moral" regulation among professionals is not incompatible with "the practice of strategies of exclusion and closure in order to gain an occupational advantage, or an emphasis on the pursuit of capitalist interests over those of other clients." In addition to the principles of professional autonomy and occupational strategy, the division of healthcare labour also has a capacity to generate norms relating to its use and disposition which are accurately conceptualized in Merton's definition (1982) of *Institutionalised Altruism*. The work of healthcare professionals is distinguishable, therefore, from that of most other workers in contemporary capitalist society; i.e. they are to some degree controlled through their commitment to professional objectives that emphasize the importance and value of a particular activity, condition, or practice and to some considerable extent they regulate their own work behavior. However, it is important to note that this commitment is not only associated with an ethical code of service to protect the patient clientele, but also with monopolistic closure and privileged societal positions. Such conditions, as Larson (1980, p. 141) argues, lead to the creation and control of "a protected, or institutional market" for professional services and "a project of collective occupational and social ascension."

Despite all this, the form of autonomy carried out by highly skilled, knowledge-based professionals does not distract from established powers and functions of healthcare sector management. As Muzio, Ackroyd and Chanlat (2008) have maintained the regulation of 'organizational

professions', and thus expert labour, is common to all societies and facilitates the embedding of professions in positions of power within structures of organizations. It is because of this incorporation that healthcare professionals in the current context are not only historically but also institutionally bound, and this represents a shift away from the sociology of the professions in the direction of the employment of these groups by governments or private medical providers. It is this employment relationship that unites professionals in a healthcare organization and enables them to have a meaningful collaboration such as patient-centered practices with other professionals and seniority-led careers in the controlling and manipulating of this organization.

This perspective on professional groups and organisations in the healthcare sector has attracted considerable support and attention; i.e. it has been recognised by labour process analysts and critical researchers (Beil-Hildebrand, 2004; 2006; Bolton, 2002; 2004; Cooke, 2006; Hanlon, 2007; Kirkpatrick, Ackroyd & Walker, 2005; Muzio et al., 2008) who have shown how healthcare professionals are ineffectively subject to managerial priorities and authority, because they retain, as well as share, considerable degrees of autonomy and control in their day-to-day work to serve their patient clientele and occupational interests. At the labour process level, they followed Larson (1980) and Derber's definition (1983a; 1983b) of proletarianisation and found some evidence that the healthcare professionals' labour process is "analogous to, but not identical with" the labour process experienced by other workers (Dent, 1993, p. 252). It is not the Tayloristic routinisation, fragmentation, and mechanisation[10] of the healthcare labour process as some commentators have tried to make us believe (Adams, Lugsden, Chase, Arber & Bond, 2000; Walby & Greenwell, 1994) but the "transformation of professionalisation strategies into generalised credentialism" and legal licence that leads to a general loss of the self-employing status that may come to be interpreted subjec-

tively as "proletarianisation" (Larson, 1980, pp. 144-145). Here, Cousins (1987) is entirely correct to suggest professional groups in healthcare organisations are exposed to different structural conditions and experience subordination in "their inability to define the ends and social purposes to which their work is put" (p. 97). In this context Derber (1983a, p. 332) suggests proletarianisation[11] may be the basis for a highly sophisticated "[i]deological cooptation", whereby healthcare professionals' moral concerns for the patient clientele can be accommodated in a form of patient-centred practice that serves occupational as well as bureaucratic ends. In return for their on-going cooptation with corporate objectives, they retain their professional autonomy and self-direction that may contribute to "management interests more than it threatens these interests" (Cousins, 1987, p. 98). As a consequence, healthcare professionals enjoy a benign employment relationship with their employing organisations and for this reason the employment relationship which supports and underwrites the provision of healthcare services takes characteristic forms. Hence, it has been well established by this scholarly work that healthcare professionals maintain and dominate the labour process as long as they willingly fulfil their purposeful duties in ways consistent with management priorities and practices. But the recognition that healthcare management cannot directly control and dominate the performance of professionals leads to the question of how they actually achieve control, direction, and legitimacy of healthcare professionals' relatively unconstrained conduct.

HEALTHCARE PROFESSIONALS AND HUMAN RESOURCE MANAGEMENT

Because healthcare professionals provide complex, discretionary services to the public and use specialised knowledge and power for socio-economic gain and monopoly control, they may pose real dilemmas for the stability and further developments of healthcare sectors and organisations. According to Bertilsson (1990), with regard to the occupational status and power that the traditional professions used to have, modern societies have closed the gap: "Professions are today held accountable either by means of state control or by means of organisations of customers or clients, in particular by powerful insurance organisations in pursuit of malpractice" (pp. 129-130). This has important implications and the outcome taken as a whole, offers compelling insights into the variety of management strategies, such as the kind of centralized, bureaucratic control exemplified by Weber (1946). When there is pressure to contain cost and to use human resources more effectively, as Ackroyd and Bolton (1999, p. 374) have described it, healthcare management has the power to control "the supply of the other things necessary to the provision of health care, including crucially, the number of patients", the broad policy questions, the type of cases and clients, the supply of healthcare professionals, etc. As a consequence, they can change the parameters by appropriate impersonal mechanisms of control within which healthcare professionals exercise autonomy in their work. For example, the key strategic objectives of healthcare managers are secured by increasing the numbers of patients with which healthcare professionals are challenged. What is important to note here is that management can reduce the amount of "time" available to treat the patient clientele and by doing so they establish "key conditions" within which professional groups have to work (ibid, p. 374). In this way, healthcare professionals are induced to work harder unless they willingly neglect "their own ideas and standards about what is appropriate to adequate hospital care" (ibid, p. 374). That is to say, healthcare professionals are not protected from the "tyranny of the clock" and management can greatly increase the usefulness and effectiveness of healthcare professionals by increasing the throughput of patients (Larson, 1977, p. 235).

However, as Ackroyd and Bolton (1999, p. 383) stress, this self-control necessitates higher levels of personal skills, flexibility, and commitment from healthcare professionals in so far as they "remain if it is to be successful." From the point of view of the professional or managerial organizational member, this contradiction is a potential source of conflict because it depends on a particular social, political, and historical context for its meaning and healthcare management may be inclined to choose alternative strategies of control within which commitment and shared understanding can be retained and reconciled to new corporate objectives.

Central to the design of more efficient, flexible, and innovative healthcare services is the use of various forms of patient-centered, decentralized, HR-based management. Here, bureaucratic controls are relaxed or removed in favor of alternative HR programs that, for example, seek to increase commitment and use various participatory and skill-enhancing schemes to improve healthcare performance. New forms of control, including soft HR practices, are welcomed as long as it is anticipated that they will enable healthcare management to ensure that they will monitor and shape what healthcare professionals actually do. This requires management to convince healthcare professionals, through practical or ideological schemes, to provide healthcare work from which the patient clientele as well as the healthcare organization will gain and benefit. In other words, healthcare management needs to rely on its professionals as an ideological and practical resource to identify and solve serious problems and to give a homogenous performance on every occasion. While the patient-centered services for the clientele may improve, the implications for managers and professionals may be very different because the former wants more than mere compliance from the latter.

Unlike many other perspectives, it is at this shifting frontier of control that the entrepreneurial HR dynamics of healthcare management collide with "the interconnectedness of social [and professional] ties and, hence, people's abilities in manoeuvring, manipulating or simply enduring various life situations" that are inescapable features of healthcare organizations (Bolton & Houlihan, 2007, p. 7). These features include the implications of changing practices for sustaining the traditions of professional autonomy and control and for adopting newer principles based on increased employee discretion and "responsible autonomy" (Friedman, 1977, p. 6). This is not to say that such features always stand in opposition to corporate objectives since they can often have the unanticipated and unintended consequence of working in the healthcare organization's favor. For example, professionals may create a much stronger sense of team- and patient-orientation in advance of management development and improve the quality of their performance. Considered in this way, active management is just a more complex form of negotiation and intervention than constant and intimate conflict between healthcare management and professionals. Nevertheless, spaces for resistance and misbehavior do occur in healthcare organizations, just as in other areas of organizational life, and may drive healthcare managers to implement additional forms of control. For example, healthcare professionals may genuinely empathize with the patient clientele but may show "organisational misbehavior" and "irresponsible autonomy" towards management actions (Ackroyd & Thompson, 1999, p. 164). However, there has been a shift in managerial strategies towards normative controls and the limited gains in employee discretion are outweighed by "work intensification and stress resulting chiefly from increased levels of responsibility"[12] (Harley, 2005, p. 42). The existence and relevance of this interplay and conflict for understanding healthcare organizations is ignored when the management of human resources is being used in an ad hoc way and linked to the notions of organizational effectiveness and success. Indeed, the reluctance of healthcare management practitioners and prescriptive writers to acknowledge the broader and

social context in which HRM is enacted – i.e. the structure and agency of management and professional autonomy and control in which mechanisms of organizational effectiveness and success are embedded – was illustrated above. It's not only the followers of the labour process perspective who have expressed such a view; it is also found, in a somewhat different guise, in the "moral economy" approach proposed by Sayer (2007) who sums up the associated research program which requires hermeneutic, structural and agential information:

To think critically about HRM is, or should be, to address the relationship between the qualities of people – indeed, what it is to be human – and the qualities of organisations. To do this we need to avoid reducing people to mere products of discourses and the organisations in which they work – hence depicting them as 'cultural dopes', 'blank slates' or beings who can be socially constructed in any way imaginable. We also cannot afford to ignore the special character of organisations as hierarchical and instrumental institutions pursuing highly specific goals. We also need to take account of the embedding of both employees and organisations in a wider field of social relations among equals and unequals. (Sayer, 2007, p. 21)

The 'greatest task' of healthcare management academics and practitioners is therefore to conduct or ask for credible accounts of how healthcare managers and healthcare professionals make sense of, and act upon, the concept of HRM within healthcare organizations to manage human subjects in different organizational, sectoral, and national contexts.

CONCLUSION

This chapter has tried to set out both the significance of, and the limits to, attempts to achieve an HRM-related change with respect to human resources and organizational performance. The academic literature on managing human resources is polarized since there are clearly two perspectives according to which HRM is treated in relation to social disorder and organizational change. What the potential reader is also presented with in this review are post-structural treatments of the management of human resources that either equate it with the systems of discourse and practices or simply assume that modern techniques, in alliance with disciplinary power, will lead to a change in human subjects. Whatever is the case, its meaning and significance within the social science domain were resuscitated at the expense of HRM being treated as an expedient mechanism of managerial effectiveness within the labour process. In Thompson and Findlay's cogent expression (1999), the empirical and theoretical work should be centered on macro-contextual milieus and on how human subjects within organizations "are attempting to reconstruct the reciprocal but contested nature of the psychological contract in contemporary social, economic and political conditions" (p. 183). That is likely to be more complex in the healthcare sector where the traditions of professional autonomy and an ethic of service are shared by the employed occupational groups. Although the nature of work in the healthcare sector is less predictable, this chapter argues for an approach to a construction of professional autonomy and control that is influenced by broader external and internal forces, as well as lived experience. This justifies ontologically and analytically, a constant interplay between social structures and human action – i.e. the healthcare professional as object and subject, as a commodity and a living person – than that articulated in the managerial and post-structural HRM claims. Against this ontological and methodological background, there is a need for recognition of attempts by distinct healthcare sectors, as well as their management, to design and impose new HR initiatives (or theories) and redraw the boundaries around arenas where healthcare professionals have traditionally exercised their professional autonomy in healthcare

organizations. However, there is also a need to recognize the different reactions to these attempts and to understand in greater detail the different performances and associated motivations which make up a healthcare organization's day-to-day life. Such a view seeks to penetrate below the surface appearances of healthcare organizations to consider their broader context, social structure, and the basic processes that are held to constitute healthcare organizing. It appears, therefore, that the extended labour process perspective is an integrated theoretical framework that can be usefully applied to a more critical and longitudinal analysis of HRM within healthcare organizations and the labour process of healthcare services. Bolstered by an expanded scope of analysis and a meta-theoretical perspective that contribute to the long-established case study orientation, Hesketh and Fleetwood (2006) outline recommendations; i.e. they ask on a more abstract level how this might work in the case of HRM:

If we understand these tendencies [the tendencies generated when healthcare professionals and managers engage with HR practices and social structures] we can make tendential predictions. We might, for example, be able to understand the tendencies generated by the exercise of human labour power to activate workers' powers for creative, imaginative, ingenious, self motivated and self directed action, as well as the countertendencies generated by the alienation, exploitation and commodification of human labour power. We might therefore be able to assess the efficacy of tendencies and countertendencies, and make a tendential prediction about the likelihood of specific bundles of HR practices increasing organisational performance. This process involves what we refer to as reflexive performance. (Hesketh & Fleetwood, 2006, p. 692)

ENDNOTES

[1] The debate about the distinction between personnel and human resource management is conceptually complex. Huczynski and Buchanan (2006) use the term personnel management to explain the nature and background of the management function as administrative tool, that is concerned with human relationships and the maintenance of those relationships; e.g. methods of recruitment, selection, training and education, methods and standards of remuneration. They use the term human resource management (HRM) for a managerial perspective which argues the need to establish an integrated range of policies to support organization strategy. The main purpose is to encourage high commitment, flexibility and high performance among employees. The concept of HRM has a theoretical dimension that there is a causal chain linking people policies, with employee behaviors, to successful organizational outcomes (pp. 654-691).

[2] In 1982 the American Nurses' Association sponsored the original magnet hospital study, which resulted in the designation of 41 hospitals across the US as magnet hospitals; i.e. hospitals that exemplify excellence in nursing services and had little difficulty in attracting and retaining nursing staff (McClure, Poulin, Sovie & Wandelt, 1983). The attributes and practices are professional nursing services and clinically competent co-workers, collegial and collaborative registered nurse-medical doctor relationships, clinical autonomy and quality, a strong, visible and supportive nursing leadership, control over nursing practice and the practice environment, support for further education, adequate staffing, and an organizational culture in which concern for patient is paramount.

[3] Unlike closed-system analysts, who concentrate on the internal working of an organization and move towards states of homogeneity, contingency analysts treat the organization as a system of interdependent parts and recognize that organizations interact and are dependent upon the environment for survival. However, contingency analysts also concentrate on how different "modes" of organizations are required depending on the kind of environment in which they have to exist. For example, Burns and Stalker (1961) examine differences between mechanistic and organic organizations and how this affects their survival in different environments.

[4] The Rubik's cube is a 3-D mechanical puzzle and each of the six faces is covered by nine stickers, among six solid colors. For the puzzle to be solved, each face must be a solid color. Within the context of HRM, the configured cube is regarded as improved organizational performances that are dependent upon the combination of different HR practices to suit the organization's environment.

[5] As Guest (1992) has noted, this functionalist view fails to take account of the external environment that is independently given, including various forms of "protective legislation, market dominance, access to supplies and possibly an advantageous geographical location" (p. 10). Further, Bolton and Houlihan (2007) remind themselves that "human relations are socially embedded, multi-dimensional and deeply reciprocal" (p. 2).

6   Parts of this chapter draw on Beil-Hildebrand (2004, 2006).

7   Foucauldian perspectives are also proven as a means of re-framing the theoretical understandings in the sociology of work. This strand, while recognizing the potential for surveillance, also raises questions of identities and, hence, of resistance and misbehavior. It is part of attempts to theorize subjectivity in the organizational sphere, though influences, such as Giddens (1984), are wider than Foucault (Fleming, 2001, 2005; O'Doherty & Willmott, 2001a, 2001b). Here, the dualistic mode of subjects has not been challenged and these analyses seem to imply that subjects have to be seen as "if the mind is assumed to act independently of the body" (Willmott, 1994, p. 119).

8   Building on the unique character of labour as an indeterminist commodity, Thompson (1990) examined the major formative theoretical inputs and established a hierarchy of concepts in the analysis of the labour process which retains its emancipator interest: First, the capital-labour relationship is the central focus of analysis, and changes here are the main motor for change in the rest of the economy and society. Second, the capital-labour relationship is highly dynamic; i.e. competing producers have to seek ever greater rates of profit, and hence the labour process will continuously be transformed in pursuit of greater productivity. Third, there is a generalized control imperative; i.e. the means of control are often very complex and forms of control exist outside the labour process. And, fourth, the capital-labour relationship is based on contradictory elements of conflict and co-operation; i.e. although it contains aspects of cooperation and consent, conflict remains an endemic and structural feature of the labour process. In combining these four key elements in labour process analysis, it can be theorized as "a specific set of structures and practices that intersect with practices deriving from other social relations" (p. 22).

9   Healthcare is typically made available by governments such as in the UK or through private medical providers, such as in the US. The distinction involves the conditions of work, whether the people are employed directly by the state or by private units, and in what way the service process is determined by market forces or by administrative political decree.

10   A form of job design theory and practice which stresses short, repetitive work cycles; detailed, prescribed task sequences; separation of task conception from task execution; and motivation based on economic rewards. The five principles are: First, a clear division of tasks and responsibilities between managers and employees. Second, the use of scientific methods to determine the best way of doing a job. Third, scientific selection of the person to do the designed job. Fourth, the training of the selected employee to perform the job in the way specified. Fifth, surveillance of employees through the use of hierarchies of authority and close supervision (Huczynski & Buchanan 2006, pp. 413-421).

11   Murphy (1990) is also concerned with combining post-Marxist and Weberian perspectives to draw analytical conclusions of healthcare professionals' subjectivity. However, he seems more interested than Derber (1983a) in grounding his analysis in the concerns of Weber's closure theory of credentials and the professions. That is, healthcare professionals have not become "proletarianised" but they have become "bureaucratised" (p. 76). In other words, proletarianisation is a "misnomer" (p. 75); it is in fact "the process of formal rationalisation and bureaucratisation" (p. 82) because

the changing nature of professions involves neither "proletarianisation nor loss" (p. 77).

[12] The above labour process and critical studies highlight how increased state control in European welfare states and the growing marketization in the US lead to greater accountability and cost control, eroding the professional autonomy of healthcare professionals. This occurs alongside cynicism from a well educated public who increasingly exert choice over their healthcare provision. Beil-Hildebrand's analysis (2004) concurs that healthcare professionals are increasingly subject to quasi-markets and hierarchies, but retain strong professional cultures which help to maintain control over a body of knowledge and day-to-day work practices.

Chapter 79

Human Resource Management for the 21st Century Global Economy

Julianne Seely
Grantham University, USA

ABSTRACT

The purpose of this chapter is to concentrate on Global Human Resource Management (GHRM) by demonstrating how the functional areas of Human Resource Management, such as talent acquisition, leadership capacity, training/development, and compensation/benefits, need to be fused with a higher level of strategic endeavor through cultural intelligence (CQ), system thinking, and the applications of related system archetypes. Understanding the role cultural intelligence plays in the global business community, knowledge of how systems and subsystems operate, and how variables impact the immediate landscape, as well as overall business performance, are the key drivers for competing successfully in the global marketplace.

INTRODUCTION

Unquestionably one the most critical issues facing globalization of the workforce today is that of talent acquisition – requisite skills, retention, leadership, and continued development of expertise necessary to compete in the complex world of unknowns. The skills and abilities we possess today will diminish in importance and application over time more quickly than ever before, and as M. Goldsmith reminds us in the best-selling book, *What Got You Here Won't Get You There*, a new set of behaviors are therefore essential. How we question the underlying assumptions that our hiring and leadership decisions are based and how we forecast and then prepare for the next iteration of global business demands as well as the evolving expectations of the global marketplace, in a very large part will determine our position in a

world economy. To that end, the objectives of this chapter are four-fold:

1. To examine how we currently address the issue of talent acquisition
2. To understand the radical changes that have taken place in the global economy and how these changes impact leadership knowledge, skills and abilities
3. To highlight and articulate the crucial role that cultural intelligence (CQ) demands for the entire workforce
4. To examine the role of systems thinking and application of system archetypes to act as the cohesive force that blends all of these variables in such a way as to position our economy in a place of leadership in the global community

BACKGROUND

The role of Human Resource Management (HRM) has somewhat evolved from a "backroom" function to a respectable place in the boardroom – to that of a strategic partner. No longer can organizations compete in a global business economy with the mindset of constraints bound by administrative tasks. The critical business of HRM today is one of partnering with business leaders throughout the enterprise to hire the 'right talent', take an active role in advancing the skill sets of its organization, irrespective of organizational position, retain that talent as well as engage leaders who possess the insight and innovation required in this uncertain, global business world of the 21st century.

To succeed in this seemingly overwhelming task, it is necessary to answer some very basic questions. How will this be accomplished given the level of complexity and change found in our boundary-less world? Who will have the capabilities to create a strategic HRM plan that incorporates the needs of a global organization? What tools will he/she use to craft and insure this strategy?

CAPABILITY 1: TALENT ACQUISITION, DEVELOPMENT, AND PROMOTION

Fifty years ago, the late P. Drucker coined the term "Knowledge Workers" to denote a class of business leaders whose value was based on what they knew. Knowledge Workers are required today more than in the past as business has become more complex due to technological advances and other factors; however, all employees need expertise that will enable them to function successfully in a global workplace. Knowledge and the ability to identify cultural differences and similarities as well the ability to respond appropriately is a necessary commodity that extends from the front line to the board room.

A study conducted by McKinsey & Company identified a new concept that has been taking precedence over an older model. Knowledge and talent marketplaces are becoming the seedbeds for global talent – a place where networks of professionals foster a rich exchange of ideas; a place where resources and systems are identified and developed. The call for inspired leadership has never been louder. The global economy requires individuals who possess business savvy, cultural intelligence, and strategic thinking.

A recent report issued by Development Directions International (DDI) found that, of the companies surveyed, the top priority of global businesses today is leadership development. Closely following leadership development was recruiting and retaining top talent. To begin this complex HR staffing journey, one needs to understand how to source the right talent, the right skill sets, and the right fit for the organization's culture – locally, nationally, and globally. However, this is no easy task. We need to ask ourselves what mechanisms are in place in those enterprises that are leading the world in a positive direction. Of particular note, even though we know that talent acquisition is a key factor, our rate of success has changed little over the past decade. In 1997, a study by McK-

insey resulted in identifying a critical shortage of executives with global expertise, and unfortunate though it is, the 2008 McKinsey Report, *The War on Talent*, stated the problem was still acute and may have, in fact, escalated in importance.

In 2002, Drucker re-emphasized the growing need for Knowledge Workers. With the retirement of the so-called "Baby Boomer" generation, this foreshadowing has become a stark reality. Even though identified to be a top priority of Chief Executive Officers (CEOs), sourcing talent remains to be an issue because of the one lack of a solid success rate. Not only is the talent shortfall evident at the higher ranks, but it also exists throughout all levels of any given organization.

Given this scenario, the fundamental questions then become: "What shift in our organizational mindsets need to change for us to move from failing hiring practices to successful talent acquisition? What assumptions regarding cultural dimensions need to be challenged? How will lack of insight regarding cultural differences become a barrier for successful hiring? How do we equip our workforce to function successfully on a global scale?" These are but a few of the questions global business demands and which thought- leaders need to be asking themselves today.

As our Knowledge Workers retire, especially in Europe and North America, emerging markets are producing a burgeoning supply of young workers. The opening statement in a paper written for Massachusetts Institute of Technology (MIT), *Navigating the World of Work*, Kochan, Ferguson, His, and Hammond state, "You will be some of the best-prepared young people in the world. You bring to work a world-class scientific, mathematical and technical education, and you will now complement that with knowledge of the economic and social context of work and organizations. This is exactly the mix of technical and behavioral skills that employers look for in new recruits… With the advantages of your education come high expectations and considerable responsibilities. In short, as graduates of MIT, you are expected to be a *leader* in the economies of the future." (2010).

However, not to be dismissed is the fact that in developing economies, a serious talent shortfall has developed despite the global economic maladies since 2007. How we prepare and contend with this huge challenge will play out critically in the global business environment. Additionally, failure to perceive the role of HRM as a strategic partner is a significant drawback. The Saratoga Institute reported that less than two-thirds of all HR Directors report directly to the CEO (2005 – 2006). In fact, some research points to the fact that the impact of HRM is declining and has not traditionally been perceived in a strategic role. Only when HR representation at the senior level is commonplace will the needs of an organization be fully addressed.

The initial challenge of sourcing for top talent will not be easily solved. Mantras of "Our people are our most important asset" need to be a core part of business strategy, not a catch-all slogan as is common in many organizations. Concentrating on high potential employees to the exclusion of the remaining workforce is shortsighted at best. These challenges are difficult enough without the addition of cultural differences in value systems and mores; differences in the perception of time and distance; differences in how life is viewed (doing vs. being). A corporate culture of inclusion builds solidarity and loyalty. Success working within a changing cultural landscape requires insight, skill, and behavior that is conducive to smooth working relationships. The creation of opportunities for all levels of employees to work on diverse teams provides exposure to divergent opinions and produces a broadening of experience and cultural intelligence. Engaging employees who can transcend siloed positions and cultural mindsets toward a holistic system of roles, responsibilities, and accountabilities is crucial.

Best Practices in Talent Acquisition

To source the best candidate for any position, successful companies have identified some of the critical components that indicate practices, processes and procedures that work well. Of particular note is the result of McKinsey's report of talent as a strategic priority (2006). This study indentified finding the right talent for the needs of the organization to be "the single more important managerial preoccupation for the rest of the decade." In November, 2007, a subsequent study by McKinsey found that "nearly half of the respondents expect intensifying competition for talent – and the increasing global nature of that competition – to have a major effect on their companies over the next five years. No other global trend was considered nearly as significant." We are in the fifth year since that study was conducted, but many organizations continue to view talent acquisition as a short term issue, and not part of the overall strategic business plan. What accounts for this lack of strategic vision is a short-term mindset, minimal collaboration and talent sharing among business units, ineffective line management and confusion about the role of HR professionals. (McKinsey, 2008).

However, several key points have been identified as being important in competing in the global war for talent:

1. Development of productive "B" players (frontline staff, technical specialists, contractors, joint-venture partners) alongside the development and promotion of "A" players. Employee development in a global context can be accomplished in many ways: diverse job assignments, work on a cross-functional and/or cross-cultural team, shadowing of high performers in the organization, formal education, performance management.
2. Attracting more diversity in the workplace through altering the organizations branding strategy. Targeting populations to include Generations "X" and "Y" (both of which have a unique set of characteristics), women, older workers, and those from culturally diverse backgrounds, as well as opening the corporate door to those recent college graduates who, although do not have experience, do possess current business knowledge of global trends.
3. Elevating and broadening the role of Human Resources to successfully identify the staffing needs on all levels of the organization, not only the "A" players. Additionally, HR professionals themselves need to acquire solid business acumen skills. Exposure to line employees as well as "A" players through job shadowing will serve to enhance the HR Director's skill set and foster a mindset that presents a strategic stance in promoting and supporting a strong people-centered culture.

In the Harvard Business Review article, *Winning the Race for Talent in Emerging Markets*, it is stated, "All three of us have spent decades studying talent management and leadership development, but this war for talent is like nothing we've ever seen before." (Ready, Hill, & Conger, 2009). Very succinctly, they identify four factors that differentiate successful global businesses from less successful global businesses. These factors are brand identity, opportunity, purpose, and culture.

Brand is particularly inviting because it has the power to open the door to personal advancement and promotion. Opportunity encompasses challenging work assignments, ongoing training and development, competitive pay, and an accelerated career track to senior positions. Purpose translates to playing a part in the strategic direction of the company to maximize its impact on the global economy and be viewed in terms of "global citizenship". Culture refers to recognition for individual accomplishments as well as strong team affiliations and a message that each employee feels they are critical to the success of the business. Ready, Hill, and Conger use the

word "talent-centric" in describing this attribute of the company's culture.

They conclude their report by saying, "Most companies continue to believe that a big salary and name brands will suffice to meet their needs, but a local company that creates genuine opportunities and exhibits desirable cultural conditions will often win out over a Western multinational that offers higher pay." (Ready, Hill, & Conger, 2009).

Capability 2: Global Leadership

"To distinguish leadership from management, one can argue that leaders create and change cultures, while managers and administrators live within them." (Schein, 2010).

For decades, we have been preoccupied with the importance of leadership as the fundamental contributor to business success. PriceWaterhouseCooper's Saratoga's Institute of 2005 – 2006 found that three in 10 leaders do not possess the key qualities necessary for effective leadership today. In the five years since that study was completed, we no longer speak of leadership in effective terms. Leadership today, in order to be effective, must be strategic, creative, intuitive, and possess emotional and cultural intelligence. If, as a leader, one does not demonstrate these elements of leadership, results are only marginally effective.

In the 2010 IBM report, *Capitalizing on Complexity – Insights from the Global Chief Executive Officer Study,* nine qualities were identified as significant for today's global leader. In order of importance, they include:

- Creativity
- Integrity
- Global thinking
- Influence
- Openness
- Dedication
- Sustainability
- Humility
- Fairness

The positioning of creativity at the top of the list not only implies but demands that beliefs of the past can no longer be applied to current global business scenarios. Original and creative solutions must replace traditional thinking. Many CEO's have described creativity as it relates to leadership as the ability to create "disruptive innovation and continuous re-invention." (IBM, 2010). As uncomfortable as it seems, examining the current states of affairs through the lenses of complexity and change, will be a key skill for the global leader. The ability to re-focus and reinvent on a continual basis has taken on a pivotal role in corporate success. This elevated role of leadership, imbued with a higher level of thinking, must evolve into the norm for economic sustainability throughout the next decade and beyond. Corporations will need the ability to tolerate disruption in order to adjust and compete with a current business environment.

This is no simple matter. New leaders will be asked to respond immediately without time to deliberate and research. This means insight, tolerance for disruption, and the ability to collaborate instantly with essential business colleagues and partners will become a necessary norm. S. Sumi, President and CEO of Tokio Marine Holdings, Inc. states, "The management environment is rapidly becoming more complex. In these uncertain times, the need for effective and swift decision making is more important than ever." The use of business analytics will aid global leaders with the ability to make quick, informed business decisions. The windows of opportunity and tolerance for a margin of error in the 21st century global economy are both very small. Workable business models need to undergo continual scrutiny in order to keep abreast of complexity and change.

In the words of I. Tyler, CEO of Balfour Beatty, PLC, "The day of the business tycoon is gone. Managers are appointed; leaders are elected. It's not a question of people following you – they need to be a part of you". The command and control style of management that pervaded past decades is no longer productive. Leaders must use skills

of persuasion, coaching, recognizing and rewarding the behavior endorsed by the newer global organizational culture. The rise in alternative channels of communication will aid in defining this new evolving culture. Experimentation in social networking and digital media are currently being piloted to assess the effectiveness of communicating in a new way.

CEO and President of Virgin America Airlines, D. Cush, states, "We need to build a multigenerational communication strategy to weave our diverse workforce together." In the same IBM study, three recommendations are offered: 1) Embrace ambiguity – this can be done by reaching across functional silos, rewarding breakthrough thinking, and taking calculated risks. 2) Disrupt legacy business models – pilot radical innovations and question industry practices, continually examine and fine tune your business model, learn from the best practices other companies. 3) Rise above traditional management styles – develop and strengthen your ability to influence, develop the ability to coach and mentor others and employ a wide range of communication vehicles. As reported in the IBM study, there are several self reflective questions to ask in order to help assess your level of leading creatively. These questions do not have simple, straight-forward answers but are questions that will impact your business now and in the future. Each executive leadership team needs to consider:

- How will you develop the critical capabilities to enhance creativity among your leadership team?
- In what ways can you explore, reward and globally integrate diverse and unconventional points of view?
- What is your approach to challenge every element of your business model to get the most from currently untapped opportunities?
- How will you leverage new communication styles, technologies and tools, both to

lead a new generation of talent and encourage breakthrough thinking?

A case study by Axiata Group reports positive results from implementing answers to some of these questions. Axiata, a large Asian telecommunication company, employs 25,000 and has 120,000 service subscribers. The vision for the Axiata group was to "be a regional champion by 2015, by piecing together the best throughout the region in affordable connectivity, innovative technology and developing talent, and uniting them toward a single goal and greater purpose: advancing Asia."

The journey began with the exit from retirement of J. Ibrahim in March, 2006. CEO Ibrahim was named "Malaysia's CEO of the Year" in 2009. The first item on the agenda for Ibrahim was to create one team from all groups to develop a shared vision for Axiata. From a shared vision come shared purpose, accountability, and success. Key stakeholders were invited to a leadership summit held in Tokyo. A traditional approach to creating this shared vision would have been many discussions on organizational issues. However, Ibrahim took a much different approach by encouraging each participant to create a futuristic view of Axiata via creation of a Press Release. This collaborative approach for building a common vision delivered astonishing results. Axiata reported tripling net profits from 2008 – 2009. This exercise of creating a futuristic press release opened up a dialogue so that its leaders could create and agree on a shared vision. This simple vehicle provided the opportunity to share differing viewpoints and resolve conflict through a creative medium: the Press Release.

Top leaders are charged with the responsibility of creating and continually re-evaluating the organizations business operating model. What many businesses sorely need is a new organizational model, one that involves streamlining cumbersome structures, discarding inefficient processes and relationships (committees and nonproductive

teams) and on the positive side, developing marketplaces that foster talent, knowledge, diverse relationships and the creation of an empowering, collaborative organizational culture.

In their essay, *The 21st Century Organization*, Bryce and Joyce coined the term "dynamic management". "What we call dynamic management can help: a combination of disciplined processes, decision-making protocols, rolling budgets, and calendar-management procedures makes it possible for companies to manage the portfolio of initiatives as part of an integrated senior-management approach to running the entire enterprise."

One of the higher level positions on the Human Resource Management team is that of a change agent. Essentially, it would be exceptional for a company to report that every employee is a change agent. Although we know this is not true given the organizational structures and business models that pervade the business world today, change agents are a critical part of the 21st Century Global Human Resource Management team. The title is a familiar one, but the role certainly is not. Change agents are leaders who cut across the organization and its business units without regard to traditional hierarchies. Their function is extremely important. Since organizations are continually being asked to 'reorganize' or re-invent themselves, the change agent takes on paramount importance. A change agent can be looked upon to perform in several capacities: Subject Matter Experts (SME's), coaches, or communication consultants. In fact, a change agent team would require the skills of all the aforementioned roles. This team should have direct reporting responsibility to senior staff. A centralized change agent team can foster the development of new ideas and propose a set of solutions to organizational issues that transgresses the smaller system and subsystems. The skills a change agent must possess are many but most importantly, a change agent must possess excellent interpersonal skills since the most important aspect of the change agent role is to lead through a murky world of complexity and change. This is

the individual who is comfortable with ambiguity, conflict and challenge. This is the individual who has the wherewithal to challenge assumptions that maintain outdated mindsets and restrict progress. A combination of academic credentialing and broad based business experience can ensure an excellent fit for this important role.

A rather nebulous trait of a change agent is that of charisma. What more important position than that of CEO requires charisma! Warren Bennis states, "The most dangerous leadership myth asserts that people simply either have certain charismatic qualities or not. That's nonsense; in fact, the opposite is true. Leaders are made rather than born." The true value of a charismatic leader is that they have the power to engage employees on a personal level. They inspire loyalty and pride in accomplishment.

To better understand the quality of charisma it is helpful to examine the performance of business leaders who are respected globally for their contribution to society and to the stellar success of their businesses. One has only to look at Steve Jobs, the founder of Apple Inc., J. Welch, the former chairman and CEO of General Electric, J. Bezos, founder of Amazon.com, M. Whitman, former president and CEO of eBay, to name a few. There is little doubt that the successes of the companies they founded and managed in a large part depended on their ability to engage their workforce, and one of the key skills of a charismatic leader is that of engagement.

In order to compete in a global business environment, organizations need high performance at every level of the organization. Talent management and succession planning are known to be critical performance drivers in robust organizations. As reported in the Society of Human Resource Management (SHRM) work titled, *Developing Leadership Talent: A guide to Succession Planning and Leadership Development*, formal succession plans were likely to include:

- Identifying employees with potential to fill future leadership vacancies
- Taking into account the organization's long term goals and objectives
- Identifying potential leadership talent gaps
- Integrating succession planning into the organization's strategic planning process
- Emphasizing the role of diversity in the global marketplace
- Promoting the visibility of women in leadership positions

Being able to forecast leadership needs in the next one to four years seems to be a strong indicator separating the more successfully competitive organizations from others. Forecasting beyond four years is extremely difficult. This research prompted a discussion regarding the identification of leadership competencies and although the questions were highly controversial, this report states that "The solutions to adaptive challenges lie not in technical answers but with the people themselves."

What vehicles are used to develop leaders? Experts estimate that 80% of leadership development comes from learning and leadership development initiatives; 10% comes from classroom education and training and the remaining 10% comes from coaching and mentoring. Given these statistics, providing opportunity for leadership in a cross-cultural context that is job related is invaluable if these skills and learnings are then applied back to the job as well as the transmission of this knowledge forward to the larger organization. This significantly reduces the impact of time and distance on developing leadership abilities. Traditionally, the measurement of success for developmental opportunities has been found in the impact on the organization's bottom line. Along with this measurement we need to take into account learning and application of learning back on the job. Research indicates that executive coaching provides about six times the return on investment compared to the cost of coaching. This is a startling finding

because traditionally, most leadership initiatives take place in a classroom setting with little to no follow-up or follow-through after the event.

The creation and implementation of stretch goals also plays an important part in fashioning cross-cultural leadership opportunities. The Center for Creative Leadership (CCL) has proposed a model that can be used as a guiding force for crafting a leadership development opportunity. The ACS model includes the elements of Assessment, Challenge and Support. Assessment provides a current snapshot of leadership abilities at a given point in time. Challenge often takes the form of a 'stretch goal' both in thinking and acting. Challenges provide a 'sandbox' environment for experimentation with new ways of accomplishing goals (getting the work done) as well as encouraging risk-taking in an unfamiliar territory. Support, which underlies the success of this model, calls for positive reinforcement for new learnings and ways of thinking. Upon completion of this stretch assignment, return to the former way of thinking and doing things is counterproductive and will not impact the bottom line in a positive manner. As is stated in the CCL study, "…sending a changed person into an unsupportive interpersonal environment is one way that organizations waste their resource investments in development."

The Kirkpatrick scale of measurement can be a useful tool in assessing the success of a 'stretch' assignment. Outcomes of a 'stretch' assignment can be evaluated on four separate levels: reactions, learning, transfer and results. The most significant measure is results which can be evaluated through gains in productivity, customer satisfaction, employee morale (employee satisfaction) and profitability. To be sure, some of these indicators will not apply for all 'stretch' assignments.

