Volume I

Section 1
Fundamental Concepts and Theories

This section serves as a foundation for this exhaustive reference tool by addressing underlying principles essential to the understanding of Human Resources Management. Chapters found within these pages provide an excellent framework in which to position Human Resources Management within the field of information science and technology. Insight regarding the critical incorporation of global measures into Human Resources Management is addressed, while crucial stumbling blocks of this field are explored. With 11 chapters comprising this foundational section, the reader can learn and chose from a compendium of expert research on the elemental theories underscoring the Human Resources Management discipline.

Section 2
Development and Design Methodologies

This section provides in-depth coverage of conceptual architecture frameworks to provide the reader with a comprehensive understanding of the emerging developments within the field of Human Resources Management. Research fundamentals imperative to the understanding of developmental processes within Human Resources Management are offered. From broad examinations to specific discussions on methodology, the research found within this section spans the discipline while offering detailed, specific discussions. From basic designs to abstract development, these chapters serve to expand the reaches of development and design technologies within the Human Resources Management community. This section includes 10 contributions from researchers throughout the world on the topic of Human Resources Management.

Section 3
Tools and Technologies

This section presents an extensive coverage of various tools and technologies available in the field of Human Resources Management that practitioners and academicians alike can utilize to develop different techniques. These chapters enlighten readers about fundamental research on the many tools facilitating the burgeoning field of Human Resources Management. It is through these rigorously researched chapters that the reader is provided with countless examples of the up-and-coming tools and technologies emerging from the field of Human Resources Management. With 11 chapters, this section offers a broad treatment of some of the many tools and technologies within the Human Resources Management field.

Volume II

Section 4
Utilization and Application

This section discusses a variety of applications and opportunities available that can be considered by practitioners in developing viable and effective Human Resources Management programs and processes. This section includes 10 chapters that review topics from best practices in Asia to ongoing research in the United States. Further chapters discuss Human Resources Management in a variety of settings (business process modeling, succession planning, outsourcing, etc.). Contributions included in this section provide excellent coverage of today's IT community and how research into Human Resources Management is impacting the social fabric of our present-day global village.

Section 5
Organizational and Social Implications

This section includes a wide range of research pertaining to the social and behavioral impact of Human Resources Management around the world. Chapters introducing this section critically analyze and discuss trends in Human Resources Management, such as transnational learning, collaboration, action research, and SME success factors. Additional chapters included in this section look at ICT policies and organizational justice. Also investigating a concern within the field of Human Resources Management is research which discusses the effects of trust in Human Resources Management. With 10 chapters, the discussions presented in this section offer research into the integration of global Human Resources Management as well as implementation of ethical and workflow considerations for all organizations.

Section 6
Managerial Impact

This section presents contemporary coverage of the social implications of Human Resources Management, more specifically related to the corporate and managerial utilization of information sharing technologies and applications, and how these technologies can be extrapolated to be used in Human Resources Management. Core ideas such as motivation, gender equality, recruiting, and other determinants that affect the intention to adopt technological innovations in Human Resources Management are discussed. Equally as crucial, chapters within this section discuss how leaders can utilize Human Resources Management applications to get the best outcomes from their employees and customers.

Volume III

Section 7
Critical Issues

This section contains 11 chapters, giving a wide variety of perspectives on Human Resources Management and its implications. Such perspectives include reading in fair compensation, fulfillment, ethics, and several more. The section also discusses new considerations within organizational culture and group dynamics. Within the chapters, the reader is presented with an in-depth analysis of the most current and relevant issues within this growing field of study. Crucial questions are addressed and alternatives offered, such as "information processing theory and incentivizing."

Section 8
Emerging Trends

This section highlights research potential within the field of Human Resources Management while exploring uncharted areas of study for the advancement of the discipline. Introducing this section are chapters that set the stage for future research directions and topical suggestions for continued debate, centering on the new venues and forums for discussion. A pair of chapters on human resource flexibility makes up the middle of the section of the final 11 chapters, and the book concludes with a look ahead into the future of the Human Resources Management field, with "Anonymous Workblogging and Organizational Coping Strategies." In all, this text will serve as a vital resource to practitioners and academics interested in the best practices and applications of the burgeoning field of Human Resources Management.

Preface

The constantly changing landscape of Human Resources Management makes it challenging for experts and practitioners to stay informed of the field's most up-to-date research. That is why Information Science Reference is pleased to offer this three-volume reference collection that will empower students, researchers, and academicians with a strong understanding of critical issues within Human Resources Management by providing both broad and detailed perspectives on cutting-edge theories and developments. This reference is designed to act as a single reference source on conceptual, methodological, technical, and managerial issues, as well as provide insight into emerging trends and future opportunities within the discipline.

Human Resources Management: Concepts, Methodologies, Tools and Applications is organized into eight distinct sections that provide comprehensive coverage of important topics. The sections are: (1) Fundamental Concepts and Theories, (2) Development and Design Methodologies, (3) Tools and Technologies, (4) Utilization and Application, (5) Organizational and Social Implications, (6) Managerial Impact, (7) Critical Issues, and (8) Emerging Trends. The following paragraphs provide a summary of what to expect from this invaluable reference tool.

Section 1, **Fundamental Concepts and Theories**, serves as a foundation for this extensive reference tool by addressing crucial theories essential to the understanding of Human Resources Management. Introducing the book is "*The War for Talent*" by Ricardo Colomo-Palacios *et al.*, a great foundation laying the groundwork for the basic concepts and theories that will be discussed throughout the rest of the book. Another chapter of note in Section 1 is titled "*Strategic Human Resource Management and Organizational Performance*" by P. Kumari and P.C. Bahuguna, which discusses the interesting progress of HRM and organizational performance both. Section 1 concludes, and leads into the following portion of the book with a nice segue chapter, "*Human Resource Development and Technology Integration,*" by Jia Wang. Where Section 1 leaves off with fundamental concepts, Section 2 discusses architectures and frameworks in place for Human Resources Management.

Section 2, **Development and Design Methodologies**, presents in-depth coverage of the conceptual design and architecture of Human Resources Management, focusing on aspects including statistical analysis, sales management, recruitment and retention, performance appraisal, and many more. Opening the section is "*HRM Adaptation to Knowledge Management Initiatives*" by José Luis Pineda, Jacobo Ramírez, and Laura Zapata-Cantú. This section is vital for developers and practitioners who want to know how to begin a process of HRM on a fundamental level. Through case studies, this section lays excellent groundwork for later sections that will get into present and future applications for Human Resources Management, including, of note: "*The Competency-Based Human Resource Management Model*" by Susana de Juana-Espinosa and Jorge Valdés Conca, and "*Human Resource Related Problems in Agile and Traditional Software Project Process Models*" by Stefan Koch and Gerhard Turk. The sec-

tion concludes with an excellent work by Dezhi Wu, titled "*Investigating Temporal Structure Usage in Individual Time Management Practices.*"

Section 3, **Tools and Technologies**, presents extensive coverage of the various tools and technologies used in the implementation of Human Resources Management. Section 3 begins where Section 2 left off, though this section describes more concrete tools at place in the modeling, planning, and production of Human Resources Management. The first chapter, "*Team Dynamics in Virtual Spaces,*" by Allen Kitchel and Martha C. Yopp, lays a framework for the types of works that can be found in this section, a perfect resource for practitioners looking for new ways to benchmark progress and assess quality in the field. Section 3 is full of excellent chapters like this one, including such titles as "*Sources of Legitimacy for the M-Government Initiatives in Turkey,*" "*Lotus Workforce Management,*" and "*Applicability Assessment of Semantic Web Technologies in Human Resources Domain*" to name a few. Where Section 3 described specific tools and technologies at the disposal of practitioners, Section 4 describes successes, failures, best practices, and different applications of the tools and frameworks discussed in previous sections.

Section 4, **Utilization and Application**, describes how the broad range of Human Resources Management efforts has been utilized and offers insight on and important lessons for their applications and impact. Section 4 includes the widest range of topics because it describes case studies, research, methodologies, frameworks, architectures, theory, analysis, and guides for implementation. Topics range from business process modeling, adequacy, attrition, and outsourcing, to more specific looks at case studies from around the world. The first chapter in the section is titled "*Budding Researchers in the Humanities,*" which was written by Vander Viana *et al*. The breadth of topics covered in the chapter is also reflected in the diversity of its authors, from countries all over the globe, including UK, Greece, Australia, Spain, Saudi Arabia, Portugal, New Zealand, USA, and more. Section 4 concludes with an excellent view of a case study in transaction-specific assets, "*Investment in Transaction-Specific Assets and Opportunistic Behavior in a Chinese Supply Chain*" by Barbara Flynn, Yi Liu, Liping Qian, and Xiande Zhao.

Section 5, **Organizational and Social Implications**, includes chapters discussing the organizational and social impact of Human Resources Management. The section opens with "*Transnational Learning and Collaboration in Delivering MBA Programs in Emerging Markets*" by Stephanie Jones. Where Section 4 focused on the broad, many applications of Human Resources Management technology, Section 5 focuses exclusively on how these technologies affect human lives, either through the way they interact with each other, or through how they affect behavioral/workplace situations. Other interesting chapters of note in Section 5 include "*Cross-Cultural Learning and Intercultural Competence*" by Pi-Chi Han and "*Communicating in Multicultural Firms*" by Jakob Lauring and Anders Klitmøller. Section 5 concludes with a fascinating study of a new development in Human Resources Management, in "*Assessment of Web 2.0 Applications Employed by Human Resource Departments in U.S. Cities.*"

Section 6, **Managerial Impact**, presents focused coverage of Human Resources Management as it relates to effective uses of knowledge management, motivation, gender equality, talent management, output management, recruiting, and many more utilities. This section serves as a vital resource for developers who want to utilize the latest research to bolster the capabilities and functionalities of their processes. The section begins with "*Managing Professions for Knowledge Management,*" a great look into how small firms can utilize benefits previously thought to be reserved to their larger competitors. The 11 chapters in this section offer unmistakable value to managers looking to implement new strategies that work at larger bureaucratic levels. The section concludes with "*Human Capital Management and Optimization*" by Jürgen Mühlbacher. Where Section 6 leaves off, section seven picks up with a focus on some of the more content-theoretical material of this compendium.

Section 7, **Critical Issues**, presents coverage of academic and research perspectives on Human Resources Management tools and applications. The section begins with "*Issues Influencing Electronic Commerce Activities of SMEs*," by Sitki Gözlü and Muammer Zerenler. Other issues covered in detail in Section 7 include human resource development, ethics, psychological contracts, incentives, job responsibilities, organizational culture, and much more. The section concludes with "*'We don't have the Key to the Executive Washroom'*" by Jessica Guth and Fran Wright, a great transitional chapter between Sections 7 and 8 because it examines an important question going into the future of the field. The last chapter manages to show a theoretical look into future and potential technologies, a topic covered in more detail in Section 8.

Section 8, **Emerging Trends**, highlights areas for future research within the field of Human Resources Management, opening with "*Innovations in Technology for Educational Marketing*" by John Rutaisire. Section 8 contains chapters that look at what might happen in the coming years that can extend the already staggering amount of applications for Human Resources Management. Other chapters of note include "*Re-Theorizing Human Resource Management and Human Resource Management in Context*" and "*Key Capabilities, Components, and Evolutionary Trends in Corporate E-Learning Systems.*" The final chapter of the book looks at an emerging field within Human Resources Management, in the excellent contribution, "*Anonymous Workblogging and Organizational Coping Strategies*" by Abigail Schoneboom.

Although the primary organization of the contents in this multi-volume work is based on its eight sections, offering a progression of coverage of the important concepts, methodologies, technologies, applications, social issues, and emerging trends, the reader can also identify specific contents by utilizing the extensive indexing system listed at the end of each volume. Furthermore to ensure that the scholar, researcher, and educator have access to the entire contents of this multi volume set as well as additional coverage that could not be included in the print version of this publication, the publisher will provide unlimited multi-user electronic access to the online aggregated database of this collection for the life of the edition, free of charge when a library purchases a print copy. This aggregated database provides far more contents than what can be included in the print version, in addition to continual updates. This unlimited access, coupled with the continuous updates to the database ensures that the most current research is accessible to knowledge seekers.

As a comprehensive collection of research on the latest findings related to using technology to providing various services, *Human Resources Management: Concepts, Methodologies, Tools and Applications*, provides researchers, administrators and all audiences with a complete understanding of the development of applications and concepts in Human Resources Management. Given the vast number of issues concerning usage, failure, success, policies, strategies, and applications of Human Resources Management in countries around the world, *Human Resources Management: Concepts, Methodologies, Tools and Applications* addresses the demand for a resource that encompasses the most pertinent research in technologies being employed to globally bolster the knowledge and applications of Human Resources Management.

Section 1
Fundamental Concepts and Theories

This section serves as a foundation for this exhaustive reference tool by addressing underlying principles essential to the understanding of Human Resources Management. Chapters found within these pages provide an excellent framework in which to position Human Resources Management within the field of information science and technology. Insight regarding the critical incorporation of global measures into Human Resources Management is addressed, while crucial stumbling blocks of this field are explored. With 11 chapters comprising this foundational section, the reader can learn and chose from a compendium of expert research on the elemental theories underscoring the Human Resources Management discipline.

Chapter 1

The War for Talent:
Identifying Competences in IT Professionals through Semantics

Ricardo Colomo-Palacios

ABSTRACT

In current organizations, the importance of knowledge and competence is unquestionable. In Information Technology (IT) companies, which are, by definition, knowledge intensive, this importance is critical. In such organizations, the models of knowledge exploitation include specific processes and elements that drive the production of knowledge aimed at satisfying organizational objectives. However, competence evidence recollection is a highly intensive and time consuming task, which is the key point for this system. SeCEC-IT is a tool based on software artifacts that extracts relevant information using natural language processing techniques. It enables competence evidence detection by deducing competence facts from documents in an automated way. SeCEC-IT includes within its technological components such items as semantic technologies, natural language processing, and human resource communication standards (HR-XML).

INTRODUCTION

The use of IT solutions has become a key issue in many organizations worldwide. Organizations currently use multiple IT/IS solutions to support their activities at all management levels (Trigo, Varajao, & Barroso, 2009). Software costs as a percentage of total computer system costs continue to increase; while associated hardware costs continue to decrease (Huang & Lo, 2006). Software development is a collaborative and knowledge

intensive process where success depends on the ability to create, share and integrate information (Walz et al., 1993), among other factors. Software development is an intense human capital activity, especially intense in intellectual capital (Sommerville & Rodden, 1996). Although the importance of human factors has been widely recognized as key for software engineering, researchers should put a larger focus on the humans involved in software engineering than what has been done to date (Feldt et al., 2008). However, poor management of human factors in technical projects, and software engineering projects can be considered as technical projects, can hinder the use and effectiveness of technology (Ives & Olsen, 1984).

Individual differences have been identified as one of the paradigms for the research of human factors in software development (Curtis, 2002). IT workers' professional practice must be continually revised and improved in order to adapt workers competences to technical innovations, and their soft skills to evolving markets (Casado-Lumbreras et al., 2009). In this scenario, competence at the individual level is required for the creation of core competence, which is crucial for today's organizations at the structural level (Bassellier, Reich, & Benbasat, 2001). But in spite of this importance, the world is facing an IT professionals shortage. Thus, attracting students in order to shape tomorrow's labor horizon has become a major issue of concern in educational institutions (Garcia-Crespo et al., 2009). According to the analysis by Morello, Kyte, and Gomolsky (2007), many young people see IT as an unattractive career option: it is both hard work and "uncool". Additionally, this negative image is confirmed by the paradox that the strategic contribution of IT is recognized within enterprises, but the status of the IT department is low (Avison, Cuthbertson, & Powell, 1999). The shortage of IT professionals has been pointed out by many authors (e.g., Acharya & Mahanty, 2008; Agarwal & Ferratt, 2002; Mithas & Krishnan, 2008; Wells & Bogumil, 2001). As a consequence of this, the war for talent (Michaels, Handfield-

Jones, & Axelrod, 2001) in the IT sector has its battlefield outside and inside the company and the internal recruitment of professionals must be done basing selection requirements against competence evidences. But in spite of the importance of competence evidences and knowledge sharing proficiencies pointed out by Liebowitz (2009), only a small number of companies have access to this data and develop their repository throughout the year.

Given the need of the corporations around the world to get competence evidences in a trusted and automatic way SeCEC-IT is presented in this paper. SeCEC-IT is a tool that based on the work performed by IT professionals in the context of software engineering development projects, extracts relevant information from software artifacts (programs, documents,…) using natural language processing and enables competence evidence detection by deducing competence facts in an automated and semantic way. These competence facts can be transferred to common human resource management tools that can exploit this information using competency management interchange standards so that it can be used for internal recruiting to projects, or to support knowledge management issues.

The remainder of this paper is organized as follows: the relevant literature in the collection of competence evidences is outlined and the main research efforts about semantic technologies are summarized. The architecture for the SeCEC-IT approach is presented along with the description of the implementation of the proof of the concept architecture. Finally, conclusions, implications for HRM, and future work are discussed.

COLLECTING EVIDENCES OF COMPETENCE

Competences and competence management has proved to be an extremely important area of study including fields such as pedagogy, psychology,

and technology. The term "competence" has been applied in reference to many different domains of behavior (Waters & Sroufe, 1983). Anderson and Messick (1974) have catalogued 29 diverse referents ranging from specific skills (fine motor dexterity) to abstract concepts such as consolidation of identity.

According to McClelland (1973), competency is comprehended as the relation between humans and work tasks, that is, the concern is not about knowledge and skills in itself, but what knowledge and skills are required to perform a specific job or task in an efficient way (McClelland, 1973). In a subsequent analysis of the term in the scientific literature, Draganidis and Mentzas (2006) state that a competency must be defined in terms of:

- Category. A group to which homogeneous and/or similar competencies belong;
- Competency. A descriptive name for the specific competency;
- Definition. Statement(s) that explains the basic concept of this competency;
- Demonstrated behavior. Behavior indicators which an individual should demonstrate if the specified competency is possessed.