The CCL study also states that the more variety in assessing the results, the more powerful the results. Reliance on one indicator is short-sighted. Lastly, these 'stretch' assignments should take place in an organizational context. Using the "Best Practices" of other organizations may not fit with

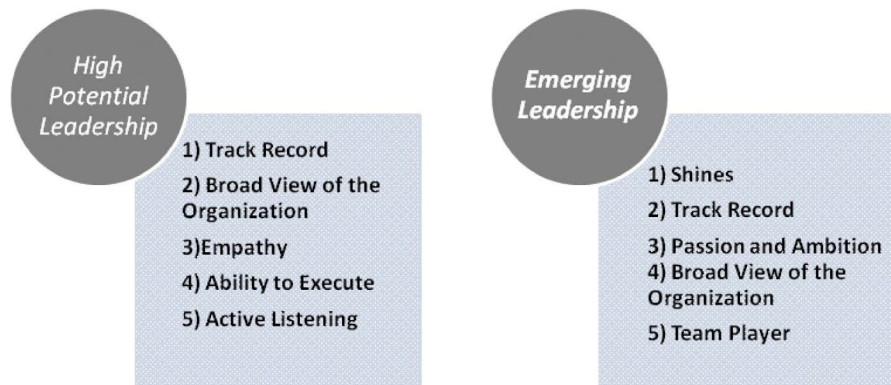
the existing global organizational culture. When considering the 21st Century Global Business Environment, given the choice of methods - education, assessment, coaching or experiential learning - that of experiential learning is the favored potent approach for leadership development. In a separate study, Fast Company (2007) took a broad view and divided leadership into two distinct categories: High-Potential Employees and Emerging Leaders (see Figure 1). When line leaders were asked to identify the characteristics for a senior leader the results of this study identified five characteristics of High-Potential Employees and Emerging Leaders. One of the managers interviewed remarked that an effective senior manager needs to have a 'big picture' mindset and be able to consider many complex dimensions of an issue simultaneously.

High-Potential Leadership defines Track Record as results achieved; Broad View denotes being able to consider a variety of issues and viewpoints when making decisions; Empathy is defined as the ability to build relationships as one achieves results; Ability to Execute denotes the ability to manage large organizational change initiatives successfully; Active Listening refers to being engaged and present in conversation to build mutual understanding.

Emerging Leaders define Shines as the ability to stand out and above (influence); Track Record is defined as ability to achieve results; Passion and Ambition refers to engagement with the job and people; Broad View of the organization is defined as being able to consider a variety of issues and viewpoints when making decisions; Team Player denotes the quality of being able to subordinate personal aspirations and works in a coordinated effort in striving for a common goal. Of particular interest is that these qualities all contain some dimension of relationship building and the ability to influence. When asked to identify Emerging Leaders; questions such as: Has the person performed well in 'stretch' assignments? Does the individual perform well in ambiguous situations? Is the individual able to influence peers to a positive view? Does this person possess a sense of urgency? Does this person have passion for continual learning?

Another issue considered for high-potential and emerging leaders is that of opportunity. What types of development opportunities/activities seem to provide the best results and are considered to be most meaningful? Line leaders ranked action learning first, cross functional job rotation second and 360 degree feedback third. The first two are experiential in nature whereas the third is the result of an assessment process.

The SHRM (Society of Human Resource Management) study identifies seven key recommendations for leadership development:

Figure 1. Characteristics of two types of leadership


1. The goal of leadership development is to promote leadership effectiveness.
2. Leadership development is driven by organizational strategy within that particular organizational context.
3. Leadership development contains a strong performance goal orientation.
4. The meaningfulness of any experience can be made more powerful when adding greater levels of ACS (Assessment, Challenge, and Support).
5. Individual development is strongly influenced by a motivation to learn.
6. Tailor the development opportunity to the organization's goals and strategies.
7. Explore external as well as internal avenues for leadership development (corporate universities, training seminars, shadowing, coaching, and mentoring).

Capability 3: Cultural Intelligence (CQ)

In 2003, the concept of cultural intelligence was introduced to the business world by two researchers, S. Ang and C. Earley in their book, *Cultural Intelligence: Individual Interactions across Cultures*. Additionally, Earley and Mosakowski published an article in the *Harvard Business Review* (October, 2004) listing cultural intelligence a business core capability. Cultural Intelligence (CQ) can be defined as "an outsider's seemingly natural ability to interpret someone's unfamiliar and ambiguous gestures the way that person's compatriots would". The key phrase here is "seemingly natural ability". An assessment developed by Earley and Mosakowski can be used to gather baseline data on Cultural Intelligence.

This self-assessment is separated into three categories: Cognitive CQ, Physical CQ, and Emotional/Motivational CQ. Each of these categories contains important questions regarding an individual's strengths and areas of development. The results of this assessment generate a profile

Figure 2. Four capabilities of cultural intelligence
for an individual that provides direction to increase cultural intelligence. There are four CQ capabilities that indicate a person's strength as well as needs. These are: CQ Drive, CQ Knowledge, CQ Strategy and CQ Action (see Figure 2).

A study reported by D. Livermore for *Forbes.com* indicated that leaders with high CQ understand how to proceed in a culturally ambiguous situation more successfully than those leaders who have a low CQ. CEO's with a high CQ have learned how to adapt to diverse markets without surrendering their brand identities. Human Resource managers with high CQ understand how to accommodate differing religious and ethnic requests. Business leaders with low CQ do not see the relationship between CQ and the bottom line. Additionally," those business leaders that have high CQ are more consistently effective and enjoy greater personal satisfaction and less burnout in all kinds of multicultural situations."

Capability 4: System Thinking / System Archetypes

The author's purpose for this chapter is to bring current and relevant information on crucial aspects of 21st Century Global Human Resource Manage-

ment, all of which are of utmost importance today. However, a powerful tool for dealing with the complexity of a global business environment has been overlooked in many organizations.

Systems Thinking can be defined as "a world-view based on the perspective of the systems sciences, which seeks to understand interconnectedness, complexity and wholeness of components of systems in specific relationship to each other." (wordIQ.com). Another component of systems thinking is monitoring behavior over time. System thinking is in stark contrast with traditional analytical problem solving techniques. An essential component of systems thinking is that of feedback, feedback loops (balancing and reinforcing) over time. This model can be applied to every organizational issue whether it be merger and acquisition, leadership development, staffing, problem solving, and so on. The system thinking model has been in existence for fifty plus years. This model has been used in high performing organizations with great success. When considering the complexity of a global environment it makes sense to employ every tool that can be used to clarify complex and ambiguous scenarios. System

thinking should be one of the highly chosen tools. This begs the question, When is it appropriate to consider the use of system thinking to understand complex scenarios? Employing systems thinking requires us to think in new ways. In the article, *Prying Management Away from the Old* by T. Babbitt states that systems thinking as a discipline would provide revolutionary change to the ways we think about how work is done and how we need to manage workers. The functional structure of the past no longer fits the complexity of today's global business environment. Too often the worker is held accountable for what is out of his control when in actuality it is a faulty organizational structure/system that is the culprit. Babbitt states that, "A systems thinker understands that organizational design flaws are rooted in management thinking and the assumptions on which the design are based." What is most likely to change are the assumptions, not the fundamental thinking that underscores adherence to a faulty system.

Some indications that system thinking can provide great insights into organizational issues can be found in the understanding of system archetypes (see Figure 3).

Figure 3. Common systems archetypes
The more commonly applied systems archetypes are: 1) Limits to growth; 2) Shifting the Burden; 3) Eroding Goals; 4) Escalation; 5) Success to the Successful; 6) Tragedy of the commons; 7) Fixes that fail; 8) Growth and underinvestment. Use of these archetypes forces one to identify the root cause of organizational dilemmas, for instance, why is the desired state (the outcome) not occurring? (Limits to Growth). An example of the Shifting the Burden archetype occurs when solutions to issues are attempted to be solved with simple explanations. The true source of the issue is never identified, hence resulting in shifting the burden to a lesser factor, one that has little to no bearing on the problem. The Eroding Goals archetype is a type of shifting the burden archetype where long term strategies are overlooked or abandoned in lieu of an immediate fix. With the Escalation archetype an adversarial game between two players declares that there can only be one winner. This often dissolves into destructive behavior. Success to the Successful can be identified when one of the two players becomes more successful than the other which prompts more resources to be funneled to the successful party. This in turn deprives the second party of necessary resources, thereby continuing to reduce the success rate of the 'underdog'. Fixes that Fail is one of the most common archetypes put into action. This occurs when an organizational problem is solved quickly and has a beneficial effect only to find that the fix did not solve the underlying issue.

L. Bryan of McKinsey Consulting states in *Dynamic Management: Better Decisions in Uncertain Times*, "…progressive strategists have been undertaking noble experiments (such as shorter financial-planning cycles) while dropping the pretense that they can make reasonable assumptions about the future. My sense, though, is that achieving truly dynamic management will prove elusive for most organizations until they can figure out how to get their senior leadership (the top 150 managers, for example) working together in a fundamentally different way." Ways

to encourage managers to think in different ways would be to promote the use of systems thinking to make actual decisions. Having the knowledge of and being aware of system archetypes before engaging in a strategic planning session would allow managers to begin the process with a new prospective, one that avoids being trapped in 'decision by assumption'.

A perfect application for systems thinking can be found at Millipore, an international supplier of products and services to the pharmaceutical industry, biotechnology companies, and life sciences research. Millipore employs approximately 6,000 people and reports consolidated sales of $1.6 billion USD. Wrestling with expansion through merger and acquisition, the central challenge for Millipore was to integrate and centralize the handling of products and services through a Shared Service Center (SSC). Prior to 2005, Millipore had a decentralized structure. Having a centralized structure with a single point of contact which would significantly improve service and operations was very attractive to management at Millipore. In 1998, Millipore decided to open a Shared Service Center near Strasbourg. After ten years management at Millipore attests that the SSC (Shared Service Center model) was more successful than they had imagined. The single point of contact concept, it was felt by Millipore management, provided the company with a strong competitive advantage. D. Kauffer of Millipore remarked that the SSC concept enabled them to "react more quickly to turbulent economic conditions." He also states that the future lies in the globalization of more of our processes. This trend of opening up Shared Service Centers is thought to provide opportunities for career development for talented employees and consequently provides a definite attractor for rich talent.

LaFarge is a world leader in construction materials. This company employs 54,000 people and has annual sales of $19 billion. As was illustrated in Millipore, LaFarge also had a decentralized business model largely due to the fact that its

products (cement, etc.) needed to be manufactured and sold locally. Spokesperson, M. Soule, relates that management made the decision to open its first Shared Service Center in 2000 in Toronto, followed by Detroit, and in 2008 four additional centers were opened in France, England, Russia, and China. The decision to move to a SSC was one of shared vision and dynamic leadership which resulted in immediate benefits, largely pertaining to economies of scale. Leadership in the center was equally important in that the goal was to create an organizational performance culture. Soule' also stated there is a need in the centers for "not only talented experts mastering highly computerized processes, but also for team leaders who know how to motivate and challenge people, in order to avoid a certain level of monotony and repetition of tasks." Clearly, Shared Service Centers represent a newer way of doing business, a new way of thinking that incorporates the four elements that is the focus of this chapter. Taken as a whole, these individual elements - talent acquisition, leadership, cultural intelligence and systems thinking - provide a powerful framework for achieving sustainability and success in the 21st Century Global Economy. Human Resource Management will experience a significant increase in importance, involvement and challenge in providing avenues for these four crucial elements to become standard fare in this continually evolving, complex, boundaryless world of business.

ABSTRACT

The chapter examines the development of online learning systems in corporations, corporate utilization of reusable learning modules, and the various forms of assessment and knowledge certification used to ensure and improve the quality of the learning outcomes. Corporations continue to embrace e-learning, at a dramatic rate. This is partly driven by a desire for cost reduction and partly to ensure that all staff to have the required skills and competencies for their jobs. Organizations are increasingly linking the e-learning/e-training systems with other modules of their human resource management systems and this chapter includes a case example to illustrate such linkages. Universities have demonstrated progress in e-learning but remain in a position to learn much from e-learning developments in the corporate world. In sum, the chapter provides an overview of corporate experiences with e-learning/e-training and how these might be transferred to the academic world; it also sounds a note of warning for the universities should they fail to observe the ongoing development of corporate e-learning systems.

INTRODUCTION

Multiple sectors such as universities, corporations, organizations, and governments throughout the world are rapidly expanding their utilization of online tools to take advantage of faster, affordable Internet access and state-of-art technology. Universities are offering more online classes to supplement, enhance, or replace their traditional ace-to-face classes and this increases student accessibility to university courses, more flexibility for instructional delivery, and a wider range of options for student-faculty interactivity (Yeh & Hsu, 2008). Corporations are reaping similar benefits from e-learning/e-training systems and have also benefitted from being to keep their employees' skills up to date. Consulting groups expect continued increases in corporate online learning (or e-learning) expenditures. For example, in 2002, Cortona projected that corporations would spend $50 billion on e-learning/e-training systems by 2010, rising from $5 billion in 2001 (Source: eMarketer) and in 2007 Global Industry Analysis Inc. (GIA) expected e-learning/e-training expenditures to exceed $52.6 billion by 2010 (Source: Global Industry Analysis Inc.). Although caution must be exercised in using these figures due to some variation in markets covered and in type of expenditure included, it is clear that corporate attention to e-learning/e-training will continue.

This chapter looks at recent developments in e-learning/e-training in the corporate environment and examines them from an academic perspective. The authors believe that the education environment (and in particular the management education environment) is going to get much more crowded and competitive. Corporate educational offerings can be viewed as a substitute for more formal training, including university-based training, and corporations have arguably moved more quickly than the universities in fully embracing online education. The authors believe there are both lessons and warnings for the academic learning community.

The chapter begins by reviewing the development of the online learning platforms and how these integrate with other human resource management systems. The chapter continues by examining the factors driving and constraining the development of corporate e-learning/e-training systems and uses a case example for illustration. The chapter then turns to what has become a fundamental element of corporate e-learning/e-training – the reusable learning objects. Assessment (a crucial factor in all learning systems) is examined next and this is followed by a brief discussion of implementation issues. The chapter concludes by discussing some implications for more traditional educational environments.

DEVELOPMENT OF THE ONLINE LEARNING PLATFORM

Technology and the changing workplace provide opportunities to approach employees' learning and skill base development in new ways. E-learning/e-training technologies allow employees to take online course on an "as needed" basis at times that best suit them. E-learning/e-training can also be timed to suit workplace skill enhancement requirements. The ubiquitous nature of the Internet, multimedia and communications technologies allow learning and training to be delivered in new formats at a lower cost.

E-learning/e-training systems are increasingly important components of Human Resource Information Systems (HRIS) (also called HR modules, HRIT systems, HRMS) which support human resource management processes in organizations such as HR planning, recruiting and selection, training and development, performance management, and compensation and benefits (Bentley, 2007). E-learning/e-training solutions can be acquired by organizations as stand-alone HRIS applications, as components of integrated performance management solutions, or as components of integrated human capital management (HCM)

systems linking learning management systems (LMS) with Talent Management Systems (TMS). Most e-learning/e-training solution vendors offer clients the option of implementing e-learning/e-training solutions in-house (self-hosting) or gaining access to customizable e-learning/e-training applications via a Web browser (i.e. as a hosted, application service provider – Application Service Provider(ASP) or Web services solution). The trend is toward hosted, ASP e-learning/e-training solutions such as that illustrated in Figure 1. Figure 1 illustrates that online training and development management is a key component in integrated Web-based TMS.

According to an Expertus's study conducted in 2006 with a sample of 249 organizations, more than one Learning Management System (LMS) is used by many companies (25% of their sample) and most (75%) of these organizations plan to consolidate their systems in the near future (Bentley, 2007). Jon Ciampi, Vice-President of Marketing at SumTotal, points out that another corporate tendency is to integrate their LMS with talent management, succession planning, and performance management systems (Bentley, 2007).

Figure 1. Strategic talent management (source StepStone Solutions)

Learning Management Systems vs. Course Management Systems

Many LMS products, such as Blackboard, WebCT, and Webboard are commercially available and Moodle, one of the biggest open source solutions for e-learning/e-training software and platforms, provides comparable functionality to that supported by commercial counterparts (Dean, 2008; Scher, 2007). The terms Learning Management Systems (LMSs), Learning Content Management Systems (LCMSs) and Course Management Systems (CMSs) are often used interchangeably (Yueh & Hsu, 2008) and the difference among them has been not clear. However, Carliner (2005) makes a distinction between CMSs and LMSs by pointing out that learning and training are different activities. LMSs (e.g., Webboard, WebCT, Blackboard) are platforms that can support focused corporate training for immediate application but CMSs (e.g., NetDimensions EKP, Saba, and SumTotal) are platforms designed to support long-term learning and development in courses such as those at universities (Carliner, 2005). Brown at el. (2007) note that Human Resource Development (HSD) practices in corporate environments are different from other types of training because they emphasize lifelong learning, hence CMSs may be best suited to support HSD processes.

Although distinctions can be made between LMSs and CMSs, this remainder of this chapter discusses patterns and trends that characterize both of these technologies.

Employee Performance Management Systems (EPMs)

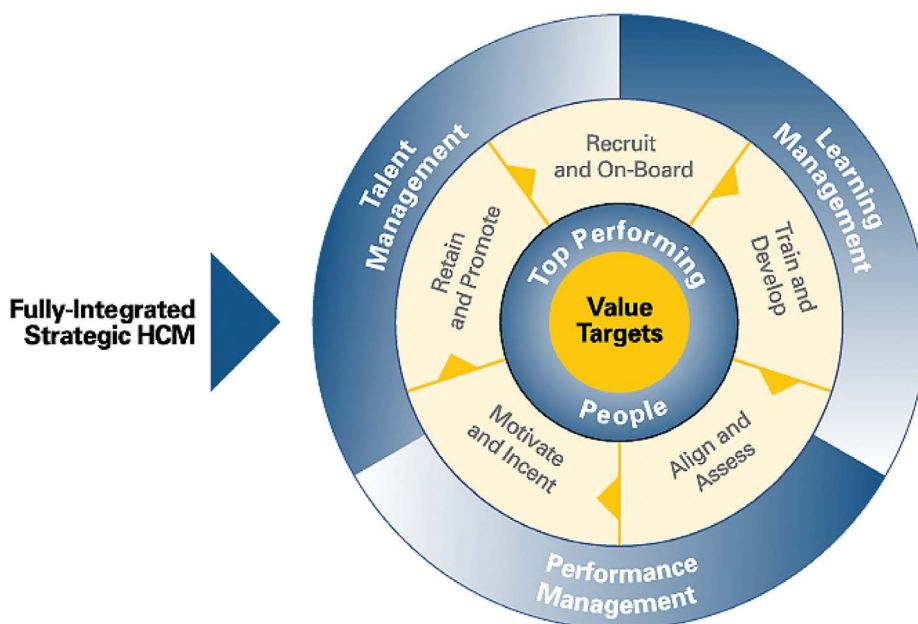
Multiple vendors offer integrated Employee Performance Management (EPM) solutions such as that illustrated in Figure 1. Some claim to offer best-of-breed solutions with robust capabilities while others offer performance management (PM) modules as part of a comprehensive integrated package. According to McMillan (2004),

the investment of hundreds of millions of dollars in research and venture capital over the last half decade has led to the development of a number of scalable Web-based performance management solutions that lend themselves to companywide deployment. McMillan notes that usable, accurate competency management systems are the cornerstones of EPM solutions because these enable the organization to articulate, target, and measure the skills and behaviors that are vital to organizational success. Since some competencies supersede any organization, many EPM solutions provide access to competency libraries and related resources (such as the Lominger Leadership Architect® Competency Library – www.lominger.com) and/ or the ability to define organizational-specific role-based competencies. The identification of critical competencies has implications for hiring, training and development, performance appraisal, succession planning, talent management, and compensation processes and applications. Because e-learning/e-training has the potential to play a pivotal role in the acquisition and development

of individual competencies, a LMS is a key component of the EPM solutions offered by many vendors (McGraw, 2001).

Human Capital Management Systems (HCMS)

In today's business environment, companies increasingly view their human resources as critical factors in their efforts to gain competitive advantage. This has led to the realization that human capital management activities are critical to achieving high levels of corporate sustainability and corresponding interest in Human Capital Management Systems (Wirtenberg, et al. 2008). As noted by Israelite and Seymour (2006), Human Capital Management (HCM) focuses on the holistic management and optimization of an organization's workforce by striving to add value to organizations via improving the organization's human capital over time. Israelite and Seymour are advocates for fully-integrated strategic human capital management systems that integrate learn-

Figure 2. Integrated strategic HCM system (source Israealite & Seymour [2006])


ing management, performance management, and talent management (see Figure 2).

Integrated HCM systems are designed to enable organizations to identify employees with high potential for success for inclusion in succession planning, comprehensive competency assessments, the development of personalized training and development programs, and tracking of individual development progress. By combining learning management, performance management and talent management, integrated HCM systems are capable of improving the overall quality of the organization's workforce. HCM leverages e-learning/e-training systems to provide personalized training and development processes and when learning management processes are coupled with individualized incentives that appropriately channel employee behavior toward key organizational goals, the organization benefits from enhanced productivity and effectiveness. When employees know that they are performing competently and will be appropriately compensated for doing so, they are likely more satisfied with the organization (and their jobs) and are less prone to turnover. In addition, by rewarding, retaining, and continuing to hone its talent, the organization positions itself to be able to attract more high-caliber employees.

Learning Management Systems

E-learning/e-training solutions are the centerpiece of Learning Management Systems (LMS). Schmidt (2003) outlines numerous reasons why corporations are attracted to LMSs including the ability to reduce training costs, personalize training curricula, make training delivery location independent, and provide expanded training opportunities beyond the expertise of in-house trainers.

LMSs enable employees to access training sessions at their convenience via their PCs whether they are at work, at home, in the field or even in another country. Through LMSs, organizations can significantly reduce a number of costs as-

sociated with traditional training processes, such as trainer fees, training facilities costs and travel costs for both trainers and trainees. For example, CompUSA, after adopting an LMS in 1998, dramatically reduced training costs, from over $50 per unit to less than $1 per unit (Margolis, 2007).

LMSs also enable organizations to offer more training options. Reusable, off-the-shelf e-learning/e-training modules, including those available from competency libraries, make it possible for organizations to extend training offerings beyond the expertise of in-house trainers. In addition, LMSs enable companies to track the individual employee's learning/training progress by capturing each employee's log-ins, the amount of spent training, and which training modules are completed. They also provide customized guidance to employees for developing the talents and skills required to be successful in their positions. For example, when logging into the LMS, an accountant will not see engineering courses as choices on the screen. Individual skill or competency levels can also be accommodated. For instance, more seasoned employees may be channeled to intermediate-level course modules or advanced-level reviews that help them retain and grow their individual skills sets. The end-result of personalization is typically less-frequent and more appropriate training sessions for individual employees; this enables opportunity costs from training-related productivity losses to be reduced.

Most traditional training delivery approaches, typically classroom-based, are not easily customized. As a result, they typically require trainers to generalize the training that is provided, which means that issues specific to the individual trainee are often overlooked. Additional customization provided by most LMSs includes the ability to match the format of training content to the individual employee's learning style. For example, visually-oriented trainees can be provided with training that includes high levels of video content.

LMSs enable managers to track employee training progress and many can be aligned with

incentive programs to encourage employees to complete training. LMS notification systems and Web-based reminders can be used to inform employees and managers of post-training course salary upgrades.

According to Schmidt(2003), the shelf-life of learning/training content is an important consideration when selecting a LMS. Firms that specialize in continually evolving technologies or services are likely to need an LMS that can easily support learning/training content changes; this is less likely to be an issue in firms in less volatile industries. Other important selection considerations are costs, return on investment (ROI), and ongoing support issues.

The ability to share and cross-reference data with other HRIS components can also be an important consideration. For example, an employee title change should ideally trigger automatic updates to the individual's training and development plan. The ability for managers to access and review employees' knowledge sets and training levels are supported by many LMS; this helps managers monitor whether an employee is qualified to keep a certification. Numerous companies are leveraging such information to assign employees to projects that utilize knowledge they have recently acquired via LMS trainings. Thus, this LMS capability makes it possible for organizations to provide "just-in-time" training – i.e. employees acquire the training they need exactly when they need it.

Some LMS products are used as customer service enhancement tools to provide remote workers, business partners, suppliers, and customers with Web-based walk-throughs of new product or service features. Because many LMS products support multiple languages, such "training" can be provided globally. While most organizations do not completely replace traditional training programs with LMSs, LMS training is increasingly being used to supplement/blend classroom-oriented training with e-training (Schmidt, 2003; Lansari, et al, 2007). Those parts of the curriculum that are best shared with live groups are maintained while those which can be easily accommodated via e-training are conducted online.

Drivers of Corporate Interest in E-Learning Systems

The foregoing descriptions of Employee Performance Management Systems (EPMSs), integrated Human Capital Management Systems (HCMSs) and Learning Management Systems (LMSs) provide support for Galagan's (2000) observation that the "bottom line" is a primary driver of corporate online learning. Skills and knowledge acquisition is expensive, and this is why LMS are more common in large organizations than smaller ones (Brown et al., 2006). Removing staff from the workplace, hiring teaching/training personnel, using physical resources such as rooms and equipment, and the maintenance of course material all contribute to sizable corporate training expense. The ability to significantly reduce, if not eliminate, training-related travel costs and irrelevant or unnecessary training sessions also drives corporate interest in e-learning/e-training systems. LMS's ability to offer highly personalized to employees is also attractive. For example, Jane Doe could receive tailored training that only includes those pieces of traditional training courses that are relevant to her position and pieces (or entire courses) that are not position-relevant can be omitted from Jane's training.

A secondary, but related, corporate interest driver is improved productivity (Bullock, 2001). EPMs, HCMs, and LMSs highlight skill deficiencies in individuals and across the organization's workforce as a whole. The provision of the required knowledge and skills as an extension of the HRMSs is a logical next step. E-learning/e-training technology allows both the individual and the organization to take advantage of either synchronous or asynchronous learning to support learning services "24/7/365". The ability to deliver customizable content allows the organization to enhance individual productivity in a manner

that best fits their individual circumstances and current skill or knowledge levels. The ability to provide course content in multiple languages is also attractive to some corporations.

Compliance with widely accepted e-learning/e-training standards is valued by many corporations. The American Society for Training & Development recommends LMS compliance to SCORM and AICC standards (Watson & Watson, 2007). Many LMSs comply with the Sharable Content Object Reference Model (SCORM) which is a set of technical standards that enable Web-based learning systems to find, import, share, reuse, and export content. This gives instructional designers, managers, and writers a specification whereby educational courses can be distributed in a "plug-and-play" manner. Compliance with standards developed by the Aviation Industry Computer Based Training Committee (AICC) enables e-learning/e-training programs to pass information to one another. For example, a simulation program could integrate with a quizzing program to receive results. McGraw (2001) notes that as a general rule, the technical architecture for e-learning/e-training is an open architecture, and must include standards for integrating existing elements, such as legacy learning technologies, enterprise applications, online learning, and emerging tools.

The ability to monitor and assess learning outcomes also attracts corporate interest in LMS. Performance management pages dedicated to assessment and feedback are built into most online learning systems – partly to reinforce the learning and partly to ensure a satisfactory standard is achieved before the learner moves to the next level. Such assessment and feedback can (and is) modified to report achievements to management and can be used for bonuses, performance reviews, promotions, and other incentives. Most LMS products used in corporations support gap analysis. Skill or competency deficiencies and centers or areas of excellence are identified via gap analysis or by the use of intelligent agents,

and the systems recommend appropriate managerial action.

Other factors that influence corporate interest in particular LMS solutions include the ability for individuals to "sign up" for courses and skill acquisition that they view as being valuable, the ability to map learning outcomes to HR metrics, the ability to monitor/assess employee and workforce knowledge of compliance requirements (e.g. Occupational Health and Safety requirements), ease of use, and vendor reputation.

Corporate Satisfaction with E-Learning Systems

Due in part to the rapidly evolving nature and expansion of online learning, there is little definitive research relating to corporate satisfaction with, or the efficacy of, e-learning/e-training technology. However, there is some evidence that this method of learning is not necessarily the learning/training solution that employees prefer (Mowbray & Dick, 2003) and employee satisfaction with e-learning/e-training solutions may be related to the personal benefits derived from the system, and not the benefits that accrue to the organization (Dunstan & Dick, 2004). This presents particular problems for the champions of e-learning/e-training in corporations – full buy-in may only be possible when they are successful in selling the idea of online learning to the "students" who will be using it.

It is possible that the research on satisfaction and efficacy may be misdirected. In the light of anticipated increases in corporate e-learning/e-training expenditures over the next few years and the expected bottom line impacts of online learning, perhaps instead of asking "How good is online learning compared with a more traditional approach?", researchers should be asking "Is it good enough?" or "What is online training's ROI?"

Depending upon the goals of the e-learning/e-training program, a more efficient and accessible program may be acceptable, even if the learning it imparts is inferior to that for more traditional

face-to-face methods. The key here is whether satisfactory learning outcomes can be achieved. In some instances, learning that is sub-optimal may be sufficient and, due to cost savings, may be the most reasonable approach from a purely business perspective.

ONLINE LEARNING AND THE GALLUP ORGANIZATION

The Gallup organization has over 40 offices in 27 countries, with its corporate headquarters in Washington, D.C., and its operations headquarters in Omaha, Nebraska. The Gallup organization employs approximately 2,000 world leading scientists in management, economics, psychology, and sociology to identify and monitor behavior and economic indicators for the last 70 years. The Gallup Poll, one of the company's four divisions -- Gallup Poll, Gallup Consulting, Gallup University, and Gallup Press -- is one of this organization's best known products/services. The Gallup organization collects data on employees and customers of its clients, mostly Fortune 500 companies; this data is subsequently fed back to client organizations for managerial decision making and assessment that helps its clients improve customer relationships and maximize employee productivity.

Gallup is both a provider and consumer of e-learning solutions and thus provides a very good mechanism for illustrating and reinforcing the key points in the previous sections. As a provider, Gallup sells online learning content to other organizations as part of its management consulting activities. Gallup University enrolls approximately 50,000 students a year. In 2008 almost all of its students were involved in some form of distance learning. While Gallup University offers some face-to-face classes, including MBA courses, most students take online courses (see Figure 3). Gallup Online is Gallup's external metrics and e-learning/e-training system. It is designed for

high-volume use and adheres to industry-standard e-learning protocols. The e-learning supplied via Gallup Online is designed to help clients understand, evaluate, and take action on data that Gallup collects and aggregates.

As a consumer, it subscribes to instruction provided by third party vendors, however, most of the e-learning materials used to train Gallup's new employees are developed in-house. Gallup's e-learning/e-training content is available for use by other organizations. Gallup is also able to leverage the e-learning/e-training content that it has developed for clients to create generic courses or learning modules on topics such as leadership and the characteristics/behaviors of effective managers. In short, some of Gallup's e-learning/e-training modules are both reusable and have commercial value. Furthermore, purposeful packaging of learning modules by Gallup and other e-learning/e-training content providers has the potential to reshape online education delivered by public, private, and for-profit universities.

Gallup's LMS

Gallup's proprietary, internal e-learning/e-training system is an exceptional example of a learning management system. Gallup's LMS is based upon a *learning object* model; this means that the number and sequence of learning events that a new employee is required to complete is determined by the individual's role at Gallup. While all new employees receive online instruction on core topics such as benefits, submitting travel expenses, and understanding one's role at a Gallup citizen, the remainder of their initial training is customized to their job. For example, a new manager of client interviewing would receive instruction on the outbound phone system, while a newly hired consultant could receive training on how to communicate effectively with clients.

All e-learning/e-training modules are accessed via a single system. This system also enables employees (and their managers) to track training

Figure 3. Gallup University

progress. The system enables individual learning modules to be updated as needed and managers can modify the number and sequence of learning modules for individual employees to support just-in-time training.

Figure 4 illustrates the login page for Gallup's internal e-learning/e-training system. When users log in, they are presented with a personalized program of instruction that is based upon their job requirements. For example, a new associate might be required to gather (or "scavenge") information about various company activities. The "user interface" for the Scavenger Hunt system (shown in Figure 5) includes "stamps on a passport" indicating that the learner has completed all required events for a particular section tracking on each learner's progress.

This administration component of the e-leaning system was designed for use by Gallup's managers. It allows them to add new material to the system and to create custom learning programs for their direct reports. The system includes an efficient mechanism for tracking learners and controlling what they see and do. Gallup makes extensive use of the Learning Object model, which

Figure 4. Gallup's internal e-learning/e-training system

Figure 5. The scavenger hunt system

employs Reusable Learning Objects (RLO) that can be selected, combined, and sequenced to meet the learning needs of an individual employee.

REUSABLE LEARNING OBJECTS

One of the main distinctions between corporate e-learning systems and comparable systems used in academic settings is the extent to which they have embraced reusable learning objects (RLOs). RLOs use in much more common by corporations than by colleges and universities and corporate utilization of RLOs provide likely insights into the evolution of academic e-learning systems.

In the quest to gain ever-greater efficiency and effectiveness from their learning systems, corporations are taking a page from the object-oriented programming playbook and building libraries of focused, concise learning modules that can be deployed in various combinations to form a custom curriculum that is tailored to the individual employee. These modules, often called

learning objects (LOs), are typically designed so that they can be redeployed in other contexts, in much the same way a Java object created for one application can be reused in other applications. A learning object may contain almost anything that is required by application in technology-supported learning such as instructional media, including text, images, audio, video and interactive components (IEEE, 2001; Muzio, 2002).

Lorents et al., (2008) categorizes LOs essential qualities into two groups, the object's content related qualities and its additional and technical qualities. The first group is related to the degree to which LOs are reusable, self-contained, and pedagogically neutral; the second group is related to the degree to which LOs are accessible, compatible, and interoperable. Churchill (2007) proposed six categories of learning objects that is useful as a framework for designers of digital resources. The six categories are presentation, practice, simulation, conceptual models, information, and contextual representation objects. Two or more categories can be combined due

to common characteristics and some categories are more likely to be used for direct instruction while others are more likely to be used to support traditional pedagogical approaches.

When learning objects support exterior form changes but do not require functions of various technologies to be changed they are known as Reusable Learning Objects (RLOs). RLOs provide learning object developers with 'plug and play' flexibility (Burge, 2008). RLOs hold considerable promise for both corporate and university learning systems. However, there are also a number of potential pitfalls.

RLO Overview

Perhaps because of their still-evolving nature (Rossano et al., 2006), the term "Reusable Learning Object" seems to have almost as many definitions as advocates; a number of authors have pointed out the plethora of definitions (Koppi et al., 2005). Fortunately, many of these definitions share some common elements. Learning objects are relatively small, self-contained modules of learning content that are focused towards satisfying a specific, well-defined learning objective (Wu et al., 2006). Reusable Learning Objects (RLOs), as the name implies, are designed so that they can be used in learning environments other than the one for which they were originally created. In other words, a reusable learning object may be "recontextualized" (Muzio, 2002).

Driscoll (2004) points out that RLOs have three main characteristics. First, they are *flexible*. Because (ideally) they are designed to be stand-alone, they are independent of any particular context. Consider, for example, an RLO designed to teach non-discriminatory interviewing techniques may be used in combination with other RLOs to form an online course on recruiting. This same RLO may be used independently as a review for a manager who needs to refresh her/his interview skills. Similarly, this same object may be used as part of a diversity course for new employees. The

developers of the International Virtual Medical School (IVIMEDS) note that the use of RLOs enables adaptive learning that takes into account variations in physicians' expertise, backgrounds and educational needs (Harden, 2006).

Second, because RLOs are tagged with a common set of metadata labels, they are *manageable* – in many instances developers can attach high-level information to each learning object (metadata). These capabilities have enabled many organizations to adopt Learning Content Management Systems (LCMSs) that allows project members to contribute, collaborate, and interact with one another during the development of a training project (Nguyen & Hanzel, 2007). In its simplest form, a LCMS may be a database that catalogs the RLOs according to these tags. For example, a project at the Virtual Orthopeadic European University uses Microsoft SQL Server to build and maintain a repository of learning objects for a medical learning system (Wu, 2006).

Third, RLOs should be *interoperable*. RLOs should be independent of any particular instructional technology or LCMS. The key to achieving this interoperability is to follow an industry-standard format when developing the learning objects. There are several such standards, including IMS (from the IMS Global Learning Consortium), IEEE Learning Technology Standards Committee (LTSC), the Sharable Content Object Reference Model (SCORM) and Aviation Industry Computer Based Training Committee (AICC) standards.

When properly designed, individual RLOs can be recombined to form new curricula. For example, Cisco Systems Learning Solution Partners combine RLOs provided by Cisco to construct new courses; the same object may be reused in multiple courses. The strategy of recombining existing objects is particularly attractive for learning content providers. Providers who successfully employ a reuse strategy are able to use a given object in learning content that is customized for a number of different clients. It is not the objects themselves, but rather the *combination* of objects

that is customized for a particular client (or individual learner).

The concept of learning objects has its genesis in the concept of object oriented programming (OOP). Those familiar with OOP may recall that improved reusability was one of the main benefits touted by its proponents. The same can be said about the RLO concept. Ideally, a learning object created for one course can be repurposed in another course. As is the case with OOP, creating reusable objects is often considerably more difficult and requires greater effort than creating a less flexible object (Parrish, 2004).

In fact, it is critical to consider reuse from the earliest stages of design; reuse does not simply happen, it must be planned for. For example, considering reuse may lead to a finer level of granularity than if the object is designed without consideration to reusability. Parrish (2004) recommends a number of tactics for taking an object oriented approach to instructional design. First, divide content into coherent, discrete units. To those familiar with computer programming, this is reminiscent of the concept of cohesion. Everything in the object (whether a learning object or computer code) should be directed at one objective. In programming, this objective is a function, in instructional design it is a learning objective. Designing cohesive learning objects makes the second reusability tactic easier, embedding metadata that provides an accurate description of the learning object. One obvious benefit of properly using metadata is that it facilitates searching. It also allows for better curriculum management through learning management systems. Parrish's third recommendation is perhaps the most questionable. Parrish recommends designing the learning object to be relatively "context-free." While this may well facilitate flexibility, many educational theorists would argue that learning is never context free, so it may be a mistake to design context-free learning objects.

Advantages of Reusable Learning Objects

When properly designed, RLOs promise a number of advantages. First, just as reusable code makes computer programming more efficient, RLOs make the development of courses be more efficient. Ideally, new courses can be constructed from existing RLOs by recombining existing RLOs in new ways to create new courses. Of course, this ideal is rarely met. It is more likely that a newly-created course will be a combination of existing and newly-created learning objects. Even in these cases, reusing some learning objects may decrease development time significantly. It is challenging to create Learning Objects and it is even more difficult to apply standards to existing Learning Objects. While instructional designers can easily implement a LMS with effective use of standards, it is often the case that an LO that works well in one LMS is not used in another LMS because developers are not aware of its availability (Watson & Watson, 2007). One solution to this problem is Automatic Metadata Generation (AMG) which enables developers to search LMS object libraries for potentially useful LOs that could be repurposed for new learning applications (HMDB, 2008).

There are other, less obvious benefits to RLOs. RLOs may help increase collaboration among instructors and designers (Parrish, 2004) and RLOs may also help make learning more adaptive to the learning preferences of individual learners. When combined with proper learning management systems, RLOs may as well allow more generative learning, in which the learning management system creates individually-tailored instruction "on-the-fly." In addition, RLOs may improve scalability, allowing instruction to be provided to larger audiences without a proportionate increase in costs (Parrish, 2004).

The fast proliferation of open source LMS tools and the Internet has the potential to take RLO use and availability to a new level. Lakhan and Jhunjhunwala (2008) have provided overview

descriptions of the most widely used open source LMS tools including Moodle, Bodington, Claroline, Dokeos,.LRN, ATutor, OLAT, and Sakai. The increasing popularity of open source LMS tools translates into the available of numerous free RLOs.

RLOs and On-Demand Learning

Perhaps one of the most promising benefits of RLOs is the ability to facilitate "on-demand" learning and communication media are increasingly following an on-demand model. Prime examples of this are found in broadcasting. One of the fastest growing trends in television is the increasing popularity of digital video recording (DVR) systems, such as TiVO. These systems allow viewers to easily record programs that are later viewed at their convenience. Program schedulers no longer hold complete power over when a particular program is viewed. While video tape recorders have allowed consumers to record programs for many years, the additional capabilities of digital video recorders have brought new vitality to the practice. The growing popularity of these systems is bringing about changes in the television industry. For example, advertisers are very concerned about the DVR's ability to allow consumers to skip commercials. Because of this, advertisers and television producers are seeking new ways to promote products. For example, more emphasis is being given to product placement strategies where advertisers pay to have their products visible in scenes or mentioned by actors during a program.

Another good example of "on-demand" media is the explosive growth of the iPod and similar devices. These audio (and now video) players give consumers the ability to essentially program their own listening experiences rather than relying on radio station programmers. Consumers can easily build custom play-lists to fit their moods, activities, and listening preferences. Once again, this ability has existed for many years through the use of tapes and compact discs. The new devices, however, make the process much easier.

Podcasting is the newest example of how emerging technologies are facilitating an on-demand lifestyle. A consumer can listen to a podcast whenever and wherever s/he pleases (once the podcast is downloaded). It does not matter when the broadcaster (or podcaster) wants the consumer to listen; now the consumer is in control.

RLOs may help facilitate on-demand learning, just as MP3 files facilitate on-demand listening. Lectures, exercises, even simulated laboratory experiments (and other learning objects) can be accessed at a time that is convenient and productive for the learner. When the original lecture occurred is relatively unimportant. The learner can access the lecture through a learning management system at any time. The instructor still maintains control by specifying the sequence in which objects should be accessed, but the learner controls the time and place of access. When done properly, this may result in a win-win situation.

Corporate Use of Reusable Learning Objects

Learning objects are being used by a number of organizations, both for internal training purposes and for providing training to third parties. One example comes from the United States Internal Revenue Service (IRS), which uses a SCORM-compliant strategy to deliver e-learning/e-training in its "Link & Learn" system, which provides Web-based training to volunteers who help taxpayers throughout the U.S.

The International Virtual Medical School (IVIMEDS) uses RLOs to help achieve its goal of providing excellent medical education to a variety of health professionals including practicing physicians. As Harden (2005) points out IVIMEDS' RLO repository enables wide-spread sharing, recombination and repurposing of RLOs. This allows the application of the RLO based courses

to be deployed across a variety of learning situations and contexts.

Verizon, a provider of wired and wireless communications, uses a SCORM-compliant LMS to deliver training to its 80,000+ field-service employees. Verizon managers estimate that reusing existing content has the potential to cut course development costs by as much as 50% (Howard, 2004). Cisco Systems is also using RLOs to facilitate the development and delivery of e-learning/e-training courses. Cisco Learning Solution Partners take advantage of Cisco's RLOs by recombining the objects to offer new courses. This strategy also allows Cisco to provide its employees and customers with personalized, on-demand e-learning/e-training (Maddocks, 2002).

Perhaps one of the best examples of a corporation leveraging the capabilities of e-learning/e-training comes from the Gallup Organization, which we discussed in an earlier section. Gallup does an excellent job of not only using e-learning/e-training resources and capabilities to manage its own associates' personal development; it also makes extensive use of RLOs in the revenue-generating e-learning/e-training it provides to clients.

Certainly, organizations must be able to determine whether their e-learning/e-training systems are bringing about the intended benefits. One critical aspect of this is assessing whether the intended learning goals are met. Assessing the outcomes e-learning/e-training is another dimension on which corporations are out in front of universities.

Assessment

Assessment is widely-viewed as a crucial part of most learning activities including those associated with e-learning and e-training systems. From a knowledge certification point of view, assessment provides some degree of assurance that the learner has achieved a certain level of knowledge at a point in time. From a student or learner perspective it provides feedback on performance to date (and perhaps indicates readiness of the learner to take a formal certification) and assessment serves to provide a learner with a way to reinforce learning activities by integrating into the learning process tests of knowledge retention and understanding. In addition, at a higher level, the assessment, when related to learning outcomes, provides a means by which achievements against the curriculum can be determined, with this in turn being considered against the desired body of knowledge.

Hall (2002) has suggested that promoting metacognition (understanding at a deep level) depends on the alignment of the learning objectives with the teaching process and the assessment criteria. In other words online education is about much more than using the technology as simply a delivery medium. Online education provides the opportunity to develop an embedded approach and to significantly change assessment procedures and to relate them more directly to practice. To date, corporations have been quicker than universities to capitalize on this opportunity.

Knowledge Certification

Assessment is built into education partly as a means of advising external parties as to the degree of competence a learner has reached. Interested external parties could include potential or existing employers, academic institutions, professional societies and accreditation bodies. As such, the role of assessment in validating and providing a statement of certification of the achievement of a certain level of knowledge needs to be objective, but aligned to the desired curriculum.

Cleveland and Bailey (1994) argue that assessment research needs to move beyond the use of grades to measure student learning in the online environment. Hay, Peltier and Drago (2004) suggest that assessment for management education should encompass the learner's ability to reflect upon their actions. Online education that uses discussion boards and interaction with peers can provide an opportunity for reflective consideration

of various scenarios and outcomes; students' responses and arguments developed in this way can be an important assessment component.

Knowledge certification also can be measured by how well one can transfer the knowledge acquired into the workplace. Iverson, Colky and Cyboran (2005) examined the influence of the user characteristics of self-efficacy, motivation, goal orientation and metacognition on outcomes, including the intention to transfer knowledge to the workplace (the desire to use newly learned knowledge and skills on the job). Their results indicated that those who were most likely to transfer the knowledge were those who were most motivated to learn. The implication of this study is that the intention/desire to apply the learning in the workplace provides a form of knowledge certification.

Feedback to the Learner

Dumont [1996] also argues that one of the current benefits of online learning is that student interactions are usually recorded as part of the learning process which facilitates assessment and feedback. Receiving feedback reflects a learner-centered orientation within the organization that promotes students' further learning (An and Reigeluth, 2008). Making it easy to provide feedback incents organizations to use the capabilities of the technology to build suitable skills in students and to respond to student needs (Clarke, 1996).

In a study of Web Based Learning in Malaysia Poon (2004) found that instructors and students considered mutual assessment and feedback as vital. The opportunity to browse the work of classmates was seen as beneficial because it allowed the students to better understand what they had done well or not so well, and how it compared with the work of others. Most also felt that the quality of their work was improved when they were able to compare it with the work of their peers.

It is highly desirable for instructors to engage the students in discussion sessions in order to provide prompt feedback to the students' enquiries since two-way communication greatly enhances assimilation and refines the quality of e-learning/e-training. However, considerable time is needed for the monitoring and advising on the progress of the asynchronous discussions (Poon 2004).

Clearly technologies associated with online learning offer significant advantages in the area of feedback and assessment -- however these are not without cost. There are high demands on the instructors' time and the students can suffer from information overload. In addition special attention is required to deal with the ready availability of completed work in an electronic form as it raises the temptation of plagiarism. Controls to prevent this should be introduced and monitored.

Learning Reinforcement

Both small and large companies agree that e-learning/e-training courses may be more likely to be successful when undertaken in a dedicated learning center that motivates learners to be responsible for their own learning (Brown et al., 2006). Conceptual understanding is enhanced by the provision of opportunities for formative as well as summative learning (Hall 2002). An obvious example of this is to relate course material to practical examples in this way learners can appreciate both the significance and the practical application of the material. In an online environment this can be achieved by short quizzes and/or discussions relating to case studies or scenarios – choosing the right approach or solution, for example. Summative assessment can be built on the formative work undertaken as part of the learning process, so that the learner can see the basis for the unit assessment. Such a process also allows the learner to work at his or her own pace and provides opportunities for him to re-visit sections or modules that he understands less well.

Alignment of Learning to Desired Outcomes

Almost all organized learning has a set of desired learning outcomes as a goal. This is translated in a curriculum and further refined into course objectives aimed at ensuring the learners are provided with the required body of knowledge. Ideally this body of knowledge is periodically assessed in relation to the desired learning outcomes.

An example that illustrates this deals with learning about immunization practices and procedures, described by Lancaster et al. (2005). In this investigation, many possible immunization interventions were listed and learners were asked to choose the 'best' four. The feedback received by learners provided a rating of the effectiveness (or ineffectiveness) of each intervention, based on an extensive review of evidence from the literature. Lancaster et al. (2005) go on to suggest that future enhancements might include allowing a learner to work a cycle of implementing an immunization intervention and following up with another online assessment.

This example demonstrates how the work of professionals can be assessed as they progress through the learning cycle. If the professionals are found to be doing the wrong thing in practice, the learning modules can be re-used to ensure that the required body of knowledge is being imparted to the learners. This suggests the need for a close relationship between the learning and practice – the closer that connection, the sooner, and more efficaciously that learning is put into practice, the quicker that needed modifications to current practices can be made. This becomes especially important in online learning in the corporate environment – online learning is often specifically targeted at a "mission-critical skills" required in the corporation (Trierweiler, 2005). The ability to quickly assess the value of the learning and to take action to modify the learning to better to suit the required skill set can be critically important.

Implementation Issues and Strategies

Universities and the general public can learn much about e-learning/e-training from the corporate world. One of the first lessons is that the business drivers for implementing e-learning/e-training should be clear. E-learning/e-training should be viewed by managers/administrators as a means for adding value to the organization either directly (e.g. via workforce enhancement) or indirectly (e.g. via training/development cost reduction). Proponents should be able to crystallize the rationale for investing in e-learning/e-training systems in a compelling business case that identifies measurable organization value via traditional financial justification approaches, such as ROI and Internal Rate of Return (IRR), or a balanced scorecard approach. If a compelling business case for e-learning/e-training cannot be made in a university setting (i.e. if the business drivers are not clear), investing in e-learning/e-training may be less desirable than directing monies toward alternatives whose ability to add value is more apparent. A problem with these measurable approaches is that intangible factors, that often are important goals of e-learning, can be ignored; also, such measurements may cause organization to only focus on short-term results (Grant & Danziger, 2005).

A closely related issue for universities is whether the school should be an e-learning/e-training provider or consumer (or both). Numerous universities are e-learning/e-training providers, but not in the same way as Lominger or the Gallup Organization. Both public and private universities have embraced courseware development and management products such as Blackboard and WebCT to provide supplemental online support for traditional courses as well as to deliver complete courses online. Such courseware has spawned online private universities such as Kaplan University, the University of Phoenix, and Walden University that provide a wide range of

degrees and certificate programs. Unfortunately, despite the prevalence of courseware development/management software, the courseware developed by both traditional and online universities limits access to the online training and education modules to enrolled students. In contrast, the reusable e-learning/e-training modules developed by Lominger, The Gallup Organization, and similar providers can be sold and used by trainees in any organization that recognizes their potential to add value, including direct competitors. As a result, many of the e-learning/e-training modules created by corporate e-learning/e-training providers have become world-class benchmarks that continue to attract clients that recognize the futility of trying to develop superior substitutes.

Consider the possibilities if colleges and universities were able to set aside intellectual property issues and "not invented here" biases (that have led to multifold duplication of online course content within higher education) and were free to consume each other's online content. What if any university could provide interested students with the best online Political Science, Calculus, or Macro Economics course that had been developed by another university? There are obvious benefits for university students in this scenario. One of the less obvious benefits for universities is the ability to direct their resources to the things they do best – perhaps to developing e-learning/e-training modules for an academic discipline whose quality would be unsurpassed in the higher education marketplace.

Numerous obstacles (including intellectual property issues) would have to be overcome for universities to evolve to an e-learning/e-training mindset similar to the one that pervades today's corporations. "Buy" rather than "build" can arguably be said to describe the corporate e-learning/e-training landscape just as it defines today's typical corporate attitude toward software acquisition. Universities, however, may be characterized as remaining mired in a "build rather than buy" mentality that results in the seemingly endless

production of proprietary e-learning/e-training modules whose value beyond the confines of each university's virtual presence is unknown.

An approach that has the potential to alter a university's perspective on being an e-learning/e-training provider is to have it become a consumer of corporate e-learning/e-training products for its internal non-academic training and development. Bringing world-class corporate e-learning/e-training capabilities to the university's non-academic staff as part of HR training and development initiatives could eventually capture the interest and attention of the academic side of the institution. This may help move the institution toward an enlightened attitude toward e-learning/e-training; one that is more consistent with the views of corporate e-learning/e-training consumers and providers.

The corporate world's utilization of Reusable Learning Objects (RLOs) should provide further food for thought for universities and other educational institutions including secondary schools. The building and refining libraries of SCORM and AICC-compliant e-learning/e-training modules has the potential to facilitate continuous improvement in course content. RLO libraries would enable educators to search for and use modules which best illustrate course concepts – ones that could be used to either augment or supplement traditional in-class instruction (or both). The use of RLOs could conceivably become a standard part of the instructional training of secondary school teachers and university professors. The development, customization and enhancement of RLOs are also likely to become increasingly desirable skills for educators. RLO libraries have the potential to improve the education experiences of students by helping to ensure that courses include e-learning/e-training modules that are likely to have the greatest impact on learners. Developing such libraries may move teachers toward being critical evaluators and selectors of learning modules via attentive selection the content of their courses this may be more likely

to demonstrate continuous improvement. In short, RLOs may revolutionize instructional design and delivery and are likely to do so as long as iPods and competing technologies remain popular.

Educators at all levels can also learn much from corporations in the area of personalization. The ability to create personalized, portable music libraries was one of the first attractions of mobile MP3 players. Thanks to RLOs, it is now also possible to create personalized learning libraries. Some universities, including Duke University, have been on the forefront in leveraging iPods and mobile devices for learning purposes. In addition, some publishers of higher education textbooks, including Wiley, are using podcasts to supplement their print materials and online courseware. While these efforts are worthwhile and indicative that some educators and educational content providers "get it", they fall well short of the level of personalization observed in typical corporate learning management systems. As noted previously, corporate LMSs enable companies to track individual learning/training progress and to provide customized guidance for developing position/job-requisite talents and skills. Individual skill or competency levels can also be accommodated and seasoned employees can be channeled to more advanced modules design for skill maintenance or growth. The level of personalization possible in corporate LMSs extends increasingly to the ability to support on-demand learning/training. The granularity of personalization of university-level e-learning/e-training is much coarser than that for corporate e-learning/e-training; in general, the same content is provided to all regardless of position or skill or competency level. In addition, there is little or no segmentation of review/refresher e-learning/e-training content for advanced learners that is distinct from that provided for first-time learners.

Universities and other educational institutions might also gain insights in promoting personal learning and skill development from studying the learning management capabilities of corporate LMS. Corporate e-learning/e-training systems typically provide managers with the ability to access and review individual employees' knowledge sets and training levels. This information can be used to ensure that individual employees qualify for promotions or bonus, or whether they have the knowledge/skill levels needed for particular projects. The ability to monitor learning progress, to align learning/training to institutional goals and to reinforce learning/training outcomes could be effectively leveraged by university and secondary school educators. In the future, student tracking systems modeled on corporate e-learning/e-training management capabilities could be used for knowledge certification and assessment. As assessment gains momentum in secondary and higher education, educators and educational administrators would be wise to see what is possible by systematically studying the assessment and learning management capabilities of corporate e-learning/e-training systems.

FUTURE TRENDS

To meet the needs of today's learners, Industrial age instructional approaches must give way to Information age approaches (Watson & Watson, 2007). Twenty-First Centrury Learners typically needed a customized pace and personalized sequencing of instruction that is more learner-centered. A continuing weakness of many corporate learning tools is that they operate like a distributor or a publisher that delivers too much information to all learners regardless of each individual's level (Karrer, 2008). Support for learner-centered approaches is essential for today's and future LMS technologies; tracking and assessing each individual's learning continues to be important as well as providing sequence recommendations to instructors.

Collaborative software and social networking capabilities that enable learners to interact and share data will increase in importance in the years

ahead because they support social constructivist learning approach (Dalsgarrd, 2006). Social constructivism advocates conceive learning as a problem-based, self-directed and collaborative process that is consistent with the personalization and individualization of learning. Dalsgarrd believes that LMSs are best used for administrative purposes and that to improve e-learning, social software tools should be added including collaborative tools such as wikis and blogs to support exchange and networking among learners (Dalsgarrd, 2006).

The use of wikis and blogs are a fairly new concept to higher education although they have been around more than a decade. Wikis and blogs are experiencing increasing use as university teaching tools. Online learning educators/trainers have started paying attention to various usages of wiki applications because they provide both collaborative convenience environments (Parker & Chao, 2007). Blogs and wikis are often compared to each other because both of them are easy publishing tools for the public. The main differences are the number of authors (single vs. multiple), time order (chronological or non-chronological), and the organization of information (by time or by topics) and so on. Although blogs are more suitable to distributing information as a publishing tool, wikis are better suited when multiple authors intend to modify and enhance the knowledge in a collaborative environment (Parker & Chao, 2007). According to Frydenberg [2008] wikis have already become a tool that complement and sometimes replace the use of LMSs and CMSs to disseminate information in today's Web 2.0 world. Moodle (open source LMS software) and Blackboard include built-in wikis as plug-ins from third party providers in their most recent versions (Frydenberg, 2008). In the future, more wikis and blogs will be integrated within LMSs to support educators who seek constructivism, or problem-based or learner-centered approaches that maximize LMSs potential. Inviting students to build a course assignment through a wiki will

give them ownership of the class and ideally students will learn more when they have to gather their thoughts to actually write something to share with other students.

Learners of all ages will be exposed to use of LMSs and LMS use by younger people will increase in the future. Not only companies and universities use LMSs or CMSs, but more high schools will offer online classes as the younger people become more familiar with computer and Internet usage. According to Shein (2008), 4,500 high school students in Gwinnett County, Georgia took at least one class online in 2007; this is a harbinger of what the future is likely to hold.

CONCLUSION

As might be expected, learning in the corporate environment is much more job specific than in the university system. Corporations also have been driven more by a "bottom line" approach and thus have been quicker to use technology to turn "learning" into e-learning/e-training. Universities have not been completely left out with many courses offered online or at least in a "web-enhanced" mode. Nevertheless, the authors believe that there are lessons for the universities in what the corporate organizations are doing.

Corporate online learning platforms are developed with a focus on short to medium term organizational needs and the way the learning can be delivered and linked back into the systems that require that learning. As such they are a ready means of ensuring that the educational offerings match the needs of the organization and the students. A similar level of emphasis on assessment and feedback might also be beneficial for academic institutions. Another important aspect of corporate systems is their functionality of combining in-house developed material with that from other organizations in a manner that is transparent to the user. Similar integration capabilities might be especially valuable for university business schools.

Corporate LMS are aimed at providing "convenient" learning – at a time and place of the student's choice – often incorporating the expertise of instructors from other organizations. This can also reduce costs – eventually borne by the student or the employing organisation. Customization is a key too – it enables the learning to be individually tailored to the student. Similar capabilities in university LMS may be beneficial and could potentially be used by universities to keep alumni up to date with new cccupationally-relevant developments – a potential lifelong "value added" element.

The focus on the reuse of modules in the corporate environment should also translate into academia – many courses have common elements that should be relatively easily transferred, rather than re-written or worse still, re-developed. However as noted earlier, this transferability does not just happen – it needs to be planned for from the earliest stages of module development.

There also would seem to be lessons for universities in the area of assessment – in particular the practical application of knowledge, motivation to learn in a non-traditional way, comparison and discussion of work with one's peers, feedback and improvement and the availability of tests and simulations to aid in learning reinforcement. Most importantly too, the online systems linked to workplace practices provide feedback on the efficacy of the learning system itself – another useful tool for academia.

Graduate courses provide universities with an increasingly large slice of their revenue; these graduate courses are often aimed directly at business employees and working adults. Business is already moving to incorporate the essential knowledge and skills elements required of their staff into the existing e-learning/e-training systems; the learning platforms and the technology now existing and emerging soon will increase the interest of business in taking a larger slice of the education pie. Universities are well advised to consider how corporations are leveraging e-learning/e-training. Doing so may help traditional educational institutions significantly improve their online education and counter the growing competition from the business world.

KEY TERMS AND DEFINITIONS

Blog: a Web site, usually maintained by an individual, with regular entries of commentary, descriptions of events, or other material such as graphics or video.

Constructivism: Philosophy of learning founded on the premise that, by reflecting on our experiences, we construct our own understanding of the world we live in.

E-Learning, Online Learning: The use of computing and/or communications technologies to provide learning in the form of courses, training or skills acquisition.

Learning Management Systems: Computer systems that allow learners to access educational content and management the ability to monitor performance in, and use of, such learning.

Learning Objects: Focused, concise learning modules that can be deployed in various combinations to provide a body of knowledge.

Podcasting: The method of distributing multimedia files over the Internet so they can be played on mobile devices.

Knowledge Certification: Some evidence that a certain level of knowledge has been acquired.

Learning Outcomes: The desired objectives of providing the knowledge in the form of a course.

Social Software: Encompasses a range of software systems that allow users to interact and share data.

Wiki: A collection of web pages designed to enable anyone who accesses it to contribute or modify content, using a simplified markup language.

Chapter 81

Expanding the Boundaries of Healthcare Human Resources Planning

ABSTRACT

Human resources are central to healthcare services, yet leveraging these resources to meet strategic operations and operational outcomes can present challenges to leaders and human resources professionals because of the complex and dynamic nature of healthcare delivery. Although the traditional roles of human resources management are necessary in supporting an organization in meeting its goals, economic, strategic, and cultural considerations are becoming increasingly important to human resources management and workforce planning in healthcare settings. This chapter presents several features of these different lenses to assist human resources managers in developing a holistic view of human resources planning in health care.

INTRODUCTION

"Healthcare is transitioning from a stable, comfortable, and complacent past to a confusing present and unpredictable future" (Begun & Heatwole, 1999, p. 342).

Although this statement was made ten years ago it is reflective of the healthcare industry of the 21st century. Today, change is not occurring in small incremental steps, but in quantum leaps. The delivery of health care, reimbursement, technology, quality measurements, malpractice claims and awards have led to dramatic and fundamental changes within the healthcare industry over the past two decades. Coupled with the shortage of

healthcare professionals, an aging population, a large workforce on the brink of retirement, the rise in consumerism, and an increase in the uninsured in some countries due to rising unemployment, these changes underscore the importance that human resources professionals must place on development of their strategic capabilities. These changes also underscore the importance of the difficulties faced by organizations as they strive to achieve optimum performance in healthcare human resources planning (HHRP).

The World Health Organization (2006) reports that there are over 59 million healthcare workers worldwide, yet this supply of workers remains insufficient to address the healthcare needs of the global population. With nearly 4 million more healthcare workers required to meet the demand for health services (World Health Organization, 2007), the global economy is experiencing the effect of a shortage. Although the gap between the supply and demand of healthcare workers is most pressing in the world's underdeveloped and most challenged nations - those lacking a robust infrastructure, a stable financial system, or impoverished by war - industrialized nations also face substantial challenges in meeting the healthcare needs of their populations because of existing or pending imbalances and shortages in the healthcare workforce. For example, it is predicted that the United States will be short of nearly 200,000 physicians over the next decade (Helwick, 2007; Phillips, Dodoo, & Green, 2005) and will lack up to 260,000 registered nurses by 2025 (Buerhaus, as cited in American Association of Colleges in Nursing, 2009). Canada has reported a pending shortage of 78,000 nurses by 2011 (Biddiscombe, 2009) and 6,000 physicians by 2010 (Kondro, 2007). Pacific and Asian nations, such as New Zealand, Australia, and others in the region are also reporting substantial shortages (Henderson & Tulloch, 2008).

As organizations, hospitals, communities, states, and nations search for solutions to address workforce shortages and other workforce-related

outcomes, these entities must consider the linkages between healthcare human resources planning (HHRP), human resources management (HRM), and other fields of study that support the development of practical and workable solutions. Certain fields of study, such as strategic management and economics, have direct relevance to HHRP because they provide direction for planning and methodologies to inform the decision-making process. The concepts and ideas found within these disciplines can provide HR professionals with a set of tools and methods to successfully integrate and extend the traditional tools of HRM in healthcare settings.

Extending HRM in healthcare settings also requires an awareness of the unique role that culture plays in determining the healthcare needs of a particular population. Cultural considerations drive the type and quantities of care demanded by a population, which in turn influences the types and quantities of healthcare providers needed to support a particular population. To the extent that the quality of the interaction between the patient and provider depends upon cultural aspects of both parties, cultural aspects of the healthcare encounter are key considerations in developing HR strategies for the healthcare workplace: HHRP must recognize that the effectiveness of any healthcare encounter will be influenced by the cultural beliefs, perceptions, and values of both patient and provider. Cultural considerations present unique challenges to the HR professional, particularly in determining how best to create a workforce that aligns and recognizes the ways in which culture influences healthcare outcomes.

Determining the correct quantities and types of healthcare workers needed to provide effective healthcare services for a particular population will require HR professionals to look beyond the traditional functions associated with human resources management. Healthcare human resources planners who explicitly incorporate basic economic relationships, organizational strategies, and cultural considerations have the potential to

make planning a process that makes a substantial difference in helping healthcare organizations and other institutions reach established goals and objectives.

HEALTHCARE HUMAN RESOURCES PLANNING

Healthcare human resources planning is a process that results in estimates of the quantity and types of healthcare professionals needed for a particular community or population at a particular time (Birch, as cited in Birch et al., 2007). Although this process is clearly interdependent with other organizational processes, the historical and contemporary approaches to HHRP underscore a process fraught with difficulties and clearly in need of strengthening. The HHRP process has become synonymous with the generation of "estimates," a rather narrow conceptualization considering the significance that these estimates hold for strategic development and HRM functions. Although the HHRP process is crucial for nations, institutions, and healthcare organizations, the process has not been one of urgency.

[Human resources for health] HRH planning continues to have a low priority in most countries. Either it is not addressed at all in a systematic manner, or the plans that are formulated are divorced from the development of the overall health system. The result is acute shortages of services and staff in some geographic areas, and costly surpluses in others. The unrealized expectations of workers trained in excess of a country's ability to absorb them or fully to utilize their skills have caused them to migrate or, at the very least, led to serious loss of morale and motivation. The failure to give sufficient priority to HRH issues is not limited to developing countries (Kolehmainen-Aitken, 1993, p. 12).

The literature on HHRP presents several methods for organizations to consider when developing plans to provide care for a population of interest, which include population-based approaches, needs-based approaches, training output evaluation, demand assessment, and benchmarking (Rickets, 2005). Other researchers have proposed similar methodological categorizations (Kolehmainen-Aitken, 1993; O'Brien-Pallas et al., 2001). The evolution of these methods reflects ongoing changes and dynamics that have occurred in the healthcare industry, particularly related to understanding the relationships between healthcare outcomes and the types and numbers of health professionals involved in care.

Population-Based Workforce Planning

Population-based workforce planning models are based upon simple ratios of the numbers of providers to the size of a particular population of interest. The clear advantage to using such a ratio lies in its simplicity of calculation (Klarman, 1969); however, these types of unadjusted measures are lacking in a number of dimensions. These unadjusted ratios tell us nothing about the meaning and applicability across specific populations, and they also provide no direction for HR activities that could potentially alleviate shortages or surpluses in actual values observed for a particular population (for example, the variation of distribution of providers within an urban-rural population in a state/nation). Because medical need does not explicitly factor into population based estimates, it is difficult—without direct examination of how the ratios were determined to be optimal—to state how a specified number of providers per population translates into health outcomes, such as mortality and morbidity. The range of physician to patient ratios is most telling. In the United States, physician to patient ratios have ranged from 1:500 to 1:5,000 (Rickets, 2005)

with physician specialties and organizational settings (e.g., HMO, fee-for-service) serving as drivers of the variation in provider to patient ratios (Hart, Wagner, Pirzada, Nelson & Rosenblatt, 1997; Henderson, 2002). As Rickets indicates, the variability in these ratios reflects different perceptions about productivity, varying perceptions of the healthcare needs for the population of interest, and miscalculations. Because simple population-based models represent some of the most simplistic ways to determine healthcare workforce needs, these may only be relevant for broad discussions about workforce planning in healthcare. More sophisticated methods involving collaboration with healthcare providers, analysis of empirical evidence about ratios and health outcomes, and recognition of how other factors, such as technology, contribute to health would provide planners with a more effective means of determining the specific quantities and types of healthcare providers needed for a particular population.

Needs-Based Planning Models

The needs-based planning model in health care is a logical extension of the simple population-based approach. Needs-based methods are used to estimate the numbers of providers required for a population of a given size based upon a professionally-determined definition of need (Odrich, 1985). Calculation of estimates requires knowledge of the characteristics of the work effort involved, as well as the time-based resources to treat the population of interest. Determining these ratios is a straightforward endeavor (Folland, Goodman, & Stano, 2001, p 337; Klarman, 1969). The required time for a direct or indirect healthcare provider to provide care for a condition that affects a proportion of the population can be used to determine an estimate of the numbers and types of providers required for the care.

Consider the following example:

On a recurring basis, say annually, an illness affects approximately 15% of a population of 1 million. The provision of care for this illness has been shown to take approximately one hour of a primary care physician's time. The available work hours for the physicians are defined as the number of workdays per year, less vacation days, multiplied by the number of working hours per day. Thus, on an annual basis, based on an 8-hour work day and 260 days of work per year, 81. 5 physicians would be needed to treat that illness. These calculations, based on Folland, Goodman and Stano's work (2001), provides an example of the approach (See Table 1.).

Achieving an optimal ratio of providers to patients can be fraught with difficulties. Planners must make all terms and concepts clear if the ratios are to be useful in the decision-making process. Institutions must provide definitions of what constitutes a provider (full-time or other), what constitutes a particular type of provider (primary care versus specialty care; physician versus nurse or nurse practitioner) and what constitutes a unit of work time, and so forth. These

Table 1. Determining physician requirements from population, prevalence, and work-related factors

Modeling Factors	Estimates and Calculations
Size of the population	1,000,000
Prevalence	1,000,000 X 15% = 150,000
Time to treat	1 hour
Total time requirement for treatment	150,000 X 1(hour) = 150,000
Treatment hours available	
Days of work/year	260 (52 weeks X 5 days/week)
Vacation days/year	30
Work-hours/day	8
Total hours	(260 - 30) X 8 = 1840
Total number of physicians needed	150,000/1840 = 81.5

types of activities fall not only within the technical domain of an organization's human resources management team, but also within the reach of HHRP.

The HHRP planner must clearly articulate the assumptions behind any model that is developed to estimate planning needs. These assumptions must also be relevant and realistic given the state of knowledge about the relationships between desired health states and the means to achieve these. Early models, particularly the well-known Lee-Jones model of manpower planning, made these assumptions known (see Klarman, 1969). However, these assumptions have been severely criticized on a number of fronts, particularly in the health economics literature. For example, the idea that a single professional group is the only group to provide the particular healthcare treatment denies the possibility that other professional groups are capable of providing the treatment for the identified medical condition (Folland et al., 2001). In the health economics literature (or generally, the economics literature), the concept of substitutability between productive inputs is one that is commonly explored and one that HHRP must consider in addressing the treatment needs of a population. In the planning process, the HHRP and healthcare HRM must also consider prices, costs, demand, and whether the group of experts chosen to develop the needs-based solution is the best group to do so (Folland et al.). At a minimum, including these concerns in the planning process will prevent the planner from encountering controversies that plagued early works. These include the assumptions that:

- physicians are the only type of input used to produce health and health outcomes
- the impact of technology plays no role or is unconsidered in planning
- a single, unique solution exists to treat the illness under consideration
- the group determining the optimal ratio is the best group to determine the ratios

- prices and costs of productive inputs can be ignored and that quantities demanded will be paid for (Folland et al., 2001).

The concept of productivity encompasses a number of critically important ideas and relationships that are central to understanding the linkages between workers and outputs that are central to addressing the key questions we face in healthcare human resources planning. Although the literature provides a wide range of definitions for the term, productivity can be thought of simply as the process by which inputs are transformed into outputs (Mahoney, 1988). The idea is central to HHRP because estimates of human resources requirements or needs depend upon the productive capacity of these resources.

Because changes in productive capacity influence output, organizations have incentives to develop and implement cost-effective means of positively influencing capacity. The requirements-production relationship is directly related to the human resources management function in organizations. Increasing productive capacity depends upon a wide range of functions assumed by the technical administration of human resources functions in an organization. For example, human resources or employee services departments are typically charged with administering and developing a number of policies, plans, and procedures designed to improve individual and group-level performance. These technical functions include employee orientation, training, salary and benefits studies, recruitment, selection, unionization, team building, job design and redesign. Dussault and Dubois (2003) note that the typical personnel administrative tasks associated with human resources management in healthcare settings are not only isolating, but also fail to address the broad range of workforce issues present in healthcare settings.

Utilization Methods

Demand-based methods of evaluating healthcare human resources requirements follow generic models for demand found in economics. For example, these models evaluate the quantities and types of healthcare services demanded given prices, the size of the market (or supported population), and other factors. In practice, utilization serves as a "surrogate for demand" (Odrich, 1985). As Kolehmainen-Aitken (1993, p. 22) points out, the use of "this method requires moderately detailed data on the utilization of services and the characteristics of the population to be served, [which complicates] its use in many developing countries." Although the types of estimates generated through use of these methods may produce accurate economic-based figures, they may neglect political or socioeconomic realities, which may in turn lead to a failure to provide equitable healthcare services (Kolehmainen-Aitken, 1993).

Another utilization-based method is what is called the service-targets method (Kolehmainen-Aitken, 1993). With these methods, HHRP is concerned with examining the number of full-time equivalent providers, staff, or other healthcare professionals needed to meet established "service production targets," particularly those related to health prevention and screening (Kolehmainen-Aitken, 1993, p. 22). Other production targets may include those that are related to alleviating wait times in healthcare facilities. In these types of cases, the expertise of the healthcare HR professional may be called on to assist in the evaluation of the numbers of healthcare workers required to meet wait-time targets.

Key Drivers, Transitions and Variation in Health Human Resources Planning

The estimates behind healthcare human resources planning can be generated through empirical estimation of the following model, which is identi-

fied as the general healthcare workforce planning model. Simply stated, the number and types of healthcare professions needed to fulfill performance objectives of a particular organization, or for a particular geographic or politically defined boundary, either in the current period or in the future, depends upon the size and characteristics of the supported population. The numbers and types of professions needed in a particular period also depend upon the productive capacity of the healthcare professional and the capacity of, and relationships with, other productive inputs, such as support staff, technology, and infrastructure. The functional relationship between the quantities of healthcare workers needed in period t and the drivers of these quantities at t can be denoted as follows:

$$Q_t = f(S_t, C_t, T_t, R_t)$$

Where:

Q = quantity of health professionals required
S = size of the supported population
C = characteristics of the supported population
T = enabling technology and infrastructure
R = relationships with and quantities of other productive inputs

Understanding temporal and spatial transitions remains one of the key challenges in estimating healthcare human resources requirements for a particular time and population. Inflows and outflows of direct healthcare providers and other professionals will have an impact on the requirements. Researchers and national-level professional bodies have indicated that healthcare provider international migration patterns play a key role in influencing aggregate workforce levels (Aki, Mustafa, Bdair, & Schunemann, 2006; Council on Graduate Medical Education, 2005; Phillips et al., 2007). Understanding these supply-side transitions—and the motivating factors behind these transitions—is critical for developing poli-

cies to ensure that the optimal numbers and types of providers are available in the workforce when needed.

From a demand perspective, transitions in population demographics clearly play a role in the types and quantities of healthcare issues presented to healthcare providers and one of the ways in which solutions may be provided through HHRP is through recognition of the value that training and education provide in addressing healthcare needs for a changing population. The American medical profession, for example, has specifically recognized the need for greater awareness of, not only the growth in population, but also the impact of the aging of the population on the healthcare system (Council on Graduate Medical Education, 2005). Besides the well-established fact that the population is becoming increasingly older, the United States is also seeing an increase in racial and ethnic minorities (Dreaschlin, 2007; Mullan, Frehywot, & Jolley, 2008) and a changing epidemiology of disease (Mullan et al., 2008). In spite of the saliency of these demographic changes, some research indicates that the medical profession has not yet begun to take sufficient steps, particularly in medical education, in order to address the changing demographic characteristics of future populations (Warshaw, Bragg, Brewer, Meganathan, & Ho, 2007).

From a planning perspective, several ways in which planners and institutions estimate workforce requirements have been identified. Yet, variability in methods is just one of the key concerns in healthcare planning. From a practical perspective, healthcare institutions have a genuine concern about the implications of managing variable demand for healthcare services. To the extent that providers are idle and non-productive when insufficient demand for healthcare services is present, organizations, and institutions will incur substantial costs when the HR system cannot readily accommodate the ever-changing demand for services. On the other hand, failing to maintain sufficient numbers and types of professionals to meet the demand for services will have potentially devastating effects on the community members who cannot access necessary health care.

Another key consideration in HHRP relates to the meaning attached to aggregate projections and requirements. If the projection or requirement represents an average, planners must be cognizant of the inherent variability behind the estimated values in order to make sound decisions about policies to obtain optimum requirements. From a spatial perspective, larger-level averages that describe shortages, surpluses, or requirements do not necessarily speak to the corresponding values at local levels. Because intra-regional variation in the supply (and demand) of healthcare human resources is a common and well-established theme in healthcare services (Goodman, 2004), using local estimates is the best strategy when examining the need at a local level. Use of global-level averages can be misleading at best, and reliance upon these through a political process to address HHRP can clearly result in misaligned policies with costly and dysfunctional outcomes. The same applies to temporal projections. Use of an average growth or decline estimates in HHRP will likely obscure temporal variability that will prevent planners from understanding the true needs as they relate to time.

LESSONS AND IMPLICATIONS FOR HEALTH HUMAN RESOURCES PLANNING AND HUMAN RESOURCES MANAGEMENT

The outcomes of earlier work and research in HHRP have pressing lessons for contemporary planning efforts. For planning efforts that result in forecasts of requirements, clearly a great deal of uncertainty exists for future requirements; the likelihood of errors increases with the distance of the forecast horizon. Errors in forecasting may be the result of the particular forecasting models chosen, but they may also be the result of chang-

ing dynamics in the healthcare field that planners have either failed to identify and adjust for, or are simply unknown at the time of forecasting requirements. Early work on state-level healthcare workforce planning in the United States pointed to and cautioned planners to examine and consider the uncertainties and relationships associated with policies, incentives, and rules of practice (Acton & Levine, 1971). Acton and Levine (1971) further conclude that uncertainties about the future state of delivery systems are as important as the uncertainties associated with demand for health services as predictive factors of healthcare workforce needs. Their report suggests that the notion of manpower planning would be better served by changing the concept to one that embodies and considers policy-related questions.