The competence approach was a major innovation in the human resource development field in the 1990s (Collin & Holden, 1997). McClelland (1987) suggested that competence ought to become the basis for more effectively predicting individual performance in organizations. Moreover, competences can be defined as features related to effective working performance (Boyatzis, 1982). That could be the reason why competence is often used in the sense of performance, however, this is not entirely accurate (Bassellier, Horner Reich, & Benbasat, 2001). Nonetheless, competence is a factor that, coupled with motivation, effort and supporting conditions, may have a direct impact on performance (Schambach, 1994).

In the IT field there are many attempts to adopt and study the competence paradigm in various areas (e.g., Acuña & Juristo, 2004; Colomo-Palacios et al., 2010; Ruano-Mayoral et al., 2010; Trigo et al., 2010; Turley & Bieman, 1995). However, competence evidence collection, in general, and in software development teams, in particular, has received little attention in both theory and practice. In the work of Ruano-Mayoral et al. (2007) an antecedent of the system presented in this paper is presented. This system is a mobile tool to collect and store competence evidences, however, the collection of such evidences is performed manually. Taking this antecedent into account, the main purpose of this paper is to present a tool aimed to detect and classify competence evidences within software development projects through using software artifacts in an automated and semantic way.

SEMANTICS: A NEW PARADIGM ENABLED BY TECHNOLOGY

The information contained in Web pages was originally designed to be human-readable. As the Web grows in both size and complexity, there is an increasing need for automating some of the time consuming tasks related to Web content processing and management.

In this scenario, the Semantic Web can be seen as a vision for the future of the World Wide Web, where the unit of information is the data, instead of the web page as in the traditional Web. Around that vision of a web of data, the W3C consortium has promoted the development of several technologies to describe resources by means of ontologies and rules. The Semantic Web represents a revolution in many senses. The term "Semantic Web" was coined by Berners-Lee, Hendler and Lassila (2001), to describe the evolution from a document-based web towards a new paradigm that includes data and information for computers to manipulate. Ontologies (Fensel, 2002) are the technological

cornerstones of the Semantic Web, because they provide structured vocabularies that describe a formal specification of a shared conceptualization. Ontologies were developed in the field of Artificial Intelligence to facilitate knowledge sharing and reuse (Fensel et al., 2001). Ontologies provide a common vocabulary for a domain and define, with different levels of formality, the meaning of the terms contained, and the relations between them. Knowledge in ontologies is mainly formalized using five kinds of components: classes, relations, functions, axioms, and instances (Gruber, 1993). The theory which supports the use of ontologies is a formal theory within which not only definitions but also a supporting framework of axioms is included (Smith, 2003).

Taking full advantage of ontologies, the Semantic Web provides a complementary vision as a knowledge management environment (Warren, 2006) that, in many cases has expanded, and replaced, previous knowledge and information management archetypes (Davies, Lytras, & Sheth, 2007). Thus, the Semantic Web has emerged to be a new and highly promising context for knowledge and data engineering (Vossen, Lytras, & Koudas, 2007). The goals of the Semantic Web initiative include the integration of data from different sources in a machine processable format in order to make them accessible to computer programs and facilitating the use of data in ways that had not been thought of when the data was entered or recorded (Battré, 2008). It is agreed that the semantic enrichment of resources would lead to better search results (Scheir, Lindstaedt, & Ghidini, 2008). In this new scenario, the challenge for the next generation of the Social and Semantic Webs is to find the right match between what is put online, and methods for doing useful reasoning with the data (Gruber, 2008).

There are several works that reflect the importance of semantic technologies and their impact in competence systems and models. Semantic technology has been applied for project management teams construction (Gómez-Berbís et al., 2008);

knowledge management for software projects (Colomo-Palacios et al., 2008); technical competence assessment (Colomo-Palacios et al., 2010); knowledge sharing and reuse (Lanzenberger, 2008); assisting the learning process (Naeve, Sicilia, & Lytras, 2008; Collazos & García, 2007); competence development efforts (Dodero et al., 2007); or assisting work assignment (Macris, Papadimitriou, & Vassilacopoulos, 2008); to cite some of the most recent initiatives.

SeCEC-IT: ARCHITECTURE AND CASE STUDY

One of the key elements in the SeCEC-IT picture is capturing competence evidences and enabling internal and established Human Resource Management (HRM) solutions to use them. Due to this potential, the reliability and precision of the competence evidences and their usability will be drastically increased. On the other hand, there is a need to develop a solution that could interconnect with a set of companies. The best tool for this purpose is the HR-XML standard.

The HR-XML Consortium is an independent, nonprofit organization dedicated to the development and promotion of a standard suite of XML specifications to enable e-business and the automation of human resources-related data exchanges. SIDES, one of the recommendations published by the HR-XML Consortium can be seen as a suite of data exchange standards for staffing issues. One of the multiple parts of SIDES is a competence schema designed to fulfill the following requirements (Allen, 2003):

- The competence schema is simple and sufficiently flexible and generalized so that it is useful within a variety of business contexts;
- The schema provides structure to enable competences to be easily compared, ranked, and evaluated;

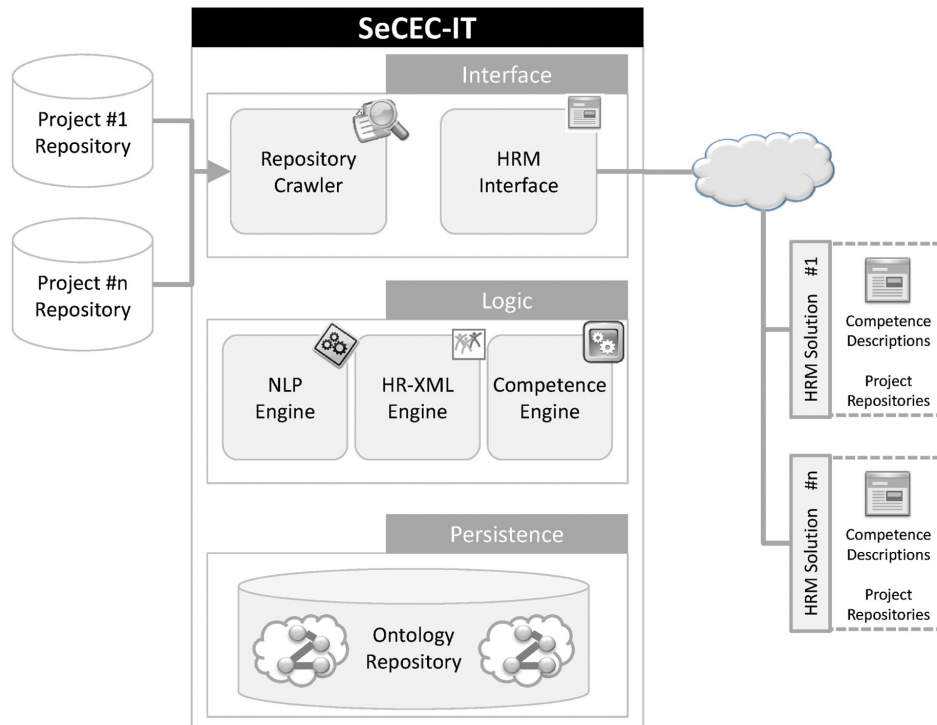
- The schema is capable of referencing competence taxonomies from which competence descriptions were taken or used;
- The competence schema is relatively simple and compact so that it does not add to the complexity of the process-specific schemas within which it is used.

For the purpose of our work, the competence schema allows integration with other Human Resources Management Systems but, to achieve the full capacity of competence analysis that this framework seeks, it is necessary to build an extension of the competence schema to store some extra information about each competence evidence. The extension was used by the authors in the past and can be found in Ruano-Mayoral et al. (2007).

In what follows an explanation of SeCEC-IT will be given showing its architecture and a use case.

ARCHITECTURE

The architecture of SeCEC-IT is based on component groups that interact among themselves, to offer an automatic solution to the problem proposed. The conjunction of these systems permits the correct operation of the whole set of components, and obtaining the necessary data to achieve the desired outcome. Since interoperability is one of the most challenging problems in modern cross-organizational information systems (Mocan et al., 2009), much emphasis is put on interoperability issues, done via web services. The final architectural approach is a tailor-made value-added technological solution. Components might be related to the behavior as specified in the collaboration among those elements, turning those structural and behavioral elements into progressively larger subsystems, and the architectural style that guides this organization. Figure 1 shows how these different subsystems communicate and the

Figure 1. System architecture


flow of exchanged messages, in order to process the final system response. In the following sections the internal working of every element will be detailed.

As mentioned above, the architecture is comprised of three operating layers or subsystems. Firstly, the interface layer is composed by a number of interfaces through which end systems can interact with SeCEC-IT. Secondly, the logic layer encompasses the reasoning, inference, and business logic management functionalities. Finally, the persistence and storage layer is composed by semantic repositories, storing the competence evidence ontology. In the following, we will detail several of the core components in each layer.

- INTERFACE. This layer presents two components, namely HRM Interface and Repository crawler.
  - HRM Interface. This component allows the communication with external HRM solutions using a web service. Three different kinds of data are exchanged:
    - Competence descriptions included in HRM Solutions. These descriptions will feed the crawler that will seek relevant information relative to these descriptions in the set of software artifacts.
    - Instructions of how to locate and reach project repositories (URL).
    - HR-XML formats containing information elaborated by the system that is transmitted to HRM external systems in response to a given query.
  - Repository Crawler. This component, given a project repository, 'crawls' documents and sends them to the NLP engine in search of competence evidences.

- LOGIC. This layer provides cutting-edge functionalities through the following components:
  - NLP engine. Given a (set of) document(s) in a project repository and a set of human resources, NLP seeks for relevant competence evidences, such as participation of a programmer in a requisite extraction process. In this module several well known tools are implemented, including GATE to syntactic annotate noun phrases and JAPE to extract all phrases related to competence evidences. Once a competency evidence is found, the Competence Engine will be responsible of its classification and storage.
  - HR-XML Engine. This component constructs a valid HR-XML document from a query by reading data in the persistence layer, and returns this document to the interface layer, in order to be delivered to the external system.
  - Competence Engine. Is responsible for dealing with the competence ontology and stores information of competency evidences in the persistence layer. It hides competence complexity to other components of the system.
- PERSISTENCE. Finally, the persistence layer stores the knowledge about the competence evidences. On the one hand, the Competence ontology defines the relevant characteristics of each competence. All this information is used to describe competences suitable for our system (technical competence). This ontology has been defined using the Ontology Web Language (OWL) (Bechhofer et al., 2004). The storage and ontology reasoning has been developed based on the Jena framework.

On the other hand, the competence evidences and their location relative to their project repositories are also stored in a database. Both the competence ontology schema and its populated instances are stored in the KAON2 ontology repository. KAON2 is an infrastructure for managing OWL-DL ontologies. In the case of SeCEC-IT, Jena is the backbone technology that relies on a MySQL database. Jena is a framework for building Semantic Web applications that provides a programmatic environment for RDF, RDFS and OWL, SPARQL and includes a rule-based inference engine.

About implementation and internals, SeCEC-IT is a Web based application build under Java EE (by using Java Enterprise Edition 5 SDK). Business logic design was done using MagicDraw. This tool enables Model Driven Architecture (MDA) architecture and automatic code generation by using AndroMDA.

The Java-based tool RACER is also implemented. RACER reasoning engine and the Jena framework are crucial for the business logic manager layer, the former for the reasoning and the latter for the RDF Management and SPARQL Querying. Lastly, JAXB is used for XML handle (in order to communicate with others) and JENA 2 for ontology information issues.

USE CASE

To explain the realization of SeCEC-IT in a functional environment, as referred before, a use case is now described.

The software development company SEMDEV would like to implement a new knowledge management and competence management program. The final aim of this program is to assign people to projects basing these decisions in resource availability and competence. Now managers perform project staffing currently just by using availability and through using informal information, but the company owners want to implement a more scientific approach that permits personnel assignation closing the gap between competence and project role.

SEMDEV sends to SeCEC-IT the information needed to start the crawling process. Firstly, the access to current software development projects repositories (giving an external granted access to a PDF and code repository), on the other hand, the set of competences and human resources aimed for SEMDEV. These competences are adapted to SeCEC-IT competence ontology and the crawling process starts. The Repository Crawler component looks for relevant information in the repository and sends relevant information to the NLP Engine. This component extracts relevant competence evidences from documents and sends this information to the Competence Engine. The Competence Engine populates the competence ontology by creating a number of instances for given competences and human resources.

For example, the analysis of a number of software artifacts may imply that the resource RCP is competent in Requirements Engineering, but his results in Software Testing are low according to several comments in their proofs. The Competence Engine will store this information in the Persistence Layer that will be stored in the KAON2 ontology repository. Once all documents are crawled, the system regularly performs an update check in order to find out if there are new versions of documents and, thus, new competence evidences.

Later on, SEMDEV implants a HRM tool (such as Meta4 PeopleNet) to support competence development and management as well as project staffing based on competences. In this new scenario, SEMDEV human resource administrators can ask SeCEC-IT for competence evidences. Let's imagine that more information about competence evidences are needed for RCP. In this case, PeopleNet could ask to SeCEC-IT for this information using the HRM Interface. Once this order is received, the HR-XML engine extracts this information from the Ontology Repository

using SPARQL and forms a correct HR-XML format in order to be sent to PeopleNet using the HRM Interface.

CONCLUSION AND FUTURE WORK

The advent of the information age represents both a challenge and an opportunity for knowledge and competence management. New forms of knowledge extraction and expert location are deeply impacting companies around the world. IT companies are facing a war for talent in which, every project must be scheduled according to the availability of resources and their competences. In this new scenario, counting on with tools to seek competency in work environment can enable a better personnel management that could be a competitive advantage for the company.

SeCEC-IT, following the path of some previous works (Colomo-Palacios et al., 2008; Colomo-Palacios et al., 2010; García-Crespo et al., 2009; Ruano-Mayoral et al., 2007) brings new features to competence management in software development projects: the transformation of plain text to competence evidences in an automatic way. This competence evidences could be used, by means of the interfaces implemented, for staffing and teaming purposes or as a support to performance appraisal.

But SeCEC-IT is not only relevant for IT professionals and managers. Counting on a tool that can derive competency evidences directly from software artifacts could be a competitive advantage for the firm. Moreover, HRM personnel could also benefit from this. Having in mind that sometimes IT workers perform a highly technical work, it's very difficult for HRM departments to infer competency from their work without the assistance of an IT manager a highly IT qualified individual. But, having in mind the lack of available time, it's sometimes difficult for HRM personnel to know the competency levels of IT professionals apart from the yearly assessment. This information could be of great benefit for the corporation and its applications are multiple: improve the person-role fit, detect competency gaps, improve internal recruitment process and perk up professional development and career planning.

Taking into account the possibilities initiated by the current research effort, four separate lines of future research may be considered. In the first place, the integration of certain Web 2.0 contents as a source for competence evidences. In the second place, authors suggest to expand the possibilities of the system to deal with cultural, gender and performance differences. In the third place, integrate the tool into a wider program in which affective factors pointed out by Smith (2010) must be taken into account. Lastly, it is aimed to integrate SeCEC-IT in Computer Aided Software Engineering tools and, in particular, in effort and duration estimation tools for software development projects.

Chapter 2
East and West, Past and Present:
Rekindle Old Principles for New Management Practices

Connie Zheng
Deakin University, Australia

ABSTRACT

This paper explores the sayings and stories of the ancient Chinese philosophers Guanzi, Hanfeizi, Xunzi and Yanzi. Their way of ruling the state and managing the people are analysed and discussed in line with thoughts from the mainstream and modern Western management gurus, such as Warren Bennis, Peter Drucker, Mary Parker Follett, Douglas McGregor, Rosabeth Moss Kanter, Elton Mayo, and Jeffrey Pfeffer. Striking similarities call for addressing key issues in human resource management. East and west thinkers across 3000 years are identified. The principles-based ruling and management were found difficult to be taken seriously in ancient times as it is today. However, these principles must be rekindled to protect organisations and the world from mischievous behaviour that has caused much human suffering.

INTRODUCTION

In the time of crisis, it is good to reflect old and new wisdom to guide our path ahead. It is the intention of this paper to reflect the sayings and stories of ancient Chinese sages. These ancient texts are compared with the writings of respected Western management scholars. We find striking similarities in the thoughts and calls for action between ancient eastern and contemporary western thinkers across thousands years. We conclude that if these ancient and modern management thoughts had been put into practice more widely, the world may have had to deal with fewer corporate corruption scandals and dysfunctional state behaviours. Rather, we may have been witnesses to more productive populations, more effective organisations, more ethical governments and a more harmonious en-

vironment, with a consequent reduction in global human suffering. We note, *en passant*, that many of the ancient sayings to which we refer were directed to the proper way of ruling the state, and often addressed to kings and lords. Nonetheless, the principles contained in these sayings and stories have been passed on through generation after generation and now appear in contemporary Chinese organisational settings. Accordingly, we draw on these sayings in the same way the insights presented in *Il Principe* (*The Prince*) by Niccolò Machiavelli (Skinner & Price, 1988) have been used to inform discussions of various aspects of organisation and management.

Management Principles According to Chinese Sages and Modern Gurus

In discussing ancient Chinese philosophy and thinking, the western management literature tends to focus on the work of Kongzi (Confucius) in *Analects* and Sunzi or Sun Tze in *the Art of War* (focusing on strategy). We do not reflect on Kongzi or Sunzi, whose works have been well dissected in other places. Rather, our focus is on other sages such as Guan zi, Hanfei zi, Xun zi and Yanzi (note: Zi used in ancient Chinese means 'Teacher or Master'), to whom much less attention has been paid. Their thoughts, on inspection, appear to parallel those of such modern management gurus as Warren Bennis (Bennis & Nanus,1985; Bennis & Thomas, 2002), Peter Drucker (1954, 1967), Mary Parker Follett (1994), Shfritz, Ott, and Jang, (2005), Douglas McGregor (1960, 2006), Rosabeth Moss Kanter (1983), Elton Mayo (1933, 1949) and Jeffrey Pfeffer (1998). In this section, we compare passages from each of the selected Chinese sages with mainstream western management thinking.