As a discipline, human resources management in healthcare settings has the opportunity to serve as a critical boundary spanner (or as "collaborative agent;" Wranik, 2008, p. 37) between the operational and strategic elements of healthcare institutions and key organizational stakeholders. Although a single typology for how healthcare human resources models function across organizations does not exist (Wranik, 2008), expanding the boundaries of the concept to include strategies found in economics and strategic management would provide the basis for local and large-scale improvements in HHRP. The stated goal of HHRP in the Canadian healthcare system—" to implement a systematic nation-wide approach to planning, so as to facilitate interdisciplinary collaborative care delivery that is responsive to community and patient needs" (Wranik, 2008, p. 36)—clearly echoes this sentiment.

Recent literature on healthcare human resources planning suggests that micro and macro-level approaches would be helpful in understanding the healthcare human resources manager's role (Wranik, 2008). From a micro-level perspective, for instance, healthcare human resources initiatives would fall into four broad categories:

- Enabling the provision of services to the limits of scopes of practice.
- Re-defining the roles of healthcare professionals.
- Collaboration between other disciplines.
- The creation of information systems and supporting technologies (Wranik, 2008, p. 31).

From a macro-level perspective, healthcare human resources initiatives could be classified into initiatives focused on changes in educational approaches and changes in policy and regulation. Wranik's conceptualization (2008) also provides broad categories of HRM-related responses that could ideally fall within an expanded HRM role, and these are consistent with visualizing a role that clearly transcends the technical functions typically associated with human resources management.

Perhaps the most important lesson for HHRP planners and HRM in its support of the planning function is the realization that planning in support of an organization's healthcare related goals is much more complex than the development of mathematical ratios or creation of economic-based utilization models. These are perhaps necessary aspects of the planner's role, but these are insufficient to fully address the complexity that is inherent in the concept of health. Health is a multi-dimensional concept, which translates into multi-dimensional needs (Thunhurst, 1985) for the populations that HHRP consider in the planning process.

Also critical for HHRP and HRM in healthcare settings is that the planning process can, and should be, informed by lessons and approaches taken from other disciplines, such as management, strategy, leadership, operations research, statistics, and economics. Gaining an awareness of these can offer ways of viewing planning efforts that leaders would have otherwise not considered.

The boundaries between strategy, strategic management, strategic initiatives, workforce planning, and human resources management are

not distinct. For example, as we move from larger organizational strategies and plans to the tactical and operational realities of organizational settings, the technical aspects of human resources management are relied upon to provide substance to the strategies. The specific HR functions, such as recruitment, selection, training, and performance appraisal, all contribute to meeting the planning needs of the institution. Other methods, such as increasing educational opportunities, altering methods of healthcare delivery, changing scopes of professional responsibilities, aligning incentive systems, are all potential solutions that can help mitigate current and future worker shortages. These ideas, and countless others, will span the breadth of strategic and human resources management. Between these two, we find the concept of HHRP.

Although HHRP may be novel from an HRM perspective, some nations have taken an aggressive stance and made tremendous strides in large-scale collaborative efforts that have incorporated evidence-based methods with HR planning. The Canadian Nurse Association (2007) reports that several large-scale, research-based studies have been undertaken to build a sold framework for HHRP, which includes a focus on development of standardized population health data and the use of these data in HHR planning.

HUMAN RESOURCES MANAGEMENT AND HEALTH HUMAN RESOURCES PLANNING LINKAGES WITH STRATEGIC MANAGEMENT

Strategic management refers to "formulation, implementation, and monitoring of strategy" (Shortell & Kaluzny, 2000, p. 398). Although the literature does not provide consensus on a definition of strategy, Mintzberg's conceptualization that "strategies are both plans for the future and patterns from the past" (1987, p. 67) clearly

embodies the idea that planning has an explicit linkage with an institution's larger strategic efforts. In fact, it resonates with one of Klarman's key ideas about health manpower planning: "… estimates of future requirements must rest on firm knowledge of the present situation and the past" (1969, p. 373).

The view that strategic management is both internally and externally focused underscores the critical role that HHRP can, and should, assume in supporting a healthcare organization's strategy (Shortell & Kaluzny, 2000). Using strategic management ideas and concepts calls for HRM and HHRP to fully gain an appreciation of the internal and external environment in the development of planning estimates. Incorporating strategic management ideas into the HR planning process clearly calls for an expanded role of the HR professional. The theoretical frameworks of industrial organization, resource-based theory, and contingency theory are considered foundations of strategic management (Parnell, 2006), and each of these frameworks offers perspectives with linkages to HHRP. Resource-based theory is focused on the internal resources and the unique characteristics of an organization to create a competitive advantage, whereas contingency theory creates a fit between the organization and its environment (Parnell, 2006). Regardless of the framework, a future-focused orientation is one of the central themes and best practices in strategic management (Zuckerman, 2006) and the pace at which a healthcare organization captures new markets and overcomes learning curves can provide a significant advantage over others that fail to respond to market signals (Shortell & Kaluzny, 2002).

Historically, healthcare organizations have used resource-based and contingency theories to develop their strategic plans. Healthcare organizations tended to be internally focused on linking their resources to strategies that created value and profit. These organizations may also consider the critical role that technology plays in supporting strategic success, particularly through the lens of

achieving excellence in clinical services, through "technological preeminence," or the extent to which the organization can contain costs or maximize profits (Dansky & Ajello, 2005, p.21), each of which can provide direction to healthcare organizations in strategic planning. Healthcare organizations, specifically community hospitals, created a niche within their community that revolved around their services and employees, and in many cases, these facilities created distinctive and idiosyncratic relationships with the supporting communities and populations they served. However, with the radical changes that have occurred throughout the healthcare industry, an evaluation of the industry itself can give human resources professionals a fresh approach to the critical issues it faces in HHRP.

Using an industrial organizational framework is one of several methods to evaluate the role of HHRP in supporting organizational strategies. Industrial organization theory focuses on the impact of the industry environment upon the organization, and how the organization adapts to the forces over which it has limited or no control predicts success and profitability (Parnell, 2006). One of the most useful and insightful models includes Porter's five forces framework.

In Porter's model, the five competitive forces that influence each industry and its structure are: rivalry among existing competitors, the threat of new entrants, the threat of substitute products or service, and the bargaining power of the buyers, and the suppliers (Porter, 2008; Shortell & Kaluzny, 2000). When crafting a future-focused workforce plan, health human resources professionals should analyze the industry as it relates to the five forces. Human resources professionals should look for patterns and trends within the industry during the analysis to understand how the industry has restructured itself and the impact this new structure has on an organization's ability to compete for employees, patients, and physicians.

In the five forces model, healthcare workforce planners must pay particular consideration to potential entrants and substitutes. Porter maintains that the threat of entry can cause an industry to hold down prices or increase investments to discourage new competitors (Porter, 2008). The cost of health care has historically not been a factor in competition between healthcare organizations because of the structure of insurance reimbursement and managed care contracts that are more specific to a patient's employer plan than to individual patients. However, healthcare organizations have strategically tried to obtain a payer mix of predominantly managed care contracts that offer higher reimbursement than Medicare or Medicaid (in the U.S.), and control internal costs to improve profits. With an increasing emphasis on reducing the costs of healthcare delivery, institutions will seek less costly means of producing the goods and services demanded.

The lens of economic analysis provides natural connections with strategic management. For the human resources professional and the healthcare HR planner, a consideration of the key questions that economic inquiry poses offers another way of thinking about the interdependency of planning, strategic management, and the uniqueness of the healthcare landscape. Clewer and Perkins (1998, p. 22) frame these questions as follows:

1. What goods and services will be produced? What mix of goods and services?
2. How will these goods and services be produced? What productive inputs will be used?
3. For whom will these goods and services be produced?

Clearly the first question points to elements of an institutional strategy, whereas question two is directly related to the unique role of HHRP. The last question is instructive as we think about the role and extent to which insurance coverage plays in reimbursing healthcare plans and providers. In determining how goods and services will be produced, HR planners must have an understanding of a population's health care needs in order to begin

determining how healthcare workers specifically contribute to addressing these needs and what factors go into the decision making processes when evaluating two or more types of providers (e.g., physician versus nurse practitioner). The planner would assist in determining the role that technology plays in providing the services that meet the healthcare needs of the population.

Understanding how varying the mix of productive inputs influences health outcomes, and meets goals of the organization can be a daunting task, but clearly one that should be considered in broadening the roles and responsibilities of the healthcare planner. The Canada Public Service Agency's (2007) view of integrating human resources and planning is also consistent with integration of HHRP and strategy. The agency suggests that steps of (a) determination of business goals, (b) environmental scanning, (c) gap analysis, (d) establishment of HR priorities relative to goals, and (e) measurement, assessment, and reporting are all important in integrating HR and planning (Canada Public Service Agency, 2007). A similar conceptualization of strategic human resources management is found in Fottler, Phillips, Blair, and Duran (1990).

HEALTH HUMAN RESOURCES PLANNING AND WORKFORCE PLANNING MODELS

Workforce planning is a tool to recruit, develop and retain the "people" resources required for an organization to realize their strategy. Human resources professionals who can use and integrate the tools of analytics, forecasting, and predictability will give their organization a competitive advantage over their industry rivals. But understanding and utilizing those tools are not enough in the uncertain, ever-evolving industry of health care. Human resources professionals will need to develop their intuitive skills and learn to read patterns and emerging threats within the industry

in order to craft creative, responsive workforce plans. Mintzberg (1987, p.74) states "the real challenge in crafting strategy lies in detecting subtle discontinuities that may undermine a business in the future."

The literature offers a number of diverse models for workforce planning, and many of these have sensible links with strategic concepts. As we have emphasized, the starting point for analysis begins with an understanding of the organizational goals facing the planner that are derived from the larger strategies of the organization or institution. Leadership of the organization should have a clear picture of the future, and have it defined both quantitatively and qualitatively to give human resources professionals the framework to begin the workforce planning process (Brooks, 2008, p. 102).

The analysis of workforce requirements to meet the healthcare organization's needs is one step in a chain of activities. Lavelle's (2007) conceptualization includes a progression of activities that includes the following:

- Basic gap analysis
- Workforce analytics
- Modeling and forecasting
- Segmentation (Lavelle, 2007, p. 373).

The basic gap analysis of current skills and future skills needed by an organization is only one step in designing a workforce plan. From an HHRP perspective, gap analysis is a way of thinking about the difference between the types and quantities of workers needed and the number that are available to provide treatment, prevention, or diagnosis for a population of interest. Gap analysis not only considers the present state, but also allows the planner to envision the differences that will exist in future states. Workforce analytics refers to a comprehensive examination of data to analyze replacement possibilities between diverse employment types and skill clusters and then linking that to business data. Modeling and

forecasting begins a more dynamic planning approach utilizing what-if scenarios to evaluate a variety of staffing models. Workforce segmentation segregates staff not just by their skills, but by how critical they are to overall success of an organization (Lavelle, 2007).

Gap analysis provides a comprehensive analysis of the current people resources. Most gap analyses attempt to identify the discrepancy between the demand and the supply of a specific skill set or job classification and the projected needs of the future organization (Lavelle, 2007). A more comprehensive gap analysis should include turnover, retirements, growth or decline of services, population growth, declines or shifts within the community the hospital serves, anticipated strategies of competitors, and future plans of local and state governments (Carissimi, 2008).

The metrics framework, utilized by organizations to develop key performance indicators of success, can be followed to develop a workforce plan. Organizations that use this model will ensure that their workforce plan supports the organization's key performance indicators. These models can provide organizational planners and leadership with effective tools in creating a workforce plan, particularly in industrial settings that provide a stable structure with known competitive threats and less reliance on the "supplier" of specialized skills. The dynamic environment of the healthcare industry, the lack of substitution of skills of the supplier, and the ever increasing demands of the diverse "buyers" can present challenges in execution of the plans and initiatives developed by the healthcare planner.

Two models that offer a deeper, more fluid perspective to gap analysis and the metrics framework are staff segmentation with employment value proposition and strategic cycling. Staff segmentation or differentiation is not a new process; this is what an organization does when grading positions and assigning compensation (Lavelle, 2007). What makes this method dynamic is the addition of the employment value dimension. This model goes

beyond gap analysis and adds the dimension of what it will take to compete for the specialized and skilled workforce to attract and retain them in today's healthcare environment. This model allows the human resources professional to look at the various staff segments and ask the same questions but to arrive at answers specific to that job segment. Lavelle (2007, p. 377) states "…a workforce architectural framework can be used to examine the strength, costs, sustainability and compatibilities of different staffing options."

Understanding the value proposition for employees to attract them is directly linked to understanding the employment life cycle. The employment life cycle outlines the progression of the employment relationship, and can be used as a guide for HR interventions that are critical to maintaining a positive relationship and retaining key skills and talent (Lavelle, 2007). Awareness of these stages can provide HR leaders with information that can inform the timing, type and development of workforce interventions. These stages include:

- Joining the organization
- Commitment
- Contribution and growth
- Choosing
- Plateauing
- Sharing and passing of wisdom
- Separation (Lavelle, 2007, p. 377).

Another dynamic process that healthcare organizations can use to develop their workforce plan is the strategic cycling model. This model differs from the more traditional frameworks previously discussed in that it does not rigidly follow a set of steps, but is fluid and flexible and constantly assesses the competitive environment (Begun & Heatwole, 1999). This model, although developed for strategic planning, can serve as a framework for workforce planning as well. Its emphasis on flexibility and inclusion of essential strategic planning activities, such as validation of

an organizational mission, development of a vision statement, establishment of success measures, and analyses of benchmark organizations make it a robust model for the fluid environment of the healthcare industry. The continuously cyclical nature of the model includes sequential movement through each of the planning activities with explicit recognition of the inter-relationships that exist between these activities. The introduction of scenario development and contingency plans in the workforce planning process allows organizations to create alternative workforce plans for various points in an employment life cycle. Table 2 provides a summary of the key elements the strategic cycling model and the other workforce planning perspectives introduced in this section.

The successful use of these activities clearly depends upon a number of important organizational factors such as stage of organizational development, organizational culture, internal capacity, leadership support, and technology. For the healthcare HR planner, examination of healthcare needs and priorities must be considered in the context of workforce planning. In each of the models presented in this section, these needs and priorities could potentially serve as one of the central drivers in development of the fundamental direction pursued by the healthcare organization. Ultimately, use of planning, evaluation, and assessment tools that include the methods of workforce planning can lead to improved health-

care outcomes. Recent work in healthcare planning has focused on the development of frameworks that recognize the interdependencies between these processes, organizational contexts, healthcare goals and outcomes (Dal Poz et al., 2006).

THE UNIQUE ROLE OF CULTURE IN HEALTH HUMAN RESOURCES PLANNING

The rapidly changing racial and ethnic mix of the United States population calls for healthcare systems and providers to meet the needs of patients with varied perspectives, values, cultures, and behaviors about health and well-being. "Failure to understand and manage social and cultural differences may have significant health consequences for minority groups in particular" (Betancourt, Green, & Carrillo, 2002, p. v). Additionally, this failure will trickle through the health care organization, eventually affecting its business health.

Over the past decade the term "culture" has emerged in the forefront of the business and health care world. Additionally, the terms "cultural competence," "cultural diversity," and "cultural sensitivity, " and what are meant by these terms, have become an integral part of many strategic plans aimed at reducing disparities in access to and quality of health care. Cultural issues in health care go beyond the culturally competent provider,

Table 2. Workforce planning frameworks and associated planning activities

Planning Framework	Key Planning Activities
Progression of workforce planning (Lavelle, 2007)	Basic gap analysis, workforce analytics, modeling and forecasting, segmentation
Strategic workforce planning (US GAO, 2008)	Establishment of strategic direction, gap analysis, development of workforce strategies, strategy evaluation and revisions
Metrics framework (Brooks, 2008)	Future state definition, identification of strategic initiatives, prioritization of focus areas, constraint assessment, planning and execution, feedback
Strategic cycling model (Begun & Heatwole, 1999)	Validation of mission and values, development of vision, benchmark analysis and establishment of measures of success, research and analysis of data, development of primary strategy, input from stakeholders and impact assessment, scenario development and contingency planning, prioritization and implementation, evaluation

and their effects can be felt at the budgetary level. "Culture is defined as the shared traditions, beliefs, customs, history, folklore and institutions of a group of people. Culture is shared by people of the same ethnicity, language, nationality, or religion" (The Community Tool Box, 2007, Section 1). Cultural competence in health care "...describes the ability of systems to provide care to patients with diverse values, beliefs, and behaviors, including tailoring delivery to meet the patients' social, cultural and linguistic needs" (Betancourt, Green, & Carrillo, 2002, p. v). Some believe that cultural competency increases access to care and can be a calculated strategy that addresses economies across the health care continuum.

Cultural Competence and Nursing

Cultural competency and culturally competent care is recognized as one of the most important aspects of healthcare delivery in nursing (Maier-Lorentz, 2008; Phillips & Weekes, 2002). A recent U.S. Department of Health and Human Services report (US-DHHS-HRSA, 2001) acknowledges the growing body of knowledge about the theoretical frameworks surrounding cultural competence. Cultural theorists bring scope, substance, and understanding to the concepts of culture and cultural competence. Some of the prominent works

in regards to cultural competency include cultural competent/care theories and models such as Leininger's transcultural nursing theory, Purnell's model for cultural competence, and Campinha-Bacote's model of the process of competence in the delivery of healthcare services (HRSA, 2001). These frameworks have been taught in academic settings; however, a review of the literature does not identify where these have been embraced by any organizations as an overarching model. Table 3 provides a brief description of key elements from these frameworks.

Having culturally competent caregivers is an asset to any organization. The performance-related outcomes that an organization experiences will depend upon the extent to which the organization develops and supports cultural competency in the workplace. There are many initiatives that address cultural competence in health such as the *Think Cultural Health* program sponsored by the U.S. Department of Health and Human Services – Office of Minority Health (DHHS-OMH). This particular program is a stepping stone for the development of culturally competent nurses. The OMH also offers a similar program for physicians. Developing culturally competent health care providers remains at the forefront of nursing education and healthcare organizations. To become organizationally culturally competent, Betancourt,

Table 3. Lens of cultural competency in healthcare settings

Framework	Features
Cross, Bazron and Isaacs	Examination of how the process of cultural competence progresses along a continuum from cultural destructiveness to proficiency.
Campinha-Bacote	Includes awareness, knowledge, skill, encounters, and desire as five components of cultural competence.
Carballeira	Live and Learn Model: Live stands for like, inquire, visit, experience; Learn stands for listen, evaluate, acknowledge, recommend and negotiate.
Leininger	Sunrise model: Seven dimensions that include cultural values/life ways; religious, philosophical, and spiritual beliefs; economic factors; educational factors; technological factors; kinship, social ties; political and legal factors.
Davidhizar and Giger	Model of transcultural assessment that examines communication, space, time, social organization, environmental control and biological variations

Note: Descriptions of models taken from *Health Resources and Services Administration study on measuring cultural competence in health care delivery settings (*US-DHHS-HRSA, 2001)

Green and Carillo (2002, p. 17) state that placing the hiring and promotion of minorities as a priority and enabling minority leaders to assume key leadership positions to develop a "a cadre of professionals" are key. Healthcare planners can assist organizations in achieving these goals through use of the workforce planning models previously discussed in this chapter.

Organizations that have developed and implemented initiatives in cultural competency have found several key lessons. For instance, some of the lessons reported by Kaiser Permanente in the United States include the following observations and cautions:

- Marketing has an influence on the ability to develop cultural competency.
- The mandating of cultural competency initiatives may lead to resistance, resentment, and only superficial adherence to such policies.
- Use of multicultural managers should be employed to reflect the diversity of the organization.
- Focusing on the entire organization to improve the service and business is key.
- Implementation of linguistically appropriate patient call-centers can help patients navigate the healthcare system (Betancourt et al., 2002).

The Culturally Competent Organization

Individuals can gain cultural competence through formal training and education, but it takes the support of a culturally competent organization to maintain individual competence. The goal of developing culturally competent individuals and organizations is one of great urgency. Over the years, HRM has become a separate function from a simple office function(s) to high profile divisions in some organizations. The role and importance of HRM in healthcare settings clearly

transcends the narrowly-defined technical roles that have long characterized the profession. The recruitment, retention, and motivation of highly diverse individuals are a challenge because of the wide canvass of race, ethnicity, and culture, and required competence and skills. This in itself is a pressing matter that can be addressed by the development of a culturally competent environment.

Having a culturally competent organization and HRM staff is encouraged by Title VI of the Civil Rights Act of 1964 (US). Supporting regulations seek to ensure that no person is subjected to discrimination on the basis of race, color, or national origin under any program or activity that receives federal funding. The Office for Civil Rights (MSH, n.d.) has found that effective programs usually have the following four elements:

- **Assessment:** The recipient/covered entity conducts a thorough assessment of the language needs of the population to be served;
- **Development of Comprehensive Written Policy on Language Access:** The recipient/covered entity develops and implements a comprehensive written policy that will ensure meaningful communication;
- **Training of Staff:** The recipient/covered entity takes steps to ensure that staff members understand the policy and are capable of carrying it out;
- **Vigilant Monitoring:** The recipient/covered entity conducts regular oversight of the language assistance program to ensure that LEP persons meaningfully access the program.

The U.S. Department of Health and Human Services – Office of Minority Health also developed the *Culturally and Linguistically Appropriate Standards (CLAS)* in health care.

The CLAS standards are primarily directed at health care organizations; however, individual providers are also encouraged to use the stan-

dards to make their practices more culturally and linguistically accessible. The principles and activities of culturally and linguistically appropriate services should be integrated throughout an organization and undertaken in partnership with the communities being served (Office of Minority Health [OMH], 2007.).

The 14 standards are organized by themes and include:

• Culturally Competent Care (Standards 1-3), Language Access Services (Standards 4-7), and Organizational Supports for Cultural Competence (Standards 8-14). Within this framework, there are three types of standards of varying stringency: mandates, guidelines, and recommendations as follows:
  ◦ CLAS mandates are current federal requirements for all recipients of federal funds (Standards 4, 5, 6, and 7).
  ◦ CLAS guidelines are activities recommended by OMH for adoption as mandates by Federal, State, and national accrediting agencies (Standards 1, 2, 3, 8, 9, 10, 11, 12, and 13).
  ◦ CLAS recommendations are suggested by OMH for voluntary adoption by health care organizations (Standard 14).

The CLAS standards have direct linkages with HHRP and HRM. Standard 2, for example, calls for healthcare organizations to consider the demographic characteristics of a service area in the recruitment, retention, and promotion strategies in the development of a diverse staff and leadership. Standard 3 calls on healthcare organizations to provide training and education that specifically addresses the cultural and linguistic characteristics of the service delivery area. Linking strategic concepts with cultural competency is also found within the standards: Standard 8 advocates the

development and implementation of a strategic plan to ensure that culturally and linguistically appropriate services are provided for supported populations.

Although the literature related to building a business case for the development of cultural competency and diversity-related initiatives shows mixed findings, Dreachslin (2007) indicates that evidence exists, from an economic perspective, that strategic diversity management can have a positive impact in performance outcomes through positive operating margins and growth in an organization's patient base (Carter & Spence, as cited in Dreachslin, 2007).

The populations served by healthcare institutions and nations will continue to become increasingly diverse, and HHRP must be aware of the impact that diversity will have on the types and quantities of workers required to provide quality healthcare services. In today's healthcare environment, nurses, physicians, and administrators are all part of a team that is charged with the mission of healthcare delivery. From a healthcare management perspective, Dreachslin advised:

"If left unmanaged, demographic diversity will interfere with team functioning. Identify a common ground among diverse groups, because similarity can pull different team members together. Invest in professional development so that team members have the tools they need to navigate their differences. Other elements that can improve team and organizational decision making include group-process and conflict-management skills, self-awareness and understanding of cultural style differences, ability to validate alternative points of view, and efforts to surface and manage implicit bias" (Dreachslin, 2007, p. 84).

These recommendations are consistent with the warning that healthcare organizations cannot afford to miss the opportunities to address the changing demographics of the populations they serve (Evans, 2005). Healthcare organizations

and institutions will continue to look to human resources professionals as the rate and complexity of changes continue to increase: Healthcare HRM and HHRP must develop forward-looking strategies to meet the new challenges. Traditional strategic planning uses the past to predict the future; however, healthcare organizations need to incorporate new tools and methods for predicting future trends to ensure operational and strategic success.

SUMMARY

The responsibilities assumed by HR professionals in healthcare settings have never been more important. The rapidly changing social, political, and legal environment creates challenges for HRM in healthcare, yet through use of economic, strategic, and cultural considerations, the HR manager and organizational leader is provided with a robust set of tools to inform policies and decision-making for the ultimate benefit of improving organizational and population health outcomes. Healthcare workforce planning models can provide a basis for generalizing and estimating large-scale needs of an organization and population. The utility of these types of models must be tempered by the fact that strategic considerations must also be considered when estimating organizational workforce requirements. The use of strategic models and perspectives can improve the ability of HR professionals to align organizational goals, population needs, and a variable supply of healthcare workers. Addressing the importance of cultural competency and diversity, through leadership and HR-backed initiatives, while considering and incorporating strategy, and the economic realities of the operating environment is perhaps one of the most important ways to leverage HRM in healthcare settings.

Chapter 82

Hu Resources Replaces Human Resources in Health Care

Emmett Davis

Hennepin County (MN) Human Services and Public Health Department, USA

ABSTRACT

Intelligent technologies are exponentially approaching the stage where healthcare professionals must begin to plan for the management of "hu" (human, software, and robotic) resources, replacing management of human resources alone in isolation from other intelligences. The healthcare industry in multiple levels and ways must begin to plan for human resources in health care to extend existing and to develop new conceptual and behavioral skills in order for humans, intelligent software, and robots to optimally partner with each other. The interaction among hu resources will be active and carried out in multiple modes and intellectual and emotional intensities. Healthcare professionals, who shape the social and cultural institutions around intelligence and active knowledge, can optimize the impact and performance of this intelligence partnership.

INTRODUCTION

"Hu" resource management will replace human resource management in health care. A hu is a human or other intelligent entity. Hus are in one of three basic forms: wet, soft, and hard, with the possibility of hybrids of two or more of these forms. A wet hu is an intelligent human being. A soft hu is intelligent software. A hard hu is an intelligent robot, i.e., intelligent software manifest in a physical form (Frenay, 2006). The phrase "hu resources" means that we recognize an essential equivalency among these three forms of intelligence in health care. Understanding this equivalency will allow the healthcare industry to optimize the health care of all wet hus through the services of all hus.

Consider how pervasive these hu resources are at the moment in new automobiles where we depend on these assisting intelligent technologies to support our safety. Search engine organizations, logistic enterprises, information technology, agriculture, and the military have developed a dependence on such advanced technologies.

"Hu resource management will replace human resource management in health care." This statement of the author would once have appeared to be so outlandish as to be only a metaphor rather than a literal statement. Surely, some will point out, there is a vast difference still (if not half way to forever) between humans and current intelligent machines (Dwivedi, Bali, & Naguib 2002; Rada 2008). Indeed a recent book by Rada (2008) knowledgeably, and with insight, pictures a 2008 world which takes a far less futuristic perspective, even while noting the advances in information technology.

A healthcare organization wishing to return value to its stakeholders in the coming years should consider the strategic failure to optimize intelligence in whatever form. Consider the missed opportunity if human resources departments, managers of healthcare operations, leaders of the industry, and professionals do not understand HR to mean hu resources, instead of just human resources.

This discussion will not focus on human resources departments, but rather on healthcare professionals and managers. It is they who will need to learn to extend their existing skills and behaviors, and to learn new skills and behaviors in order to optimally partner with hu intelligence for the benefit of communities and individuals.

As software becomes embedded in our vehicles and systems, in our bodies and brains, it does so invisibly until the software needs to bring a matter to our attention. Where the software touches our awareness is at the surface of these systems. The surface or obvious human interface of software and robots will distract some until we become habituated. Still the fulcrum upon which we must leverage for an optimal effect on the health care of all is the intelligence of software and robots and how each health care worker can hinder or optimize the development of intelligent hus.

CO-EVOLUTION

More important than the distraction of artificial intelligence is the shift in our relationship with intelligent hus. We will no longer be passive users of artificial intelligence as one would use an essentially static hammer or an electronic medical record system. We are becoming partners, co-evolving soft and hard hus with ourselves. Intelligent systems follow user-driven design and learn and improve with usage. Usage rather than form will determine function.

Machine systems, such as automobiles, that we use today are often mass produced. The basics made available to us at the point of purchase are determined in the factory. We can order a vehicle made from standard parts, choosing among those standard parts. Our vehicle is either a heavy-duty pickup or a small car suitable for just two people around town. Other than deteriorating, most of our vehicles will not evolve as we use them.

Intelligent systems will evolve as we use them. Today's voice recognition system evolves and improves with our use. Intelligent systems will develop functionality by seeking out modules and features to add to themselves as we, and they, need them. The challenge will be as individuals, wet hus, and teams use them within corporate environments. As professionals move from one corporate environment to another, they will want to take their version of a system with them. Also if licensing bodies and corporations seek certified consistency, a professional's intelligent systems will need to learn this and map variations from the original version to its current state.

Consider if the human shaping an intelligent system is not just the healthcare professional, but also the patient. As healthcare systems focus on

an individual and a family or community over the life time of each individual patient, the intelligent system evolves to that user, individual, or network of individuals. These intelligent systems will learn from the systems of healthcare professionals, as patients today learn from their primary physician.

The equivalency of hu resources does not mean that we blindly trust automation by passing responsibility over to systems. I do not trust wolves as the caretaker of my sheep when night comes and I want to leave the windy fields and go home to a warm bed. What I do trust is the interaction, the slow dance, the long term relationship with a wolf, that is now, a dog, who with myself as shepherd, as alpha wolf, and the wolf as sheep dog, will team to care for more sheep than I could alone and will be there to defend the sheep when I cannot be there. Or when I am not there and asleep, the dog will bark and raise the alarm. This wolf is my partner. With this wolf, we will co-evolve, dancing, and transforming through time and evolving over eons.

In the metaphor of the wolf, we partnered with a mature and evolved intelligence. With software, robots, genome technologies, and nanotechnologies, our partners are far less advanced. But still the ability to co-evolve is present.

Consider a scene in the beginning of the movie and book, *2001: A Space Odyssey*, (Clarke, 1968) where the humanoid ape is learning to use a large leg bone as a tool, to extend and increase the power of his arm as a weapon against a hostile environment. We now recognize that fire, physical tools, and language are not just something we were intelligent enough one day to recognize and use. Rather we co-evolved with these companions. We shape them, and their use shapes us. In the movie, the ape, who now walks upright, tosses the thigh bone high into the air. As it tumbles in the air, we visually transfer to the scene of a space station floating in space. The space station is the co-evolved leg bone acting as a force multiplier. The humans of the space station are co-evolved apes who cooperate in tribes (as large as continen-

tally distinct nations). These apes trust technology enough to create artificial environments to take to the Moon and the outer planets (Clarke, 1968). In our world, we send out robots from Earth to the outer planets as our surrogates.

In this sense of partnering, of extending what is human into space, but also in the sense of evolving through time, in this sense, I trust technology. True, one popular suggestion is to replace humans with technology. If the task is to drive a nail into wood, my hand prefers that the point of impact on the nail's head be the hammer's head. Rather than *replace* the human, another proposal or model of technology is to *extend* the human.

Regulators and licensing agencies, educational and professional bodies, and individual professionals will shift into an increasing engagement with soft and hard hus, as they do with all aspects of health care that hold opportunity for improvements in health care and patient outcomes. The difference is that while procedures, best practices, and buildings all are passively improved by healthcare professionals, intelligent systems more actively improve themselves and us.

Consciousness is not required for co-evolution as Pollan (2001) discusses in his book, *The Botany of Desire,* where apples, tulips, potatoes, and marijuana all co-evolve with humans.

"In a coevolutionary bargain like the one of the bee and the apple tree, the two parties act on each other to advance their individual interests but wind up trading favors: food for the bee, transportation for the apple genes. Consciousness needn't enter into it on either side and the traditional distinction between subject and object is meaningless" *(Pollan, 2001, xiv).*

"Bees and humans alike have their criteria for selection: symmetry and sweetness in the case of the bee; heft and nutritional value in the case of the potato-loving humans. The fact that one of us has evolved to become intermittently aware of its desires makes no difference whatsoever to the

flower or the potato taking part in this arrangement. All those plants care about is what every being cares about on the most basic genetic level: making more copies of itself" (Pollan, 2001, xv).

In this sense, health care workers are co-evolving with intelligent systems now and in the future. Being aware of the potential of co-evolving merely improves both the speed and fruition of the full potential of intelligence.

If the concept of co-evolution is a barrier for you, consider the equally activist theory of Hurwicz's mechanism design in economics (Mechanism Design, Wikipedia, 2009). The assumption still stands that complex institutions are plastic and amenable to shaping into increasingly successful forms.

EQUIVALENCY

That all hus actively improve themselves and each other is one of the features of the equivalency of the intelligence of wet, soft, and hard hus. Intelligence provides a dynamic foundation for equivalence, for interchangeability, among the three forms of hus.

We are long (in terms of scores of thousands of evolutionary centuries) accustomed as humans to using tools and very recently (in evolutionary time scales) complex machines. We use weapons interchangeably with using our hands or feet or teeth. We use material-shaping tools and machines also interchangeably with using parts of our body or the bodies of other humans.

In health care we use electronic medical record systems instead of just using our long term memory. We even use patient monitoring systems in place of having professional medical staff constantly in the room. We use robots in a hospital pharmacy to fill medication prescriptions and supplement human pharmacists.

These simple collectors of data and performers of repetitive tasks are intermediate forms between data and information technology systems of yesterday and the intelligent systems of tomorrow. They, and forms which will arrive soon, differ from past systems in terms of four attributes; surface, independence, knowledge representation, and self-improving.

Surface

Surface is where software and the new intelligences touch our human awareness. The surface of many of these systems will be embedded in complex tools, such as vehicles, communication devices, and diagnostic machinery. When Medtronic and similar medical device companies (Medtronic, Inc., 2009) embed systems in our bodies and brain, then the surface may also become invisible. The computer system's surface becomes increasingly invisible when it becomes increasingly distributed, such as with cloud computing (Microsoft, 2009). Cloud computing dynamically uses Internet resources to virtually provide infrastructure and software as services. The surface becomes invisible when cell phones and computer tablets with wireless cards are mobile and grab on to one and then another transmitter tower's services.

Independence

Humans in health care decreasingly monitor new technology systems when they become boringly consistent. Technology can be more consistent than humans, even when humans work under best practices. The attention of humans wanders as we habituate to consistent input. Technology's attention may be fragile in not catching new, out-of-the-box situations, but technology's attention is at least consistent. So we cease to rigorously monitor these child-like intelligences just as we let thermostats regulate the consumption of energy to maintain the best temperature in our buildings.

Knowledge Representation

More and more of these new systems have increasingly complex and expressive representations of knowledge. These representations in the form of schemas, rules, and semantic and non-semantic structures provide models for systems to reason over the data and information increasingly stored in record management systems. Local efficiency for humans would have been a sufficient reason to switch from paper medical records to electronic records. But the potential for more effective use, for multiple re-use of medical records, adds to the reasons we benefit from electronic medical records interpretable to software through meta-data and other forms of knowledge representation.

Self-Improving

Have you worked with a voice recognition or transcription system that improves in interpreting what you are saying as it works with you and has you actively correct it? Perhaps you notice that your own word processor's spell checker learns new words from you. Search engines and online book search systems automatically learn from you and other users. Database management systems in your IT department's computers continually build more and more efficient indexes as its users ask certain types of queries out of the very large number of possible query types. These are examples of systems which are self-improving. These are systems which improve their efficiency and their effectiveness with use.

More esoteric are artificial intelligence systems, such as those using genetic algorithms, genetic programming, and neural nets to rapidly generate a large number of solutions, keep the best, generate more solutions from these best, and repeat these steps.

The early adoption of intelligent systems will be because they become consistent with routine tasks. But increasingly they will help us with managing complexity and compressing solutions into smaller time frames and using fewer resources. Then they will help us to manage situations so complex that we could not do without these allies.

More aggressively, we use thermostats not only to monitor the temperature of buildings, but also, without humans, to cause changes in the functioning of a building's heating and air conditioning systems. More energy is consumed solely on the orders of the thermostat, a machine.

TIME LINE

We cannot say that new intelligences will arrive February 29 of this or that year. The unfolding of these new intelligences is a process, not a single event.

To understand the time line of the transformation of hu intelligence, we need to consider both a scalar and an exponential time frame. The human transformations needed draw heavily on further evolving current wet hu functions and behavior. Even with extending current habits, it will take years for humans to change. It will take several annual planning, budgetary, and project cycles for large and currently successful enterprises to change direction and adapt to the changes needed to optimize intelligent wet, soft, and hard hu development. That is, the rate of many wet hu changes is scalar: we add a fixed amount of change within set frequencies of time.

Soft and hard hus appear to develop at an exponential rate, following Moore's Law. Gordon Moore, a co-founder of the silicon chip company, Intel, noticed within a decade of first making chips that the number of transistors or electronic switches Intel employees were fitting into their computer chips was doubling every eighteen months for essentially the same manufacturing cost. That is, the rate of productivity or evolution of silicon chips is exponential, where we do not add on a fixed amount of change, but rather we double the old amount to get to the new (Kurzweil, 2005).

Imagine your bank savings account with accelerated compound interest where the principal doubled every year and a half. Other systems related to these silicon computer chips also improve exponentially, although often over a longer time frame. Software developers' productivity doubles every five years. Information workers double their productivity every ten years. Bandwidth, or the capacity of telecommunication systems to move larger and larger electronic content, triples every two years (Kurzweil, 2005).

Industrial competitors ever increasingly create new and improved models of health care devices and systems. Healthcare professionals and patients ever increasingly adapt these new innovations.

Thus we have increasingly sophisticated and intelligent systems involved in buying and selling stock; assembling vehicles; guiding unmanned missiles; exploring Mars; and providing expert humans – pilots, surgeons, and truck drivers – with assistance in handling what would have been overwhelming complexity, quantity, speed, or scale.

An aspect of our exponential timeline that speeds it up even more is the convergence of information related technologies, such as genome and nanotechnology, whose informational capacity are also increasing exponentially, especially in health care (Kurzweil, 2005). When these developments converge, they can speed each other up. A limitation on any new technology is the general absence of enabling technologies. Enabling technologies are parallel to the new technology and are required for its optimal use. When the first photocopiers were available, their enabling technology was paper, standardized to not jam in the copier's rollers (Kurzweil, 2005).

Hu resources management understands the equivalency of a wet hu (human), soft hu (intelligent software), and hard hu (robots). Understanding hu resources creates a complex adaptive system where boundaries shift to create hybrid solutions. The key is not that one form replaces another, but rather that there is a mix of these forms of intelligence when providing health care.

PLAY

Hu systems will distinguish themselves by improving with intense play. Consistent and static use will not be sufficient for the more intelligent hu systems. Hu systems will seek challenges. They will seek to improve how they perform. Play will become more important. The abstractions, the explicit knowledge, the accessible information, and smart displays – visually intelligent – will entice wet, soft, and hard hus to apply their intelligence to healthcare challenges. For wet hus, the partnership of hus will lead to artificially intelligent technologies providing humans with assistance. Time and space will melt away before this partnership enabling asynchronous, global teams focused on small or large facility, clinic or hospital, situations.

Commercial web sites, such as American Well (2009), which started in 2008, provide individuals with real-time, online contact with physicians. A decade of telemedicine has brought specialists to rural areas. Thomas Friedman (2005) in his book, *The World Is Flat*, discusses how work, converted into information, can be performed anywhere in the world at any time of the day or night. Thus X-rays taken in North America in the evening can be read and interpreted by specialists immediately in Asia, rather than waiting until the next day for a medical interpretation. The next step in this conversion of work into information will be intelligent systems that ever-increasingly begin and carry out the diagnosis. Consider our digital cameras that can recognize faces as we are aiming the camera. Turning work into information is an enabling technology, a pre-condition for intelligent systems.

Turning healthcare work into information available in many settings, invites many parties to participate, such as Friedman's Asian interpreter of North American X-rays. Consider the real HR problems that all these non-local human actors create with licensing of practitioners, legal liability, training, and deployment of profession-

als. Consider these challenges as they compound within the interplay of hu and HR.

The coming knowledge technologies will bring more intense play than information technology alone had brought. Knowledge systems require initial knowledge extraction from experts. In addition, rule engines and semantic nets, as well as neural net systems, reason over the explicit knowledge representations, generating intelligent solutions, which as the solutions succeed or fail, provide all the hu actors with information for further improvements.

These cybernetic feedback patterns need not wait for futuristic software agents. Decades-old business rule engines are evolving into business rule management systems with smart authoring interfaces. These systems allow subject matter experts (SMEs) from the business side to author and own business rule systems. These systems are then applied to business processes, again made explicit and represented. This allows business expert authors to develop process improvements with business process management systems. These business process management systems are business systems with IT parallel support for mature quality and guidance on the essence of media's algorithms and heuristics (Hill, 2008).

That is, even today, healthcare professionals, planners, and managers must speed up their metabolism, their hu "play metabolism." Organizations and humans who cannot evolve beyond scalar rates in a world that improves exponentially must begin as soon as possible to change their play metabolism. We will transform from *homo sapiens* into *homo ludens*, the playful human (LABoral Centro de Arte y Creacion Industrial, 2009).

INTERFACE

A driver facilitating these changes is the melting away of the visible and isolating interfaces of hu systems. Computers and cell phones are converging. Wearable computers will soon follow

(Zetter, 2009). Soft hus are melding into wet hus and into other soft hu systems. Individual humans with disabilities find solutions with embedded intelligent systems to monitor and intervene with bodily functions and subsystems. As soon as direct wet hu brain interfaces with artificial intelligent systems become standardized, we will have still more efficient surfaces among hus.

We have been through this interface revolution once before and benefited immensely. Long before health care, long before humans – millions of years ago – our single cell ancestors (prokaryotes) embedded within themselves smaller, independent prokaryotes, developing a symbiotic relationship. The larger host shelters and provides the smaller with nutrients. The smaller organism provides adenosine triphosphate (ATP) molecules to the host. A possible explanation is that the smaller organism, which became our mitochondria, supports our aerobic respiration, generating chemical energy by metabolizing sugars, fats, and other fuels with oxygen.

The resulting eukaryotic cells were efficient enough to support evolution into multi-cell organisms and ultimately into humans. The symbiosis benefits us and extends and intensifies what we can do as a life form. The relationship still is of two entities (in that the mitochondria have retained some of their own DNA). Some plant and animal cells have one instance of mitochondria, others have thousands.

So too we may engulf and host software agents with which we will have symbiotic relationships, maintaining over the next millions of years our own identities. We have done this before. We have already had experienced success with becoming part of more complex systems.

Before we have technology systems interfacing directly with our brains, the increasing ubiquity of technology in smart houses and buildings surrounds us with technology. The ever-increasing intelligence of technology creates intelligent bridges that shorten the distance between humans in health care and useful technologies. Smart

systems will both increasingly monitor patients and self-monitor their own performance. Intelligent technologies will increasingly develop self-healing functions, as well as self-improving functions. Neural net and genetic programming systems today are systems that evolve optimal states, that is, they self improve.

WET HU REACTION

Humans appear to have standard reactions to intelligent systems. Humans have a strong psychological propensity to ascribe human characteristics to intelligent systems. While soft and hard hus may one day actually care about humans, humans often treat systems as if they already do care about us, when they obviously cannot yet do so (Billings, 2007).

In the mid-1960s Joseph Weizenbaum of MIT discovered this "ELIZA" effect when he built ELIZA, a computer program which behaved in a way inspired by a non-directional, Rogerian therapist. That is, the program mostly just rephrased into responding questions the substance of whatever the user had keyed into ELIZA (Weizenbaum, 1976).

This was before the natural language processing of today's Ask.com. It was magic! Weizenbaum told people using ELIZA (certainly the graduate students understood) that ELIZA did what it did without intelligence, by just parsing and substituting key words into canned phrases.

After World War II, Alan Turing invented what we now call the Turing Test that has become a high (and so far unreachable) standard for determining if an artificial intelligence system is truly intelligent. The test essentially is that if a user cannot determine whether the responding system is a human or not, then the system has passed the Turing Test (Wikipedia, 2009).

Using ELIZA one can certainly trip up the program and soon realize that ELIZA cannot pass the Turing Test. But for a brief moment, for hours, lay people forget or set aside this knowledge, and

luxuriate in having an intelligent companion to whom they can unburden themselves. Consider trying ELIZA yourself. Descendants of ELIZA are available online through several web sites, just google for "ELIZA computer program."

Through this human-machine interaction you may fall into the ELIZA effect, into the illusion that ELIZA is more than what she (it) is. As you can see, my pronouns have tripped me up. Is ELIZA a she? Many stress the illusionary phenomenon and warn us like Weizenbaum (1976) in his book, *Computer Power and Human Reason: From Judgment to Calculation*. Consider exploring the opportunities presented by this effect.

The ELIZA effect is the human tendency to ascribe human level behavior to machine behavior, even when we know that the computer program is just a computer program. The effect is that we anthropomorphize non-humans. While our history is full of lost opportunities where bigoted humans did not consider other humans as human, here we treat technological entities as if they were human.

While the Eliza effect may be the result of a subtle cognitive dissonance between the user's awareness of an application's limitations and their behavior towards the output of the program, the effect may help us improve the efficiency of human-machine interactions.

For health care, for example, the opportunity is that by using social engineering and the insights of human factors, that is, the interaction of humans and machines, we can reduce the friction and wear-and-tear in our increasingly intimate relationship with machine intelligence. While advances in software are necessary for optimizing soft and hard hus in health care, the software advances are no longer sufficient. Wet hus must contribute to the relationship.

Weizenbaum's ELIZA was clever and lucky in that essentially primitive components created a magical effect far greater than the sum of the parts. Healthcare planners and professionals will need to work with the new generation of smart software to cleverly and similarly create a magical

effect far greater than the sum of the parts. The magical effect will often emerge from the new software interacting with enabling technologies and behaviors.

One of the challenges of humans in this mix is not to consider our human tendency to treat intelligent entities as human as a defect. It is a characteristic from which both risk and opportunity arise. From the time of Ovid, the Roman poet, and his story of Pygmalion, the sculptor falling in love with his creation, the statue Galatea, through today's robot pets for the elderly and juveniles; or to ELIZA, humans recognize colleagues in intelligent wet and hard hus (Billings, 2007).

Humans, including healthcare workers, must learn when to override and when to acquiesce, when to demand white box explanations and when to settle for black box responses. This human capacity to interact intelligently with intelligent systems must match the drive for ubiquitous computers and sensors, such as smart houses, coupled with socially and emotionally-aware systems able to appropriately interact with an individual's entire continuum of care.

Health care, of all industries, will proceed quickly with intelligent technology being embedded in human bodies and brains (Medtronic, 2009). As intimate as being embedded in one's body, the intensity of human relationship with intelligent systems will seem greater when we work with increasingly social software systems or anthropomorphic robots.

Consider the impact of Kismet, an expressive anthropomorphic robot that engages people in natural and expressive face-to-face interaction (Massachusetts Institute of Technology, 2009). Kismet perceives a variety of natural social cues from sight and sound, and delivers socially meaningful signals to its target humans through gaze direction, facial expression, body posture, and vocal babbles (Frenay, 2006, 114).

In Korea, Japan, Europe, and North America, specialists in this area are cautionary about the power of the ELIZA effect expressed even more powerfully toward robots. The power of this human reaction is such that several national and international charters have been drafted around "roboethics." The increasing number of social robots being used outside the research lab adds intensity to these charter efforts. Social triggering robots as toys for children (and adults) and as care providers for seniors are leading the way (Billings, 2007).

CONTINUOUS WITH DERIVATIVES

Up to now the information age has been remarkable for the overabundance of information, uncomfortably if not dysfunctionally, overabundant (Dwivedi, Bali, &.Naguib, 2007). Yet going forward, the flow of information will increase. Information will literally flow and change from discrete and frequent quanta of information into a continuous flow. While we ingest food presented to us in discrete amounts, we prosper within a flow of air and oxygen as well as light which we "ingest" in discrete amounts each day.

We do not feel that a flow of air or light is overwhelming. So we will not feel that the change from receiving information in frequent, discrete amounts to continuous will be overwhelming. Partly this will be so because we will develop new ways to manage and make sense of this flow of information. From calculus we will learn to monitor flows of data and information with derivatives, straight lines whose slope will meaningfully tell us about changes in continuous curves, in the flow of information.

Also we will change from having a single focus toward information with implied multiple meanings to multiple foci with multiple levels of meaning granularity (such as, cell to system to ecological community). Much of the information our body takes in is relegated by involuntary systems that do not need our conscious attention. Thus, we can walk and chew gum, as well as multi-process many other marvelous and necessary tasks. Even

my heart "knows" enough to pump faster when my muscles need more oxygen when I exert myself.

At a more subtle level, we will change from diagnosis as model confirming and searching for a best fit model to model improving. We will change to continuous user-driven design (Petroski, 1992). We will change to evaluating by using probabilities. No longer will certainty be the pretended goal.

For instance, an actuarial-based diagnostic system uses several overlapping probabilities that from among many factors, this or that cluster of characteristics suggests a specific diagnosis and implies a specific set of treatments. If we follow the system's recommendations and the positive outcomes are fed back into the system, then the probability of success is strengthened for the next user. If the results are negative, then the probability is weakened for this whole set of factors. If we follow a treatment other than that recommended by the system and the positive outcomes are fed back into the system, then the next user may find one recommendation and an alternative. That an individual with a set of characteristics fits a diagnosis and therefore a treatment, is not a certainty, but a probability, with the risk that this individual has further characteristics which places them outside the diagnosis and treatment recommended.

NEW HABITS

Healthcare workers will need to develop new behavioral patterns in order to optimally work with intelligent technologies and to continually improve them and ourselves. Workers will not merely use intelligent technologies; they will be physically integrated with technology as technology becomes ubiquitous.

Workers are already embedded in discourse communities that are semantically rich and often full of jargon and specialized codes for the concepts of the domain or subject with which the members are involved. A classic example is the discourse community composed of people interested in and communicating with each other about nineteenth century Hong Kong stamps. While the members may be scattered geographically and be diverse in other demographics, they share the language and behavior tools which allow them to learn and teach each other about this subset of world stamps.

Health care is full of discourse communities at all levels, professionals and patients and their continuum of care. Every illness, especially if it has the intensity of cancer, or is chronic, develops socialization mechanisms to initiate members into their role within the discourse community. The knowledge of a discourse community domain can be represented in an ontology or in, for instance, a semantic net expressed in a frame-based system, consisting of nodes and arcs, of attributes and facets, of operations and processes, and of relationships which are themselves full frames (McKesson, 2009).

When experts (Rada, 2008; Yolles, 2008) discuss the fragility of healthcare expert systems, for instance, they are discussing rule-based systems which neither use semantic net technologies nor a well developed ontology. Nor are semantic nets the only knowledge representation technology; but for more information about semantic nets do consider reading the now classic (in Internet years) article by Tim Berners-Lee, James Hendler and Ora Lassila (2001) published in *Scientific American*.

Consider that the intelligent system is not only functioning in the immediate time after the user has carried out some data entry. Besides the intelligence and knowledge involved, most of the data involved is in, and has been entered in, other systems. Berners-Lee's (2001) vision is not of systems that interfere with, for example, a physician while "clinicians must confront patients in intense, intimate, time-pressured, face-to-face, *belly-to-belly*, events" (Rada, 2008, p. 131). We are considering here intelligent systems that are awake for an asynchronous duration extending beyond the professional's initial entry of data.

With these more intelligent systems, health care needs to encourage modes of abstraction for all health care workers at whatever level or role; indeed all healthcare stakeholders must be able to test and improve these intelligent technologies. Usage determines function and form, even if not in the simplicity of Brin's (1995) science fiction world in his book, *The Practice Effect*. Abstraction is an important tool for individuals and discourse community members in improving intelligent technologies. Consider Eric Kandel's (2006, p. 381) comment in his autobiography, *In Search of Memory*, about how his form of abstraction and model building, that of reductionism, has its uses and limits when approaching complex systems.

RISKS

Hus will need to be aware of the limits in our future. Is knowledge processing a P or NP complete problem, (see NP-complete, Wikipedia, 2009; NP standing for standing for nondeterministic polynomial time) that is, which problems when they scale cannot be calculated in a reasonable amount of time? When will systems become overly sensitive to initiation conditions? When will collaborative behavior devolve into chaotic conditions? Will initial soft hu emotional and social awareness be mere facades? Will new complex systems of systems have hidden cliffs discovered during perfect storms?

The use of terms, such as NP complete, has usually been restricted to computational technologies. In a hu resource world, the issue also applies to whether humans are computationally limited. Will soft hu intelligence overwhelm wet hus with an information overload? Is there a limit to the complexity of systems that wet hus can build? The existence of specialists indicates a common acceptance of our limits. Specialists focus on a specific area. The challenge will be for specialists to contribute to general teams without losing the edge of their specialty. A further challenge is when specialists have kept their edge are they are able to communicate with generalists, both to receive information and to provide it.

The underlying challenge for healthcare workers in engaging with intelligence (wet, soft, or hard) is an observation discovered before 1960 by Calvin Northrup Mooers. A native of Minneapolis, Mooers in 1948 at the Massachusetts Institute of Technology coined the terms "information retrieval" and "descriptors." By 1959, Calvin had published Mooer's Law that an information retrieval system will tend NOT to be used whenever it is more painful and troublesome for a customer to have information, than for them not to have it (Austin, 2001). Where an information retrieval system tends not to be used, a more capable information retrieval system may tend to be used even less.

Intuitively, I would consider a system that is more capable to be less troublesome. But Mooers' insight is that intelligent systems are troublesome to users who do not thrive on the challenges and the cost of a continuous flow of new information. If I prefer my internal static model of my world, maintained with minimal effort, new information from the cornucopia of information systems is bothersome, a form of information overload, screaming in my silent sanctuary.

Health care will need to continue to monitor itself for behavior that indicates that its members are avoiding information because new information (not just the technology's interface) is troublesome.

Health care will need to value actors in the healthcare system for what they can learn, not just for what they know. Does the hu tolerate multiple points of view? Is the hu able to participate in mass collaboration and other collective processes? Can the hu understand and model using systems thinking? Can the hu tolerate control in a different place? Will the hu contribute to the evolution of the design of health care? Can the hu (wet, soft, or hard) author systems and provide feedback for improvements?

When healthcare hus are someday mature will we consider them to be wise? Certainly they will be useful and within local options and choices contribute to the rules which govern global impacts no matter what the actor's role and need. The trick is not, access or not to a computer or technology, but to useful tools within the area of access.

LEARN ABOUT CHANGE AND INTELLIGENCE

On top of all this is the challenge to understand emergent behavior using systems thinking. Increasingly, invisible surfaces such as a brain-computer interface coupled with intelligent technologies that are emotionally sophisticated and socially aware will need healthcare "meta" workers, who can abstract outside of immediate tasks conceptual models of their individual situations. The complexity of new medical and bio-genomic knowledge will still require us to reason within reductionism, but we are identifying questions, such as, "how an objective phenomenon, such as electrical signals in the brain, can cause subjective experience, such as pain" for which we will need "a significant change in methodology" (Kendal, 2006, p. 381).

In an environment of constant and accelerating change, driven by the need to reduce the cost of transactions, health care is a complex adaptive system that requires all actors and stakeholders to be wise and follow the serenity prayer where one changes what one can, accepts what cannot be changed, and is wise enough to know the difference (Serenity Prayer, Wikipedia, 2009).

Software developers are increasingly bringing users into the evolving design of software with subject matter expert authoring interfaces and web analytic feedback loops. Also wet hu actors (patients and workers) increasingly vary in their cultural boundaries, with some trading privacy for convenience and functionality. Cultural differences imply something other than simply privacy concerns, but also the way in which illness may be diagnosed or treated, or the way in which consumers and providers interact (Farrall, 2008). New hybrid systems will vary their mix in order to meet personal and cultural preferences. To all this we will add the team and activist roles clustered within the children's story of *Stone Soup* (Brown, 1986): prosumer, socially aware, seeking and creating meaning, within the shadow of competitive advantage dynamics, and made visible with web analytics feedback loops (Tapscott & Williams, 2008).

PRIVACY

A feature of soft hus is their persistence, their obsessive persistence. They can stare unblinking hour after hour at the stars of the universe, where wet hus would need coffee breaks, lunch, and vacations. Soft hus will monitor continuously. Thus, when we are seeking recruits for evolving a new set of responsibilities, roles, and best practice standards, we should consider soft and hard hus. In smart houses, intelligent systems can watch for preventative opportunities and risks. Health care can now work with individuals as pre-patients and post-patients. From cradle to grave – all the time – while individuals sleep or are awake, intelligent systems can apply and evolve early prevention and reduce the cost of learning healthy habits by applying them continuously. These intelligent systems can provide longitudinal raw and interpreted information for specialists and generalists alike, all while preserving the privacy of the individual.

Consider what such flows of information would mean for controlling the complexity of current health care challenges. No longer will workers drop calls, forget tasks, or inadvertently act inconsistently. In the same way semantic net systems monitor actions to look for actions that, in the context of a specific patient, break local hospital best practice rules (McKesson, 2009). Deaths and damage due to these slips will disap-

pear. Instead we will dwell in complexity arising from rules embedded within a variety of hu resources: swarming, cooperative, and problem solving.

Returning to the privacy of all stakeholders, including patients and their continuum of care, each individual, probably in cohorts, will balance privacy with convenience and functionality. As systems become more intelligent and aware without forgetting the details of patients and all the actors' actions against a backdrop of best practice, each individual stakeholder will, in one sense, have less privacy. Where individuals are comfortable in drawing the line between privacy and functionality, or even convenience, will depend certainly on situational factors of how the reduction of privacy is handled, but more so on the individual's sub-culture (Berton, 2006).

The healthcare industry is overseeing the embedding of technology into human bodies, including brain-computer interfaces. We are bypassing eyes for reading and ears for hearing as ways to learn from and to communicate with intelligent technology. In home entertainment, humans through Wii™ use body movement to communicate commands to the computer in virtual spaces. Tivo® dissolves time, Wii™ dissolves space.

Can it be a surprise that Phillip Armour (2009) in an article to software developers discusses new formats for creating software? Armour discusses the ontology of paper, that is, the very use of print on paper or print as expressed in electronic formats and metaphors and surrogates for paper, bring with them a context of meaning for whatever knowledge is communicated within these environments. For example, concepts read as text on paper are always in sequence. Reading is a control sequence activity and allows for only single tasking.

Unlike health care which is such a team process, Armour (2009) urges software developers to use knowledge software to produce more knowledge. Armour reminds us that most of the

creative activity in software development occurs alone inside the brain of a software developer. This isolation, this avoidance of using intelligent soft and hard hus as partners, as creative team members, cripples our ability to revolutionize our industries. If we play among all hus in providing and improving health care, then wet hu limitations will be compensated for by our hu partners as wet hus will compensate for their limitations. Few wet hus could win a race with soft hus to sort the contents of large telephone directories in phone number order. Few soft hus could win a race with wet hus to recognize general patterns.

Consider what it will be like to perceive or ingest information from intelligent technology not through readouts on dashboards or on flat screens, but to visualize this information in three-dimensional models. Consider what it will be like to perceive flows of information (raw and interpreted) directly into our brain. When humanoids began using tools to process food, their teeth no longer needed to be huge and costly to maintain. We outsourced processes and functions outside our body. So too here, we will outsource to soft and hard hus the filling of prescriptions in a pharmacy or delicate surgical operations. My guess is that most of this new experience will be accumulated bit by bit, more and more quickly over the next twenty years. But all hus will find in time which scripts are relevant in which situations with differences built in for specific actors.

CONCLUSION

Health care is a complex adaptive system in which the play of intelligence among humans, software, and robots will be both a delight and productive for all hus. The exercise of intelligence by intelligent entities is…I am not sure we have found the correct word yet…suitable, pleasurable. In that sense all hus will focus on play with pleasure.

The play will intensify both the humanity and the intelligence of all hus. For the improved qual-

ity of health care resulting from all this, it will be important for wet hus to continually learn about change and intelligent technologies and tools. Increasingly, we will value, in all healthcare workers and actors, curiosity and passion, probing the smart technologies, looking for the sweet spots.

Above we referred to the ideas of Phillip Armour (writing for software developers) about using (really using) intelligent software to build software and knowledge systems that software could automatically apply. Near the end of his article he reminds us about the relationship of steam engines to the Industrial Revolution. "The Industrial Revolution did not occur when we built steam engines, it occurred when we used steam engines to build steam engines" (Armour, 2009, p. 24).

HR, Human Resources, is today about management of intelligent resources, that is, humans. As software and robots move toward intelligence consider that HR should also manage these resources. Hu Resources would manage wet, soft, and hard hus under two principles:

1. Equivalence: When and where can one form be used for another and where are hybrids and partnerships appropriate? The United States military asks this today.
2. Play: Humans in tomorrow's work environment will need to relearn how to optimally work with these new emerging intelligences through play.

The metaphor for the interaction of wet, soft, and hard hus in health care is not that of the American folk hero, John Henry, competing with a new-fangled steam engine, a steel-driving machine, winning, but at the expense of destroying his heart and dying. The correct metaphor is the millennia-old relationship among John Henry, the wielder of a hammer; his wood and steel hammer; the colleague who holds and turns the steel spikes; and the steel spikes, plus the transportation revolution that needed the rock John Henry

smashed and moved, smashed and moved. John Henry melding with steel continued a millennia-long relationship stretching back to the ancient Hittites and their fashioning of iron tools in the Ancient Middle East. So, we wet hus will meld with soft and hard hus to fashion stronger solutions by co-evolving, by covering each partner's weakness with a partner's strength.

Chapter 83
Emergent Dynamics of Workforce Program Reductions:
A Hybrid Multi-Level Analysis

ABSTRACT

This paper reports on research that explores designing a hybrid system dynamics/agent modeling (HSDAM) simulation methodology to evaluate potential effects of a new human resources policy in a company. The study measures the effect of changes in the company's pension policies on individual employee retention, promotion and employment longevity. The Delphi method for elicitation of expert views was used, as four expert panels composed of human resource specialists and general managers participated in model design and predicted employee behavior. The model integrates multi-level organizational data inputs from macro-level business data to granular individual-level employee information. Each simulation run used four years of workforce longitudinal data at the start. Initially, the expert panel predictions did not validate simulation results. However, once alteration of a key model parameter recalibrated individual employees as more economically rational, later runs provided strong support for the model and modeling approach. The simulation results confirmed, among several expert panel predictions, that setting a policy that decreased the likelihood of employee willingness to retire due to replacement income concerns could lead to other consequences with potentially adverse strategic implications for the firm.

INTRODUCTION

System dynamics models often use a top-down design strategy to test the impact of organizational policies on long-term patterns of performance. Hines and House (2001, p. 4) note, "from a system dynamics viewpoint, a company *is* a system of policies. A company's particular collection of policies gives the company its unique identity—an identity that survives employee departures, spatial relocations, and corporate reorganizations. Functional areas such as marketing, finance, and human resource (HR) management promulgate policies that interweave and branch across and throughout the company. Over the past several decades, the potential impact of policies on company performance of HR decisions has been underestimated, creating unintended and undesired consequences.

In one such case, studied here, possible effects of a change in the company's retirement policies and other HR conditions upon employee willingness to continue their employment with the firm worried its management. The analysis prospectively considered the possible effects of making changes in the firm's pension policies. Most HR management research has ignored the importance of employee pension adequacy, and instead focused on conventional workforce motivators to increase employee commitment to continued working. These factors may include addressing importance of working to employees, flexibility of working arrangements, interests outside of work, plus supervision and work environment issues (Shacklock & Brunetto, 2011, p. 252). This paper proposes that such underestimations of the importance of human resources policies, and specifically employee retirement plans, result from three major causes: 1. organizational distance between cause and effect; 2. miscalculation of the effects of aggregating individual decisions; and 3. time delays between cause and effect. Historically, there has been an absence of both strategic and systems thinking in HR management practices. However, there is mounting evidence of a shift

in the direction of greater use of more systemic strategic practices.

In recent years, scholars have advocated taking a more strategic approach toward managing people in organizations (e.g., Becker, 2001). However, conceptual and methodological barriers have hindered efforts to do so. There is an increasing agreement among researchers that strategic human resource management (SHRM) necessarily involves three levels of organizational analysis: 1. macro, 2. micro, and 3. meso. Macro analysis concentrates on firm strategy, production and finance and contextual factors, while the micro level focuses on the attributes, needs, and contributions of individual employees. In between these two levels is the meso level, which focuses on the firm's management programs – here those of HR – that translate between the other two levels. Unfortunately, most HR research is limited in scope and tends to ignore the interactions among these multiple levels. Only a few scholars (e.g., Jackson & Schuler, 1999) have sought to bridge these levels, and their research does not offer testable hypotheses. There has been an absence of HR methodologies capable of systematically measuring critical SHRM variables and testing the effects of policies across multiple levels of the firm. A major goal of this research is to begin to redress this gap by proposing that multiple levels of strategic policy analysis be adopted by HR managers.

LITERATURE REVIEW

Levels of Organizational Analysis, and Limits of Current Research

Why does a comprehensive SHRM study necessarily involve all three levels of analysis and why does the methodological gap exist? Bowditch and Buono (2005, p. 236) note, "the main focus of organizational behavior … has been on individuals, small groups and their leaders" due to the

backgrounds in psychology of early researchers and the social context that shaped early research traditions. Within a SHRM context, micro-level theorizing explores individuals' motivations and the effects of their personal abilities. Once sociologists began studying these issues, theoretical analyses were more likely to adopt a "top-down" perspective. As related to SHRM, such macro-level theories examine employers' cost structures and competitiveness in product and service markets. The meso level of analysis is less well examined. House, Rousseau, and Thomas-Hunt (1995) define it as the simultaneous study of at least two levels of analysis involving the linking processes that connect them. A number of researchers now have focused on the bridging structures and processes that compose a firm's HR function and subsystems. These translate between individual employees' characteristics, needs, motivations, and firm-level strategies. The need to adopt a systems perspective to interconnect these variables is clear.

SHRM studies necessarily involve all three organizational levels and should treat them as being interactive elements of a system. SHRM research must take a longitudinal perspective because data and relationships resulting from these interactions emerge over time. Traditional SHRM research methods do not employ such a systemic paradigm. Jackson and Schuler (1999) review SHRM research and conclude "…the available theories are admittedly inadequate. Each deals with pieces of the larger phenomenon and none addresses the whole domain of HRM in context" (1999, pp. 3-9, pp. 17-19).

Taking a More Systemic Approach to SHRM

Over the past decades, a number of scholars have used a "systems approach" to describe phenomena at the micro or meso levels of SHRM research (e.g., Campbell, Dunnette, Lawler, & Weick, 1970; Dreher & Dougherty, 2002). However, they do not meet the methodological challenge of testing

and subsequently disconfirming these theories. In summarizing this research, Wright and McMahon (1999, p. 61) note these studies "…have tended to focus on cross-sectional studies that only give a glimpse of the relationships among practices at a particular point in time. [Models] must be expanded to consider the relational feedback from the environment and to discuss the internal HRM adjustments in response to this feedback." Forrester (1961) developed systems dynamics (SD), which employs rigorous modeling of systemic structures that generate intended or unexpected performance patterns over time. Systems researchers, such as Senge (1990) observe that unintended consequences arise through interactions of *system structures* and policies. Such systems may be a firm, a function, a process, a multiple firm enterprise, or even society (Meadows, Meadows, Randers, & Behrens, 1972; Forrester, 1973). There are many tools available for performing such types of systemic analyses. For example, conventional structural systems elements (e.g., feedback, delays, nonlinear relationships) of system dynamics modeling are appropriate for developing models for gaining insight into SHRM policy-driven dynamics. Both material and information delays (Sterman, 2000, pp. 409-412) are found in SHRM problem situations. Time delays occur in the maturation of employee skills, and time passes from decision-making to implementation of policy. Such delays affect the consequent adaptive expectations of firm participants. Social and policy science often ignore feedback processes and their effects they cause (Richardson, 1991; Tesfatsion, 2002). While HR analysis frequently ignores strategic and systemic considerations of interest to organizational executives, SD provides a more balanced perspective.

SD analyses typically concentrate on strategic concerns of top management (Coyle, 1996, p. 15) when modeling a firm or its HR subsystems. SD models often treat individual agents as being fundamentally homogeneous within a "stock". However, individual employees are multi-dimen-

sionally complex, leading to potential behaviors that are difficult to accurately characterize using a SD "stocks and flows" model. Needs may vary from worker to worker in important ways, depending on their combinations of personal and professional characteristics. To account for heterogeneity in data sets, SD software permits the tracing of *aging chains* and simultaneous *co-flows*, as well as the use of *data subscripts*. Repeated use of these techniques quickly becomes cumbersome as the number of individuals' dimensions of interest grows; the SD approach really does not aim to "do" heterogeneous individuals intensively. Labedz and Stalker (2008, p. 5) suggest that "it appears that models which use even a small set of non-randomly-distributed employee attributes will *always* require a supplementary data storage mechanism." An alternative to using the equation-based system dynamics approach for modeling is found in agent-based modeling.

Agent-Based Modeling and Simulation

In organizations, employees may be viewed as being *agents* following a particular set of decision rules or a broader game plan designed to achieve a particular outcome. Individual agent behavior is often seen as being the product of individuals employing multiple interacting decision rules (Holland, 1995, p. 7). Agents interact with each other as well as with their environment. When the collective behaviors of social agents, such as ants, bees, or employees are observed it often becomes possible to recognize various emergent patterns of behavior that may not be representative of any individual or small group. Holland (1998, p. 117) has noted that even though the rules employed by any single agents in a system may be simple, collectively the resulting alignment among their individual behaviors generates emergent patterns that tend toward being complex. This evolutionary process results from non-linear dynamics that are inherently confounding and pose extreme

challenges to analysts seeking to indentify causal patterns. Computational agent-based models (ABM) enable the causal patterns and policies that generate this emergent behavior to be more clearly understood. Borachev and Filippov (2004) argue that ABMs are more efficient than other modeling approaches for modeling systems that are defined by active agents, such as people or animals, than are system dynamics models.

Parunak, Savit, and Riolo (1998, p. 1) describe agent-based models as consisting of "a set of agents that encapsulate the behaviors of the various individuals that make up the system, and execution consists of emulating these behaviors." They propose that agent-based modeling competes with equation-based approaches, such as system dynamics. Kirman (1992) argues that reducing agent characteristics to one of uniform sameness is usually unjustified and causes misleading conclusions. In practice, firm-level consequences can emerge from individual effects in ways that evade SD modeling practices because salient individual characteristics, and their combinations, do not always follow normal distributions across employee populations. Further, individual interactions may lead to emergent social activity (e.g., growing interest in union representation) that is unaccounted for by existing structures. Some individual characteristics simply require continuous visibility, to permit managers to identify multiple workforce dimensions of strategic interest. Agent-based modeling focuses more on individuals' interactions, modeling and examining the "global consequences of [their] individual or local interactions…" (Scholl, 2001).

SD permits modeling of the structures, behaviors, and control of systems, especially at an aggregated, macro-organizational level of analysis, e.g., firm level. SD and agent-based modeling are distinct but complementary methodologies (Parunak et al., 1998). Both have supplied partial "solutions" in examining SHRM problems. SD approaches, such as by Petrides and Dangerfield (2004) [generations model, nation-state pension

funding], Bayer, Gann, and Salter (2004) [workload fluctuation], and Hafeez, Aburawi, and Norcliffe (2004) [recruitment to homogeneous "skill pools"], do not model individual actors at all. ABM has been used to simulate other HR issues, including hiring and cessation of employment (Tesfatsion, 2001), organizational withdrawal behavior by employees (Hanisch, 2000), and effects of pay for performance systems (Schwab & Olson, 2000). Each of these models created individual representations defined by limited sets of dimensions (e.g., degree of job experience or of developed competency, focus on a single decision-making criterion) that change state. Although micro-level agent behaviors are important observables, they are *situated behaviors* within the larger, dynamic macro-level context of the firm. They also interact with HR management practices at the meso level of analysis. While such agents naturally exhibit some different state values, they usually do not exhibit different values over a very wide range of variables.

Because both approaches explain dynamic, nonlinear social behavior, albeit from different directions (Scholl, 2001; Rahmandad & Sterman, 2004) and others have called for cross-study and joint research between them. The modeling approach used in this research provides for a more heterogeneous view of individuals while still relying on conventional SD processes. Since both SD and ABM approaches offer unique benefits for capturing emergent dynamics of systems it is worth exploring their potential for working together in combination.

Moving Toward HSDAM for SHRM Analysis

Several scholars have combined agent-based and system dynamics models. Größler, Stotz, and Schieritz (2004) designed a small Vensim model to provide internal decision-making schemata to supply chain agents modeled using the RePast agent software. Their approach provides for a

single distinguishing attribute among manufacturers who are modeled as agents. Akkermans' (2001) SD model incorporated supplier and customer agents. These agents differed only in "the degree in which they emphasize the short-term or the long-term performance of their counterparts…" in making contracting decisions over time (Akkermans, 2001, p. 4). Geerlings, Verbraeck, de Groot, and Damen (2001) modeled the manpower planning process in the Royal Netherlands Navy. Their purposes too were somewhat limited. Simply, their model focused on achieving a timely matching of supply (sailors' available competencies) and demand (aggregate competencies needed to crew a vessel). It was not relevant to the modelers' purpose that individuals have any other distinguishing characteristic (e.g., gender) or attribute (e.g., motivation), and none was tracked. The limited expectation for this model was well-served through a flow mechanism: only the ebb and flow of homogeneous sailors were of interest to the client.

As Rahmandad and Sterman (2004) and Sterman (2000) note, the adequacy of any system model (ABM or SD alone, or a combined approach) is contingent on the purpose of the model, the variables of interest, and the levels of precision required. For the current research, a hybrid system dynamics / agent modeling (HSDAM) methodology will serve better than a "pure" SD or ABM one alone. Further, this research continuously observed many heterogeneous characteristics of employees and necessitated the extension of both the scope of HR system models and agent descriptions beyond the ones reported to date. The dynamic complexity of the issues faced by the subject firm in question warrants such an approach. It is typical of the multi-faceted, multi-level SHRM challenges that confront HR leaders. The specific methods used to design such a multi-level SHRM model follow.

METHODS

Sterman (2000, pp. 85-105) identifies five major steps in the SD modeling process: 1. problem articulation and boundary selection, 2. formulation of dynamic hypotheses, 3. formulation of a simulation model, 4. testing, and 5. policy design and evaluation. He advises that modeling is an iterative process, leading to reframing the succession of steps as a set of phases. The methodology used in this research follows these recommended steps, but with several divergences.

Problem Articulation and Reference Modes

This step asks, "What is the issue of greatest concern to the client? It defines clients as "the people you must influence for your work to have impact" (Sterman, 2000, p. 84, p. 87). This research commenced in discussions between the primary researcher and the vice president of human resources (the "client executive") of a mid-sized North American industrial company, a subsidiary of a European-based global firm. This executive identified concerns about a prospective change in the retirement benefits that the firm offers its nonunion, U.S.-based employees. The subsidiary was considering these policy changes in order to deal with excessive and unpredictable annual employee benefits costs. He was concerned that unintended consequences might emerge over time in other human resources areas, if the firm made changes to the retirement plan. Due to the nature of the request from this top executive, the modeling process has taken a strategic future-focused orientation designed to anticipate an array of potential problems that could arise resulting from policy revisions.

In this research, the problem formulation process is prospective, as the problematic behaviors had not yet happened. The HR domain is sufficiently complex that problems may occur indirectly, far from the retirement benefits area of responsibility, or well off in the future. The client executive sought to explore a prospective problem that, if effectively addressed through policy changes, is preventable. SD modelers generally look to develop a reference mode, which is a set of data that describe the behavior of key variables as the problem arose, and how it might develop still more in the future. Reference modes need to extend far enough back to trace the emergence of the problem and "far enough into the future to capture the delayed and indirect effects of potential policies" (Sterman, 2000, p. 90). They needed here to trace variables in the areas of human resources and general management concerns typically considered as being "remote" from the arcane, specialized area of retirement benefits.

Two sources served to develop retrospective reference modes. First, the client provided corporate strategic plan information, data from its general and financial management information systems, and several longitudinal human resources databases covering all individuals who worked for it at any time during a four-year period. The database included both its ongoing workforce and those who left it for any reason during that time span. When aggregated across segments of the workforce, the individual-level data provides such firm-level parameters as: 1. rates of hire (monthly and annual), 2. changes in compensation expense, and 3. retirement rates. The firm's current workforce totaled 5,500 employees, of which approximately 30% are salaried nonunion employees. Because of data quality issues, the number of individual subjects is approximately 3,100, tracked over a four-year period. Taken together with broader industry and regional data obtained from public secondary sources, these provide many of the parameter values required to model historical and prospective HR dynamics of the firm.