We first look at what is 'management'?. According to Gomez-Mejia, Barkan, and Cardy (2008), management in all business and human organisation activity is simply the act of getting people together to accomplish desired goals and objectives. So from the surface, management is about managing people. People, human resources are the focus of the management. In another sense, management can also refer to the person or people who perform the act(s) of management. Therefore, both those who manage and is managed are the focus of management, in addition to the functional activities such as planning, organising, staffing, leading or directing, and controlling, which are conducted by a group of one or more people or entities for the purpose of achieving organisational objectives. Follet (1994) asserted that management is the art of getting things done through empowering people not 'power over people' (Kennedy, 2007). Here, we see the importance of people or human resources as compared to the firm's financial and physical resources, and to treat the contribution of individual employees as the key to the organisational success (De Cieri et al., 2008)

Such a view is not dissimilar to that expressed by Guanzi (ca.728-645BC), prime minister to the King of Qi for 40 years in the Spring and Autumn period. Guanzi saw each individual as a drop of water, together forming a great ocean. People, like water, can both easily carry and sink the boat and so must be managed properly. He said to the King of Qi:

The sea does not reject the water, so it can form the ocean. The mountain does not reject the soil and stones, so it can become the high mountain. The wise king does not reject the people, so his country can become a great country. (Guanzi, Xing Shi Jie)

The people will be upset if they are deprived of their interests. They will be happy if they are offered privileges. This is the human nature. The ancient holy kings knew this rule, so they manifested the appearance of offering privileges and concealed the essence of obtaining the interests from the people. (Guanzi, Qing Zhong Yi)

In the last quote we hear echoes of Karen Legge's (1995) criticism of the rhetoric versus the reality of human resource management. The ancient rulers knew about the duality of achieving their own goal of ruling and satisfying the people upon whom their kingdoms were based. It is clearly seen that managing people is at the heart of ruling, and the kings knew well that the people would be willing to work for them, suffer for them, go through dangers and even die for them if the kings met the needs of people and made them happy (Guanzi, *Mu Ming*).

Nevertheless, they were also very clear that 'the best method of winning people's hearts is to benefit the people. The best method of benefiting people is to guide the people in the right direction' (Guanzi, *Wu Fu*). How to guide the people in the right direction? There must be certain rules and regulations – law and decree – or policies and standard industry code of practice *per se* in the modern language, and these must be so consistent that the people can follow without confusion. As Guanzi advised the King of Qi:

If the penalty is strict and impartial, the decree will be implemented and the officials of all ranks will fear the law; if the penalty is not strict and impartial, the decree will not be implemented and the officials of all ranks will neglect their duties. Therefore, the bright king has perceived the key of administrating the people and there is nothing more important than the decree. (Guanzi, Zhong Ling)

It is seen here that Guanzi was very instrumental in advising his king on how to manage his officials. 'The king must examine the officials by the law and decree according to their positions and achievements' (Guanzi, *Jun Chen Shang*). The clear measurement using 'the law and decree' (policies and code of practices at the firm level) is emphasised in judging officials' performance, not their relationship ('*guanxi*') to the King, as often so much mistaken when trying to understand the

Chinese culture and their current human resource management practices. A similarly instrumental view in managing officials was expressed by the legalistic ancient guru Hanfeizi (ca. 280-233BC). He advocated consistency in designing and implementing the law and regulation, and appointment of officials according to their abilities and contributions made to the country instead of using the soft side of reasoning, such as debating on trivial matters and trying to get away with responsibilities by flowery wording. Further, rewards and punishment should be executed so that people would be fearful to obey the law and regulations. These views are reflected in the following Hanfeizi maxims:

Appointing officials according to the contribution, the common people will have less talk; appointing officials according to the speech of kind-heartedness and righteousness, the common people will advocate empty talks. (Hanfeizi, Chi Ling)

The superficial contributions according to the regulations of reward are difficult to identify. The mistakes covered up by beautiful reasoning are difficult to discern. Therefore, reward and punishment are likely to be confused by the inconsistent conditions. (Hanfeizi, Zhi Fen)

In contrast to this instrumental view of people management, Yanzi (ca. 590-500BC) took a humanistic approach, when speaking about managing people, as seen in his story-telling illustrated below. Yanzi emphasised treating people with benevolence and advocated the participative approach to encourage, empower and engage people to serve the common purpose of the state ('organisation' *per se* in the context of management), in the same way that Follett (Graham, 1994) and Kanter (1983) have done more latterly. Below we illustrate some key principles of people management in ancient China, which is relevant to today's world.

Principle of Merit-Based Selection

In the process of recruitment and selection, the critical aspect is the prior job analysis and job design that ensures the organisation seek the right people with right skills to do variety of tasks (Compton et al., 2009). This idea of making sure that people are properly fitted to their tasks and jobs was expressed in the conversation between Yanzi and the Lord Jing. The story goes like this:

One day, the Lord Jing asked Yanzi: 'in the ancient times, how did the rulers rule their countries and manage their people?'

Yanzi answered: 'the land or soil has different components, yet nurtures the same plant. It is quite impossible to ask for the same outcome of the plant in such varieties of soil or land. Similarly, people's abilities are different, if you ask them to do the same job, it is impossible that all will do well. Therefore, it would be unwise to ask people to do many tasks. A wise king neither appoints obsequious men close to himself nor selects people likely to fraternise to pursue self interest. He is able to accommodate subordinates' merits and shortcomings and encourage them to work on the things they are good at, not to impose them to do things that they are not capable of doing. These are the basic principles for recruitment and selection (Yanzi, Volume 3, Nei Pian Wen Shang No. 3)

One of the people management practices of successful organisations identified by Pfeffer (1998) is 'selective hiring'. The message is that if the organisation does not recruit and select the right people, compatible with the organisational culture, the whole organisation will collapse. This is reflected again in Yanzi thinking, though not as directly as in Pfeffer's (1998) criticism of the thousands of American companies that boast 'people are our greatest asset' without actively engaging in strategic, selective hiring.

Yanzi, when questioned by the Lord Jing about 'what is the main concern when dealing with state administration?', tactfully replied that 'my key concern is not able to judge what is good and bad'. The Lord Jing persisted: 'then what methods could be used to judge what is good and bad?' Yanzi was thereafter more direct to say: 'carefully choose and select the personnel'. Why? 'Because when people working nearby you are good, then all would be able to work properly according to their abilities in their respective positions. Judging good and bad will be then easier'.

On another occasion, the Lord Jing questioned Yanzi: 'how to choose the good people?' Yanzi answered: 'according to his speech (communication *per se*), his prior actions, his knowledge about how to rule and manage the country. You may first respect these people and get close to them and observe without losing the etiquette between you as a King and them. By this approach, you will get the right and best people. Therefore, a wise King, even though establishing less positions, can get his people to do most work. When you select the men, never look for their superficial beauty outside but check whether they are good at working on the practical matters, and whether they ever say what is unnecessary and do what is unlawful' (Yanzi, Volume 3, Nei Pian Wen Shang No. 3).

It is quite clear that Yanzi knew the importance of setting the selection criteria and used a number of selection techniques, such as observation, assessing past and present work experiences, practical skills and relevant knowledge, and checking references, etc to get the right people (Compton et al., 2009; Stone, 2008). The ancient recruitment and selection approaches were just as "modern" as today's HRM practices.

Principle of Attraction and Retention

The periods of Spring and Autumn and Warring States bred perhaps the most scholars and able men in the Chinese history. Yet each state was still fighting the so-called "war for talent" as we see today when organisations are facing skill shortages. Many kings of the different states enquired about an effective approach to get the best people for the country's service and there was great discussion

on how to become a 'kingdom of choice' as many able men and scholars could freely choose to go wherever they wanted to go (in much the same way as our modern high skilled knowledgeable Generation Y workers are choosing to do).

On one of those occasions, the King of Wu met with Yanzi and asked: 'On what conditions would one consider working for the country? And on what conditions would one consider leaving?' Yanzi answered: 'I have heard that one would work for the country whereby people in that country work according to their positions, regardless whether they are close to or away from the King. High officials are committed and loyal. There are no complaints from the grassroots. Punishments are not harsh. Under these conditions, people would stick to the principle-based king and enjoy work in the peaceful and stable country. On the contrary, if people nearby or far away can not carry out their respective duties, and officials are not loyal with many complaints about piled up administrative files ('workload issues' in the modern setting), together with heavy punitive actions, one should consider leaving the country. Clever men will neither love high pay under cruel rulers nor high position in the disorderly country (Yanzi, Volume 4, Nei Pian Wen Xia No. 4).

Reading this story, there are two points for reflection. One is that the 'kingdom of choice' was not much different from our current discussion of 'employer of choice', whereby people felt happy and satisfied with their work conditions; there was also a strong leadership based on principles instead of cronyism; and less grievance in the workplace (De Cieri et al., 2008).

Second, it was emphasised that 'clever' and 'capable' men would not work for monetary incentive or even for status if the state (or organisation) was neither orderly nor engaged with people or had bad reputation. The idea was very much in line with Elton Mayo's (1933) human relations management theory where the roots of work satisfaction were identified as non-economic and connected to other factors such as people being

valued and feeling cohesive within their groups in the society. A similar view was expressed by Xunzi (ca. 298-238BC), 'Even when the ancient virtuous men were in poverty without enough to eat and without proper clothes to wear, they would not accept the improper promotion or the improper salary' (Xunzi, *Da Lue*). If we compare this principle with what have been exhibited in many high-paid CEOs in large corporations nowadays, we see how much they have fallen short according to such measurement!

Principle of Contribution-Based Reward

Kanter (1983) in her book *The Change Masters: Corporate Entrepreneurs at Work*, emphasised that rewards need to link more to contribution than to position or status. This principle was upheld by Yanzi illustrated in another story below.

The Lord Jing happily invited a few subordinates and wanted to reward those he liked. Three persons were rewarded 10,000, five awarded 1,000. When the order of the rewards came to the palace accountant, he refused to pay. The Lord Jing was so angry that he ordered the dismissal of accountant, but the order was not carried out by the official in charge of dismissal. The king was very upset.

Yanzi came to see the Lord Jing who complained to him: 'I am the king of this land; I should be able to grant benefits to someone whom I like and distance myself from someone I dislike. Now I like someone but cannot give benefits and dislike someone, yet cannot distance myself from. This is really out of the steps as a king?'

Yanzi said: 'I have heard if the Lord acts justly, his subordinates will obey but if the Lord goes astray, the subordinates will betray. Now you reward those obsequious officials and order the subordinates to obey, this is what I would call "the king goes out of his normal steps" and loses his principles because he forces his subordinates to do things beyond their duties. The late kings

established the rules of rewarding certain people because by doing so people are encouraged to do good; and set the rules of punishment for the sake of eliminating people to do harm…..People were then rewarded because of the good they did to the country not to the kings themselves, and the kings liked them; they were punished because of the bad they did to the country so the kings disliked them. Therefore, when the rules of likes and dislikes were clarified, many good people emerged and bad people extinguished. The country was in peace, people were united and lived in harmony. On the contrary, when your precedent kings loved those who were submissive to them, rather than the country and hated those who disobeyed them, the rules of likes and dislikes were set based on different principles, then many vicious men appeared and so did virtuous men extinguish. People were homeless and the country was in edge of destruction…' (Yanzi, Volume 1, Nei Pian Jian Shang No. 1).

It is clear that Yanzi's principle of reward was based on people's contribution made to the country not on their position *per se* or how close they were to the king – the idea advocated by Kanter (1983) and others subsequently (De Cieri et al., 2008; Stone, 2008). Similar to one of Pfeffer's (1998) people-management practices, higher than average pay must be justified by how it links to organisational performance. If employees make no contribution to achieve organisational objectives, they should not be rewarded. We have also seen the recent corporate scandal whereby those CEOs were paid more on their position instead of their actual contribution to the firm and the society.

Principle of Participation Management

Participation in decision making and communication between management and workers are two sides of the coin in the concept of participative management. One key insight attached to the Hawthorne experiments by Mayo (1949) was the vital importance of management-worker communication, on the basis of the dramatic increases of productivity when the researchers discussed the changes with workers before they were put into effect. Similarly, Kanter (1983) argued that the key to a corporate renaissance was 'participative management' or empowering and encouraging employees to become a true organisational citizen, fully aware of their rights and responsibilities in the democratic environment. To do so, there must be certain mechanism made available so that individuals can channel and contribute their ideas to (Kanter, 1983). In this regard, Yanzi appears to be at one with Follet (Graham, 1994), Mayo (1933, 1949), and Kanter (1983) who promoted democratic participation, not only in politics and the society, but also in business organisation. Yanzi expressed in the following story how important it is to provide channels for people to air their views freely and to exchange ideas between the King and his men.

This was one of very rare occasions Yanzi put the question to the Lord Jing: 'when you hold the meeting, do you make it orderly and serious as in the dignified or stately manner?' The Lord Jing retorted: 'isn't it good to hold the orderly and serious meeting?' For this, Yanzi replied: 'if you hold every meeting seriously and orderly, your subordinates will dare not speak. If no voice comes from your subordinates, you will not be able to hear good suggestions. If subordinates do not speak, I call this "mute", if the king could not hear the voices, I call this "deaf". The country full of mute and deaf people, what good would they do to the country?

Furthermore, the barn is filled up with small things one by one, and the curtain is knitted by small threads. The majestic Mount Tai is not made of one single stone, but many small stones. Managing the country requires not just one view but many views. There might be a time and it is reasonable to hear the suggestion but not implement it. However, I've never heard anyone refus-

ing to hear different views (Yanzi, Volume 4, Nei Pian Wen Xia No. 4).

Hearing the 'different views' is what Follett called the creative possibilities of conflict, which should be used to work for us not against us (Graham, 1994). Yanzi understood that, to manage a country well, free thinking should be promoted to generate different views. When a country (or an organisation) is represented by only one voice, the days to its doom are numbered. Beenen and Pinto (2009) recently recounted that one of the reasons contributing to the fall of Enron was the autocratic leadership style by its then CEO Jeff Skilling, whose corrupt practices continued for a number of years without being questioned. Employees' views were ignored. In fact those employees who did question the practices were punished by being either fired or transferred to less significant posts in the organisation (Beenen & Pinto, 2009). Long before the fall of the major corporates in the USA in the early 2000s, Warren Bennis stressed the importance for managers and leaders not only to do things right but do the right thing. To Bennis, a good manager/leader must listen to his men and learn from the people he leads (Bennis & Nanus, 1985). How similar thoughts these are to that of Yanzi. It appears, nonetheless that China has even moved quite far away from this principle in terms of their government based on one-party system and most enterprises' decision making is still from the top, instead of the mass.

On another occasion, Yanzi was feeling really sad to see a very eloquent and well-known man named Min zi-wu who was not able to speak properly in front of him, an authoritative figure. Min came from another country to seek employment under Yanzi. Perhaps because of his nervousness, or given his strong accent from another state, he was mumbling, even though Yanzi smiled and showed a friendly face to encourage Min to speak out his views, for Yanzi had already known that Min was the most capable man in his own state. Confronted by such an experience, Yanzi knew that there would be more able men in the coun-

try who simply could not overcome the fear of authority to speak freely, and that their valuable views would be buried without notice. Asked by his disciple why he was so sad, Yanzi answered: 'I would rather be Min's student to hear what he said than be in this position of authority. How could I be honoured while losing all ideas and views from these able men who are still living, not to mention those who were already dead?' (Yanzi, Volume 5, Nei Pian Zha Shang No. 5).

Here we see Yanzi not only aware of the importance of hearing different views but also encouraging participation of people from different backgrounds, speaking even with different accents! He appears to have been advocating both participative management and a management that was inclusive of diversity. Yanzi was sufficiently humble to be willing to learn from his subordinates, an attitude of humility in a leader that Bennis and Nanus (1985) summarise in terms of 'the more vulnerable I am to my people, the more I can influence them…' Yanzi's thinking, of the benefits of breaking down the barriers of status, is another precursor of the principle of best people management practices of successful organisations advocated by Pfeffer (1998), whereby 'an egalitarian attitude to status in the organisation' must be promoted.

Principle of Leadership and Ethics

Reading from a selective number of writing and saying by the ancient Chinese sages, as compared with modern western management gurus' thinking, it is found that the key concern of ruling the country and managing the people in ancient times was little different from running modern business organisations, whereby wise kings or managers/leaders must trust and empower followers and effectively share their vision with the people they manage and lead. Warren Bennis stressed the importance of leaders being able to translate their vision into proper words so that their followers can understand and be joined by the emotional

glue of 'trust' that 'binds followers and leaders together' (Bennis & Thomas, 2002). Kanter (1983) also perceived the individual human dimension within the organisations, warned the dangers for organisations to become more 'mean' than 'lean' and stressed the importance of overcoming this by sharing values in the corporation. Peter Drucker (1954) went even further to speak about management as a social art, requiring good communication with, and regard for, the people working in the organisation (Kennedy, 2007).

It appears that ancient and modern management thinkers are agreed that if the people/employees are not doing well, the responsibility is squarely on the shoulders of the leaders/management. As Guanzi said: 'the world is not afraid of having no virtuous and talented officials, but afraid that there is no virtuous king to appoint them; the world is not afraid of having no wealth, but afraid that there is no smart person to manage it' (Guanzi, *Mu Ming*). More latterly, Douglas McGregor (1960) observed that 'there are no bad troops, only bad officers' (Kennedy, 2007). The question remaining is who can be a good manager/officer?

One might remember Socrates' argument that 'good managers of a family would also be good generals' (Shafritz, Ott, & Jang, 2005). Zengzi, one of 72 disciples of Confucius in *Great Learning* shared this view, arguing that 'before being able to rule a state, one needs to manage his own family well'. Differences in the two views lie only in the focus – whilst Socrates spoke about similar managerial *tasks* shared by a household manager and an Athenian army general, ancient Chinese were more concerned about the *personal qualities* of the rulers of the state.