Boundary Selection and Expert Delphi Panel

Common SD modeling practice looks to develop working simulation models through an iterative process. Sterman (2000, pp. 79-105) details and summarizes accepted, "good" modeling practices. Articulation of the boundary of the problem commenced through discussions with the client. These helped in identifying key variables at multiple levels of analysis. This aided the formulation of a theory of the possible problematic behavior that spanned them. The dynamic hypothesis focused initially at the macro-organizational level where concerns about continuing affordability of aggregate employee benefit costs gained the attention of the firm's senior management. Their concern was translated into proposed reductions at the program (i.e., meso) level of analysis in future benefits accruals. The reductions would affect dissimilarly situated employees and prospective employees differently, however. Some effects might *seem* directly related to the reductions, but others only to bear an indirect and delayed connection to them.

As Sterman notes (2000, p. 57), it is common for SD modeling efforts to include interviews of many individuals within an organization, to obtain their qualitative and quantitative observations about the modeling problem and the system in which it resides. Because in this case the problematic behaviors have not yet occurred and, if they do arise, may occur in "remote" areas of the SHRM domain, we concluded that we needed to tap additional expertise beyond that held by the firm's HR staff. In addition to the client executive of that subsidiary, we sought input from human resource experts and general managers outside the company regarding expected future behavior. They identified what problems might emerge and what potential patterns of emergence we might observe.

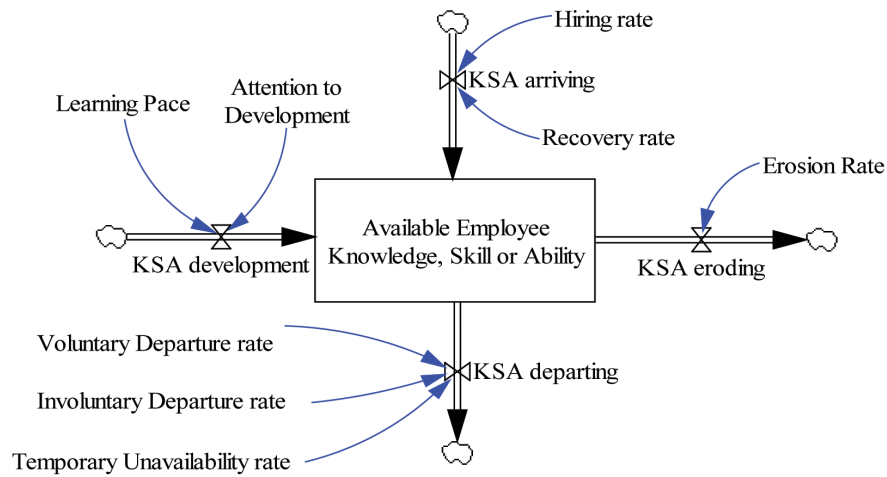
This research makes extensive use of the Delphi method (Dalkey & Helmer, 1963; Adler & Ziglio, 1995). In the absence of empirical data relating to

consequences of prospective SHRM actions, four "Delphi panels" of such experts were established. Their charge included: 1. suggesting boundary conditions, 2. providing prospective reference modes, and 3. helping to identify both the dynamic operation of and the interconnectedness among the "remote" areas of human resources management. Additionally, three specialist Delphi panels were created to analyze particular aspects of the anticipated problems.

Work of the Three Specialist Panels: Formulation of the Simulation Model

Eighteen external human resources experts and general managers drew upon their broad, lengthy and complementary experiences to help define the SD model's systems structure or to identify the scope and pattern of any emergent unintended consequences.

Eight of these experts participated in the three specialist panels. They developed the subsystems' causal loop drawings and stocks and flows models, which were then reviewed with the client executive for adequacy and perceived "fit". In one case, the *ability management* specialist panel was charged with identifying and then arraying their understanding of the processes by which a firm's stock of skills, abilities or knowledge change over time. They produced several "ability flow" drawings that combined causal influence as well as stocks and flow features. Figure 1 conceptualizes the stock or current supply of a knowledge, skill or ability (KSA) as the sum of two net flows. The flow depicted vertically inserts the individual capabilities of new employees who arrive at the firm, and subtracts KSAs that become unavailable through an employee's departure or temporary unavailability. The horizontal flow depicts an individual's growth in KSAs through learning, as well as the oft-overlooked decrease in this stock through erosion, including by this both forgetting what one knows and having a particular

Figure 1. Composite "net flows" model of KSAs


knowledge, skill or ability become obsolete for the employer's purposes.

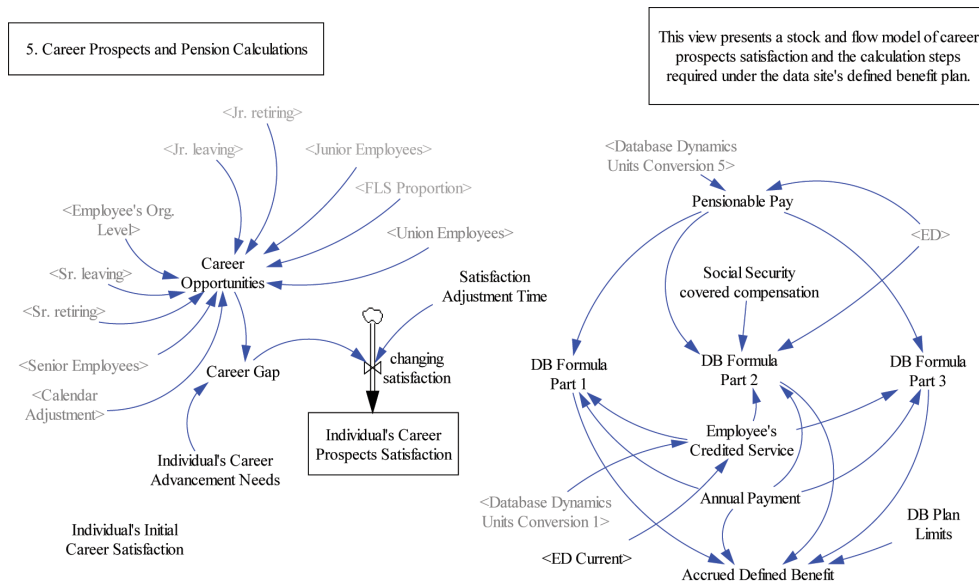
It is important to observe that Figure 1 depicts the stock of KSAs at an individual or a workforce level of observation equally appropriately. In many SD models, stocks of employee abilities are modeled at the workforce level, as when an aging chain is used to track longitudinally the stocks of apprentice, qualified and advanced KSA levels across otherwise-assumed homogeneous workers. The methodology here introduces the ability to trace an aggregated KSA stock as the sums and differences of arrivals, departures, learning and forgetting, observed at the level of individual employees.

Why should this added hybrid detail be important? With distributions of its workforce and hiring and promotion prospects along many and varied demographic and work-related dimensions, a proposed change in Total Rewards offerings may affect them dissimilarly. If so, the effects of departures, promotions and arrivals upon its aggregate KSA may be quite different from those, usually modeled in SD initiatives, as average metrics distributed across assumed-homogeneous workers. As detailed, Hafeez, Aburawi, and Norcliffe (2004), Aburawi and Hafeez (2009),

and Geerlings, Verbraeck, de Groot, and Damen (2001) simulate workforce environments involving homogeneous talent pools.

The ability management Delphi panel also developed a traditional "aging chain" rendering of KSA supply, but added to it a co-aging chain or "co-flow" that begins to incorporate the dynamic relationship between KSA supply and the dynamic operational demands of the firm. While the ability management experts focused principally on the detailing the dynamics of the "supply" side of the KSA matching problem, whereas the *opportunity management* panelists worked to describe the "demand" side. They concluded that the unit of analysis for the Opportunity Management subsystem of human resource practice is that of the *position* within the firm. By contrast, the unit of analysis for the Ability Management subsystem is the *individual* who occupies or may occupy the position. This led these panels down parallel modeling paths. The relationship between their work involves paired comparisons, at sequential points in time, of attributes preferred for or required by the position and those offered by the individual.

Figure 2 presents two sub-models. On the left hand side, it models the changing stock of an individual's satisfaction with career prospects.

Figure 2. Career prospects and pension accruals


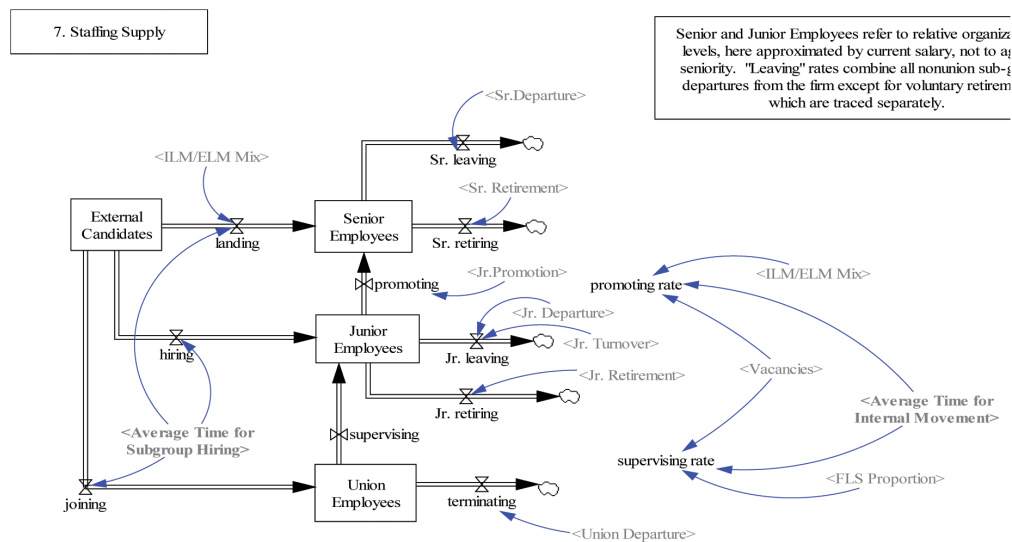
Note that the relevant organizational level is input on a person-by-person basis through a dynamic data-feed from "ED", the employee database constructed in support of this hybrid simulation. Career Opportunities are also affected by numerous inputs identified by the opportunity management panel. The right hand side of this figure presents the mechanism used to calculate the 3-part defined benefit pension accrual for each employee -- under the firm's nonunion plan -- consistent with inputs and review by the total rewards management Delphi panel.

Figure 3 sets forth a traditional aging chain formulation of employees. It begins with that small subset of union employees that agrees to promotion to junior-level supervisory status, and then from junior-level employees into more senior positions. Peterson models junior faculty promotions as perfectly mixed first-order processes, but describes full professors' retirements through third-order delays in order to approximate their generally extended tenures before retirement (Sterman, 2000, p. 486). Within each of its stocks of professors, the members have completely homogeneous characteristics, because this model

does not require otherwise. We adopted this approach with modifications. In Figure 3, the several "average time" factors employ dynamic, yet homogeneous, average rates, but the "retirement" and "departure" rates do not. Between any two time steps (i.e., months) during the simulation, these elements count the actual terminations of employment, as they occur, in the employee database through individual-level entries of termination codes. In this exemplar instance and in others, the simulation presented here substitutes agent-level data for group average rates.

Modeling Individual Employees

A limited approach to agent modeling was employed by adopting a number of simplifying assumptions. This is due to the lack of availability from the client firm of many other employee- and organizational-level data elements beyond the substantial data it provided. Each individual employee, former employee and hiring prospect is modeled using his or her distinct properties including: 1. age, 2. gender 3. ethnic status, 4. pay, 5. retirement benefits, and 6. organizational

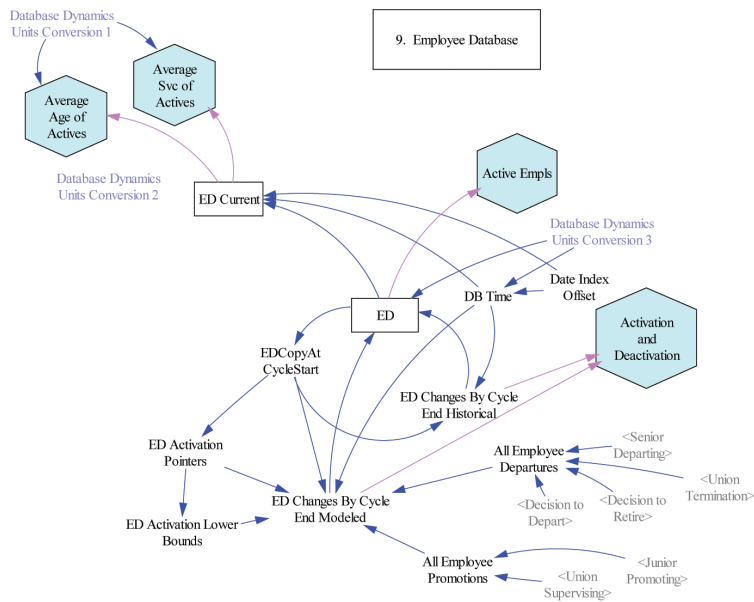
Figure 3. Employee flow into, up, and out of a workforce


status. In the case of active and former employees, these personal data are input from the databases supplied by the company. In the case of prospects, they are supplied through an algorithm that takes into account the demographic characteristics of the local labor pools available to the firm at its two largest locations. Each employee is modeled as making a decision (to retire, quit, or stay) based on individual properties, including the adequacy of employment-related funds available to that person from time to time. Secondary effects of these individual decisions on one's co-workers (promotion opportunity) and the firm's labor pool (employment opportunity) and aggregate costs, in turn, are modeled. Regression analyses were done among employees' ages, salaries and replacement income percentages, and eta^2 analyses in which decision to terminate was the dependent variable. Inspection of the pattern of values for retirees indicated that decisions to retire had not been strongly associated with their individual replacement income percentages, notwithstanding the vice president's belief.

Individuals are complex organisms. Bar-Yam (1997) estimates the descriptive complexity of human behavior approximating the magnitude of

10^{10} bits of data, or more. Individual employees have many independent multi-valued properties, whether personal characteristics or firm specific attributes. These characteristics are relevant to the management of a firm's human resources. Beyond the characteristics numbered above, an individual's firm-relevant personal attributes include degrees of skill and knowledge, whether technical or interpersonal, and degree of match to current or prospective job responsibilities. Together, these attributes form the basis for defining the many data fields that a comprehensive human resource information system makes available to a firm.

Figures 1 through 3 appropriately sample the outputs of the three specialist Delphi panels. Much of the model structure likely is generic across American industrial companies. All told, more than 300 formulae-specified or test variables, and many more causal loops, comprise the model. All model formulas are presented in Appendix B, and captions describing their organization into 12 model views also appear as Appendix B (additional discussion of the hybrid mechanism may be found in Labedz and Stalker (2005, 2008). At the beginning of each simulated month, there is a complete write of micro-level data from the

Figure 4. The hybrid employee data exchange mechanism (simplified)


employee database (ED) into the simulation within Vensim. The simulation proceeds for one month and then, becomes interrupted. At the end of each simulated month, a complete reverse rewrite from Vensim to ED occurs. Figure 4 depicts the monthly data exchange mechanism.

Work of the Senior Generalist Panel

The fourth Delphi panel of ten senior HR generalists and consultants served in a different capacity than the others. Supplied by the primary researcher with extensive anonymous data regarding the client's SHRM context and workforce, the members of the fourth panel then shared their views, during a moderated asynchronous Delphi discussion, regarding likely unintended consequences of the policy revisions under consideration. They did not have access to the three expert panels' causal loops, nor the stock and flow drawings. The client executive earlier had identified more than ten possible unintended consequences of material reductions in non-union retirement benefits at his company. After comparison with the fourth

panel's views, it was determined to test the five hypotheses set forth in Figure 5.

The chief concern of the executive stemmed from a potential slowdown in retirement incidence. He reasoned that employees, aware of their reduced pension amounts and operating as rational economic actors (Luce & Suppes, 1965), would choose to work somewhat longer before retiring, in order to "make up" lost monthly benefits. Their longer tenures would translate into the "right-shift" predicted in hypothesis 1. Many of the senior panelists shared this view. Each of the other hypotheses depends, in turn, for its explanatory power on this assumption of postponed retirements due to reduced replacement income.

Validating the Model and Testing the Hypotheses

Four preliminary behavior reproduction examinations were conducted before testing the hypotheses. After originally experiencing excessive "churning" within the ranks of junior employees, the introduction of a "Jr./Sr. ratio" constant, es-

Figure 5. Dynamic hypotheses tested through the hybrid model

1. The incidence of nonunion employee retirements after attaining age 55 will be delayed (that is, will "right-shift") to later ages;

2. Cumulative nonunion retirements will aggregate at a pace that is significantly slower than the firm's historical experience;

3. Voluntary terminations of junior employees at ages earlier than 55 will increase at a pace significantly greater than the firm's historical experience;

4. Per capita gross costs for salaries and company-provided medical benefits for active nonunion employees will increase to levels higher than those projected on the basis of the firm's historical experience; and

5. Percentages of "diverse" employee nonunion populations will not increase significantly from their current representation at the data site.

sentially a correction reflecting management span of control (Urwick, 1956), finally established initial model equilibrium conditions. Active junior employee counts produced a coefficient of variation of 0.48% following this structure assessment test. The next test under extreme conditions used methods suggested by Sterman (2000, pp. 869-870). For example, setting a model "switch" to stipulate that no employee could long be satisfied in his or her job should cause the modeled firm to exhaust its pool of 10,000 initial external job candidates precipitously, and it did so only 30 months into the simulation. In database replication testing, the various simulation-recreated historical values were then collected and compared to firm-supplied data. R^2 values relating to key headcount values ranged from 0.84 to 0.96. Data were decomposed wherein data series' mean square errors were calculated. It was determined that almost all error represented UM, or slight model bias. Finally, further model refinements were made after reconciliation with historical data. Ratios of mean historical data to refined monthly model outputs across key headcount variables ranged from 0.98 to 1.05. The equilibrium model was tested for appropriate behavior in extreme conditions, by altering key variables dealing with individual career decisions and employee flows.

For hypothesis testing, we ran a 16-year simulation (4 years historical and 12 projected) using Vensim in a processing mode as described. The hybrid approach permitted calculation and sharing of each variable's values (e.g., each individual's current age) across all of the monthly time steps. It permits policy design and evaluation through the comparison of projected behaviors of a firm and its heterogeneous workforce over time. The investigations it makes possible exhibit attributes of both "true" pretest-posttest control group and "quasi-experimental" before-after experimental methods. In the base case, behaviors are simulated extrapolations from the historical data provided by the client with adjustments. (Data adjustments are stipulated explicitly in the simulation documentation.) We present and discuss the results of hypothesis testing in the next sections.

RESULTS

Historical Data and Panel-Predicted Data

Figures 6 through 10 present time series data of the actual (or trended as indicated) results, and summarized predictions of the fourth Delphi panel. The panelists were asked to assume the firm's pension policy was revised to reduce pension accruals for all employees after 2005. They assumed other business conditions remained constant. The

Figure 6. Reference mode: Panel predictions of retirement dates
predictions offer reference modes with which the simulation projections are comparable. Figure 6 presents baseline data of the actual incidence of retirements during the period 2000 - 2003.

This baseline depicts retiring employees as percentages of all eligible employees of that age -- whether they retired or not. These measures were provided in the fourth Delphi panel discussion, calculated annually, and summed. Figure 6 also displays the behavior of that measure in 2006-2010 as then predicted by the panelists. The panel predicted a "right-shift" in the behavior over time pattern. The panel expected the odds of retirement of employees to decrease at the historically important ages of:

- 62 (availability of unreduced early retirement pension),
- 65 and 66 (range of full retirement ages under Social Security),
- and to increase at each of ages 67 through 70.

Hypothesis 2 predicts cumulative retirements will aggregate significantly less quickly than the firm's historical experience. Figure 7 presents the cumulative incidence of the firm's retirements during years 2000 - 2003. It also displays the Delphi panel's prediction of behavior from 2006-2010. The panel predicted retirements would decline by 3.9% annually between ages 57 and 61, and then by 8.7% on average over the next five ages.

Figure 7. Reference mode: Panel predictions of cumulative departures
Figure 8. Reference mode: Panel predictions of early departures
Hypothesis 3 predicts voluntary terminations of junior employees at ages earlier than 55 will increase to levels significantly greater than the firm's historical experience. Figure 8 presents the cumulative terminations from 2000 - 2003. It also displays the behavior of that variable during the period 2006-2010 as predicted by the fourth Delphi panel. They predicted that voluntary departures in the age group of 20 through 55 would exceed historical levels by almost 2% (0.0187) each year.

Hypothesis 4 predicts higher-than-anticipated levels of health care and salary costs for active employees due to retirement delays. The panelists' predicted health care costs differed by less than

1% from the 12% annual trend. Figure 9 displays average salaries during 2000-2003, and those projected by the panelists during the period 2006-2010. The panel predicted annual increases averaging 4.1% of pay, 30 basis points greater than the assumed trend.

Hypothesis 5 predicts that workforce diversity percentages (i.e., of all employees other than white males) within the workforce will not increase significantly because the current workforce (more than half of which is White Male) will experience decreased turnover. To the contrary, on average the panelists foresaw increases of 200 basis points or more in the percentages of African American

Females and Hispanic Males, at the "expense" of the White Males proportion (down 5.6%). Table 1 presents the baseline workforce distribution in 2003, the predictions for 2010 of the nine responding panelists, and the mean predictions.

Historical Employee Behavior as Rational Economic Actors

How have employees actually behaved? Was their decision making about retirement economically rational in past years? After all, the data presented in Figure 6 are based on attained age, not on

perceived adequacy of economic resources in retirement. Data for years 2000-2003 suggest this decision is driven by one's replacement income percentage. If increased replacement income, as a percentage of one's pay, should predict increased willingness to retire, the null hypothesis is that there is no relationship between these variables.

One's decision to retire is a nominal, binary (i.e., leave or stay) measure. When one variable of interest is interval or ratio in level and the other is categorical, including nominal, eta^2 is an appropriate statistical test for association, whichever variable is considered as the dependent one. Eta

defines a "perfect" relationship as curvilinear and defines the null relationship as statistical independence. Eta² provides the percent of variance in the dependent variable explained linearly – or non-linearly – by the independent variable – in either case eta will approach 1.0 (Siegel, 1956). Based on inspection of the data (Table 2), an assumption of normal distribution of values was not made, and so the F statistic was not further examined.

This is not to suggest that older retiring employees do not leave the firm with generally greater replacement income percentages than do younger retirees. The data suggest that they do. However, the percentage increases often are gradual from month to month, so that almost every retiree who leaves the firm with a particular income level has previously declined a series of slightly lower levels prior to leaving. The client executive speculated that reduced employee replacement income percentages would lead to delayed retirements. This view assumes a linear relationship that was not supported by the findings of this study. If this assumption is unfounded, the relevance of further analysis might ordinarily be questionable. The highest credibility is given to those cases wherein the simulation results corroborate the simulation data.

Retirement Predictions Based on Replacement Income Levels

Using the simulation permits, however, examination of a scenario in which the assumptions of the executive and the fourth Delphi panel are credited. The simulation contrasted three alternate scenarios based on likelihood of retiring among the firm's employees. Scenario One ("History") projects values based on the firm's data from 2000-3. Scenario Two ("Panel") is based on panelist-provided data, as stated in Figures 6 and 7. Figure 10 presents the annual and cumulative differences between these two arrays. We treat the differences predicted by the panel as resulting from the decrease in participants' defined benefit pension accruals, and workers' wishes to restore their levels of retirement security prior to leaving employment.

The hypotheses were also tested based on a third pattern (Scenario Three). Here, a retirement array was designed that (a) is based explicitly on levels of replacement income percentages, and (b) produces results comparable to the actual staffing patterns of the data site from 2000 through 2003. Replacement income was based on cohorts in 5% increments, and assigned to member's annual likelihoods-to-retire that began at four percent, for those in the 0-5% cohort, and which increased by four percent with each successive 5% cohort. Note that the panelists' hand-drawn estimates of departure odds were not required to net to zero, and over this eighteen-year period they do not. Table 3 presents selected values of this third pattern of departures.

When entered into the simulation, the odds of replacement income percentages operated to substantially reproduce the behavior of key macro-level model variables derived based on ages at retirements. Table 4 compares the mean

Table 2. Measures of association, 2000-3 retirements

Table 4. Comparison of replacement income- and age-based results

	Replacement Income based		Age-at-Retirement based	
	Mean	s.d.	mean	s.d.
Active Employees	3149	7.2	3147	8.1
Active Juniors	1439	5.7	1436	6.5
Avg. Age at Term NU under 55	38.3	3.2	39.0	2.5
Avg. Age at Term NU 55 and Up	56.5	4.9	60.4	8.4
Avg. Age: Actives	42.9	0.2	43.4	0.1
Avg. Service: Actives	9.5	0.4	9.9	0.2
Avg. Service: Former Employees	10.5	2.3	9.8	2.0
Diversity Pct.	0.516	0.1	0.514	0.1
Cumulative New Hires	2558		2693	
Cumulative Former Employees (Junior)	914		1049	
Remaining External Candidates	7469		7336	
Average NonUnion Salary	$59,453		$59,967	
Per Capita Cost of Health Care: Firm	$33,127		$32,845	

values of those key variables using the two sets of odds to drive retirements, and the table includes standard deviation values where that statistic is appropriate.

Table 5 compiles the three departure rules, just described, that we will employ in testing the five hypotheses (see Research Note in Appendix A).

Results of Hypothesis Testing

The Table 5 hypotheses were tested to assess the extent to which employee retirement decisions would match simulated predictions and the scenarios formed by the expert panels.

Hypothesis 1

Hypothesis 1 predicted a "right-shift" of retirements. Table 6 presents the results in tabular form across the sixteen years of the simulation. Across just the five years of inputs requested from the panelists (i.e., months 73 through 132 of the simulation), the mean retirement ages evidenced the same trend: 61.6, 61.5, and 60.1. So, although the members of the fourth Delphi Panel on average predicted a delay in retirement ages (overall, and at each quartile) compared to the firm's historical pattern, the "rational economic actor" simulation, based on replacement income percentages, led to the opposite conclusion.

Result

Hypothesis 1 was rejected.

Hypothesis 2

Hypothesis 2 predicts that cumulative nonunion retirements will aggregate at a pace significantly slower than suggested by the firm's historical experience. In essence, it describes the integral of the retirement patterns considered in Hypothesis 1, and it proposes a "right shift" in the graph of cumula-

Table 5. Alternative employee retirement "rules" used in tests

Rule	Retirement "Rule"
History	Pattern by ages of nonunion employee retirements from the data site during 2000-3, as carried forward to all simulated years.
Panel	Pattern, by ages of nonunion employee retirements from the data site during 2006-2010, as predicted by the fourth Delphi panel.
RI Pct	Pattern, by Replacement Income Percentage cohort rates, that produces pretest departure patterns comparable to History, based on Criterion Odds with mean value 2.50 in range [0,5].

Table 6. Hypothesis 1 results: retirements delay

	Average within Fourth Panel	Histori-cal Trend, Projected	RI Pct Simu-lated
Mean	61.8	61.4	60.1
s.d.	3.3	3.5	2.9
25th percentile	59.7	59.0	58.1
50th percentile	61.4	61.2	59.8
75th percentile	63.9	63.4	61.5

tive retirements. We predicted that Hypothesis 2 the firm data would not support the hypothesis. Figure 11 presents cumulative incidence data that confirm that result. Cumulative retirements based on replacement income considerations exceed ("left shift") the projection that is based on the firm's historical pattern, notwithstanding the reduction in replacement income percentages caused by the proposed pension accrual reduction.

The consequences predicted in the other hypotheses are dependent on delayed retirements. The executive though a "right-shift" in the number of retirements would lead to increases in

Figure 11. Hypothesis 2 results: Cumulative delay
average pay and benefit cost levels, to decreases in career prospects satisfaction among younger employees about their prospects of organizational advancement, and so forth.

Result

Hypothesis 2 was rejected.

Hypothesis 3

Hypothesis 3 predicted that voluntary terminations of junior employees at ages earlier than age fifty-five would increase to levels significantly greater than the firm's historical experience, as a result. Figure 12 presents the cumulative incidence of such departures as simulated.

Figure 12 shows that panelists predicted a slight increase in the firm's cumulative turnover experience, but that the replacement income settings produced a reduction in cumulative turnover across the years below the levels projected from the firm's 2000-3 data. Departures of under-55 *Junior* Employees (i.e., those earning less than

$90,000 annually), however, did increase as predicted.

Result

Hypothesis 3 was supported.

Hypothesis 4

Hypothesis 4 predicted higher-than-anticipated levels of health care (Hypothesis 4A) and salary costs (Hypothesis 4B) for active nonunion employees resulting from the onset of delayed retirements. Figure 13 presents per capita medical costs and Figure 14 presents average salaries of active nonunion employees as predicted.

Result

1. Hypothesis 4A was marginally supported (as to medical costs).
2. Hypothesis 4B was not supported (average salaries of active nonunion employees)

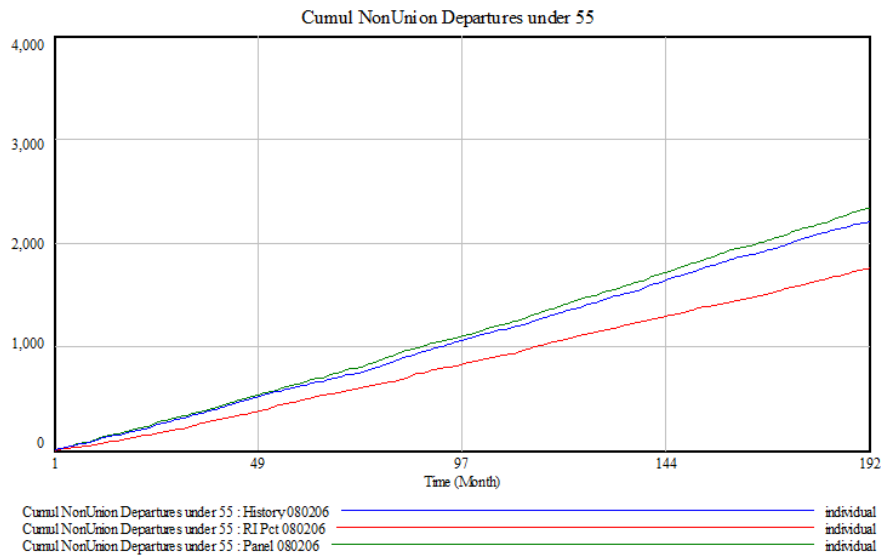
Figure 12. Hypothesis 3 results: Accelerated turnover


Figure 13. Hypothesis 4 results: Increased program costs
Figure 14. Hypothesis 4 results: Increased salary costs
Hypothesis 5

Hypothesis 5 predicted that workforce diversity percentages (i.e., of all employees other than white males) within the workforce will not increase significantly, because the current workforce will experience decreased turnover. Changes in work-force composition depends not only the "types" of individuals leaving an organization, but also the types of employees that join it. An organization may or may not hire the same types of individuals as those who once joined, and whom it now seeks to replace.

Result

Hypothesis 5 was rejected.

Summary of Hypothesis Testing

Table 7 compiles the principal results from testing the five hypotheses (presenting mean or cumulative values and standard deviations where appropriate) from Table 6, and Figures 11 through 13. Only hypotheses 3 (in part) and 4A were supported. Because hypothesis 2 cumulates all of the retirements counted in testing hypothesis 1, we expected these two results to come out in tandem and they did, albeit not in the predicted direction. The analysis section that follows examines the extent to which the hypotheses were supported and potential reasons that may explain any failures to confirm them.

ANALYSIS

This research investigated how pension policies can be aligned with a firm's strategic goals. SHRM studies rarely account for multiple levels of organizational analysis, longitudinal behavior, or unintended consequences arising from poli-

Table 7. Summary table: results of the hypothesis tests

Hypothesis	Historical Trend, Projected	RI Pct Simulated
1. Average Retirement Age	61.4 (3.5)	60.1 (2.9)
2. Cumulative Retirements through 2015	694	782
3. Junior Departures; Average Age	630; 39.0 (2.5)	685; 39.6 (3.1)
4a. Health Care Costs	$32,845	$33,127
4b. Average Salary	$59,967	$59,453
5. Diversity Percentage	56%	55%

cies. Much of the literature criticizes prevailing SHRM research methods as inadequately taking long-term dynamics into account (Jackson & Schuler, 1999). Current models fail to provide valid methods for testing assumptions, leaving them unverifiable.

The research design strategy for this study created three *specialist* Delphi panels composed of expert human resource practitioners. They supplied the inputs for designing the structures built into the simulation model. The firm provided details of its strategic context and four years of employee level data to populate the model. The eight members of the first three panels operated "blind" and were not privy to company data. Their contributions reflected researcher insights that were not contextually bound to the firm. These contributions were then translated into generic inputs of a system dynamics stock/flow model. This model was composed of hundreds of variables related across many levels of analysis. The simulation model imported data from the firm's employee database and provided – through a two-dimensional (employee, property) subscript array within it – for both individual-level and rolled up metrics. The generic structures and the hybrid methodology were tailored transparently to test specific hypotheses relating to the firm's pension policies. The research question focused on determining whether the proposed retirement plan revision would generate unintended SHRM consequences that might be distant in time or "locus" from the intentionally-modified HR program.

Model Parameters and Sensitivity

Only the last of the five hypotheses appeared supportable when pre-test and post-test simulation runs were compared with one another and with the panel's predictions. Most of the post-test results moved in the opposite direction from what almost everyone predicted. This development provoked further review of some key values used in the model to define employee decisions to remain

employed or retire. This review led to the discovery of an unjustified variable parameter in the model. It had been assumed *a priori* that one's replacement income in retirement and one's propensity to retire were positively correlated. All research participants assumed that *retirement-eligible* employees are *rational economic actors*. Actual replacement income data compiled from the firm for years 2000 – 2003, however, did not display such a positive relationship. Employee departures (Figure 6) seemed more closely tied instead to age-related milestones, like one's attainment of the normal retirement age. After reflection, the extent of individual economic rationality in the model was adjusted, and the post-test simulation was run twice more. Doing so altered the corresponding likelihood of employees electing to retire in particular months. The simulation was re-run under both alternate settings, and model variables were re-examined. This new simulation produced credible results using the hybrid methodology. Table 8 restates Table 7 to include these new results.

A decrease in the likelihood of *willingness to retire* at an individual's particular replacement income level (i.e., a quartering of the odds against which a per-employee random value was compared) led to the macro-level behaviors predicted by the panel. With this revision to the model, it caused an increase in the firm's average retirement age (from 60.1 to 61.3 years) in the simulation. The increased average employee retirement age in the firm resulted from the following factors:

1. A decrease in cumulative retirements,
2. An increase in departures by younger employees who were blocked from succession and promotion,
3. Increases in health and salary expenses reflecting a chronologically "more experienced" employee mix.
4. Overall, transition of the active nonunion workforce to become older, more highly paid, and more prone to higher health care expenses.

Conversely, after doubling the value of "Odds at Replacement Income Percentages", the test results all moved in the opposite direction toward a workforce that was younger, had greater tenure, and showed slower growth of total rewards expense. The simulation results continue to show appropriate sensitivity to changes in key parameters, and respond as expected to directed changes in a key assumption.

Table 8. Sensitivity of the results of the hypothesis tests

Hypothesis	Historical Trend, Projected	RI Pct Doubled	RI Pct Simulated	RI Pct Quartered
1. Average Retirement Age	61.4 (3.5)	58.9 (2.2)	60.1 (2.9)	61.3 (3.2)
2. Cumulative Retirements through 2015	694	808	782	687
3. Junior Departures; Average Age	630; 39.0 (2.5)	575; 38.8 (2.7)	685; 39.6 (3.1)	703; 40.1 (4.5)
4a. Health Care Costs	$32,845	$30,742	$33,127	$35,829
4b. Average Salary	$59,967	$56,675	$59,453	$62,759
5. Diversity Percentage (all groups)	56%	49%	55%	54%

Note: standard deviation values, where appropriate, appear in parentheses.

DISCUSSION

The dissonance observed between expert opinion and simulation output raised initial doubts about model validity. Barlas (1996, p. 183) argues that model structure should be the target of efforts to achieve validation in system dynamics simulations. However subsequent simulations, conducted with revised model settings, served to reinvigorate confidence. The revised settings alternately defined individuals as being more or less economically rational in their retirement decisions than empirical data had indicated. Initially, the first null hypothesis predicted no difference in retirement ages once the pension formula reduction was introduced. Therefore, the first simulation run correctly failed to reject this null hypothesis. Other null hypotheses fared similarly in the first run. These failures to reject the null were correct outcomes based on the initial historical values of Odds at Replacement Income Percentages. Employees' actual retirement decisions during 2000 - 2003 proved to be not strongly associated with their replacement income percentages.

This hybrid simulation model permitted additional insights to be obtained by adjusting model parameter values to increase individual sensitivity to replacement income levels. The next simulation run confirmed the predicted differences in retirement, turnover and expense patterns. Employing the rescaled parameter values; most of the null hypotheses could now be "correctly" rejected, in keeping with the concerns of the client executive and the predictions of the fourth Delphi panel.

Although the positive correlation between the simulation behavior and the panel predictions was encouraging, it is not alone sufficient evidence of model validity. As Sterman (2000, pp. 846-850) points out, validation and verification of any non-axiomatic model, simulated or otherwise, are impossible. This model has face validity due to the panel input into model design and the hybrid and multi-level method, use of variables at each level of the firm across a time horizon of 192 months.

Ultimately, however, there are practical limits to the testing and conformational analyses, whether in this study or others. Data demands and lacunae also posed limitations for this simulation.

The research question posed in this study seeks to determine if using a hybrid simulation method can yield productive insights into the structurally induced dynamics common to SHRM issues, and specifically to retirement policy issues. The methods used here exhibited dynamic sensitivity to changing replacement income levels and employee characteristics over a 16-year period. The model incorporated behaviors and policies spanning multiple levels of analysis: macro, meso, and micro. The hybrid methodology used four years of the firm's data, enabled systematic testing of the dynamic hypotheses and their retesting after model adjustment.

Efforts to reduce employee pension benefits have accelerated since the late 1980's, originally in the private sector and currently in the public. This study's hypotheses address the heterogeneous, dynamic and unintended effects generated by a firm's policies on its workforce over time. This research also examined the effects of aggregating individual behaviors on the firm's performance over time. The hybrid methodology proposed here is one means to overcome the barriers to studying such issues. The hybrid approach used here also empirically "demonstrates" the invisible linkages and mechanisms by which micro-level responses may aggregate and generate emergent behavior. A general benefit of using the method proposed here is to sensitize decision makers toward more clearly seeing how various stakeholders' roles may cause unanticipated remote effects in the name of taking bold strategic action.

FUTURE DIRECTIONS

Theoretical propositions which were "not intended to be testable" need not, and should not, remain unchallenged save through rhetorical device.

HSDAM helps to reveal plausible patterns of longitudinal behavior and dynamic sensitivity that may emerge from both local operational level inputs and strategic ones. It helps to fill some of the theoretical and practical gaps articulated by SHRM scholars. Yet, the proposed methodology is not without limitations and the modeling process not without challenges. Any research designs which employ expert panels to perform causal analysis of complex dynamic systems can be subject to tendencies toward identifying and preferring policies which reify the value of low-leverage policies. Any sort of group speculation on the future effects of policy revisions is subject to culturally-embedded mental models and bounded rationality unable to account for non-linear effects. We close by citing some cautionary advice on models and modeling from austere historical figures.

- One fictional science officer warns, "We can expect to do no better than our own programming skills*"* (Roddenberry et al., 1967).
- Box and Draper (1987, p. 424) observe, "All models are wrong, but some models are useful".
- Eco (1995, p. 95) cautions us of "the impossibility of drawing a map of the empire on a scale of 1 to 1."
- Hawking (2001, p. 59) notes, "All one can do is find which mathematical models describe the universe we live in. It turns out that a mathematical model involving imaginary time predicts not only effects we have already observed but also effects we have not been able to measure yet nevertheless believe in for other reasons."

Models are simplifications of reality, and their validation is impossible. The overriding goal of modelers should not only be to help their clients make higher quality decisions, but to inform those decisions by designing optimal models. By doing this it will, over time, help clients to understand that theory construction and theory validation are two threads of a fabric woven together through iterations as part of an ongoing recursive learning process.

APPENDIX A

Research Note

The use of cohort odds (whether arrayed by replacement income percentages or by attained ages) should not imply that all similarly situated individuals will make the same retirement decisions among themselves from month to month. Here, as elsewhere in the simulation, an individual-by-individual and month-by-month random criterion value was used to introduce micro-level variation. This was done because not all eligible-to-retire employees actually leave in a given month. The model variable "Criterion Odds: Replacement Income" provides a random monthly value against which an Employee's Retirement Odds, based on his or her replacement income, are compared in producing a simulated decision that month regarding retirement. We first defined Criterion Odds: Replacement Income as a different random number between zero and five, having a mean value of 2.5 for each employee each month.

The settings that gave rise to the results reported in Table 4 created one issue of interest upon inspection: an excessive number of employee departures occurring only in the first month of the simulation. These values returned promptly to desired equilibrium levels. This pattern was interpreted as reflecting the immediate departures of a "backlog" of employees who each had sufficient replacement income percentages to retire comfortably, but who had actually chosen (in the historical data) to remain employed. Such historical behavior may contribute somewhat to the absence of association between decisions to retire among nonunion employees and replacement income percentages that were reported in Table 2.

Chapter 84
Trends in IT Human Resources and its Determinants

ABSTRACT

This chapter discusses the driving forces behind the trends in Information Technology (IT) that are likely to influence the number of available IT jobs in the future. One advantage of focusing on industry trends as opposed to the current job market is that long term trends are more likely to be useful for strategic planning. Institutions of higher education (IHE) want to provide their graduates with the knowledge and skills needed by employers, but given the rapid change within the IT industry, chasing short term trends as part of a multi-year degree is a fool's errand.

The purpose of this chapter is to examine the various, sometimes contradictory, factors influencing the demand for IT professionals and to build a simple framework that can be used to predict demand. The ability to predict the demand for IT professionals with a reasonable degree of accuracy is important for IHE's and businesses to correctly identify where their scarce resources should be allocated to develop a curriculum for the 21st century workforce.

INTRODUCTION

When one of the authors was in a doctoral program, the PhD students from the business school would occasionally gather in a local drinking es-tablishment and engage in an attempt at scholarly banter over various fun topics. One of the topics that emerged on several occasions was which business discipline is the most important for a successful business.

The accounting students might point out that without accounting you would not be able to effectively keep track of your money. Management students might counter that without operations you would not be able to effectively make products. Marketing would try to sell us on the idea that without marketing a firm could not effectively sell products and thus there would be no need for any of the other disciplines. All the other disciplines would pitch in with why their area was the most important area of study and so the conversation would go. There was one exception to the arguments. It emerged during those conversations that nearly every discipline admitted that an understanding of Information Technology was essential for a complete understanding of their discipline. Correspondingly, an understanding of other disciplines was essential for most Information Technology students and practitioners.

The emergence of IT as a discipline has been recent and has evolved rapidly. Topics such as Business Intelligence, Data Mining, and Software Development were once mainly topics that Information Technology researchers discussed and only a few large businesses experimented with using a small fraction of their budgets. Now IT has become essential for most businesses and is becoming more integrated into the way businesses function each year. IT areas such as software development have also become much more of a process driven endeavor and have moved away from the days of an individual or small team working in isolation to produce spaghetti code that resulted in software that seemed to be produced by magic to the end user. Modern business software tends to be very complex and to span multiple business functions. Because it is beyond the capability and an individual to be able to build software in isolation project teams are formed. These teams have functions that can largely be broken down into three areas, management, technology expertise, and domain expertise in area such as accounting, marketing, or consumer psychology to give a few examples. Each of the team members contributes

toward the design and implementation of application that would be beyond the ability of even the most capable person to produce in isolation.

Officers and managers of a firm no longer have the luxury of an army of data analyst at their disposal to find data, analyze it and then present the findings to the executives. Because of the IT revolution management has had to embrace the use of technology and learn how to use the firm's IT tools to utilize the data resources for more efficient and effective operations across all areas. The digital revolution has caused IT to go from being something a firm might use to being a core part of most organizations.

IT cannot exist in isolation because it is integrated throughout the firm. In fact, IT has become so pervasive that most jobs now require interacting with IT. To have competent IT performance, firms need an adequate supply of IT professionals and many of these professionals will need to be provided by institutions of higher education. The challenge for institutions of higher education is how to balance the need for rigorously teaching students the underlying theory of a field, needed skills, and how to engage in the type of continuous life-long learning that will be needed to keep them up to date after completion of their degree. These goals should be accomplished within a curriculum that provides students with relevant knowledge and skills that are in demand by employers. One of the reasons it is difficult to develop such a curriculum is that the technology field is in a period of tremendous change.

According to futurist George Gilder (2002) the amount of technical knowledge is doubling every two years and it is expected that the pace of growth will continue to increase. Because of this rate of rapid change, institutions of higher education that offer degrees in the Information Technology fields will have difficult choices to make regarding how their curriculum should be structured. Schools will have to be willing to adapt quickly to the needs of their key stakeholders to remain viable (Fleming, 2008). Some scholars

question whether it is even possible for business schools to adequately prepare their graduates for the workforce given the current structure of the schools (Mintzberg, 2004; McKenna, Cotton, & Van Auken, 1995; Bennis & O'Toole, 2005; McNamara, 2006).

As a result an increasing number of businesses are choosing to train their employees in-house through corporate universities (Gerdes, 2005). Corporate University Xchange estimates that the number of corporate universities totals 2000 which is up from only 400 about 15 years ago and they predict that the number will grow to 3,700 by 2010 (AACSB, 2002).

This chapter reviews trends in IT human resources (HR) and postulates some factors that are likely to impact the number of IT jobs, filled or vacant. One advantage of looking at industry trends as opposed to current jobs is that long term trends are more likely to be detected since the short term vagrancies of the job market are filtered out. Another advantage of looking at industry trends is that we can develop a framework that is generic enough so that human resources departments can use the frame work to better communicate with IT departments at educational institutions for the purpose of developing a customized curriculum. It is imperative that businesses and IHE's work together to develop students into graduates who are exceptionally well qualified and can contribute value to an organization quickly. This collaboration will also enable IHE and businesses to correctly identify where their scarce resources should be allocated to develop employees for the 21st century workforce. IT graduates face a highly competitive job market while businesses face a competitive global marketplace so any efforts to produce market ready graduates and to increase productivity should be explored.

Curriculum committees can conduct curriculum reviews to indentify niches that are available for their particular institution by considering the framework presented in this paper. Gerdes (2005) reported that for mid-tier MBA programs,

focusing on niche areas has led to growth in their programs. While no research could be found that examined niche undergraduate programs, it is not unreasonable to believe that a curriculum that is employer friendly and results in more job offers for graduates would also be welcomed by students. For example, if an environmental scan reveals that many businesses who are key stakeholders of the educational institution are involved in the use of business intelligence (BI) then the curriculum can be developed so that more graduates will have knowledge and skills that are valued for that application of IT. A different institution might find that they are located in an area where their key stakeholders rarely use BI but there is a huge demand for graduates with programming and system analysis and design knowledge, in which case the curriculum could be adapted to produce well rounded graduates who have a concentration of courses in that area.

It is in the best interest of businesses and IHE's to work together to help determine what skills and abilities are likely to be in demand. Human Resource departments are tasked with finding the right personnel for the available positions. By working with IHE's HR departments can increase the number of qualified applicants and decrease the amount of time needed for newly hired employees to provide value.

BACKGROUND

Bureau of Labor Statistics Projected Growth Rate

Bureau of Labor Statistics (BLS) data indicates that one of the fastest-growing sectors in the U.S. economy is the IT sector (Dohm & Shniper, 2007). Ten year employment rolling forecasts of IT labor demand have been made every other year since 2000 (Dohm & Shniper, 2007; Hecker, 2006; Hecker, 2004; Hecker, 2001). These forecasts are published biennially and each biennium the future

growth rates are revised. Based on projections it is anticipated that the increase in demand for IT professionals will continue but it will do so at a decreasing rate. Figure 1 shows a plot of these projections.

Each revised projection is getting flatter indicating that the growth rate of IT related jobs is being revised down with each new report. One possible explanation that we will explore in this chapter is that the nature of who performs the business processes is transitioning from IT specialist to more general knowledge workers in other functional areas.

The BLS has a reputation for nonpartisan research and does an excellent job. However, all projections are necessarily subject to error by their very nature. Figure 2 compares actual IT professional jobs to BLS projections. The intent is not to in anyway criticize the BLS projections but rather to gain some insights into what type of errors may be occurring in order to consider possible sources for the nature of the error. In 2002, BLS was very optimistic about the IT labor market which is reflected in the more than 10% projection over actual number of jobs. In 2004, the difference reduced drastically to 2.1%, and

in 2006 BLS was pessimistic about the market, with the projected number of jobs being 4.4% less than the predicted jobs. Although the latest projection (2008) is greater than the actual, the difference in percentage points is one third that of 2002. As the IT field matures and is incorporated into other functional areas it is anticipated that the BLS projections will continue to become more accurate as errors generated by the evolutionary nature of IT enabled business practices diminishes.

From examining Figure 2 it would appear that the increase in demand for IT professionals is actually present. One shortcoming with the forecast as presented so far is that skills sets for IT professionals are not easily transferable. That is to say for example, a programmer is generally not equipped to perform well as a business analyst or vice versa. Knowing if there are particular job categories that are net winners and losers in the job creation process would be more useful.

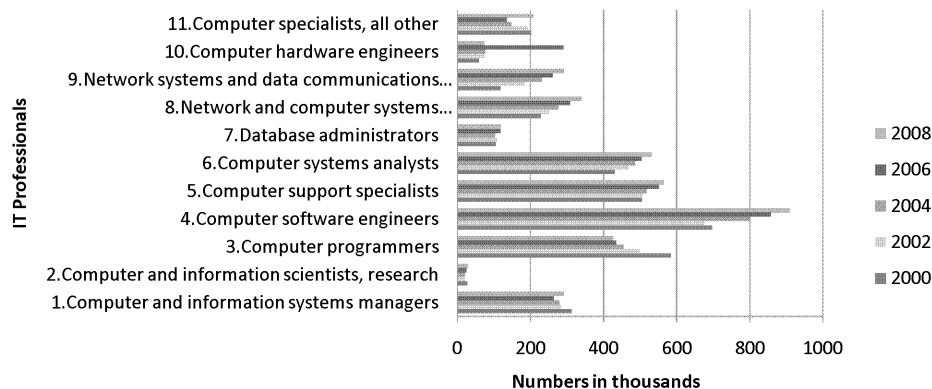
From 2000 until 2008 there was a positive overall growth rate for the development and adoption of IT applications but the growth was not across all categories. Two out of the eleven IT professional job categories experienced declines between 2000 and 2008 as shown in Figure 3. The

Figure 1. BLS 10-year labor projections
Figure 2. Actual jobs compared to projected
categories are computer and Information Systems managers and computer programmers. The fastest growing IT jobs include network systems and data communications analyst (145%) and network and computer systems administrators (48%). Computer software engineers accounts for the highest proportion of all IT professional jobs (over 21%).

One complicating factor that makes the BLS data of very limited value for predicting HR needs is that the job growth rates across different industry segments and geographic regions are not likely to have a uniform demand for different knowledge sets. As an example, the demand for a systems analyst might be high in an urban area

or an area where there are a lot of software development firms but it is likely that in some rural areas those skills would not be in high demand because of the lack of larger companies or software development houses.

That does not indicate an absence of need for courses that develop students for other IT areas such as business analyst. Instead it is an indicator that while a standardized approach such as that put forth by the Association for Computing Machinery is a very valuable guide for developing a core curriculum that covers the knowledge all IT majors need in their respective broad subject areas, it will not be sufficient to produce an agile IT workforce that is able to become productive

Figure 3. IT jobs by category


quickly after employment. In areas where there is a thriving vibrant business environment that needs a certain IT niche there is an opportunity for businesses and institutions of higher learning to partner together to serve that community's needs by developing and emphasizing an area of study that will increase the value of IT graduates.

Therefore, the needed framework is one that can serve as a lens through which trends in the community can be viewed so that areas of emphasis can be identified. Toward that end, we have identified the key factors that are likely to influence the demand for IT professionals and allow for the prediction of which areas are likely to be in most demand.

FACTORS CONTRIBUTING OR INHIBITING GROWTH IN IT HUMAN RESOURCES

Demand for IT Applications

The average IT investment by U.S. organizations is approximately 3.5 to 7.0% of their sales revenue (Network World, 2009) and contributes up to 50% in total capital costs (Applegate et. al. 2007). IT is essential to survival for most businesses but while IT jobs have not been spared from the economic downturn currently impacting the global economy they have not been as hard hit as the overall economy in the United States. According to an analysis of Bureau of Labor Statistics data conducted by GovInfoSecurity.com the unemployment rate for IT professionals was 4.1 percent for the second quarter of 2009. While that was up substantially from the 2.3 percent unemployment of a year earlier it was still far better than the overall jobless rate of 9.3 percent (BLS, 2010). There are also some signs of recovery on the IT front. President Obama has requested an increase of 1.2 percent in spending for IT projects for fiscal year 2011 bringing total requested IT spending for the United States Government to

$79.4 billion. Global spending on IT was down 4.6 percent in 2009 but it is expected to rebound to $3.4 trillion in 2010 (Gartner, 2010). This increase is likely to be driven by demand for new technologies such as cloud computing, software as a service (SaaS) and Enterprise Resource Planning packages among others.

Reliance upon Information Technology is pervasive and is likely to become more so in the future. The acquisition of new software can be broken down into two categories. The first category is software that a company acquires primarily from another source. This includes common applications such as Microsoft Office, Quickbooks, and more complex applications such as Peoplesoft which have to be extensively customized during implementation. For the purpose of discussion we will refer to software made by other companies that is not for one particular client as Commercial Off-The-Shelf (COTS) applications. The second category is software that a company largely develops on their own and for their own use. Software developed largely in-house and not for sale will be considered proprietary software.

The skill set needed to manage an IT infrastructure consisting primarily of COTS software is different than the skill set needed to build and maintain proprietary software. In order to predict the demand for different types of software professionals we need to understand the trends in COTS and proprietary software development.

Businesses are moving toward great use of software solutions to satisfy customer demand, increase effectiveness, and become more efficient. This is leading to an overall growth in demand for IT applications that is driving the greater need for both proprietary and COTS software. As an example, customers increasingly want to utilize their mobile communications devices, such as smart phones, netbooks, and tablet computers, to check their account information online. This creates a demand for a service that many businesses have to satisfy. In looking for a solution they might need to purchase a COTS solution from a

vendor or they might decide to build a proprietary system. Whichever choice they make will influence the skill set needed to implement, manage, and maintain the solution The trends could be explained with the framework depicted in Figure 4. The framework is developed based on the model suggested by Agrawal, Tenkorang, Agrawal and Taylor (2009) and Agrawal (2005 a, b).

Components of the Framework

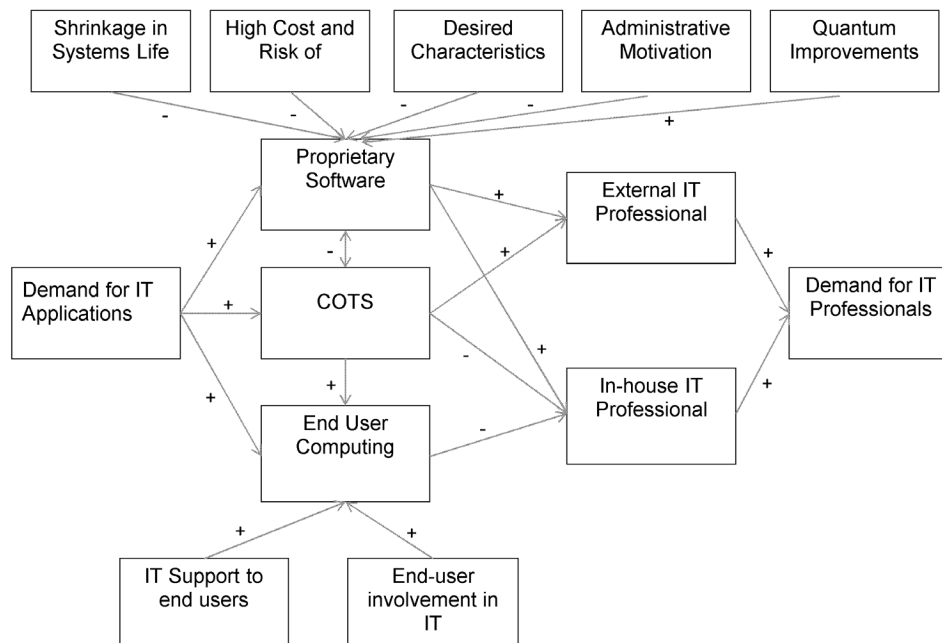
The growth in demand for IT applications is driving the greater need for proprietary software and COTS software. However, assuming constant demand for IT applications, increase in demand for proprietary software will have a negative impact on COTS and end user computing. A detailed discussion of the framework components is presented below.

Proprietary Software

The shifting role of IT as a strategic necessity will affect strategic decisions regarding the level of corporate investment in IT (Carr, 2003). When organizations have a possibility of strategic advantage, the organizations will maximize investments and develop proprietary application packages, maintaining control of the software development and the flexibility in the packages.

In a free market, it is very difficult to get and maintain a sustainable competitive advantage (Porter, 1980). This goes for using IT as a competitive advantage as well. When a competitive advantage is achieved the time to duplicate the advantage is very short (months not years) once a rival's IT is understood.

Organizations such as Wal-Mart, Dell, and Jet-Blue have used proprietary IT to gain a competitive advantage in the marketplace (Wailgum, 2007). By using proprietary software these companies and others have been able to add capabilities that were hard for their competitors to copy as long as the capabilities remained confidential. However, because of factors associated with developing customized software companies have begun to use less proprietary software in favor of COTS

Figure 4. Framework


software. Even companies such as Wal-Mart that have traditionally believed that technology should be built to support best practice business procedures have started to adopt best of breed commercial application for business intelligence and other infrastructural technological needs (Wailgum, 2007) while at the same time building new custom applications when there is a potential to gain a large strategic advantage. The observed decline in proprietary software use is attributed to four major trends.

These trends are shrinkage in systems life cycle (faster development time), high cost and risk-prone tendency of the needed software (more complex projects), desired characteristics of the software solution (ease of use and predictability), and administrative motivation (desire of management to avoid risks and to focus on core competencies.

Each of these serves to make the development of proprietary software more risky and of less incremental value than using commercial off the shelf software. One countervailing force is when quantum improvements, improvements that radically change existing business practices, in software are desired in order to get a competitive advantage. The overall decrease in dependence of firms on proprietary software is seen in their shift to COTS software for an increasing percentage of their applications. We will consider each of the trends in turn with respective to its impact on COTS.

Commercial-Off-The-Shelf Software (COTS)

As a result of the trends previously mentioned human resource departments need to identify which strategy their company is likely to predominantly employ so the skill sets of employees will meet the needs of the business. In order for human resource professionals to understand which strategy their business is likely to adopt we will consider each of these in turn. This overview is not intended to be exhaustive but is instead designed to serve as a primer to enable the reader to converse with senior management regarding areas of long-term strategic alignment of HR resources with business needs.

The *systems life cycle is shrinking* as software development advances. With blurring national boundaries, the numbers of competing organizations and knowledge workers have been increasing. Additionally, the environment is turbulent, changing rapidly, and in an unpredictable manner (Applegate, 2007, Scott-Morton, 1991; Turban et al., 2001). The characteristics of this environment identified by El Sawy et al. (1999) include time-compression, short product life cycles, strategic discontinuity, increase in knowledge intensity, and a customer-focused approach. The environmental trends will make organizational processes and resulting software applications vulnerable to frequent changes. The faster obsolescence of packages will result in an increase in the cost of the IT applications. Li and Ye (1999) also contend that it is an era of time-based competition. The same strategy will not work for a prolonged period of time. The changes in strategy will lead to alteration in the processes and the resulting software. Matheson and Tarjan (1998) and Nidumolu and Knotts (1998) found that software firms have very short development time cycles since technology changes very rapidly. Brancheau et al. (1996) asserted that the effectiveness of software development has been a key management Information Systems issue since the 1980s. Agrawal (2005d) asserted that the higher rate of product obsolescence will lead to increased adoption of Enterprise Resource Planning (ERP) packages and decrease in usage of off-the-shelf applications (other than ERP packages). Under such circumstances organizations are expected to invest a minimum amount of time and money on the software by using traditional off-the-shelf solutions, cloud computing, software as a service, Enterprise Resource Planning packages, and other COTS solutions as appropriate.

Software development is expensive and risky due to the complexity of modern systems and high

project failure rates. A report by Standish Group International on the success of software projects reveals that in the United States 31.1% of projects are not completed; while 52.7% are completed, but with an average cost overrun of 189%, and many of these did not contain all the functionalities of original specifications. Only 16.2% of projects are completed in-time and on-budget (Hays, 1997; Turban et al. 2001). Since the early 1980s the estimated failure rate of large-scale software development is 85% (Ambler, 1999). According to Laudon and Laudon (1999), a complex package is one which contains more than 400 programs and 500,000 lines of codes. Jeong and Klein (1999) note that more complex systems are susceptible to high failure. Most integrated packages can be considered large and complex, and therefore have an inherent risk of failure. Turban et al. (2001) have stated that because of associated risks, some managers refuse to develop systems that require budgets over $1 million, take more than one year, or require more than ten people for completing the project. Agrawal (2005a) stated that the higher costs and risks are associated in development of organization specific software and therefore, organizations are using off-the-shelf/ERP packages in higher proportion compared to proprietary packages. In the past, in-house development was popular due to the flexibility needed in the packages and the control on the development cycle. Because of the reusability of codes and customizability, the object oriented approach results in higher software development productivity. It will also lead to increased flexibility, increased predictability, and few errors (Nidumolu & Knotts, 1998). However, the faster rate of obsolescence, high cost, and risk factor will make the in-house development option unattractive for all but the simplest projects unless the functionality required is such that COTS is not a viable option.

Desired characteristics of software that favor a transition to COTS are ease of use and predictability of cost and outcome. In order to reduce training costs and improve user satisfaction firms want software that is easy to use. A simpler user interface and improved artificial intelligence are factors that are leading many COTS systems to be usable with little or no training. To avoid some of the risk factors mentioned earlier firms want predictability. By using an established COTS solution firms are able to know the approximate costs, requirements, and functionality before committing to a product. In the case of the off-the-shelf/ERP solutions, it is possible to get reliable predictions of costs of acquisition, implementation, and use (Heikkila et al., 1991; Laudon and Laudon, 1999). Furthermore, these software packages are available without delay and can save up to 50% or more in development efforts. In addition, organizations can save high maintenance costs associated with in-house developed packages. The maintenance costs of in-house developed packages are as high as 80% of the corporate IT budget (Turban et al. 2001).

The ***administrative motivation*** for moving to COTS includes many of the factors mentioned previously. Some reasons for administrative motivation include the continuing growth in software and the outsourcing market that can be attributed to the reliability of services provided by these sources and to the role of IT as a commodity. Because management is not satisfied with the performance of IT departments they are replacing in-house development with COTS (Turban et al. 2001). The shift to the COTS or outsourcing helps organizations survive in an increasingly competitive environment.

Agrawal, et al. (2001) argued that a move from proprietary to COTS packages will reduce cost at the expense of flexibility. If IT's role is only a strategic necessity and not a source of competitive advantage, then the substantial risks and high investments associated with proprietary packages are not desirable. In a turbulent environment with faster obsolescence in product/services, the combination of limited time available for development and the need for frequent changes will also make the option of proprietary packages infeasible and

unattractive (Agrawal, 2005d) and the uses of commercial off-the-shelf/ERP packages will be in higher proportion compared to proprietary/customized packages (Agrawal, 2005a). Thus, it does not seem possible in a short period for organizations to develop the complex and integrated large size packages which can be used for a short amount of time. Additionally, such projects may require a very large in-house IT department with continuous training and upgrades of technology. Under this situation the organizations will tend to rely more on commercial off-the-shelf packages/ERP solutions and outsourcing.

Continuous improvements/quantum improvements: Intense competition leads to uncertainty and stimulates higher innovation and adoption rates that will, in turn, increase competition (Ettlie, 1983; Lewin et al., 1987). Porter (1980) argued that in a competitive market with free entry, firms cannot earn sustainable supernormal profit. While in the short-run it may be possible to earn such profits, in the long-run the accounting profit will be just enough to pay for the cost of capital and compensation to the owner for any unique inputs to production (i.e. management expertise). It is possible to achieve a short-term competitive advantage with IT if secrecy is maintained. However, the time to duplicate applications is months, not years, and new innovations (which are very fast and rapid) will make the old ones obsolete (Porter, 1996; Turban et al., 2001), raising doubts about the role of IT in gaining competitive advantages. Conversely, there are a number of arguments identifying IT mostly as a commodity or a strategic necessity for the organization. Thus, IT cannot be a source of sustainable competitive advantage (Brynjolfsson, 1996; Clemons 1990, 1991; Clemons & Kimbrough, 1986; Emery, 1990; Kermer & Sosa, 1991; McNurlin, 1991).

Further, most businesses in the industrial world could not compete, and many could not even survive without computers and software (Jones, 1994). The shifting role of IT as a strategic necessity will affect strategic decisions regarding the level of corporate investment in IT. Considering IT's role as a strategic necessity, the organizations will invest minimally on application packages by using off-the-shelf/ERP solutions with a policy of continuous improvements. On the contrary, with a possibility of strategic advantage, the corporations will maximize investments and develop proprietary application packages, maintaining the control on the software development and the flexibility in the packages.

The increase in usage of COTS software will lead to lesser demand for programmers and higher demand for system analysts including project managers. It is important for HR planning professionals to keep in mind that these changes are macroeconomic and apply to the United States. Individual labor markets may vary. In the cases where a labor demand in a local market is markedly different from the national market it is important that partners in higher education be advised of the differences so appropriate strategic planning can occur.

Generally, COTS involves point-and-click and/or very simple commands to solve problems, hence it has led to increase in end-user computing.

End-User Computing

The growth in the importance of Information Technology as part of an enterprise's basic infrastructure is augmented by evolutions in hardware, software, and the graphic user interface (GUI) which facilitates the use of IT applications by many end-users. The growth in the usefulness and the ease of use of software applications has greatly increased demand for the number of people who are knowledge workers and this growth is expected to continue. The radical transformation of business processes from IT centric computing to increased adoption of end-user computing (EUC) has fundamentally changed the way businesses operate. This trend accelerated in the 1980's when the effectiveness of software development became a key management Information Systems issue. As

executives wanted access to information to make better decision and companies needed more IT applications developed by IT professionals there was not enough capacity to get things done in a timely manner. The growth in end-user computing is one of the solutions to handle such a backlog of information demand. Trends in hardware and software such as miniaturization, speed, connectivity, interactivity, multimedia, and affordability (Sawyer and William, 2003) have contributed to the growth of end-users computing by providing more *support to end-users from the technical component of IT*. The control of Information Systems departments on their manpower and IT budget has been decreasing and has shifted to end-users (Edberg & Bowman, 1996; He et al., 1998; Lucas, 2000). These and other factors are *drivers working toward involving end-users in the IT functions*.

The end-users are taking more and more responsibilities of Information Systems applications, and their involvement is also positively correlated with the success of Information Systems (Doll & Torkzaddah, 1988; McLean et al., 1993; Winter et al., 1997). Turban et al. (2001) claimed that many of the user requirements are smaller in size and can be developed by end-users themselves.

The modular approach in an object-oriented system makes some programming jobs much less complex, and allows end users to accomplish some functions that formerly required professional programmers.

Furthermore, because of the reusability of codes and customizability, the object oriented approach results in higher software development productivity. Agrawal et al. (2001) claimed that the object-oriented approach would make the development process simple, enhancing customizability and contributing to the growth of EUC. These projections have been largely born out and are expected to continue.

Expert systems and other forms of artificial intelligence (AI) hastened the trend toward end-user computing. The use of AI helps businesses make decision better and faster. As these tools have spread throughout businesses their use has become common and continues to spread to jobs throughout the corporate hierarchy. Examples range from executives using applications that utilize artificial intelligence to build complex risk analysis models to cashiers using AI to identify produce (Sadahiro, Checkley, & Trivedi, 2001).

The natural language processing will lead to simple user interface. It will also lead to increased flexibility, increased predictability, and fewer errors (Nidumolu & Knotts, 1998). The graphical user-interface (GUI) makes software user friendly and allows end-users to communicate with the application more effectively in their familiar vocabulary. These trends have lead to the development and adoption of Web 2.0 applications that allow the user to customize the way they interact with the virtual world. Customers expect businesses to be able to provide an interactive experience for viewing bills, shopping, and getting support among other traditional activities. This trend has important implications for the type of employees human resource departments need to hire. Employees who are technology illiterate will not have the needed skills to provide maximum benefit in the Web 2.0 world. Employees who have extensive technical skills will have some benefit but in order to be of maximum value to the firm they will need to learn business processes and how to interact with customers.

Agrawal and Kotcherlakota (2006) asserted that in a stable IT environment end-users will make more use of the technical component of IT. Contrarily, in an unstable environment the end-users will not be able to work effectively with IT and will thus be required to look for tools and/or skills that are not IT based in order to meet their functional requirements. This reduction in the use of IT would also lead to a corresponding reduction in the need for end-user support but the enterprise would have a competitive disadvantage in regards to their technological infrastructure.

The trends seen in proprietary software, COTS, and end-user computing have implications for both external and in-house IT professionals.

The trend toward more end-user computing will reduce the number of tasks that are required of in-house IT professionals as end users are increasingly able to accomplish tasks that formerly required an IT professional. This trend will be across industries. Some companies will see a growth in the number of IT professionals required to support functions not previously offered so the human resource professionals at those companies will need to work closely with the firms IT department to identify areas of need. Since the overall trend should be toward a reduction of in-house personnel dedicated to IT infrastructure demand it is important that sources for the entry level personal who will be needed should be identified.

External and In-House IT Professionals

When firms decide to build their own proprietary software applications they can either build the applications in-house or they can outsource the development of the application. If the application is built in-house the demand for in-house software developers will increase. If the application is built by a professional software development shop the demand for software developers will increase. Hence, in both scenarios there will be an increased demand for more programming for potential employees.

External IT Professionals

Outsourcers, application service providers, and software houses using their economies of scale can meet their requirements economically. The current declining trends (compared to the projections of BLS) in the requirements of IT professionals, in addition to the earlier discussion, leads one to believe that the concentration of IT professionals will shift heavily from in-house IT departments to software houses, outsourcers, and application service providers. Moreover, it implies that the current declining trend in the requirement of IT professionals is the symptom of the higher use of readily available solutions, i.e. production and usage of more and more COTS/ERP solutions.

In-House IT Professionals Demand

The shift to COTS and subsequently to more end-users control has led Information Systems departments to reduce control of their manpower and IT budget (Edberg & Bowman, 1996; He et al., 1998; Lucas, 2000). The main reason for this shift is credited to the availability of user-friendly software, knowledgeable end-users and extensive company support to EUC (Turban et al., 2001). The end-users are taking more and more responsibilities for Information Systems applications, and their involvement is also positively correlated with the success of Information Systems (Doll & Torkzaddah, 1988; McLean et al., 1993; Winter et al., 1997). Agrawal (2005b) stated that the growth in EUC will increase the requirements of help desk support. Furthermore, the faster obsolescence in products/services and turbulent environment will lead to higher involvement of end-users in implementation and maintenance of software packages (Agrawal, 2005c). As end-users start to become more involved in areas that were once exclusively within the purview of IT departments, a decline in the requirements of in-house software developers is likely to occur (Agrawal, 2005b)). It should also be pointed out that the increased demand for COTS will have some positive impact on in-house IT professionals required. However the net overall effect will be a reduction since the usage of COTS/ERP packages in higher proportion will further lead to a decline in the requirements of in-house IT professionals. Lazowska (2008) asserted that 70% of all IT jobs are with "IT consumers" (companies that use it) rather than with "IT producers" (companies that invent it). The increased usage in COTS/ERP

packages will lead to a growth in 30% segment and shrinkages in 70% segment.

Projected Demand for External IT Professionals

We predict that the demand for external IT professionals will increase. This will be driven by a shift toward more commercial off-the-shelf software applications, increased utilization of application service providers (ASPs), as well as mainstream outsourcing arrangements. Commercial off–the-shelf solutions include ERP applications and other packages that allow for customization. The advantages that specialized developers have in areas such as scale, experience, and specialization are difficult for an in-house team to compete against on a consistent basis (Klepper & Jones, 1998). Companies that develop software as their primary business also have the added advantage of being able to more easily introduce the latest technologies and skills into their labor force without a disruption of their business.

Implications of Growth in IT Human Resources in Curriculum Design

This chapter has discussed the various drivers of demand for IT professionals and the impact to IT HR. While there are macroeconomic factors at work the microeconomic considerations are paramount considering the difference in demand among firms and regional industries. In the absence of careful planning and the development of proactive solutions for future IT needs firms are facing a sustained shortage of IT professionals and knowledge workers who work outside of the IT functional area but who do many of the jobs that have traditionally been within the province of IT professionals. Human resource professionals and IHE's should work together to plan for changes in curriculum and course offerings that will allow graduates to be productive in the shortest possible time while also equipping the graduates with a

knowledge of theoretical principles that with enable lifelong learning.

LESSONS LEARNED

The role of IT is a strategic necessity but is unlikely to be a source of sustained competitive advantage. Because of this management is likely to focus on strengthening their products and services and forego development of proprietary software. In most cases current IT requirements can be met by complex and integrated high volume off-the-shelf/ERP software without the need for the problems associated with proprietary software, such as risk associated with time pressure and very high costs. This will lead to a higher dependency on outsourcers and software vendors as well as consulting services for professional assistance. The shift toward more reliance on outsourcers, software vendors, and consultants will lead to organizations adapting be reducing IT manpower for implementation and increasing support to end-users. Few senior IT executives will be needed in the organization for IT strategy and planning; maintenance and development of IT architecture. The trends will lead to growth in IT manpower for technical positions such as programmers and systems analyst at outsourcers and software houses, but the in-house departments dedicated solely to IT may start to shrink. Furthermore, the growth in end-users computing and faster obsolescence in technology would lead an increased demand for employees to integrate the use of technology throughout their job functions. This will lead to a need for human resource departments to revise their hiring practices to increasingly look for employees who not only have the expertise needed in the functional area being filled but who can also demonstrate proficiency in IT through course work and/or experience. Human resource professionals will also need to manage the training and development of end-users to keep them current in the IT skills needed to be productive. The needed

training could be obtained from the in-house IT department or from outsourcers.

CONCLUSION

IT curriculum committees are faced with an ever more difficult challenge as they try to retain a curriculum core of knowledge that should be universally understood by all graduates in their departmental areas. At the same time, these committees are trying to predict what knowledge is most needed by the rapidly changing society so that students can have both the depth and breadth of knowledge they will need upon graduation. To facilitate the planning process we have developed a conceptual framework that is based upon a review of megatrends within the IT area that will drive the market.

The framework was developed by looking at macro level trends. One trend found is that some industry experts are strongly predicting the demise of corporate IT departments allowing business users the capability to take on operational-level technical tasks, freeing a small core of IT staffers to focus on analytical and strategic issues. Because technology is becoming easier for end users, and considering IT function as problematic to manage, a lot of IT processes will move to outsourcers. The cost and risk of developing applications in-house will also prompt some organizations to rely more on customized or off-the-shelf packages, including ERP software. However, each IHE has its own unique group of stakeholders to be served so each school will need to review the model looking at the environment for their school and determine the effects of the short and long term trends upon their program viability. The framework presented in the paper is general and can be used as a template by human resource professionals to help shape their mental model when developing a staffing strategy plan.

Chapter 85

Anonymous Workblogging and Organizational Coping Strategies

Abigail Schoneboom
City University of New York, USA

ABSTRACT

In recent years, the rise of blogging has led to debate about whether employees should be free to talk about their employers on the Internet, and whether they should be able to blog on company time. Several high-profile cases of fired bloggers between 2002 and 2006, drew attention to important labor and civil rights issues that led to debate among human resources and employment law experts in the mainstream media. The negative publicity surrounding the cases of fired bloggers has given rise to an alternative management strategy – a cautious embrace of blogging by employers, who saw the practice as a potential opportunity for marketing and professional development. However, efforts by bloggers to retain their right to blog anonymously signify continuing tensions, revealing the contradictions between workplace surveillance and an "enlightened" management doctrine based on openness and trust, indicating a refusal by some employees to align their blogging endeavors with the interests of their employer. This chapter examines the workblogging phenomenon as an intersection of organizations, technology, and trust, and makes some tentative connections between Guerra et al.'s (2003) concept of "trust-tension" and the critical management literature.

INTRODUCTION

Ever since workblogs – online diaries about work – entered the mainstream in 2002, bloggers' rights have been controversial, and the fight for blogger freedoms has raised labor and civil rights issues that go far beyond the act of blogging itself. High-profile cases of fired bloggers have helped to shape the debate and led to discussion about free speech in the workplace, the right of workers to organize, employees' freedom to do what they like when off-duty, and the encroachment of work into personal space.

This debate has placed management in an uncomfortable position: employers who have disciplined or fired bloggers in order to remove what they perceive as a potential threat to their company have been subjected to hydra-like retaliation from the blogging community. For business as a whole, the media focus on fired workbloggers has created bad publicity, drawing attention to the economic vulnerability of workers and revealing cracks in a corporate ideology that is ostensibly founded on openness and mutual trust.