Developing the person qualities as managers and leaders of the organisation has perhaps been less emphasised in the west than in China. Responding to an interview Rosabeth Moss Kanter suggested that future leaders should be 'probably more Confucian than cowboy.' otherwise, 'things could get worse before they get better' (Crainer, 2003). Here Kanter might have referred

to developing personal qualities of integrity and responsibility as leaders and managers, at a time when America was facing a number of corporate collapses due to the greed of top managerial teams. Bennis also emphasised the need for an 'integrated self' before leadership qualities can emerge (Bennis & Thomas, 2002). Drucker (1954) being most visionary in his view of management, said two decades earlier before the recent corporate scandals and financial crises that 'contrary to the approach to the study of political and social organisation that has prevailed in the West since Machiavelli, I stressed all along that organisation does not deal with power but with responsibility …the business organisation, as any organisation, is a human, a social, indeed a moral phenomenon. Customer service rather than profits should dominate management thinking.' (Drucker, 1967; Kennedy, 2007). Perhaps if more attention had been paid to these words and saying from both east and west, we might not have seen the fall of companies such as Enron and world.com, or even the economic maelstrom of recent times.

The world was perhaps as much in a state of flux in the Spring and Autumn period as it is today, prompting Shu Xiang, one of Yanzi's students to ask, 'the world is in disorder, violating the law of the universe; kings have gone astray, not act according to the ethical standards. Under such circumstances, if one acts in integrity or keep principles, one may lose people; but if acting unethically to keep people, one may lose principles. Should I keep principles and lose people or should I keep people and forfeit principles?' Yanzi answered: 'I have heard that he who upholds human dignity for those at the lowest position and keeps integrity under the worse circumstances treats people as the foundation of all things. Therefore, if you want to keep people, how could you lose the principles, and if you keep the principles, how could you lose people – in fact, people will flock to you?' (Yanzi, Volume 4, Nei Pian Wen Xia No. 4).

The message is that there need not be conflict between people and principles, or people and performance but, there will be problems if there is a violation of human relations. Commenting in 1973 about Elton Mayo's work, Peter Drucker observed that 'the human relations prescription, though rarely practised, remains the classic formula' (Kennedy, 2007). These ethical views contrast with the current circumstances of the Western economies whereby the interests of a few have been supported by the involuntarily sacrifices of millions of taxpayers, through their government representatives. Similarly, one might also argue that China's three decades of economic reforms can also be understood as benefiting mostly those in positions of power, rather than the masses, even though many were lifted out of poverty (Yuan, 2008).

CONCLUSION

Examining the sayings and stories from the ancient Chinese sages, we have identified a number of philosophies and thinking that are clearly consistent with modern approaches to people management. There is every reason to believe that ancient thoughts about the principle-based leadership and management approaches are still applicable to contemporary organisational practices both in China and elsewhere. Through close examination of the ancient thoughts against some of the writings by the mainstream western management gurus, it is found that the call for recognising and valuing individual contributions to business organisations and the wider society is not dissimilar across 3,000 years of human history. At the same time, it appears to be just as difficult to get modern managers in industrial organisations to implement sound management theories and translate them into practice as it was to get kings to listen to the wise advice of the Chinese ancient sages. However, if we stick to the principle-based

management approach, we might be more able to balance the needs of adding value and enhancing organisational performance and the needs of upholding ethical standards and caring for employees and their families and communities, and work for the good of the wider society.

Chapter 3

The Influence of Information Technology on Organizational Behavior:
Study of Identity Challenges in Virtual Teams

ABSTRACT

This paper attempts to examine the effects of virtual team dimensions on social identities of its members. A review of the literature shows that the geographically dispersed, culturally diverse as well as temporary dimensions of virtual teams do not match with their stability as members have different ethnic, social, or cultural backgrounds. Sources like culture, place, and time seem to continuously acquire social identities. Due to the importance of social identity, an attempt has been made to examine its influence on organizational variables (i.e. job satisfaction, job involvement, job commitment, and organizational citizenship behavior). Questionnaire-based data have been accomplished from 149 members of 44 teams. The hypothesized relationships among the proposed variables are tested via a structural equation model (SEM). Results show that the geographically disperse and culturally diverse variables are negatively related to the social identity as against those of temporary and organizational variables which are related positively.

INTRODUCTION

The ever increasing de-centralization and globalization of work processes have caused many organizations to respond to their dynamic environments by introducing virtual teams, in which members are geographically dispersed but coordinate their work via electronic information and communication technologies (Hertel et al., 2005). A virtual team is often consisted of a geographically dispersed, culturally diverse, temporary, electronically communicating work-group (Shin, 2005; Harvey et al., 2004). However, little is known about human resources within these teams, despite the level of research interest and growing of this new work form (Hertel et al., 2005; Lin et al., 2008). In other words, having different human resources challenges, the study of virtual teams with its diverse memberships has become an emerging trend these days.

Team members may have different sexes and racial groups, with different ethnic, social, or cultural backgrounds. Based on the social identity theory, members of a team with heterogeneous characters may find it difficult to integrate their diverse backgrounds, values, and norms and work together (Eckel & Grossman, 2005). Social identity has been defined in many ways; the common element in these definitions is inclusion of group membership as part of one's self-concept (Meyer et al., 2006). However, the virtual teams with geographically dispersed members from different cultures find it difficult to integrate socially.

The social identity involves one as part of a larger whole (Rousseau, 1998; Tajfel, 1978). Since they belong to multiple or collective groups such as an organization, division, and team, employees can form multiple social identities, one or more of which might be prominent at any given time (Meyer et al., 2006).

The present research intends to address the following major questions related to the effects of virtual team on social identity and organizational behavioral variables (satisfaction, job involve-

ment, commitment and organizational citizenship behavior).

1. What are the sources of social identity acquisition and how they affect virtual teams?
2. What is the social identity status in virtual teams?
3. Is there any significant correlation between social identity and organizational behavior variables in virtual team and what is the status of these variables?

Literature review of virtual team and necessary resources for the identity acquisition is given along with the research methodology. Results are discussed with concluding remarks and a brief avenue for future research is highlighted.

DEFINITION OF VIRTUAL TEAMS

Globalization has transformed not only the market structure, rather customers' needs, and technological innovations have made organizations choose a new structure to respond to rapid environmental changes (Harvey et al., 2004; Bauer, 2003; Shin, 2004; Kock, 2008). Virtual organizations are one of the new entities shaped on this basis. The formation of virtual organizations requires information technology and qualified and knowledgeable personnel and leaders (Wickham & Walther, 2007; Kahai, et al., 2007; Hambley et al. 2007; Glückler & Schrott, 2007; Konradt & Hoch, 2007) for inter-organizational group activities (Larser et al., 2002).

The virtual organizations are often defined as the one, constantly interacting with the environment, and whose internal structure is based on virtual teams. In other words, virtual teams constitute the core of virtual organizations (Larser et al., 2002; Lipnack & Stamps, 1997). Researchers have variably defined the virtual organizations and there analysis indicates that the main part of

those definitions is highly analogous, except in some cases (Martins et al., 2004).

As such, a virtual team consists of a group of geographically dispersed people utilizing communication and information technologies in order to perform their organizational tasks (Jong, 2008; Kelley & Sankey, 2008; Martin et al., 2004). Most of the definitions introduce the virtual teams as of having the characteristics of temporal structure, cultural variety, geographical dispersion and electronic communications (Hertela et al., 2005; Shine, 2005; Harvey et al., 2004). In other words, they are considered as the combination of distributed specialties in temporal, geographical and cultural domains. Cosequently, their characteristics can generally be defined in four dimensions of spatial, temporal, cultural and organizational dispersion. *Spatial dispersion* refers to the degree to which the team members' workplaces are dispersed. *Temporal dispersion* dimension is concerned with the degree to which the team members work at different times. *Cultural dispersion* is concerned with the extent to which the team members are constituted from various cultures. *Organizational dispersion* is concerned with the degree to which the team members work between organizational boundaries (in various organizations) (Shin, 2005).

In most of the contemporary organizations, the teams and personnel participate in virtual activities, and organizational processes exist in both the traditional and the virtual forms. Thus, the virtual teams possess different degrees of virtuality depending on the extent to which they use virtual processes to perform their functions. Different definitions apply diverse standard to measure the degree of virtuality. In fact, the degree of virtuality is a function of the magnitude of each of the four factors mentioned above. One of the behavioral dimensions that may be affected by an increase in the team's virtuality as well as a subsequent decrease in face-to-face communications is the identity dimension.

SOCIAL IDENTITY

Individual's self-perception is often shaped by his personal, social and organizational identities. Here the process of perception is a dialectic process between one's own perception and those of others. In other words, the individual's perception is not created in a void, but is affected by the perceptions existing in the group, organization or society (Howard, 2000). Therefore, the theory of social identity is an attempt to explain the interaction between personal perceptions and those of other people (Ashforth & Mael, 1989; Tajfel, 1982; Hogg & Terry, 2000). People's social identity is affected by the groups to which they belong. Possessing organizational and social identity does not mean the individual has no personal identity. In other words, the individual identity refers to ones' personal characteristics and has nothing to do with any particular organization or group; however the organizational identity is defined based on the characteristics of a particular organization. This paper primarily deals with the social identity.

The most famous theoretician of social identity, George Herbert Mead believes that every individual shapes his/her own identity or ego through organizing others' attitudes in the form of an organized social or group attitudes (Mead, 1964). In other words, the image the individual creates or the way he feels about himself, are basically the reflection of other people's attitudes towards him (Jenkins, 2000). The logic of social identity states under what circumstances social contexts cause the organizational identity to gain more significance for the individual. Then, this basis is examined for some important organizational behaviors such as leadership, group's motivation, communications and the organization itself (Haslam, 2001).

Accordingly, the social identity is part of an individual concept originating from the awareness of his membership in a social group (or groups) with having interrelated values and feelings (Turner, 1999). The theory of social identity provides an

implicit framework for the understanding of inter-group relationships. This theory tries to identify and analyze motivational processes related to the structural and ideological characteristics of the social environment (Reicher, 2004; Turner, 1999). During the last two decades, the social identity has been developed and organized as one of the most important theoretical frameworks to study inter-group relationships. At the outset, this theory was developed to explain not only inter-group basis but it successfully proposed explanations for these cases in later stages (Ellemers et al., 1999).

The individual's own image is shaped not merely by factors existing in his inner existence; rather some external social entities also play important role in it. Further, the identity is not something given to the individual beforehand rather it is something created through constant interaction with the world (Giddens, 1991). Part of this interaction may be with organizations as individuals define and identify themselves on the basis of their attachment to an organization or involvement to an occupation (Tajfel & Turner, 1986). In other words, people identify themselves with the organization for which they work (worked or will work), and acquire a psychological feeling of possession (Pierce et al., 2001; Shamir & Kark, 2004). Organizational identity consists of establishment of affective-cognitive ties between the organizational definition and the definition of oneself (Dutton, 1994), and means the integration of the self and the organization (Tyler & Blader, 2000). When one unites his identity with beliefs, goals and activities of an organization, he is said to have acquired organizational identity (Albert et al., 2000; Van Dick et al., 2004). Again, when the individual's identity is united with that of an organization he works for, he becomes more loyal, more studious and more committed (Dessler, 1999).

SOURCES OF SOCIAL IDENTITY ACQUISITION

Given the importance of social identity, critics have attempted to identify sources of identity acquisition. As such, components of place, time and culture have been introduced as the primary sources of identity (Golmohammadi, 2007; Goffman, 1959; Jenkins, 2000):

- **Place**: It is one of the important sources of identity acquisition. The feeling of being distinct has always been an essential component of identity, which requires the existence of more or less permanent and impenetrable boundaries. Place not only can be delimited, but it has some degree of permanency. Through creating social solidarity, place also creates the feeling of belonging to the collectivity. In fact, the ability of place to play this particular role is related to its stability and limitability.
- **Time**: If we consider identity as a system of representation, Time and space constitute the principle parts of this system. All identities are based on a representative space and time, and require the imaginary geography of their own (Hall, 1996). Identity is based on continuity, and continuity is defined based on the time factor and every individual or group bases its identity on a historical memory (Jenkins, 2000).
- **Culture**: Culture is the mental software of human beings (Hofsted, 1997). Undoubtedly, it is the richest, and the most important source of identity (Peterson, 1999). It creates both distinction and solidarity. It creates a particular lifestyle. This differentiation not only paves the way for the creation of identities, but also gives meaning to human existence. Anthropologists, sociologists and many other researchers have defined the culture hence; most of them agree that culture

consists of people's particular ways of life. House et al. (2002) in their Globe Research define the culture an entity consisting of values, beliefs, identities and common interpretations and meanings of significant events, originating from the public experience of the members of a society, and handed down to posterity.

SOCIAL IDENTITY CHALLENGES OF HUMAN RESOURCE IN VIRTUAL TEAMS

Given the structure of virtual teams, a research on characteristics and challenges faced by human resource in such teams becomes significant (Harvey et al., 2004). This is also because the main focus of the current article is to focus on identity structure that poses various challenges to the personnel of virtual teams. The most important challenges in such teams seem to be decreasing or lack of face-to-face interactions. Scheduled meetings, face-to-face interactions help create particular situations of bodily and facial postures, nonverbal messages and social impacts, which do not exist among virtual team members using computer-based technologies for their communication (Harvey et al., 2004). This absence of face-to-face interaction and cooperation could create conflicts (Larser et al., 2002) among virtual team members because of their geographical differences or different perceptions (Shin, 2004). Conflicts caused by the absence of common perceptions and the lack of appropriate socialization disrupt communication and cooperation procedures (Harvey et al., 2004). The dynamic environment of virtual teams forces the members into accepting newcomers without sufficient socialization processes. Thus, socialization processes and understanding the norms in order to mitigate conflicts are disrupted (Haslam, 2001). Given the intense affiliation existing among virtual teams' members, measuring individual and operational efforts of the job will be difficult (Har-

vey et al., 2004; Lin et al., 2008). The absence of face-to-face interactions also makes the formation of informal norms and regulations, which may be necessary for moderating deviations still more difficult (Harvey et al., 2004).

With regard to the identity concepts, these are believed to be the basic principles in the formation of communications and the requirements of social life (Jenkins, 2000). The identity acquisition requires more or less specific sources, a disruption in each of which would undermine the very foundation of identity acquisition (Goffman, 1959). Since, the structure of identity is based on continuity and differentiation as perceived by individuals (Jenkins, 2000); the formation of a stable identity would be extremely difficult if these requisites are not provided for them through the sources of identity acquisition (Goffman, 1959). As mentioned before, place, time, and culture are the main components of identity acquisition hence; an attempt has been made to investigate each of them in order to assess their ability to create identity under given situations. Some critics however stress on the possibility to define virtual organizations using the four dimensions of space, boundary, time and culture, and to describe their characteristics (Shin, 2004):

- **Place and Space**: This dimension is concerned with the distribution of personnel along various geographical limits. Given the organizational structure, employees while being in different geographical areas are able to communicate with one and another using information technology (Shin, 2004). As such, virtual organizations have wide geographical distributions. Further, the boundary dimension is concerned with the distribution of organizational processes (Shin, 2004). Since, the virtual activities are often established based on intra-organizational processes, it is not so easy to specify organizational boundaries on the basis of such activities (Vakola, 2004).

These two dimensions (space and boundary) in virtual organizations are similar to place and space components in the sources of identity acquisition. Determining more or less permanent boundaries fulfill the need for social solidarity, and contribute to the formation of distinction and continuity (Golmohammadi, 2007). Thanks to the advancement of information technologies, virtual structures have accelerated the process of spatial disintegration, and have increasingly split the living ties of social space with a particular land or place in a way that it is difficult, or sometimes impossible, to determine social boundaries based on geographical and spatial limits (Golmohammadi, 2007).

- **Time dimension**: This is concerned with temporal dispersion, or in other words, with the degree to which the employees can work together simultaneously (Shin, 2004). Geographical dispersion is one of the factors affecting the temporal dimension, causing some changes in the personnel's working hours in virtual organizations (Larser et al., 2002). Given the fact that different geographical areas may have different working hours depending on ground conditions, the issue of simultaneity gains so much significance that the employees have to develop a regular plan to have simultaneous interactions. Another issue related to the temporal dimension is the nature of temporal relationships in virtual organizations. In such organizations, relationships are often short-term, and the passage of time changes the structures of virtual activities (Chudoba, 2005). The function of time in the identity acquisition, according to some is "based on continuity, and continuity is defined based on the temporal dimension. Every individual or group bases its own continuity on memory and history (Jenkins, 2000) in a way that

all identities are established and developed in their own symbolic time." The concept of time has been changed in virtual organizations as simultaneous communications have been made available to all people. This will eventually overshadow identity distinction and stability among varieties and variations (Golmohammadi, 2007) in a way that due to the rapidity of changes, the connection between the past and present would be broken, and people would no longer be able to base their own identity structures. Temporary communications make people unable to appropriately develop the feeling of solidarity required for the formation of their identities (Giddens, 1991).

- **Culture**: This dimension deals with the cultural distribution of personnel, as the existing cooperation is based on participation of people with diverse organizational and national cultures (Harvey et al., 2004). By definition, virtual teams have common work no matter may possess different organizational and national cultures (Bauer, 2003). People belonging to different cultures communicate in differently and show different behavioral patterns (Shin, 2004). In other words, cultural diversity contributes to complexity, conflict, confusion and ambiguity in communications, making the task of management very difficult. As a matter of fact, the cultural diversity might decrease the real output of such teams (Adler, 1997). Studies have also indicated that the cultural diversity reduces the degree of integration among members of the team, leading to many difficulties in an organizational setup.

As mentioned before, culture is one of the richest as well as the most important sources of identity acquisition. It creates distinction that paves the way for the development of an identity (Jenkins,

2000). In virtual organizations, cultural components and elements inevitably interact with one another and constitute a harmonious whole (Harvey et al., 2004). Through penetrating boundaries and contributing significantly to cultural interactions, the structure of virtual organizations raises people's awareness of other cultural elements such as norms, values and customs. In fact, this awareness is awareness of the relativity of social and cultural world, which indicates that culture is no longer able to fulfill its peculiar function (in creating distinction and solidarity) appropriately. When the most important traditional source of identity becomes so vulnerable and relative, the people relying on that source would also face a crisis of identity and meaning.

A comparison between the characteristics of virtual organizations and the sources of identity shows the lack of actual identity contents and in such organizations hence; this identity crisis is likely to happen. Based on the above discussion, following research hypotheses are formulated.