The goal of this chapter is to question whether employers have contained the blogging phenomenon, surveying media coverage and blog content, and looking in particular at the limitations of both surveillance and more "trust-based" management strategies that have been used to deter or co-opt bloggers. The study, which is strictly exploratory and not aimed at offering practical advice, situates the practice of employee blogging (or "workblogging") in relation to the sociological literature on workplace resistance, trust, and blogging. Arguing that the content of these blogs mirrors the criticisms of modern work culture that have been raised by writers such as Hochschild and Ross, the literature review contextualizes workblogging in terms of recent studies of worker recalcitrance. This chapter makes an exploratory connection between this critical management literature, which highlights ongoing employee discontent in today's "enlightened" workplaces, and Guerra et al.'s (2003) concept of "trust-tension."

Exploring how organizations have coped with the workblogging phenomenon, the chapter analyzes two key cases: Dooce (a.k.a. Heather Hamilton), a Los Angeles-based web designer who lost her job in 2002 after her supervisor found irreverent comments about the company on her blog; and Petite Anglaise (a.k.a. Catherine Sanderson) whose dismissal in 2006 led to a successful labor tribunal and a lucrative book deal. These cases are set against a backdrop of emerging management responses to employee blogging, which range from draconian surveillance measures to a cau-

tious embrace of the practice by companies such as Yahoo and Sun Microsystems. Looking at these developments, this chapter illustrates how some employees have publicly refused to align themselves with management policies that attempt to co-opt and contain blogging, and traces organized efforts to protect bloggers' rights to anonymous and non-corporate sponsored self-expression.

BACKGROUND

Knowledge organizations demand free-flowing information, employee autonomy, and flexibility. However, this can create anxiety for the organization in terms of minimizing worker behaviors that might threaten the organization. This chapter examines the workblogging phenomenon as an intersection of organizations, technology, and trust, and draws some tentative connections between the trust literature and the critical management sphere.

The wide-ranging debate about trust and technology examines the relationship between proximity or familiarity with technology and one's willingness to engage in online social or economic transactions (Dutton & Shepherd, 2006); the impact of the loss of physical cues (Wallace, 2001), and the possibility for alternative trust-generating mechanisms such as the availability of high-quality online information in computer-mediated interactions (Ben-Ner & Putterman, 2002; Riegelsberger, Sasse, & McCarthy, 2003). Of particular interest to this study, however, is Guerra et al.'s (2003) notion of trust-tension.

In their discussion of e-commerce transactions, Guerra et al. emphasize the transfer of data that must take place in order to establish accountability, but point out how this flow of personal information creates anxiety over the potential misuse of the information: "In this way, there is a 'trust-tension' between privacy and identity: absence of data impedes trust as accountability is limited, but data gathering creates trust problems regarding the use of the data in question and intrusions on privacy"

(2003, p.5). Guerra et al., draw on Bacharach and Gambetta's (2001) three-component definition of trust: uncertainty, exposure on the part of the trustor, and temptation on the part of the trustee. This chapter posits that the concept of trust-tension might also apply to internet use in the workplace, where knowledge organizations demand free-flowing information for their smooth functioning, yet this creates anxiety among managers because this information might be used or represented by employees in ways that are damaging to the firm, especially in the presence of the Internet's rapid dissemination infrastructure.

As we have transitioned from the rule-bound certainty of Taylorized workplaces to "looser" management cultures based on normative control, the interplay of organizational exposure and worker temptation has become a central component of the workplace. By granting autonomy, management exposes the organization to disruption. On the one hand, knowledge work has been facilitated by corporate cultures that promise self-actualization through non-hierarchical teams, flexible schedules, and strong social ties, which produce loyalty and hard work in the absence of command and control structures (Deal & Kennedy, 1982; Drucker, 1973, 1994; Peters & Waterman, 1982). However, this openness also creates vulnerability, as organizational exposure to the outside world is increased and workers are tempted to indulge in behaviors that are not sanctioned by the employer. These concerns are amplified by Internet connectivity, which transcends organizational boundaries, and potentially connects recalcitrant workers to mainstream media.

As illustrated by the testimony later in this chapter, the practice of anonymous workblogging has been perceived by some legal and business interests as a breach of the trust that has been placed in today's knowledge workers by employers. However, efforts to restrict anonymous workblogging have resulted in negative publicity since punitive measures clash with organizational philosophies that are ostensibly based on autonomy. Aware of

the ideological disconnect presented by anonymous workbloggers, savvy corporations have, instead of banning the practice, begun to accept blogging, by promoting employer-sanctioned blogs and open discourse between workers and their supervisors. However, the energetic pursuit of anonymizing strategies and legal protections on the part of the blogging community indicates that bloggers continue to see a conflict between company interests and their creative freedom.

Building on Guerra et al.'s concept of trust-tension, it appears that the contemporary knowledge organization is in a quandary. From a critical management perspective, it might be argued that, despite the promises of management gurus, underlying conflict between workers and management precludes complete openness between organizations and employees. On the part of employers this has resulted in a complex interplay of blogging deterrents, moral injunctions, and pro-blogging maneuvers. Meanwhile, anonymous workblogging persists, albeit in a significantly suppressed form.

The persistence of workblogging is consistent with Thompson and Ackroyd's (1995) claim that even today's relatively comfortable workplaces cannot eliminate worker misbehavior. In their study, *All Quiet on the Workplace Front*, Thompson and Ackroyd call for renewed study of worker resistance in environments where workers are not necessarily physically oppressed – the well-lit, Internet-enabled offices that nourish today's bloggers are a far cry from the grueling labor process endured by yesterday's factory workers, yet there still seems to be a need to resist or push back. Anonymous workbloggers are often productive employees but they make fun of management buzzwords, celebrate time-wasting on the job, and express a lack of motivation and an underlying conviction that their labor is meaningless (Schoneboom, 2007).

Their writings mirror the claims of a critical sociological literature that includes the work of Hochschild (1997) and Ross (2002), which expos-

es the insidious consequences of corporate culture in terms of time-scarcity and self-exploitation. As an act of ironic distancing from one's job, anonymous workblogging is reminiscent of the complex navigation of organizational self outlined by Kunda (1992), where workers use dramatization and irony to resist the colonization of their private thoughts and emotions by the company. However, I argue that the highly networked, Internet-based nature of the blogosphere[1] affords employees the opportunity to transcend organizational boundaries, form alliances, and connect with traditional media in ways that go beyond the individualized and easily contained resistance demonstrated by Kunda.

Recent studies have revealed that workbloggers generally do not see themselves as engaged in a labor struggle, and tend to characterize their blogging activity as a form of creative self-expression rather than an act of resistance or defiance (Lenhart & Fox, 2006; Richards, 2007). The blog cases featured in this chapter fit this description. Dooce's blog, at the time of her firing, was a well-written narrative about her daily life, which happened to include details about her job; Petite Anglaise's blog touched on work very rarely before her firing, and focused on Paris, her love life, and childrearing, not on a systematic critique of the labor process. However, I argue that when bloggers have been fired, their blogs become sites of resistance, loosely organizing diffuse employees and other interested parties around common concerns. Where cases of fired bloggers have become *causes célèbres*, the debate has focused on labor issues, especially knowledge workers' sense of vulnerability and their rejection of job-centered fulfillment. While these efforts are relatively diffuse and ephemeral, I argue that they are useful to the labor movement, and that they signal future organizing possibilities for labor, in spite of management's ongoing effort to contain and co-opt the blogging phenomenon.

This study was originally part of my PhD dissertation, which examines the practice of workblogging as a creative act of resistance. The research for this section consisted of an informal exploration of the phenomenon, followed by three case studies (two of which are included in this chapter). In order to familiarize myself with the phenomenon, I downloaded and read several hundred postings and comments from 25 bloggers who had been fired between January 2002 and December 2006, which had been identified through the *Morpheme Tales* blog (Hopkins, 2009), reading postings dates three months before and after each firing and following all links from these postings to news and blog coverage of firings. I narrowed this sample to three blogs (*Dooce*, *Petite Anglaise* and *The Woolamaloo Gazette*), reading all postings submitted 12 months before and after the firing. I also performed Google searches for journalism and policy articles related to these three bloggers. Two of the case studies (*Dooce* and *Petite Anglaise*) are detailed in this chapter, while the third is being developed as a longer journal article. I analyzed the blog postings, comment streams, and news articles using techniques drawn from grounded theory (Glaser & Straus, 1968). This entailed coding content related to specific issues and aligning common material with particular concepts that emerge from the blog. For the 2004-2006 period, I adopted a virtual ethnographic stance as a blog reader, regularly reading workblogs as part of my dissertation research. I followed firing events as they unfolded on blogs, and analyzed the impact of the mainstream media coverage as it echoed through the blogs and new sources that I was monitoring. One obvious shortcoming of this method is that no direct participation and observation of fired bloggers was built into the study. However, I am concerned less with measuring blog realities against "real life" events than with evaluating the media effect and social interaction to which these events led. I have therefore focused on the blogosphere as the "field" of study, exploring it as a loosely cohesive and unfolding social network that is open to virtual ethnographic analysis (Beaulieu, 2004; Hakken, 1999).

FIRED WORKBLOGGERS AND ORGANIZATIONAL POLICY

Being Dooced: The Fired Blogger Phenomenon

In February 2002, Los Angeles-based web designer Heather B. Hamilton was fired from her job because of comments posted on her blog, *Dooce* (http://www.dooce.com). She had not mentioned the company by name and had concealed her identity, using only the pseudonym "Dooce," but someone emailed top executives at the company, informing them that she was writing about the company on her blog and she was fired shortly thereafter. The firing of Dooce immediately became a hot topic in the blogging community and she was flooded with emails from her readers. The press picked up on the issue and before long the term "dooced," to be fired from one's job because of one's blog, had become part of the blogging lexicon.

Dooce's blog was notable because it was extremely well written, irreverent, and funny. Her postings in 2002 were varied but many described her experiences in the workplace, offering vivid and scathing caricatures of her colleagues. In "The Proper Way to Hate a Job" (Hamilton, 2002b), she counseled readers on "successfully avoiding any work related to your actual job," suggesting that readers spend the afternoon conducting, "seemingly academic experiments with bandwidth by seeing how many simultaneous downloads of 'Get Ur Freak On' your CPU can handle." At other times her portraits of colleagues were cleverly evocative, as in this description of her boss, entitled "Intimidation": "When she talks with her hands she looks like she's molesting the air around her, sticking her fingers in holes and around forbidden curves. Often the air around her is the air around me, and my air doesn't appreciate it" (Hamilton, 2002a). Dooce's posts were littered with cynical references to team meetings and PowerPoint presentations, making fun of corporate buzzwords like "consumerizing," "creative shaping," and "expandable flow linkage," and demonstrating contempt for the company's cultural norms and its butchery of the English language.

As a well-paid employee of a high-tech company that had embraced contemporary management thinking, Dooce's comments emerged from a workplace that afforded workers a significant degree of freedom to manage their time and set their own schedules, and her writing pointed to the exploitative and frustrating aspects of a boundaryless labor process. Yet prior to her firing, Dooce was in good standing at the company and was far from being perceived as a disgruntled worker in the eyes of her supervisor. In addition to providing a place to vent about interpersonal conflicts, Dooce's blog gave her a way of distancing herself from those aspects of her job that she could not reconcile with her own value system, helping her to maintain an organizational self that could perform well on the job without having to submit entirely to the company's culture.

As Kunda (1992) has shown, workers respond to the new emphasis on employee participation in a strong corporate culture in diverse ways, using irony, humor, and dramatic metaphors to negotiate an "organizational self" that meets the demands of the job while maintaining some distance from the company's claims on their private resources and emotional lives. In this sense, "The organizational self becomes an active and artful construction, a performance, a tightrope walk, a balancing act of organizational reality claims, fluctuating between contradictory modes of relating to the organization and always threatened with the threat of burnout, or the exposure of its own illusions" (p. 216).

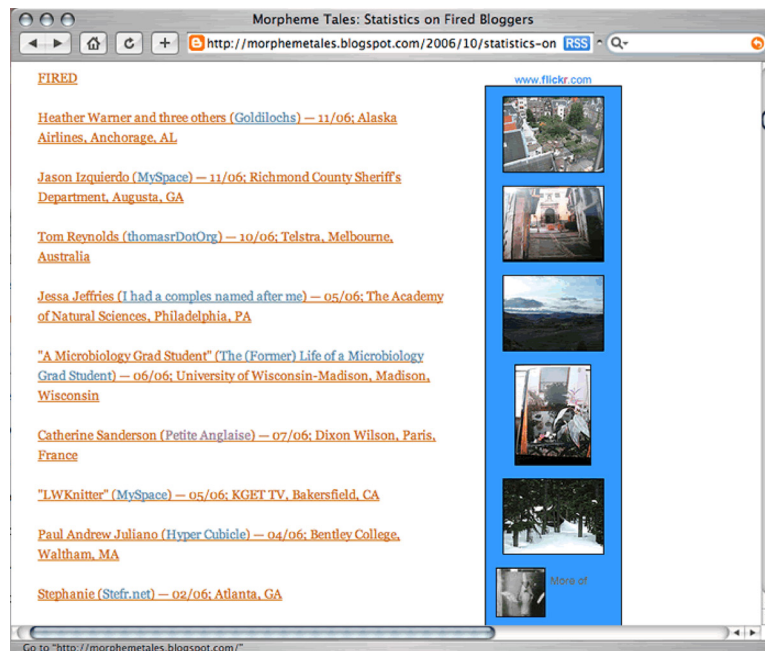
Dooce's blog is an example of individualized role-distancing (Kunda, 1992), or innocuous blowing off of steam about minor workplace frustrations (Barsoux, 1993). However, the tone of her writings, the public nature of her blog and the media attention that her firing generated, suggests an altogether more explosive ideological disconnect, and represents a more threatening situation

that goes beyond the type of self-contained and largely apolitical employee behavior analyzed by Kunda or Barsoux. Dooce's commitment to free self-expression, regardless of the consequences, persists as an inspiration to the community of bloggers who continue to risk being "dooced" by writing about their job or blogging on company time: "I made a conscious decision when I conceived dooce.com that I would never bow to the intimidation of others, including employers or pussy-ass cocksmacks who think I should just stop complaining and be a good worker bee already" (Hamilton, 2002).

Dooce's firing was the first of many highly publicized blogging cases between 2002 and 2006 that caught the attention of the mainstream media, drawing attention to labor issues and demonstrating the reach that could be commanded by individual employees. These included Delta employee Ellen Simonetti, who was fired in 2004 for posting photos of herself in uniform on her blog, and the UK's first fired blogger, Joe Gordon,

a Waterstone's bookstore employee who lost his job because of irreverent comments he had made about his boss on his blog, *The Woolamaloo Gazette*. In 2004, San Francisco-based writer Curt Hopkins began to keep track of fired bloggers via his posting, "Statistics on Fired Bloggers." This posting has been updated many times, based on information provided by readers, and has become an authoritative source of information on people around the world who have lost their jobs because of blogging (Hopkins, 2009). Between 2002 and 2006, Hopkins lists 42 fired bloggers from organizations as diverse as Richmond County Sheriff's Department and the *Ladies' Home Journal*. Most of these firings appear to have occurred without being generating a media furor, but a small percentage garnered international media attention.

During this period, some popular workplace blogs disappeared without warning, raising suspicions that authors had been discovered by their employees and forced to take down their blogs. For example, Dr. Dre's blog, *Doing Less Harm*,

Figure 1. Curt Hopkins' blog posting "Statistics on Fired Bloggers." (© 2009, Curt Hopkins. Used with permission.)


based on the perspective of a National Health Service employee, was removed suddenly in January 2004, leading to suggestions in *The Guardian* that the NHS had forced Dr. Dre to remove his postings (Butler, 2005).

The firing of workbloggers points to an interesting tension between organizational and private selves and raises questions about how far organizational mandates about appropriate behavior extend into the personal lives of employees. Again drawing on the concept of trust-tension, anonymous workblogging has clearly tested the limits of a system that increases autonomy and free-flowing information as a means of promoting organizational health and harmony between workers and management. Critical revelations about the workplace that stem from anonymous workblogs represent a failure of the system to maintain complete openness, resulting in a sense of over-exposure for the organization and signifying that, with the Internet at their fingertips, temptation on the part of recalcitrant workers is too difficult to resist.

The following sections explore the ways in which organizations have responded to the workblogging phenomenon, tracing a growing awareness among employers that summarily firing employees could lead to damaging publicity. I show that employers who wished to promote workplace cultures based on trust and openness were moved to accept and co-opt blogging rather than prohibit it. However, organized efforts to protect anonymous workblogging indicate that many employees do not wish to align their identities with corporate interests. Irreverent workplace blogs may, I contend, reflect fundamental criticisms of contemporary work culture, which may ultimately be of use to the labor movement.

Technology Policies with Teeth: Employers Respond to Bloggers

Organizational reactions to the blogging phenomenon range from disciplinary action to the development of "enlightened" strategies that cautiously encourage employees to blog about work, while reminding them of the firm's trust in their responsible behavior. On the disciplinary side, there was an increased demand in 2004 and 2005 for surveillance of employees' computer use, and the promotion of blogging policies that discouraged anonymous blogging about work. According to the 2005 Electronic Monitoring and Surveillance Survey conducted by the American Management Association (AMA) and the ePolicy Institute (American Management Association, 2005), "companies increasingly are putting teeth into their technology policies," with 26% firing workers for misusing the Internet and 76% monitoring workers' website connections. According to guidelines on Internet and email policies, produced by ACAS, similar trends were identifiable in the UK (Advisory Conciliation and Arbitration Service, 2004).

According to AMA data, firms were intensifying their monitoring of Internet use and adopting technological surveillance tools to "battle people problems" (American Management Association, 2005). The AMA survey reports that 89% of firms inform employees that their Web usage is being tracked but that only 20% had policies on operating personal blogs on company time. Firms were encouraged by the ePolicy Institute to institute specific blogging policies that would supplement existing policies on Internet and email use. Law experts argued that such a policy could protect an employer from appearing heavy-handed when it came to disciplinary action. For example, in February 2005, the UK employment law firm Cobbetts (2005) advised employers, "failure to have such a policy in place may result in claims that sanctions imposed are too draconian and may lay an employer open to claims in the employment tribunal."

During 2004 and 2005 an alternate corporate strategy emerged that is in some ways a tacit acknowledgement of the ideological limitation of punitive workplace policies that result in bloggers

being fired. This new strategy has been promoted by David Sifry, founder and CEO of Technorati, which monitors trends in the blogosphere and advises businesspeople about commercial opportunities. In October 2004, Sifry announced in his blog, "there is still a tremendous opportunity for forward-thinking companies and management to have a significant positive impact on their public perception by encouraging an enlightened blogging policy, encouraging openness both within and outside of the organization" (Sifry, 2004). Sifry announced that forward-thinking companies such as Sun Microsystems were encouraging their workers to have personal blogs, while other firms, including Boeing and General Motors, were setting up corporate blogs where they invited employees to post authoritatively on new developments and products. This news marked a new corporate embrace of blogging, with firms competing to adopt these "enlightened" strategies that reflected the latest management thinking.

In this spirit of open embrace of employee blogging, several companies, including IBM and Yahoo, officially encouraged public posting and discussion of their blogging policies. Writing in May 2005, IBM employee and blogger James Snell praised IBM's policy as a triumph over anonymous blogging, noting the company's endorsement of IBM bloggers and its enlistment of employees in devising and formalizing the policy:

IBM today is publishing an announcement on its Intranet site encouraging all 320,000+ employees worldwide to consider engaging actively in the practice of "blogging" […] The core principles – written by IBM bloggers over a period of ten days using an internal wiki – are designed to guide IBMers as they figure out what they're going to blog about so they don't end up like certain notable ex-employees of certain notable other companies. (Snell, 2005)

Snell dismisses as "crap," a CNN article offering advice on anonymous workblogging, and

reminds IBMers, "this isn't a policy that IBM is imposing upon us – it is a commitment that we all have entered into together." The guidelines emphasize IBM's corporate values of "open exchange and learning" and "trust and personal responsibility in all relationships," and encourage IBM bloggers to identify themselves and their role in the company. Company-hosted blogs are to be written in a way that "adds value" to the company, and, while the guidelines indicate that what employees do outside of work is their own business, they are cautioned that, "activities in or outside of work that affect your IBM job performance, the performance of others, or IBM's business interests are a proper focus for company policy" (Snell, 2005).

The development of corporate blogging as a strategic response to anonymous workblogging signifies the ability of organizations to respond quickly to perceived threats and minimize potential damage by devaluing acts of resistance. Corporate blogging policies such as those launched by IBM, cleverly restore to employees the idea of self-management and self-determination, while subtly impugning the moral value to workers who blog under a pseudonym. However, such openness creates uncertainty over how information might be shared or misused, leading to some organizational anxiety over how to control or limit the potential for such behavior without leading to negative publicity.

Anonymous Blogging Continues

In 2004 and 2005 period, corporate blogging strategies aimed at co-opting or condemning anonymous workblogging were received skeptically by many in the blogging community, and the mainstream media continued to express concerns that an employer-sanctioned blog would be no substitute for one written in complete freedom. In the *Daily Telegraph*, James Hall (2005) captured this reaction, commenting that, "The very point of blogs is that they are open and honest. But how can blogs that have been sanctioned

by a company be objective, wary bloggers ask." Amid proposals that employees should obtain permission from their employer before starting their blog, *The Guardian*'s Patrick Butler (2005) argued that employer-sanctioned workblogs by definition lacked the satirical edge that made them capable of revealing truths and perspectives that could be gained elsewhere. In some cases, bloggers themselves were given a mouthpiece by mainstream media sources. In an August 2005 *New York Times* Op-Ed column, Jeremy Blachman, who had been "outed" in December 2004 as the author of the very popular blog *Anonymous Lawyer* argued for the continuation of anonymous blogging about work:

Now that everyone can publish online, we can get these incredible glimpses into worlds we might otherwise never get to see. People across the world can share stories, commiserate and connect with each other. Potential employees can see beyond the marketing pitches. (Blachman, 2005)

The promotion of corporate blogging by David Sifry, James Snell, and other supporters was met by a vigorous rebuttal from non-profit organizations and individual bloggers devoted to anonymous blogging. Most prominently, in April 2005, The Electronic Frontier Foundation (EFF, http://www.eff.org), a US-based nonprofit organization dedicated to protecting Internet freedoms, published its guide, "How to Blog Safely about Work or Anything Else" (2005a) which clearly stated the EFF's support for anonymous blogging and provided concrete advice on how workers could blog without revealing their identity.

The EFF guide describes blogs as "personal telephone calls crossed with newspapers," and counsels bloggers not to give away telling details about their workplace, as well as strongly advising against blogging while at work due to the high probability of detection. It outlines anonymizing technologies and services, such as Tor, Invisiblog, and Anonymous Surfing software, which conceal

the IP address of a computer, potentially helping bloggers to elude surveillance efforts. The EFF issued popular FAQs that explain bloggers' legal rights, reminding non-unionized US employees that in most states they are hired "at will," a status that affords workers very few protections from being arbitrarily fired. The Labor Law FAQ (2005b) informs US-based bloggers that, under the First Amendment, they cannot be fired for talking about unionizing or (so long as they notify the appropriate regulatory body first) for whistle blowing, and it explains the protected category of "concerted speech," where two or more people may legally blog about their working conditions, such as the pay scale or vacation policy, without fear of retaliation.

By reminding employees of their at-will status and their right to organize, EFF reaffirmed the role of unions in protecting workers' rights and reinvigorating labor questions that may previously have seemed irrelevant or anachronistic. Although EFF's guides focus on US employment law, the organization's efforts toward protecting the right to anonymous and free speech on the Internet generated considerable interest and support in the UK, revealing the need for a similar organization specializing in UK issues and triggering an Internet campaign that led to the formation of the UK-based Open Rights Group (http://www.openrightsgroup.org) in November 2005 (Doctorow, 2005).

For members of the blogging community who write irreverently or critically about their work, it has been difficult to avoid the cautionary tales about fired bloggers, and some have responded to the warnings by reevaluating their practice. Many of the anonymous workblogs that flourished in 2004 and 2005 were discontinued by 2006. These included fairly widely read blogs such as *Doing Less Harm*, and the supermarket blog *Life of a Morrison's Employee*, which was suddenly taken down and replaced by a link to an employee forum. Some bloggers removed only their work-related postings, leaving those that could not get them in trouble, while others took down

Figure 2. Graphic promoting the Electronic Frontier Foundation's resources protecting bloggers' rights. (Courtesy Electronic Frontier Foundation. Used with permission.)

their entire blogs. Google's addition of blog searchability in 2005 (Sifry, 2005) made it hard for bloggers to hide in obscurity, creating an additional deterrent for those who wished to blog even occasionally about work. As "Dan," a blogger in the north of England, comments:

One thing I don't write about now, although I used to, is my work. I had written a series of posts, starting out quite harmless, but ending up a lot more risky- there was one all about racist remarks made by a colleague, one comparing a visiting VIP visitor from company HQ to a particularly self-important Roman Emperor, and another about my unwillingness to take on a move to another team because, among other things, it sounded a bit too much like hard work and I would have less time to devote to the blog. I started to worry about being found out (it would at that time have only taken a Google search for my name) so one day took them all down. But those stories are all just in hibernation really and the day will come when they reappear in some untraceable online place – I even have the title of my new blog all worked out. (Dan, personal communication, November 11, 2005)

Dan has been alarmed at the prospect that blogging might threaten his livelihood but he hasn't given up hope of continuing once he has covered his tracks better. However, the concerted effort to protect bloggers' rights indicates a more sustained

threat, made possible by Internet-enabled, loosely networked bloggers who, like Dan, have been temporarily cowed but remain committed to the ideal of non-corporate self-expression.

The Case of Petite Anglaise

Exemplifying this commitment, the 2006 firing of the Paris-based blogger Petite Anglaise, confirms the persistence of recalcitrant blogging despite corporate attempts to control it. Petite, whose real name (as revealed by the press) is Catherine Sanderson, was terminated from the accounting firm of Dixon Wilson in April 2006 after her employer found out about her blog, accused her of blogging on company time, and of potentially bringing the firm into disrepute through her writings. Sanderson, who worked as a bilingual secretary, had never identified the firm or referred to the accounting industry in her blog, and wrote only rarely about incidents at work.

The sacking of Petite was in some ways anachronistic – her firm was notably conservative and clearly oblivious to the learning curve that many organizations have followed with regard to the negative publicity that could result from firing an employee for blogging. However, the case also represented a maturing of the blogging community and confirmed the persistence of anonymous work-blogging in spite of corporate attempts limit or prohibit it. Petite's case highlights widespread attachment in the blogging community to principles of free speech and the right to maintain a detached and even critical orientation to the labor process. Her firing, and the explosive media and Internet coverage that it generated, awakened a "sleeping giant": the possibility that any employee could be connected to a powerful and vocal network. The case also highlighted knowledge workers' dedication to making use of workplace resources and networks for their own creative projects, pursuing self-fulfillment through avenues other than their formal work duties. Further, Petite Anglaise illustrated the power of creative writing itself in cultivating a following, creating a sense of intimacy among a diffuse group of readers, and

Figure 3. One of Petite's postings from July 2006, telling the story of her firing and its aftermath. (© 2006, Catherine Sanderson. Used with permission.)

nurturing countercultural values that clash, albeit subtly, with the idea of job commitment.

Catherine Sanderson started writing *Petite Anglaise* in July 2004 after reading about blogging on *The Guardian*'s website and following links to blogs such as Belle de Jour, the now discontinued blog of a London call girl (Anglaise, 2007a). Writing pseudonymously as "Petite," Sanderson's blog chronicles her personal struggles in raising a child, coping with the ends and beginnings of relationships, and trying to survive financially in the French capital. It was already a relatively popular blog before her firing, commanding a readership of about 3000 visitors per day (Randall, 2006), but this number swelled ten-fold to 30,000 a day immediately afterwards (Frost, 2006).

In Sanderson's entire blog, only a handful of anecdotes pertain to workplace events and characters – Petite gives the number as 12 out of 384 posts (Anglaise, 2006a). In one, "titillation," she describes the accidental baring of her cleavage during a videoconference hookup, making reference to the conservatism and sexism that prevails at the firm. In a passage that was repeatedly cited in the press, she writes of one of the firm's partners: "This other boss is very old school. He wears braces and sock suspenders (although I don't have any firsthand experience of those), stays in gentlemen's clubs when in London, and calls secretaries 'typists'" (Anglaise, 2005b). Petite also intimated in her blog that she had taken time off from work on a false excuse in order to spend time in a hotel room with her new lover (Anglaise, 2005a). And, as became important in the later legal tribunal, it was evident from the timestamps on her blog entries that she had blogged during work hours.

Petite wrote about her firing in July 2006 and was immediately bombarded with comments from readers, provoking interest from a Paris-based *Daily Telegraph* reporter who broke the story in the mainstream press, quoting Sanderson as taking a moral stand, "defining the boundaries between personal and professional activities, where the line should be drawn for bloggers who

touch on the events of their working life in their writing" (Randall, 2006). Multiple press and radio interviews followed and the story was picked up by Associated Press and syndicated worldwide. In *The Guardian*, Petite described herself as a "competent and dependable worker" (Sanderson, 2007), commenting in *The Times* that she objected to otherwise good workers being sanctioned for their blogging activity (Bremner, 2007). In the following months, she was given opportunities to write opinion pieces for *The Guardian* (Sanderson, 2007) and *New Statesman,* and secured a book deal worth close to a million dollars with Penguin (Rickett, 2006). A memoir based on her blog was released in 2008. In March 2007, Petite won a legal victory against her employer, when a French labor tribunal granted an unfair dismissal verdict and ordered her firm to pay 44,000 Euros in damages. She told *The Guardian* that she hoped her case would, "send out reassuring signals to the millions of people blogging in France" (Johnson, 2007).

In the aftermath of Petite's firing, regular followers of the blog were joined by new readers who had heard of Petite's plight, and the slew of comments immediately following the media publicity overloaded the server that hosted Sanderson's blog (Anglaise, 2006a). The comment box at *Petite Anglaise* became a gathering place for people who wanted to offer their sympathies, express their support for free speech, and report on how the story had been covered in their local media. Readers from places as far afield as Estonia and China posted comments about how the story had reached their local and national newspapers. While not all comments were supportive, the vast majority were, leading a reader called O. to comment, "there are literally thousands of readers supporting you," while a visitor called Monty chimed in with, "You represent the people and to all our eyes you are perceived as the victim" (Anglaise, 2006b).

More specifically, Petite's blog became a site where other workers talked about their own fears

about blogging from work. Several "Dooced" bloggers commented about having themselves been fired, and others posted information about employee rights, including the Advisory Conciliation and Arbitration Service (ACAS) Internet guidelines (2006) and the EFF guide to anonymous blogging (2005). A reader called Sydneysnider commented, "hope everyone reading this is unionized" (Anglaise, 2006b). Some readers lamented the increased surveillance that bloggers faced at work – as the labor tribunal commenced, a reader called Morgan wrote, "This e-climate of terror will have most of us censoring ourselves for protection, even though we write because we believe in free speech and rights to personal, non-corporate opinion" (Anglaise, 2007b). Among the comments, were several demonstrations of solidarity with Petite in asserting the right to blog from work, with visitors commenting that they were reading through the comments and posting from work on company computers in their own workplaces. According to one commenter, Petite's fans temporarily detonated a Google bomb (influencing the ranking of a given page in results returned by the Google search engine), associating the search term "Dixon Wilson" with the Wikipedia definition of stupidity (Anglaise, 2006a).

Although most of the comments were one-off remarks, at times, readers responded to each other, building on previous comments and bringing forth diverse viewpoints amidst the largely supportive tone of the discussion. In response to the tribunal result, a reader called Paul Reichel interrupted the generally supportive vein of opinion by posting an opposing view: "You used their time and their facilties [sic] - both of which they and not you had paid for." A debate ensued, with some readers defending Petite's right to blog on company time or to be given fair warning rather than an immediate dismissal, while a smaller number upheld the view that Petite's employer was partly in the right.

The incidents surrounding Petite's firing and subsequent legal proceedings, gave her readers – many of whom were bloggers themselves – an

opportunity to reflect on their orientation to their organizational role and to elevate their acts of creative self-expression onto a plane in which the reclamation of time and resources from the labor process became a communal rather than an individual act. Petite's widely publicized case elevated the everyday acts of resistance undertaken by her audience, imbuing the reading of blogs on company time with moral and political significance. Through engagement in the discussion, readers were able to affirm their ideological distance from corporate values, renewing their commitment to writing anonymously on their own blogs. Regular readers who had been attracted to the blog by the quality of Petite's writing, became united around shared values – such as a lack of job commitment – that were subtly present in the blog before the incident but became overt after the firing. By demonstrating their intellectual sophistication – expressing contempt for tabloid newspapers, for example – Petite's readers attempted to distinguish themselves as educated, critical thinkers, ready to contribute their ideas and analysis to the case.

While Petite's readers made no move toward any kind of long-term political organization, their willingness to engage in discussion about the labor process demonstrated a creative need for unfettered self-expression and a commitment to borrowing time from the work day for dialogue and artistic endeavors. Research on workblogs has indicated that bloggers do not identify their activity as resistance (Richards, 2007), and has highlighted the personal nature of the phenomenon (Lenhart et al., 2006), emphasizing that most anonymous workbloggers blog as an act of creative self-expression rather than an act of defiance. Amidst the media furor over her firing, Sanderson referred to her blog as a personal endeavor, yet acknowledged its inherently public nature: "I've often thought it's a little like being an actor on the stage and not being able to see the audience because of the lights. You can kind of forget that they're there and just write for yourself" (Frost, 2006). Her blog underscores the connection be-

tween creative writing and resistance, reconciling the seeming contradiction between writing that is intimate and personal yet able, albeit ephemerally, to precipitate large-scale political mobilization in support of worker's rights. In the long-term, Petite's blog, and others like it, helps members of the blogging community to strengthen their adherence to iconoclastic values, making subtle connections between their writing and a literary culture that rejects traditional career values and fuels its members' individual efforts to limit their participation in a labor process that they find somewhat alienating.

FUTURE RESEARCH DIRECTIONS

Assessing the potential impact of anonymous workblogging is difficult, since the practice is a moving target that shifts continually in response to workplace computing policies and rapidly evolving Internet technology. The case studies presented here are very specific to the technological and social moment in which they emerged and, as such, they are not presented as generalizable phenomena, but rather as unique manifestations of technologically enabled employee recalcitrance that, it is suggested, is likely to continue in as yet undetermined forms.

Blogging technology is constantly morphing, and blogs themselves will inevitably be replaced by other social technologies. As Internet-enabled cell phones become the norm, reliance on workplace networks in order to blog from work is no longer a necessity, and new developments such as "microblogging" (see Twitter, http://www.twitter.com/) may take advantage of SMS text capabilities, being driven by postings from handheld devices rather than desktop computers.

Some commentators have observed that amateur blogging is already very much on the decline (Boutin, 2008), and that there has been a mass migration to Facebook as an alternative communication medium. Future research might explore whether these developments represent new avenues for dissent, permitting workers to circumvent company network surveillance and use their own wireless technologies for workplace-based resistance. Another relevant task for researchers is to assess the degree to which the human need to elude surveillance drives the development of new Internet technologies, rather than merely responds and adapts to technological developments.

Recent discussion in the media has pointed to concern among neuroscientists that newer tools such as Facebook lack any sustained narrative and lead to atomized and self-absorbed communication. As blogs give way to Twitter and Facebook, it may be interesting to explore the presence (or absence) of narrative in these newer tools, which may have implications in terms of organizing power or media impact.

Workplace policies and management ideology must be a central focus of future research and must be regarded as in dialogue with emerging technologies and behaviors. An intriguing issue, as blogging morphs into newer forms of social technology, is whether workers will be able to stay one step ahead of workplace policies, creating new opportunities for disruption of the labor process. Today's anonymous workbloggers could be tracked longitudinally to see how they take advantage of emerging tools, while also scanning emerging Internet-based social realms for new voices of resistance. In broadening the analysis, it may be interesting to move beyond the study of workblogging and related practices in purely Western contexts, and incorporating a more international perspective on what is essentially a global phenomenon.

CONCLUSION

From the employer's perspective, blogging has presented a form of trust-tension (Guerra et al., 2003), where free-flowing information is necessary to organizational health, yet lack of control

over how this information is used creates a sense of over-exposure and vulnerability. Drawing on critical management literature, this chapter has shown how organizations have coped with the anonymous workblogging phenomenon, revealing limitations of punitive anti-blogging policies and questioning blogging strategies that promote transparency between workers and employers.

Critics of corporate culture such as Hochschild (1997), Ross (2002) and, in the UK, Bunting (2004), have argued that the colonization of workers' emotions and creative impulses in the service of salaried time has led to overwork, time-scarcity, and neglected families and communities. Looking at workers in a high-tech environment who are simultaneously seduced by the company culture yet wary of its encroachment into their private space, Kunda (1992) adds an important and subtle dimension to this analysis, focusing on how white-collar workers engage in minor acts of resistance yet, in the absence of a compelling alternative, return to the organization as their principal source of affirmation. Thompson and Ackroyd (1995) have criticized Kunda for promoting a "Foucauldian turn" in organizational sociology that forecloses the possibility of resistance in the knowledge workplace. They advocate a revival of academic research into informal and subtle forms of resistance.

The mainstream media, in covering the high profile cases of fired bloggers, has often treated anonymous workblogging as a political phenomenon, characterizing bloggers as recalcitrant employees engaged in conscious acts of rebellion. However, recent studies of blogging have cautioned against regarding the workblogging phenomenon as a conscious act of defiance and have downplayed the idea of blogs as public forums for rhetoric and debate (Lenhart et al., 2006; Richards, 2007). Yet, analysis of the relationship between personal creative writing and political mobilization in the blogosphere reveals a subtle yet concrete process of ideological convergence around anti-corporate, anti-work, and generally iconoclastic values that represent a firm and sustained detachment by some bloggers and their readers from the labor process in which they are engaged.

The containment of blogging through periodic tightening of Internet surveillance and institution of blogging guidelines has stifled workplace and work-themed blogging. Furthermore, corporate blogging policies that cautiously welcome employee bloggers under a banner of mutual trust and openness, have promoted the idea that anonymous bloggers are morally questionable. However, as recent high-profile workblogging controversies have illustrated, anonymous blogging is a potentially disruptive, highly networked phenomenon that makes use of rapidly evolving Internet technologies to create new opportunities for dialogue and action.

Anonymous workblogging highlights a kind of trust-tension in organizations that require free-flowing information for their health, yet might be threatened by over-exposure in the blogosphere or the media. Efforts to suppress anonymous blogging by increasing surveillance and discouraging the practice through written policies have encountered ideological limitations, since they clash with corporate culture based on employee freedom and self-management. Some of these limitations have been surmounted by the powerful new corporate strategy of permitting blogging as an integral aspect of the corporate culture and encouraging employees to blog openly and candidly about their work. Yet, although this "corporate blogging" strategy has garnered vocal support from prominent employees of influential organizations and has been hailed as a moral victory over anonymous blogging, employer-sanctioned blogs fail to accommodate the continued need for unfettered critical distancing from the labor process. As newer technologies are ushered in, the viability of management philosophies that are based on openness and trust remains an intriguing question.