H1: *The culture dimension of virtual team in software producing companies is positively related to social identity.*

H2: *The place dimension of virtual team in software producing companies is positively related to social identity.*

H3: *The Time dimension of virtual team in software producing companies is positively related to social identity.*

The main function of identity is to develop a framework for social life (Jenkins, 2000). Any change in identity foundations would cause subsequent changes in organizational concepts. Since personnel constitute the main organizational elements at this point, a question arises as how human resource's output is affected by the identity structure and how does any change in identity foundations would change this output?

Identity is one of man's psychological needs, and is the prerequisite for any form of social life.

According to Tojfel, social identity is conceptualized for the individual as his awareness of belonging to a particular social group, and the affective importance of this membership for him (Turner, 1999). In recent years, the social identity theory has been examined in a wide range of researches dealing with organizational behavior. This shows that social identity has close connection with organizational issues (Haslam, 2001). Virtual teams are considered as social environments requiring particular identity structures in order to establish and continue communications (Harvey et al., 2004). Regarding the fact that identity contributes to the formation of relationships and creation of meanings in personal and social life (Jenkins, 2000), it influences the personnel's understanding of other organizational variables. Following sections will be investigating the influence of social identity on job satisfaction, job involvement, organizational commitment and organizational citizenship behavior.

SOCIAL IDENTITY IN VIRTUAL TEAMS AND JOB SATISFACTION

Job satisfaction means the extent to which one likes his job i.e. the individual's assessment of his own job. In other words, does the individual have a positive attitude towards his job factors in general? This assessment includes perceived occupational characteristics, job feelings and the workplace as a whole. Due to wide range of aspects, it can be said that the job satisfaction consists of a series of attitudes. Here, one may be satisfied with a series of his job factors or unsatisfied with another. But in the study of organizational behaviors, all of these factors are investigated under a single category of job satisfaction (Weiss 2002; Locke 1976).

Job satisfaction includes satisfaction with the job itself, payment, promotion, colleagues and management (Weiss, 2002). Many social theories state that an increase in the level of organizational identity can contribute to people's satisfaction with

the organization. People differentiate between the members of their own group and the others and this creates a feeling of satisfaction among them (Haslam, 2001). People's satisfaction increases once they come across an appropriate definition of themselves and their organization. This satisfaction has great significance in groups. They will reduce their interactions and finally leave the group if the members are unsatisfied and pursue their own private interests, while in organizations active in the area information technologies, much importance is attached to human resource (Tidwell, 2005).

Job satisfaction is the outcome of assessing job characteristics. If an individual is unable to develop his organizational identity by means of which to offer a particular definition about himself and his social relationships in that organization, it will make his task difficult to assess the characteristics of his job hence; this may have negative effects on his job satisfaction. Therefore, yet another research hypothesis may be proposed as follows:

H4: *The social identity of virtual team in software producing companies is positively related to job satisfaction of its members.*

SOCIAL IDENTITY IN VIRTUAL TEAMS AND JOB-INVOLVEMENT

Job-involvement shows the degree to which an individual is mentally, cognitively and psychologically occupied with his job and attaches a particular importance to his job (Paullay et al., 1994*)*. In other words, the individual takes pleasure doing it and does not get tired once involved with his job. Indeed, making personnel involved with their jobs is one of the difficult tasks of managers because "self-alienation" and "job-alienation" are among the outcomes of organizational life.

Lodahl and Kenjer (1965) developed a concept of work-involvement to operationalize the Protestant working ethics, in which the value of working

is part of the individual's own value. They also differentiated the concepts of "work-involvement" and "job-involvement" where the former is a more general concept, indicating individual's esteem for work and working. But job-involvement is merely concerned with individual's present occupation (Kanungo, 1982). In other words, job-involvement is related to vocational identity and an individual job holder usually identifies himself with it. Such a person does his best to realize the organization's goals (Lawler, 1986; Pfeffer, 1994).

Active participation in groups requires an individual to have feeling of affiliation towards the nature of the job, and appropriately identify himself with the job and actively participate in it. In terms of definition, the function of identity has a close relationship with the development of the concept of job-involvement. Identity enables people to appropriately understand the nature of their jobs, and to formulate the nature of their own personality. Therefore, the study of identity structures and their effect on people's participation in their jobs is crucially important. Thus, the research hypothesis may be stated as follows:

H5: *The social identity of virtual team in software producing companies is positively related to job involvement of its members.*

SOCIAL IDENTITY IN VIRTUAL TEAMS AND ORGANIZATIONAL CITIZENSHIP BEHAVIOR

In primitive schools of management, people used to be assessed through their behaviors expected from personnel in their job specification. In the past, based on vocational behaviors of the personnel or their intra-role performance, they were recognized and awarded by the official system. Today, extra-role behaviors are the focus of attention which is concerned with vocational behaviors outside the realm of personnel's formal

roles, which are optional and usually thankless (Haslam, 2001).

Researchers have categorized the organizational behaviors with different headings i.e. pro-social behaviors (Brief & Motowildo, 1986; Adebayo, 2005), extra-role behaviors spontaneous behaviors (George & Brief, 1992), Pre-contextual work (Borman & Motowildo, 1993), and generally, organizational citizenship behaviors. However, researchers are disagreed over the aspects of organizational citizenship behaviors. Aspects such as helping behaviors, sportsmanship, organizational loyalty, organizational obedience, individual creativity, conscientiousness, personal development, courtesy, civic virtue, altruism, all have been addressed in various studies.

Studies about social identity and organizational citizenship behavior indicate that people with a high degree of commitment toward group work have a greater tendency to participate in the extra-role activities (organizational citizenship behaviors) (Haslam, 2001). When the vocational behavior of some is determined by individual identities, people are more likely to participate in activities promoting their personal status. But when the vocational behavior is determined by social identities, they are more likely to show greater effort to promote group interests (such as helping new employees and performing other thankless jobs). Studies have indicated that organizational identity can promote organizational citizenship behavior (Dutton et al., 1994; Haslam & Powell, 2000; Van Knippenberg, 2000).

Thus it can be said that the social identity and the organizational citizenship behavior help bring solidarity and stability to teams. Therefore, study of the relationship between these two behavioral variables in virtual teams in which the structures of identity acquisition have not been sufficiently developed is crucially important. Therefore, a research hypothesis statement may be stated as follows:

H6: *The social identity of virtual team in software producing companies is positively related to organizational citizenship behavior of its members.*

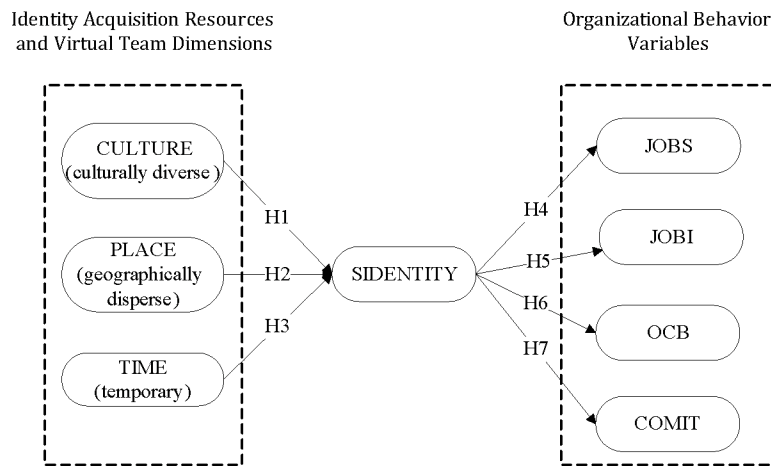
SOCIAL IDENTITY IN VIRTUAL TEAMS AND ORGANIZATIONAL COMMITMENT

Organizational commitment, as a dependent variable, indicates obligation that forces the individual to remain in the organization and studiously work for the realization of its goals (Meyer & Herscovitch, 2001). In other words, organizational commitment is accompanied by a series of productive and constructive behaviors. An individual with a high organizational commitment remains in the organization and puts considerable effort or even self-sacrifice to realize the organizational goals.

Studies show a strong relationship between the concepts of organizational commitment and identity (Haslam, 2001; Van Knippenberg & Sleebos, 2006; Meyer et al., 2006). They are interrelated and the mere difference between these two concepts is that identity is a reflection of the definition of "self", but commitment is not (Van Knippenberg & Sleebos, 2006; Meyer et al., 2006; Brown, 2000).

The identity and organizational commitment have been the focus of attention in recent studies because of their influence on other behavioral variables. Once people promote their knowledge while belonging to a particular group with specific feelings and values, they actually seek to accept a social identity in such groups. Any change in the sources of identity in virtual teams can influence people's identities. Regarding what has been said so far, a research hypothesis can be stated as follows:

H7: *The social identity of virtual team (Figure 1) in software producing companies is positively related to organizational commitment of its members.*

Figure 1. Research model


METHODOLOGY

The methodology followed in the current study will be discussed in terms of sampling and data collection, measurement instrument, reliability and construct validity of questionnaire as well as data analysis.

SAMPLING AND DATA COLLECTION

Basedion the structured questionnaires from 40 teams, data were collected over a 4-week time frame. These teams which are employed by two software provider companies (System groups, Kishware) work on analyzing, designing and supporting information systems in Iran. These companies were selected for their high-level electronic communication and upgraded services to their customers. Of 85 questionnaires distributed, a total 145 employees completed the questionnaire with a response rate of 82.7%. A complete anonymity was guaranteed to all participants. 62 sample (42.8%) were female and 83 male (57.2%). The average age of respondents was 33 years, 60% of whom possessed bachelor degree while 40% had master.

MEASURES

Responses were measured using the same 5-point Likert scale ranging from 1 (strongly disagree) to 5 (strongly agree). The reliability test was done through Cronbach's coefficient alpha (α). An α value of 0.70 or above indicates a reliable measurement instrument.

- **Satisfaction**: The Brayfield and Rothe (1951) measure of satisfaction was adapted to the parameters of the current study. Specifically, respondents came up with statements variably: "I feel fairly satisfied with [organization's name]," "I find real enjoyment when attending functions at [organization's name]," "I am often displeased when at [organization's name]," and "When I go to [organization's name] I feel right at home." The alpha level was .86.
- **Commitment**: Commitment was assessed through the Meyer and Allen (1984) affective commitment measure. Participants were asked to respond to the statements such as: "I feel emotionally attached to [organization's name]," "[Organization's name] does not deserve my loyalty (R)," and "I would be happy to participate in [or-

ganization's name] for the rest of my life." The alpha coefficient was .85.

- **OCB:** Organization citizenship behavior was assessed by adapting the Podsakoff and MacKenzie (1997) measure. Participants were asked to respond to the following statements: "I help out other [organization's name] member if someone falls behind in his/her works", "I willingly share my expertise with other member of the [organization's name], "I take steps to prevent problems with other [organization's name] member and "I attend and actively participate in [organization's name] meeting." The alpha coefficient was .86.

- **Involvement:** Job-involvement was assessed by adapting the Kanungo (1982) method. Participants were asked to respond to the statements: "The most important things that happen to me involve my present job", "I live, eat and breathe my job", "Most of my interests are centered on my job" and "Most of my personal life goals are job- oriented". The alpha coefficient was .87.

- **Organizational identification:** Haslam's measure of social identification (2001) was adapted for organizational identification. Participants were asked to respond as: "When someone criticizes [organization's name], it feels like a personal insult," "I am very interested in what others think about [organization's name]," "When I talk about [organization's name] with others, I usually say we rather than they," and "[Organization's name] successes are my successes." The alpha level was .84.

- **Culture, Time and place:** The Chudoba et al., (2005) measure of culture, time and place was adapted to the parameters of identity acquisition resources and virtual team dimensions. Specifically, respondents replied the statements: Place ("I work at home during normal business days", "I

work while travelling, e.g. at airports or hotels", "I collaborate with people in different sites or geographies", "I collaborate with people you have never met face to face". The alpha level was .87) Culture ("I collaborate with people who speak different native languages or dialects from your own", "I collaborate with people from different cultural backgrounds", "I collaborate with people from different cultural values". The alpha level was .86) and Time ("My work extended days in order to communicate with remote team members", "I collaborate with people in different time zones", "Participate in real-time online discussions, such as chat or instant messaging",. The alpha level was .85).

DATA ANALYSIS

Structural Equation Modeling (SEM) was applied in this study to estimate direct and indirect effects using LISREL 8.5. Assuming the measurement model meets goodness-of-fit criteria, the hypothesized relationships are tested in a SEM.

The comparative fit index (CFI), the non-normed fit index (NNFI), and the root mean square error of approximation (RMSEA) were used to evaluate the model. Values approaching .95 for the CFI and NNFI and less than .05 for the RMSEA are generally considered indicative of acceptable model fit.

RESULTS

A first exploratory step in the analysis is a correlation analysis that includes all independent and dependent variables (Table 1). Each of the variables in model are shown with the expressions i.e. culture with CULTURE, place with PLACE, time with TIME, social identity with SIDENTITY, job satisfaction with JOBS, job involvement with

Table 1. Covariance matrix for constructs

Variable	Mean	SD	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)
JOBS (1)	2.53	0.57	1							
JOBI(2)	2.31	0.49	0.331	1						
COMIT(3)	2.56	0.57	0.468	0.337	1					
OCB(4)	3.11	0.41	0.316	0.339	0.656	1				
SIDENTITY(5)	2.01	0.599	0.374	0.416	0.767	0.580	1			
TIME(6)	3.27	00	00	00	00	00	00	1		
PLACE(7)	3.46	00	00	00	00	00	00	00	1	
CULTURE(8)	2.98	00	00	00	00	00	00	0000	0000	1
All coefficient are meaningful at 99% level										

JOBI, job commitment with COMIT and organizational citizenship behaviors with OCB.

The resulting indexes indicated that the measurement model fitted the data well. Figure 2 shows the results of the Structural Equation Modeling (SEM) for the constructs. The overall fit of the proposed structural model was quite satisfactory (e.g. $\chi 2$=343.86, df=367, ρ<0.001, with Root mean square error of approximation (RMSEA) =0.000, Comparative fit index (CFI)= 0.99, Normed fit index (NFI)=0.86, Goodness-of-fit index (GFI)= 0.86, and Adjusted goodness of fit index (AGFI)=0.84. Although $\chi 2$ is a bit large ($\chi 2$=343.86), the value of (Chi-square/degree of freedom) is less than 2 and the GFI and AGFI are

close to 0.90. In addition, the RMSEA value is less than 0.05 (RMSEA=0.000). The above figures imply good model fit. Moreover, the ranges of all factor loadings and the measurement errors were acceptable and significant at alpha=0.001, which provided evidence of convergent validity.

RESEARCH FINDINGS

Hypotheses examination:

Using LISREL, seven significant relationships were accomplished such as: culture and social identity, place and social identity, time and social identity, social identity and job satisfaction, social

Figure 2. Structural Equation Model Results (H1 through H7) $\chi 2$=343.86, ρ<0.001, df=367, RMSEA=0.000, CFI=0.99, NFI=0.86, GFI=0.86, AGFI=0.84. All solid line path coefficients are significant at ρ<0.001***
Table 2. Result of hypotheses

	Hypotheses	Result
H1	The culture dimension of virtual team is positively related to social identity	Supported
H2	The place dimension of virtual team is positively related to social identity	Supported
H3	The Time dimension of virtual team is positively related to social identity	Not supported
H4	The social identity of virtual team is positively related to job satisfaction of its members	Supported
H5	The social identity of virtual team is positively related to job involvement of its members	Supported

H7	The social identity of virtual team is positively related to organizational commitment of its members	Supported

identity and job involvement, social identity and organizational citizenship behavior and social identity and job commitment (Figure 2). Except hypothesis (H3), all other hypotheses (H1, H2, H4, H5, H6 and H7) were supported (Table 2).

DISCUSSION AND CONCLUSION

As Table 1 indicates, an average sample of the social identity is 2.01. Statistical tests show that this average is low and in is critical situation. The test results find that the identity is a challenge for the virtual teams hence; the first hypothesis is approved.

The influence of the information technology in organizations and emergence of virtual teams along with reduction in the sources of identity acquisition have made identity-building and identity-finding difficult with traditional methods. In such scenario, the individuals in such teams cannot establish meaningful and permanent communication with each other. The identity crisis disturbs the social life, and individual or group need to solve the crisis. Rebuilding the identity is one of the factors that should be considered in such situations that can be considered at three levels i.e. ego, ego and group and intergroup.

Virtual teams continue both to weaken the identity acquisition resource and increase the possibility of rebuilding the individuals' identity.

It has a dual feature: it has both opportunity and threat for the organization. On the one hand, individual can take pleasure in building virtual identities (such as male organizational identity instead of female organizational identity) which are desirable to him but on the other hand these identities affect the organizational identities. In such a situation, employees may be able to select right combinations, create new world for themselves. It must be noted that manager's attempts to establish and create identities are proper in respect to the situation and objectives of organization that can play an important role in establishing identity. Theoretically, the paper has studied comprehensively all the variables affective on social identity of virtual teams. On the other hand it presents organizational variables affected from such identity that is a suitable guide for managers to control and lead virtual teams.

Chapter 4
Quality Assurance through Innovation Policy:
The Pedagogical Implications on Engineering Education

Marlia Puteh
Universiti Teknologi, Malaysia

Kamsiah Mohd Ismail
Universiti Teknologi, Malaysia

ABSTRACT

A number of countries are focusing on innovation to advance their economies up the value chain. Hence, a large emphasis is given to engineering education as activities that engage scientific development generally originate from the engineering field (Ashford, 2004). A country's innovation policy also determines educational reform as the education sector is a key player, holding holds the intellectual capacity and trained human resources to execute the transformation. In this regard, the engineering profession and accrediting engineering programs have repeatedly called for reform in the engineering education pedagogical approach. Despite debates over the effectiveness of outcome-based education, the prominent teaching methodology has always been attributed to the traditional approach of "chalk and talk" (Mills & Treagust, 2003). This study investigates the critical role of science, technology and innovation to a country's economy. It will also examine the extent to which the educational approach, particularly in the engineering education field, is coherent with the national system of innovation, exposing students with real perspectives for future workplace environment.

INTRODUCTION

"For developed countries, innovation is the key to growth, prosperity and quality of life."
(Carlson & Wilmot, 2006, p. 274)

Countries around the world are engaged in strategic moves towards building a more innovative and vibrant economies. In this regard, Carlson and Wilmot (2006) proposed that these countries should rely on the innovation led economy which constitutes the creation and delivery of new customer value in the marketplace. Hughes (2005) provided an important warning when discussing the 21st century competitiveness strategy. According to Hughes (2005), the "health" of the economy inevitably shapes the focus and speed of innovation on the whole economy (p. 74). In a similar vein, Ertl et al. (2007) claimed that science, technology and innovation activities have initiated economic and social change to countries around the globe. Even the Americans have identified innovation as "…the single most important factor in determining America's success through the 21st century" (Council on Competitiveness, 2005, p. 7).

According to the United Nations Educational, Scientific and Cultural Organization (UNESCO), innovation is broadly defined to include not just new technologies but new services and new forms of managerial organization (Aylen & Marjoram, 2008). The Organisation for Economic Co-operation and Development (OECD), in addition, defined innovation according to the following four types of innovation; product innovation, process innovation, marketing innovation and organizational innovation (http://www.oecd.org). Despite the ambiguity of the term as it refers to both the process and the result of innovation (European Commission, 1995), the term *innovation* has shown a tremendous influence in the academic, societal and political arena worldwide. In lieu with this, UNESCO has outlined three basic assumptions underlying the notion of innovation i.e. innovation involves strategies from the national governments,

innovation relates to scientific research, IT infrastructure and patents and innovation as a crucial concept in the economic domain. Carlson and Wilmot (2006) further identified the major roles of government policies, critical infrastructure of a country and cultural determination of its people to help construct an environment which fosters opportunities for innovation. The authors reflected on the Chinese and Indians work culture of 60 to 70 hours per week and the fact that these people are "…full of ideas, enthusiasm and energy" to "…surpass the United States and the rest of the world" (Carlson & Wilmot, 2006, p. 23).

Hence, Carlson and Wilmot strongly proposed that innovation is integrated into the basic curriculum to promote the culture of innovation. This tallied the recommendations made by the United States' National Council on Competitiveness. The Council argued for the "retooling" of curriculum by creating an "innovation culture" which provides students with exposures on open-ended problems, teamwork and cross-discipline project engagement at all levels from kindergarten to graduate education (Council on Competitiveness, 2005, p. 19). Using some of Carlson's and the National Council on Competitiveness innovative proposals, this paper analysed the extent to which institutions of higher learning contributes to the intellectual capacity and innovative human resource to help advance a country's economy. The following section will discuss the innovation performance of a few selected countries because understanding the relationship between science, technology and innovation is crucial in appreciating the unwavering impacts of these components to the economy.

SCIENCE AND TECHNOLOGY AS INNOVATION INDICATORS

Many countries have engaged in efforts to strengthen their science and technological capacity by fostering innovation to improve their global competitiveness. Technological innovation com-

monly driven by government policies support the national development strategies and drives the industrial growth of a country. What are the innovation indicators of a country? The World Bank (http://www.worldbank.org/) measures of innovation activities include the following; high technology exports (% of manufactured exports and current US$), patent applications (residents and nonresidents), R&D expenditures, R&D researchers, royalty and license fees (payments and receipts), trademark applications (direct resident and nonresident), R&D technicians and the number of scientific and journal articles. According to Arundel (2007), "…R&D indicators were the most widely used and were considered to be the most valuable" (p. 51). Reporting on the dominance of these R&D indicators to the innovation policy making in Europe, Arundel attributed this development to the ongoing power of the

linear model of innovation and the structure of innovation support programs which are currently implemented (Arundel, 2007). For the purpose of this paper, only selected indicators by the World Bank will be discussed. Table 1 demonstrates the performance of some developed and developing countries on innovation activities in 2007.

North European countries represented by Sweden, Denmark and Germany are among the countries which R&D expenditure is rather high as compared to the others, with the exception of Japan. Sweden ranks at the top of the list with regards to R&D investment, despite the size of its economy. Likewise, Singapore, Japan, Denmark and Sweden yield more than 5,000 researchers per million people, ten times more than the developing countries' average of 700 researchers per million people. Table 1 also displays the progress made by emerging countries represented

Table 1. Innovation Indicators 2007 (selected countries)

Country	High Technology Exports (% 0f Manufactured Exports) [f]	Patent Applications (residents) [f]	R&D Expenditure (% of GDP)	Researchers in R&D (per million people	Scientific and Journal Articles [c]	Technicians in R&D (per million people)
Australia	11.81	2718 [e]	2.17 [d]	4230.6 [d]	15,957	992.8 [d]
China	28.66	194,579	1.49	1070.9	41,596	n.a.
Denmark	15.57	1634	2.57	5430.8	5040	2005.7 [d]

[a] 2000 data, [b] 2001 data, [c] 2005 data, [d] 2006 data, [e] 2007 data, [f] 2008 data

n.a.: data not available

Source: The summary of the data and the above statistics are selected from the World Bank Data and Research Online available at http://data.worldbank.org/topic/science-and-technology Assessed May 2010

by Philippines and Malaysia. These two Asean countries gave much emphasis on high technology exports in the field of manufacturing as compared to the developed countries, excluding Singapore. For example, high technology exports made up 66.27% of Philippines' total manufactured exports, comparative to Australia (11.81%) and Denmark (14.26%) respectively. China ranks third with 194,579 patent applications behind Japan (330,110) and the United States (231,588). China's performance in patent activity is 37 times better compared to India even though both are being regarded as emerging, global economic giants. This vast difference probably reflects their science and technological policy divergence in these largely agricultural economies.

The World Bank data above gave very strong emphasis on R&D-based indicators. As Arundel (2007) argued, many policies mostly lies on "… long-established indicators for R&D" (p. 50). Despite these policies excellence measures on creative activities for innovation, he revealed that some characteristics of innovation in the modern economies are not adequately measured. These include the diffusion of technology, the role of distributed knowledge bases, the increased role of the service sector and the informal innovative activities which are non-R&D based. Until the construct of the new measures are in place, more research should be carried out to identify the indicators that better meet the need of the community and can be internationally compared.

MAJOR CHALLENGES FOR HIGHER LEARNING INSTITUTIONS

The National Innovation agenda of the United States highlighted three critical components in optimizing the entire society for innovation; the human dimension of innovation, the financial dimension of innovation and the physical and policy structures that support innovation (Council on Competitiveness, 2005). It is the first

component that higher learning institutions very much responsible; building talent to survive and succeed in the global economy. Kearney (2009) noted four priorities which several countries have adopted vis-à-vis higher education, research and innovation:

1. creating innovative policies in higher education and in science, technology and innovation
2. improving and developing necessary infrastructure
3. continuous effort in training and retaining of highly skilled human resource
4. intensifying investments in research and higher education

These enabling environments promote innovative thinking and creative experimentation and advance national development. However, very little importance is given to innovative approaches to teaching and learning. In preparing skilled human resources, Kearney (2009) claimed that tertiary education has shifted its paradigms to promote "learning by doing" through individual creativity, characterized by employable graduates, groundbreaking research and strong technology transfer.

Despite Kearney's claim, a UNESCO "Expert Workshop on Science and Technology, Innovation and Development" agreed that there is no clear indication of the role of universities in developing local capabilities to innovate in the developing economies. The lack of autonomy of the higher education sector has prevented local training and promoted a brain drain of talented local human resources (Aylen & Marjoram, 2008). The following section will investigate this issue further.

INNOVATION IN ENGINEERING EDUCATION

Innovation is the central theme throughout the curriculum to produce productive and innovative

students in addressing the issue of human resource for the innovation-led economy. Kearney (2009) argued that partnerships among the governments, the economic sector and the research universities are growing rapidly, linking new knowledge to countries' development goals. However, she cautioned that innovation typically takes place outside academic setting and this process warrants further analysis by research experts.

A country's innovation policy also determines the educational reform as the education sector is the key player which holds the intellectual capacity and trained human resource to execute the transformation. Owing to our increased dependence on scientific and technical innovation, engineering has become the major element of advancement in the technological society (National Science Board, 2007). Hence, a large emphasis is given to engineering education as activities that engage scientific development generally originate from the engineering field (Ashford, 2004). In this regard, the engineering profession and the responsible bodies in charge of accrediting engineering programs have repeatedly call for reform in the engineering education pedagogical approach. Hence, the Engineering Criteria 2000 (EC2000) was developed to emphasize on students' learning outcomes, rather than specific curriculum specifications (Prados et al., 2005). Similarly, Steiner (1998) argued that any engineering currriculum that does not address innovation is depriving its students of essential competencies for engineering success in the global marketplace and for career enrichment and advancement.

This has prompted the introduction of the Conceiving, Designing, implementing and Operating (CDIO) initiative which was aimed at reforming the curriculum, pedagogical approaches, and the laboratories (Brodeur & Crawley, 2009). The CDIO approach has been growing in popularity and has been adopted in a number of universities worldwide including Arizona State University, Beijing Jiaotong University, Purdue University, Lancaster University, Taylor's University College,

Malaysia and Singapore Polytechnics, to name a few. The CDIO approach consists of twelve 'standards' that are adopted by an educational institution (please refer to Crawley, 2001 for more details on CDIO syllabus). The CDIO initiatives aimed to improve teaching and learning via the following approaches; increasing active and practical learning, emphasizing problem formulation and solutions, exploring the theories of engineering tools and procedures and engaging in innovative methods of collecting feedback (www.cdio.org). Lynch, Seery and Gordon (2007) claimed that CDIO supports project-based learning whereby students are informed of the desired learning outcomes prior to starting any project. Likewise, CDIO also promote curriculum restructuring to include design and build projects and integration of other subjects in interdisciplinary engineering course.

There is no doubt the CDIO initiative is a valuable initiative of a larger effort in transforming the engineering curriculum. However, such curriculum innovation is risky to the whole process of quality assurance in engineering education as it is subjected to "…top-down, bottom-up and push-pull forces" (Eijkman, Kayali & Yeomans, 2009, p. 225). They warned that there are a range of issues surrounding curriculum innovation including that of financial assistance, resistance to change, engineering content and educational structure.

This article does not dispute the advantages of the CDIO initiative, rather proposing another alternative which can be adopted by institutions which face a lot of issues in implementing this innovative curriculum as a wider university strategy. Despite the calls for re-designing of the engineering programs curriculum and the creative introduction of the CDIO initiative there are several critical issues that need to be considered if reformation of the curriculum were to take place. Firstly, this effort takes a long time as it must be planned carefully and funded generously. Secondly, the institutional leader must demonstrate "sustained and sensi-

tive leadership" (Gray & Patil, 2009, p. 305) to facilitate this innovative change in the curriculum. Finally, faculty members must be open to new ideas and prepare to apply new tools in their teaching in order to materialize curriculum innovation. If these do not occur, the CDIO initiative is rather difficult to be implemented in any institutions and may take longer time to come about. In this case, the findings on curricular and instructional change with regards to EC2000 by Prados, Peterson and Lattuca (2005) should not be taken lightly. They revealed that out of 3,000 faculty members who were surveyed from forty participating institutions, approximately 80% claimed that changes in their focal course is influenced by their "own initiative" whereas 28% credited ABET i.e. the EC2000 as a moderate influence on course changes. This implies that instructional strategies applied by instructors are more prominent albeit the strong focus on curriculum reformation in driving curricular change.

REFORMING ENGINEERING EDUCATION VIA PROJECT-BASED ENGINEERING PROGRAMME

Significant changes to the current delivery of engineering education are highly essential in order to prepare students with future workplace environment. Felder, Woods, Stice and Rugarcia (2000) revealed that "…many engineering classes in 1999 are taught in exactly the same way that engineering classes in 1959 were taught" (p. 26). This is a shocking revelation because for the past 40 years, there is not much improvement in the way engineers have been taught. Harris & Cullen (2009) agreed with Felder et al.'s assertion that engineering curricula is still employing the traditional practice of adding content to address the EC2000. These old-fashioned instructional strategies have prompted Mills and Treagust (2003) to argue for more student-centered activities in engineering programs.

This paper proposes that project-based approach (PJBL) be applied as an intervention prior to the introduction of the CDIO initiative in any institutions which have problems in implementing the whole CDIO model. Despite the sheer number of literature that refers to project-based learning as PBL (Gao et al., 2008; Guthrie, 2009), this paper will adopt the term PJBL to differentiate the acronym for problem-based learning (PBL) and project-based learning in order to avoid misunderstandings of both pedagogical approaches. PJBL in itself is an innovative strategy if the implementation fulfills the initial objective of engaging students with real-world projects. Montufar-Chaveznava et al. (2008) claimed that not only PJBL generates good results; it also managed to bring about the agreement between the demands of the industries and university instructions in regards to the skills and abilities of engineering students.

How does PJBL be considered as an innovative approach to teaching and learning? The authors propose PJBL as an innovative approach to the pedagogy of engineering education based on the following reasons:

1. the concept of "project" is common to students (Mills & Treagust, 2003)
2. task and role differentiation expected of students highlights individual uptake (Mills & Treagust, 2003)
3. institutions with funding difficulties might be able to adopt this approach as it can be applied to individual courses, if not throughout the curriculum
4. it can be implemented as small projects by the "Lone Rangers" (Bates, 2000) or interested and enthusiastic instructors, not necessarily the whole faculty
5. it tallies Felder et al.'s (2000) recommendation that to ensure the success of an instructional method, the method must be pertinent to engineering education, falls within the context of typical engineering classrooms,

requires a small amount of practice of the instructor and coherent with current theories of learning

PJBL is a comprehensive approach to classroom teaching that is designed to engage students in the investigation of authentic topic and issues (Gao et al., 2008). In response to the evolving nature of engineering and the development of technology, PJBL is increasingly practiced in institutions of higher learning. Examples include 4th year civil engineering design project with CDIO elements in Shantou University, China and an introductory project design in Chalmers University of Technology, Sweden. However, the application of PJBL varies particularly between lectures, tutorial work and students' self-directed learning, compared with the actual project learning. PJBL also exposes students to constructivist learning which Tam (2000) associated with multi-layer interaction between learners' current knowledge, the social environment and the problem itself. Tam also noted that the constructivist learning process engages students with "good" problems and collaborative work. PJBL is resonant with this constructivist approach as it encourages students to work in groups and solve projects which are meaningful and genuinely complicated. Gao, Demian and Willmot (2008), in addition, associate PJBL to the constructivist approach due to the freedom of choice offered to the students and the independent learning concept that it mooted.

If employed, what are the advantages of PJBL? Stouffer, Russel and Oliva (2004) argued that if PJBL is frequently applied, it can result in increased critical thinking, self direction, comprehension and skill development, self-motivated attitudes and enhanced teamwork awareness. Similarly, Siaw (2002) is in favour of PJBL not only because it encourages self-directed and life-long learning, but it also fosters the development of critical thinking and problem-solving skills. Angilides (2000) further added the list of benefits of PJBL to include the improvement on students' understanding and retention of knowledge.

Montufar-Chaveznava, Yousuf and Caldelas (2008) observed that PJBL is one of the strategies that can be applied when teaching some engineering topics particularly for basic and advanced engineering subjects. This is because PJBL requires students to associate the theoretical framework offered in basic courses such as biology and mathematics to real application. One innovative way in experimenting with PJBL is to engage with case studies. Case studies are one of the strategies in PJBL implementation. Stouffer et al. (2004) viewed case studies as modeling lessons taught in the classrooms around real projects. They outlined the following benefits of case studies; engaging students with cutting-edge practices and procedures, allowing students to invite case participants into the classroom, promoting students' creativity and exposing students with multiple solutions to a case. In a similar account, Savery (2006) noted that case studies develop higher order thinking skills of the students. "A well-constructed case," he argued, enables students to comprehend the critical aspects of the situation, hence preparing them for future comparable situations (p. 15). He identified a few advantages of case studies namely developing students' critical thinking skills, assisting students in building context-specific vocabulary, encouraging students' understanding of the relationship between case elements and developing students' communication and team working skills.

These instructional methods are by no means perfect in the teaching of engineering education. PJBL and case studies may not be applicable throughout the whole engineering program and may be pertinent to certain courses, to start off. Nevertheless, as we have argued earlier, PJBL is useful as an intervention for curricular change prior to the university-wide implementation of the CDIO initiative. Earlier sections of the paper have discussed the advantages of PJBL and its focus on fostering innovative projects are worth to be attempted by interested faculty members.

CONCLUSION

In order to survive the era of research and innovation, countries need to nurture new talent of diverse, innovative and well-trained human resource. In this regard, higher education institutions have a serious role to play by stimulating creative thinking and innovative skills through the implementation of powerful instructional principles.

This paper has proposed that project-based learning be used to address this situation. Developing realistic students' projects is not an easy task. Likewise, incorporating traditional lectures and assigning closed-ended problems in teaching limits the creativity and innovation of the engineering students. Therefore, engineering educators and higher learning institutions need to employ innovative teaching strategies to overcome this demanding issue. More emphasis on hand-on practical aspects such as PJBL especially with real projects can enhance engineering students' learning and expose them with the creative process of the teaching and learning.

Project-based learning enhances the students' learning outcomes during the project realization and provides better engineering education experience for the engineering students. They gain knowledge and skills as well as develop attitudes and behaviors relevant to their future work scenario. Both case studies and project-based strategies promote active learning and engage students in higher-order thinking as claimed by Savery (2006). Some elements of creativity and innovations are also fostered in the students. Case studies also help learners to understand the important elements of the situation so that they are better prepared for similar situations in their future undertaking.

The challenges for universities are to retain the innovativeness of engineering projects in order to make them more interesting and to reduce the attrition in engineering courses. Universities also face the challenge to immerse students in intellectually stimulating projects, apart from developing realistic students' projects especially for classes with large number of students.

The findings of this study is expected to contribute to the understanding of the type of teaching approaches adapted by higher learning institutions and its contribution to the intellectual capacity and innovative human resource in assisting governments in advancing the economy. Engineering education is at the forefront of this change as engineering is the key to an innovation-led economy.

Chapter 5
An Exploratory Cross–National Study of Information Sharing and Human Resource Information Systems

ABSTRACT

Information sharing has recently received considerable academic interest because of the importance knowledge management plays in the creation of sustained competitive advantage for global firms. The interest is attributed to the need for achieving higher levels of worker empowerment and effectiveness. However, the existing research in the area lacks an examination of how national differences impact information sharing activities. This study responds to this need by presenting a structured yet exploratory inquiry into factors impacting information sharing and the adoption of Human Resource Information Systems (HRIS) by examining key national differences. Assessing national differences is extended beyond the examination of national culture by including institutional contexts in the study. Using a 22-country sample from the CRANET database, the study suggests there is a significant and predictable variation in the level of information sharing and HRIS adoption in firms from different countries, and that national differences, including cultural and institutional contexts, have an impact on information sharing. The study also indicates that the level of HRIS adoption is positively associated with information sharing. The authors discuss these findings, their implications for research and practice, and address limitations along with opportunities for future research.

INTRODUCTION

Understanding national differences is critical as organizations continue to expand operations beyond their home borders. However, the study of information sharing and information technology adoption, two key aspects of managing geographically and culturally diverse workforces, has not been fully addressed from a broad-based international perspective in a single research model. In response to this gap in the existing literature, our study focuses on the relationship between national difference, information sharing, and Human Resource Information Systems (HRIS).

National culture, information sharing, and information technology (IT) adoption have become increasingly important topics in managing organizational members and information (Gibson, Porath, Benson, & Lawler, 2007; Luo & Shenkar, 2006; Pfeffer, 2005). Particularly, information sharing and IT are important themes in global business (Griffith, Cavusgil, & Xu, 2008; Torre & Moxon, 2001). For the past decade there has been an increase in attention to such areas as knowledge management (Foss & Pedersen, 2004), participatory management (Ichniowski & Shaw, 1999), organizational learning (Kang, Morris, & Snell, 2007), and strategic use of IT (Alavi & Leidner, 2001). Studies have consistently recognized that people are an important source of sustained competitive advantage. To effectively execute their duties, workers must be well-informed about internal and external conditions of the organization (Pfeffer, 2005). Thus, information sharing through formal and informal systems facilitates employee learning and results in competitive advantage (Gibson et al., 2007).

Both research and practice indicate that IT plays a large role in knowledge management and organizational learning by making firm-wide sharing of organizational, financial, and operational information possible (Alavi & Leidner, 2001; Haines & Lafleur, 2008). In particular, some (Becker & Huselid, 1998; Chow, 2005) of the literature on

human resources recognizes information sharing and IT as vital elements for organizations to develop such capability. Increasingly, the role of what is broadly called as HRIS tends to go beyond "automating" and now is becoming "informing" employees and managers through easy access to organizational knowledge (Hendrickson, 2003; Shani & Tesone, 2010). Previous studies have attempted to examine the impact of IT on the level of information sharing in the contexts of technologies such as communication systems and enterprise systems (Alavi & Leidner, 2001; Davenport, 1998), but there has been little research on HR-related IT in relation with organization-wide information sharing.

In addition, as more firms are "going global" for the acquisition of materials and workers, and in the pursuit of additional sales, there has been a large body of research on the role of national difference in many dimensions of firm activities (Ichniowski & Shaw, 1999; Katz & Townsend, 2000; Kogut & Singh, 1988; Niederman, Boggs, & Kundu, 2002; Tellis, Stremersch, & Yin, 2003). Recently, studies have examined the role of national culture on organizational practices such as information sharing (Chow, Harrison, McKinnon, & Wu, 1999; Shin, Ishman, & Sanders, 2007). Most of these studies have focused on only two or three countries and related differences in information sharing, management styles, and others. In this regard, studies using a large sample of data from multiple countries can further advance our understanding of the impact of national culture on information sharing.

Finally, there have been several studies examining the relationship between national culture and IT adoption and usage (Martinsons, 1994; Straub, 1994). However, limited research exists that focuses on HR-related IT in a national culture framework. Related to studying the variation that national difference causes in organizational practices, a growing number of recent studies (Parboteeah & Cullen, 2003; Tsui, Nifadkar, & Ou, 2007; Tung, 2008) suggest the necessity

of including not only national culture but also institutional contexts when examining national difference.

Our study attempts to respond to the need for a broader inquiry into national difference, information sharing, and HR-related IT (or Human Resource Information Systems, HRIS) adoption. In this study national difference is assessed using two dimensions: National culture and Institutional contexts. First, we provide a brief review of three streams of research: national differences, information sharing, and HRIS. Then, we present a theoretical framework integrating national culture and institutional factors and develop several hypotheses to test the relationships of national difference, information sharing, and HRIS adoption. We assess firm-level data from a 22-country sample from the CRANET database to evaluate the significance of such relationships.

Our analysis indicates there is a significant variation in the level of information sharing and HRIS adoption among different countries and national differences, including institutional contexts such as economy and education. In addition, our research suggests national differences, such as systematic tendency to avoid uncertainty and educational attainment, are powerful predictors for variations in the level of information sharing. We find that a country's economic development is an important predictor for variations in HRIS adoption. That is, countries with higher levels of industrialization and education, and lower levels of uncertainty avoidance, tend to exhibit higher information sharing and HRIS adoption rates. Our analysis also indicates that the adoption of HRIS is positively associated with information sharing. Finally, we discuss these findings, their implications for research and practice, and address limitations of our work along with opportunities for future research.

The contributions of this study are clear. While there has been much research interest in information sharing and IT for HR, studying these two innovative organizational practices simulta-

neously through a cross-national framework is rare. Most previous studies of information sharing and HRIS have tended to focus on a single organization or, at most, one or two countries. We believe that the major contribution of this study is the development of a theoretical research framework integrating cultural and institutional factors to understand those two important themes in global information management. This framework can be useful to study the adoption of other organizational innovations by firms in different countries. Another major contribution is that this study presents broad cross-national findings from several world regions about the adoption of information sharing and HRIS. This sheds particularly light on the role of national culture and societal institutions for explaining a significant variation of organizational and technological innovations in firms from different countries. The findings of this study suggest that researchers and managers alike should pay keen attention to the influence of a nation's cultural and institutional factors on the adoption and diffusion of information sharing and HRIS. Several avenues of future research emerge from these findings and suggestions.

BACKGROUND LITERATURE

The present study focuses on a relationship between information sharing, HRIS, and cross-national differences. Organizational institutionalism is the guiding theoretical perspective. Through this theoretical lens, organizations "are influenced by their institutional context" (Greenwood, Oliver, Suddaby, & Sahlin, 2008, p. 3). Institutional theory researchers have focused partly on how the context of organizations create "an inexorable push towards homogenization" which leads organizations in a common context (such as the same country) to have similar organizational practices (DiMaggio & Powell, 1983, p. 147). From this perspective, each country tends to have distinctive regulatory, normative and cultural cognitive forces, which

press organizations to be similar within a country and distinct compared to organizations in other countries (Scott, 2008). These institutional forces that influence organizational practices are quite varied, but national culture, economic development, and general educational levels of a country has been a reoccurring focus. This section offers a brief review of related literatures on information sharing, HRIS and national differences, prior to developing hypotheses in the following section.

Information sharing. Information sharing is an innovative organizational practice which leads organizations to increase the amount of the company's internal data and organizational information available to members of the organization for greater productivity and innovativeness. Information sharing has recently received considerable interest in academic research and industry practice. The rising interest is attributed to the trend, at both societal and organizational levels, toward more worker empowerment (Kang et al., 2007), decentralized decision making (Pfeffer, 1998), and organizational IT adoption (Alavi & Leidner, 2001). There have been suggestions as well as empirical findings that greater adoption of information sharing is associated with higher levels of individual learning and organizational performance (Chow et al., 1999). Information sharing practices are now widely adopted in managing strategic alliances and supply chain networks (Lee, 2000; Samaddar, Nargundkar, & Daley, 2006).

Similarly, there has been much attention to the role of information sharing and its influence on organizational performance. For example, Pfeffer (2005) recognized information sharing as an important way of producing and sustaining competitive advantage by organizations over their competitors. From this perspective, it is critical for organizations to inform people of business strategy, financial performance, and other issues and help them in the sense-making process (Ahmad & Schroeder, 2003). Gibson et al. (2007) suggested that the organizational practice of

information sharing enhances employees' ability and potential to make more contributions to their units and organizations and is positively related to the firm's financial performance. Information sharing is also considered to be one of the core elements for a high performance work system (Becker & Huselid, 1998). Despite this interest, there has not been much effort in the literature to understand information sharing from an international perspective.

Human Resource Information Systems (HRIS). There are numerous studies on HRIS (DeSanctis, 1986; Haines & Lafleur, 2008; Hendrickson, 2003; Kovach & Cathcart, 1999; Mayfield, Mayfield, & Lunce, 2003; Ngai & Wat, 2006; Teo, Lim, & Fedric, 2007). These studies generally recognize that IT promises such benefits as automation of administrative HR tasks, easy access to employee related data, and fast delivery of a firm's financial and operational data to employees. Several studies offer a review of HRIS, including some general roles and benefits of IT for HR (DeSanctis, 1986; Mayfield et al., 2003). Recently, additional studies (Haines & Lafleur, 2008; Hussain, Wallace, & Cornelius, 2007; Kovach & Cathcart, 1999) have addressed the influence of HRIS on HR tasks. In this vein, some studies (e.g., Hussain et al., 2007; Mayfield et al., 2003; Shani & Tesone, 2010) have even suggested the increasing role of IT in strategic HR areas that goes beyond its traditional role (e.g., automation of administrative HR tasks). Studies show more active roles of HRIS as enabling organizational learning and knowledge management (Mayfield et al., 2003), radical organization change (Tansley, Newell, & Williams, 2001) and transforming the role of HR function within organizations empowering employees through easy access to information (Hendrickson, 2003; Shani & Tesone, 2010).

Generally, studies of HRIS are limited to a single organization or, at most, one country and they lack accessing HRIS through a cross-national perspective. For example, Haines and Lafleur (2008) evaluated the associations between IT us-

age and HR roles and effectiveness. Their study assessed survey-based data from HR executives of the firms in Canada. Tansley et al. (2001) presented an active role of integrated HRIS in the course of business process reengineering. Their case research is based on a single organization in UK. Ngai and Wat (2006) studied perceived benefits and barriers to the implementation of HRIS. They drew a survey data from HRIS consultants and HR managers in Hong Kong. Lastly, Teo et al. (2007) reported the adoption and diffusion of HRIS using survey data from firms in Singapore. One notable exception is the study by Martinsons (1994) that examined HRIS adoption in Hong Kong and Canada. Broader-based research is clearly needed. Recent research by Panayotopoulou, Galanaki, and Papalexandris (2010) and Strohmeier and Kabst (2009) have expanded the more typical single country focus to evaluate IT-assisted human resource management across multiple European countries.

National differences. As business operations become globalized, understanding national differences becomes increasingly important to the effective management of people, communication, and organizational resources. There is wide recognition within country homogeneity and cross-country heterogeneity that many institutional theory-based research efforts have observed (Greenwood et al., 2008). Due to this increasing need in the global business contexts, more studies have adopted cross-cultural or national perspectives on the issues in several business fields (Chow et al., 1999; Gerhart & Fang, 2005; Gooderham, Nordhaug, & Ringdal, 2006; Katz & Townsend, 2000; Myers & Tan, 2002; Pagell, Katz, & Sheu, 2005; Shin et al., 2007; Tsui et al., 2007).

There are various cultural frameworks available for investigating the role of national differences (see Myers & Tan, 2002; Tsui et al., 2007). Among these, Hofstede's work (1980) has been one of the most popular references for cross-national studies (Gallivan & Srite, 2005; Gerhart & Fang, 2005; Kirkman, Lowe, & Gibson, 2006;

Leidner & Kayworth, 2006). His framework assesses national culture from four dimensions: uncertainty avoidance, power distance, muscularity, and individualism. A growing number of recent studies view national differences from both cultural values (e.g., individualism) and institutional arrangements (e.g., industrialization). For example, Parboteeah and Cullen (2003) argue that exploring the influence of national difference on such topics as work centrality needs to consider not only national culture but also institutional arrangements such as education, economy, and industrialization. Also, a study by Sundqvist, Frank, and Puumalainen (2005) considered both economic wealth and cultural variables to examine the adoption of wireless communication in different countries.

RELEVANT THEORY

This study is interested in two specific types of organizational innovation—information sharing and HRIS adoption—in international contexts. Therefore, the theoretical background of systematic worker preferences by national origin lies in the literature on national difference. Previous cross-country studies of information management have paid much attention to national culture, but only a limited number of studies, to our best knowledge, have examined societal or national institutions in their cross-country inquiry. "Nation and culture do not completely overlap, that nations differ in many aspects beyond cultural values" (Tsui et al., 2007, p. 462).

For example, the Gooderham et al.'s (1999) research on collaborative management practices investigated patterns of information sharing across several European countries. Understanding nation-based institutional influences include both national culture and other factors (Greenwood et al., 2008; Hofstede & Hofstede, 2005); however, there is no complete listing of what these include. Therefore, we approach national difference by

considering cultural dimensions and other societal institutional factors.

For national culture, we rely on the aforementioned cultural framework developed by Hofstede (Hofstede, 1980; Hofstede & Hofstede, 2005). Hofstede defines culture as "collective programming of the mind" (Hofstede, 1980, p. 13) and presents differences in national level cultures (Hofstede, 1980; Hofstede & Hofstede, 2005). His original framework (1980) includes four dimensions of national culture and we particularly examine two of them: uncertainty avoidance and power distance. Hofstede (Hofstede & Hofstede, 2005) notes that uncertainty avoidance and power distance, among other cultural dimensions, are two most important dimensions for understanding organizations. Similarly, previous studies have pointed out that uncertainty avoidance and power distance, among Hofstede's cultural dimensions, tend to strongly affect management's decisions on organizational innovation (Png, Tan, & Wee, 2001). Katz and Townsend (2000) also note "to understand why managers make decisions affecting the design of organizational infrastructures, uncertainty avoidance and power distance have been suggested as important factors of national culture" (pp. 25-26). In this similar line, numerous studies have shown uncertainty avoidance and power distance as the most important cultural dimensions for understanding information management in global contexts (Agourram & Ingham, 2007; Erumban & de Jong, 2006; Everdingen & Waarts, 2003).

Uncertainty avoidance refers to "the extent to which the members of a culture feel threatened by ambiguous or unknown situations" (Hofstede & Hofstede, 2005, p. 167). "On the cultural level, tendencies toward rigidity and dogmatism, intolerance of different opinions, traditionalism" (Hofstede, 1980, p. 155) are likely to be strongly present in a country with high uncertainty avoidance. High uncertainty avoidance culture tends to avoid any new practices that "may call into question the certainties of today" (Hofstede &

Hofstede, 2005, p. 256) and to leave planning, controlling, and decisions to specialists or key members (Hofstede & Hofstede, 2005). Thus, new organizational practices are less likely adopted in a country with high uncertainty avoidance. For example, previous IT adoption studies have demonstrated that high uncertainty avoidance countries are risk averse and less likely to adopt technological innovation (Gaspay, Dardan, & Legorreta, 2008).

Power distance is defined as "the extent to which the less powerful members of institutions and organizations within a country expect and accept that power is distributed *unequally*" (Hofstede & Hofstede, 2005, p. 46, emphasis added). In a country with high power distance, power and authority are concentrated to superiors and subordinates are strongly dependent upon superiors' decisions. Subordinates tend to have "fear to disagree with superiors" (Hofstede, 1980, p. 92) and such unequal distribution of power is not likely to be challenged in a country with high power distance (Hofstede, 1980; Hofstede & Hofstede, 2005). As a result, organizations in such a country are likely to adopt more centralized decision making and top down organizational structure. Also organizational innovations promoting values and practices against the unequal distribution of power are less likely adopted in a country with high power distance.

A nation's institutional environment includes additional forces beyond national culture to understanding organizational practices and managerial actions (Neumayer & Perkins, 2005; Parboteeah & Cullen, 2003). This theoretical frame has been increasingly used in the study of IT adoption (Weerakkody, Dwivedi, & Irani, 2009). "Institutions are multifaceted" (Scott, 2008, p. 48) and national institutions have different elements. The literature recognizes that a nation's institutional contexts include various types of dimensions such as political structures (e.g., government regulations) and economic factors (e.g., level of industrialization), and recognize that decisions

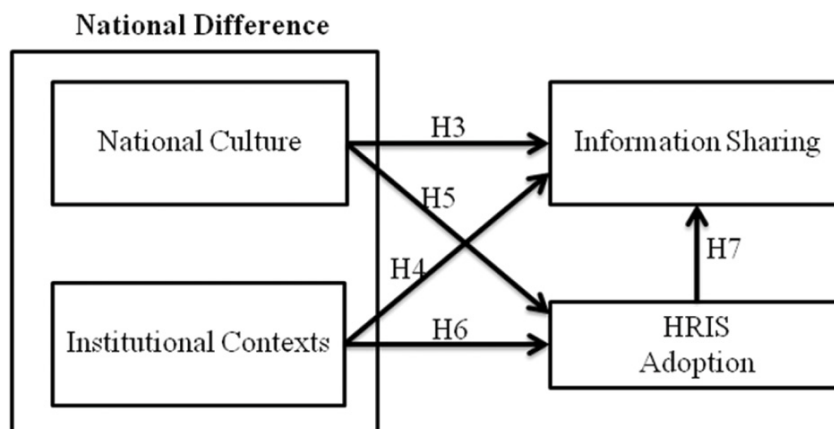
about organizational practices are influenced by these institutional contexts (Scott, 2008). Two institutional contexts—industrialization and education—are particularly important in this study since they have been considered as important factors in numerous institutional studies of organizational and technological innovation adoption (Bagchi, Hart, & Peterson, 2004; Martinez & Williams, 2010; Neumayer & Perkins, 2005; Parboteeah & Cullen, 2003; Tellis et al., 2003; Zhao, Kim, Suh, & Du, 2007).

Industrialization is an important element, indicating how developed a particular country is in economic terms. Studies have suggested that industrialization has a great influence on broader aspects of economic decisions and activities (Parboteeah & Cullen, 2003; Zhao et al., 2007). The more industrialized a country is, the more receptive the firms in that country become to new innovative practices and technical standards (Neumayer & Perkins, 2005). Thus, industrialized countries are likely to adopt new technological innovation faster than their counterparts (Bagchi et al., 2004; Martinez & Williams, 2010; Zhao et al., 2007).

In addition, education as "a powerful institution" (Parboteeah & Cullen, 2003, p. 141) is closely linked with the level of innovation capability in different countries. "Education involves the exposure of people to a constant stream of new ideas, which makes them more receptive to innovations" (Tellis et al., 2003, p. 194). Education increases human capital, which serves an important social infrastructure for new practices to be adopted and implemented in firms and countries. Therefore, "firms with better-educated workforces are not only more likely to have knowledge of new organizational practices, but are likely to find it cheaper to implement them" (Neumayer & Perkins, 2005, p. 247). Thus, people with higher levels of education tend to be more receptive to innovations (Tellis et al., 2003) and, likewise, countries with a high level of education are more likely to adopt new practices.

RESEARCH HYPOTHESES

Drawn upon the previous section this section develops several hypotheses about the relationships between national differences, information sharing, and HRIS (Figure 1). The underlying proposition in the research design is that significant variation in the level of information sharing and HRIS adoption in organizations occurs in different countries based on underlying national factors. The research design allows us to assess whether the variation is explained by the differences in national culture (uncertainty avoidance,

Figure 1. Theoretical relationships and research design


power distance) and institutional arrangements (industrialization, education level).

Difference of information sharing. The background literature suggests that national differences matter in technological and organizational innovativeness and proposes why organizations in different countries differ in terms of organizational practices, decision making, and technology adoption. Specifically, Chow (2005) demonstrated that national difference explains the variation in management practices, particularly high-performance work systems, in different countries. Pagell et al. (2005) showed that national difference significantly explains the variation in operations manager's decision-making and behaviors. Neumayer and Perkins (2005) pointed out the variation of the adoption of organizational innovation such as ISO 9000 in different countries based on the nation's institutional contexts. Straub (1994) explained the variation of technology adoption in Japan and the US using Hofstede's culture framework. Other studies (Leidner & Kayworth, 2006; Myers & Tan, 2002; Tsui et al., 2007) offer literature surveys of extant cross-national studies on management and IT.

Some studies are particularly relevant to information sharing in an international context. For example, Chow et al. (1999) reported the variation of information sharing in Taiwan and Australia, attributing such differences to national culture. Shin et al. (2007) demonstrated the influence of culture values on information sharing practices in China. In addition, Ahmad and Schroeder (2003) showed there is a significant variation among business practices, such as information sharing, in different countries. National differences appear to be influencing the degree of innovativeness (Shane, 1995). Considering information sharing as a type of organizational innovation, it is expected that firms in some countries are more likely to adopt information sharing in their business practices than those in other countries. Thus, we propose:

Hypothesis 1a: The level of information sharing within organizations will be significantly different from country to country.

In addition, based on Gooderham et al.'s (1999) research on collaborative HRM practices in Europe we anticipate expected comparative levels of information sharing of some, but not all, countries that we consider. Denmark and Norway were significantly higher than United Kingdom with respect to collaborative HR practices, while Germany, France and Spain were significantly lower than England in the use of these practices. These reflect both cultural and other institutional forces such as high level of unionization and legal mandates to share information with employees in Scandinavia and a relatively stronger institutional granting of strong managerial autonomy to organization in countries such as Spain and United Kingdom. Based on the patterns seen in the Gooderham et al.'s (1999) results, the following hypothesis is proposed:

Hypothesis 1b: The level of information sharing observed in organizations from Scandinavian countries is high compared to all other countries investigated, while Germanic countries, Spain and France will exhibit lower patterns of information sharing and the United Kingdom will have intermediate levels of these practices.

Comparative research by Brewster, Mayrhofer, and Morley (2000) have generally found organizations in south-eastern and central European countries to have less developed HRM practices than northern European countries. This is likely to be partially related to general economic development and weaker traditions of workplace democracy. Based upon this research the following is proposed.

Hypothesis 1c: The level of information sharing observed in organizations from Italy, Greece, Turkey, Slovakia, and Bulgaria will

be lower than that seen in northern European countries.

Differences in HRIS adoption. Today, IT significantly influences organizational design, information sharing, and decision-making. Thus, in addition to information sharing, HRIS is an important dimension for business strategy (Kovach & Cathcart, 1999) in international contexts. National differences matter to information management in international contexts (Agourram & Ingham, 2007; Ein-Dor, Segev, & Orgad, 1993; Katz & Townsend, 2000; Leidner & Kayworth, 2006; Veiga, Floyd, & Dechant, 2001). Previous studies have shown there is a significant variation in the adoption of various types of technological innovation, including e-mail (Straub, 1994), frame relay technology (Png et al., 2001), ERP (Everdingen & Waarts, 2003), wireless technology (Sundqvist et al., 2005), Internet (Zhao et al., 2007), and others (Bagchi et al., 2004; Chai & Pavlou, 2004; Straub, Loch, & Hill, 2001), and this variation has been ascribed to the differences in national culture and other institutional factors that vary across countries. Likewise, it is expected there is a significant variation in the level of HRIS adoption in different countries. Thus, we propose:

Hypothesis 2a: There will be a significant difference in the level of HRIS adoption from country to country.

In addition, we anticipate two specific patterns for the level of HRIS adoption in countries. The first pattern is related to the differences in the level of technology adoption across different geographical regions. Extant studies suggest that countries in North America and Europe have a high level of adoption in a broad range of technologies, compared to other regions (Bagchi et al., 2004; Chinn & Fairlie, 2007; Comin & Hobijn, 2004). This is attributed to the national infrastructure (e.g., free economy, open trade, high expenditure on technology) which is favorable for adopting new

technological innovation (Chinn & Fairlie, 2007; Comin & Hobijn, 2004). Comparative research (Tellis et al., 2003; Vicente & Lopez, 2006) also suggests that Scandinavian countries turned out to be faster in adopting new technologies than other European countries. Based on these findings, we propose that there will be a similar pattern observed in HRIS adoption.

Hypothesis 2b: The level of HRIS adoption observed in organizations from Scandinavian countries, USA, and Canada are high compared to all other countries investigated.

The second pattern we anticipate from HRIS adoption is related to Hypothesis 1c, projecting that northern European countries have more developed HRM practices than south-eastern and central European countries. HRIS are deployed to support traditional HRM practices (e.g., HR administrative tasks) (DeSanctis, 1986) and also enable new or transformative HRM practices (e.g., employee empowerment, knowledge management) (Shani & Tesone, 2010; Tafti, Mithas, & Krishnan, 2007). In this vein, countries with more developed HRM practices are likely to be faster in adopting HRIS than countries with less developed HRM practices. Thus, we project that the pattern of differences noted in Hypothesis 1c should be seen in HRIS adoption.

Hypothesis 2c: The level of HRIS adoption observed in organizations from Italy, Greece, Turkey, Slovakia, and Bulgaria will be lower than that seen in northern European countries.

Cultural values and information sharing. As noted earlier, national differences can be considered through cultural values and other institutional arrangements. First, several studies posit that cultural values alone significantly influence management practices of organizations in different countries. For example, Chow et al.

(2005) examined whether cultural values such as individualism and power distance are positively or negatively associated with the level of information sharing and found that the differences in information sharing in Taiwan and Australia "are consistent with the cultural characteristics of Chinese and Anglo-American cultures" (p. 579).

Information sharing is an organizational practice emphasizing employee empowerment, participation (Gibson et al., 2007), and informed decision making by various levels of workers including non-management employees. Thus, it can be considered an innovative organizational practice (Chow et al., 1999) on how organizations communicate with their employees (Black, 2005). Previous studies show there is a relationship between national culture and organizational innovation and practice (Shane, 1995). Some studies predicted that power distance in Hofstede's framework would negatively influence the adoption of worker participation (Black, 2005) and decentralized organizational structure (Katz & Townsend, 2000). Firms in a country with high power distance would be less likely to adopt such an innovative practice which aims to "inform" organizational members through more intra-organizational information flows and potentially leads to greater employee autonomy and participation in decision making because such an innovative practice ("information sharing") is not likely to support the existing structure of social inequality. In addition, information sharing as an organizational innovation would be relatively newer to some countries than to others. People in a country with high levels of uncertainty avoidance are less tolerant of innovative practice (Shane, 1995) since innovation often comes with organizational change whose outcome is unknown in advance. Thus, high uncertainty avoidance would potentially lead organizations to be reluctant to implement information sharing as a new organizational practice.

Hypothesis 3a: Uncertainty avoidance will be negatively associated with the level of information sharing.

Hypothesis 3b: Power distance will be negatively associated with the level of information sharing.

Institutional arrangements & information sharing. In addition to cultural values, other institutional factors are important to consider. According to institutional theory (DiMaggio & Powell, 1991; Scott, 2008), firm-level decisions regarding innovative practices occur in broader institutional contexts. Gooderham et al. (2006) suggested that institutional arrangements influence managerial and organizational practices. The adoption of information sharing as an innovation would be no exception. In the literature there are different types of social institutions in a country (Scott, 2008) and thus different social institutions can be considered as predictors for the variation in the level of information sharing. Previous studies were particularly interested in political, economic, and educational institutions (or institutional arrangements) and demonstrated the influence of those institutional dimensions on organizational practices such as work centrality (Parboteeah & Cullen, 2003) and ISO 9000 (Neumayer & Perkins, 2005).

We examine the relationship that economic and education-related institutional variables have on information sharing. These institutional variables represent the level of country development (Parboteeah & Cullen, 2003). They have been found to be important institutional predictors for the adoption of organizational practices and innovation (Bagchi et al., 2004; Martinez & Williams, 2010; Neumayer & Perkins, 2005; Parboteeah & Cullen, 2003; Tellis et al., 2003; Zhao et al., 2007). Previous studies show that high industrialization and education level are positively related with the adoption of organizational innovation (Neumayer & Perkins, 2005; Parboteeah & Cullen, 2003). In other words, developed countries tend to have

more adopted innovative practices than their less-developed counterparts (Black, 2005; Chow, 2005; Sundqvist et al., 2005). Thus, we propose:

Hypothesis 4a: The level of industrialization will be positively associated with the level of information sharing.

Hypothesis 4b: The level of education accessibility will be positively associated with the level of information sharing.

Cultural values and HRIS adoption. Various studies have shown that cultural values significantly explain IT adoption and usage. Whether this may be the case for HRIS would be an interesting question to answer. Uncertainty avoidance and power distance are two important cultural factors that may predict the adoption of technological innovation (Bagchi et al., 2004; Erumban & de Jong, 2006; Katz & Townsend, 2000). For example, Straub (1994) studied the usage of e-mail and fax in US and Japanese companies and found that US companies use e-mail more extensively than Japanese counterparts. He attributed this variation to uncertainty avoidance in Hofstede's framework. Png et al. (2001) focused on the adoption of telecommunication technology using Hofstede's power distance and uncertainty avoidance. Their study reports that companies in high uncertainty avoidance countries are less likely to adopt the technology. They explained that innovation such as new IT is perceived as an increase of uncertainty and thus organizations in the country with high uncertainty avoidance are less likely to adopt innovations like new technology. Studies have suggested that high uncertainty avoidance is negatively associated with internet diffusion (Zhao et al., 2007) and wireless technology (Sundqvist et al., 2005). Similar to these studies, others also suggest that national culture may facilitate or impede the adoption and diffusion of certain technologies. For example, high power distance would restrict the availability of information and technology to certain groups of

people in a society or organization in order to maintain the status quo of power base (Katz & Townsend, 2000). In addition, Everdingen and Waarts (2003) suggested that high uncertainty avoidance and power distance are negatively associated with the adoption of IT innovations like enterprise systems. Innovation itself or technology adoption is likely to be considered as some sort of uncertainty creation. Thus, we propose the following:

Hypothesis 5a: Uncertainty avoidance will be negatively associated with HRIS adoption.

Hypothesis 5b: Power distance will be negatively associated with HRIS adoption.

Institutional Arrangements and HRIS. The rate of technology adoption varies among countries (Erumban & de Jong, 2006; Martinez & Williams, 2010). The examination of institutional contexts has long been an interest in the studies of IT adoption (Avgerou, 2001). Studies have explored the role of nation's institutional arrangements for explaining the variation in the adoption of various technologies (e.g., Internet) (Comin & Hobijn, 2004; Sundqvist et al., 2005; Tellis et al., 2003). Zhao et al. (2007) suggested that organizations in developed countries are more likely to adopt IT than those in developing countries. Particularly, their study shows that a high level of industrialization and national education accessibility is positively related with the adoption of Internet diffusion. Developed countries tend to have higher educational attainment level and better infrastructure. Such conditions enable a high rate of technology adoption (Erumban & de Jong, 2006). Other studies also use national educational level as an important variable in explaining technology adoption variation (Comin & Hobijn, 2004; Stremersch & Tellis, 2002). We propose country-specific institutional factors will help explain differences in the level of HRIS adoption in organizations in different countries as follows:

Hypothesis 6a: The level of industrialization will be positively associated with HRIS adoption.

Hypothesis 6b: The level of education accessibility will be positively associated with HRIS adoption.

HRIS and information sharing. Shin et al. (2007) noted that IT offers an infrastructure for more information sharing in organizations. HRIS are considered as an important part of organizational IT infrastructure supporting extensive information sharing and knowledge management practice (Hendrickson, 2003; Hustad & Munkvold, 2005; Mayfield et al., 2003; Tafti et al., 2007). Since its inception in the 1960s (DeSanctis, 1986) HRIS has co-evolved with human resource practices within organizations, which have also transformed from mainly personnel management (e.g., recruitment, training, bargaining, employee data management, performance evaluation, compensation) to the inclusion of innovative practices (e.g., information sharing, employee participation, profit sharing, knowledge management, organizational learning, worker autonomy) (Tafti et al., 2007). Thus, in addition to their traditional usage of "monitoring" personnel (Tafti et al., 2007) and "automating" administrative HR tasks (Hussain et al., 2007; Niederman, 1999; Shani & Tesone, 2010), there has been a broader role of HRIS as a technological infrastructure for informing employees and increasing their effectiveness (Haines & Lafleur, 2008; Hendrickson, 2003; Kovach & Cathcart, 1999), which is aligned with those strategic and transformational HR practices, such as information sharing and employee empowerment. To respond to this increasing role, the scale of HRIS has also evolved from stand-alone information systems to an integral part of an enterprise IT infrastructure (Bondarouk & Ruel, 2009; Hendrickson, 2003; Hustad & Munkvold, 2005). Thus, we propose:

Hypothesis 7: Technology (HRIS) adoption is positively associated with the level of information sharing.

RESEARCH METHODS

Data

Our study uses data gathered through the Cranfield network on European HR management (CRANET) survey. The CRANET survey, which has been conducted since 1990, includes a large set of firm-level data in human resource practices from over 20 countries. Several previous studies (Beck, Kabst, & Walgenbach, 2009; Brewster, Wood, Brookes, & Ommeren, 2006; Papalexandris & Panayotopoulou, 2004) have used the CRANET survey database. The 2004 survey process was similar to previous CRANET collection procedures (Tragaskis, Mahoney, & Atterbury, 2004). The survey, which focuses on a wide variety of HR practices, was completed in 2004 by senior HR leaders in firms from 32 countries. Beck et al. (2009) report a 17 percent response rate. To evaluate the presence of any bias associated with industry sector and size, Stavrou, Brewster, and Charalambous (2010) compared early and last survey responses from European countries on these measures and did not find evidence of systematic response bias. They report evidence that the CRANET survey process, at least in the case of Europe, results in samples that are "broadly comparable to the EU's employment patterns for organizations with more than 100 employees" (p. 942). Firms from countries with less than 100 responding firms were excluded from this analysis. The details of earlier collection rounds, which are similar to the 2004 administration, are discussed in detail by Brewster, Tregaskis, Hegewisch, and Mayne (1996) and Tragaskis, Mahoney, and Atterbury (2004). Steinmetz, Schwens, Wehner, and Kabst (2011) provide a detailed methodological critique of the CRANET survey process and find many strong points. They note that while efforts to gather a representative sampling of public sector organizations is consistently applied across countries, there is some variance in the sampling frames used by country-based researchers who

are most focused on gathering samples representative of the larger economies of each country. The result is that different country-based samples tend to vary with respect to organizational size and industries represented. For cross-national comparative research, it is ideal for all countries to employ a common sampling frame.

Variables and Measures

Data source and sample. Our analysis includes 22 countries in the CRANET database with a total sample of 6411 firms. The number of companies located in 10 countries (e.g., Hungary, Czech Republic, Philippines, etc.) were not numerous enough (fewer than 100 organizations) for reliable analysis. Firms from those countries were deleted from our analyses. The 22 countries included are: United Kingdom, France, Germany, Sweden, Spain, Denmark, Netherlands, Italy, Norway, Switzerland, Turkey, Finland, Greece, Austria, Belgium, Bulgaria, Australia, New Zealand, Israel, USA, Canada, and Slovakia. These countries represent different world regions and provide a look at information sharing and HRIS practices in companies from a wide range of culture, regulatory, nation and institutional environments.

Information sharing scale. The nine-item scale examines three key areas of internal business activities: Business strategy, financial performance, and organization of work. For each,

the survey respondent indicated with yes/no responses whether professional/technical, clerical, and manual employees were each formally briefed about each focus area. A high score (on the 0 to 9 scale) indicates that the organization is engaged in formal information sharing across all non-managerial employee groups on each of these three foci. A single factor solution, using principal components analysis, produced an Eigenvalue of 3.7 with factor loads of .47 or higher. The standardized Alpha reliability coefficient is .81. These items are a subset of those used in the longer collaborative HRM practices scale employed by Gooderham et al. (1999), which used an earlier version of CRANET database. Table 1 presents descriptive statistical information for all variables and the Appendix presents the items that form this scale.

Human resource information system (HRIS) adoption scale. The measure of HRIS adoption uses a single item to access the type of computerized HR information system in the respondent's organization. The three-point scale consisted of: (1) "do not have a computerized HR information system," (2) "primarily independent HR system," and (3) "primarily interfaced/integrated into a wider management information system." As noted earlier, HRIS have changed with the evolving human resource practices encompassing personnel management and other innovative practices such as organizational learning and

Table 1. Descriptive statistics

Scales	Mean	SD	1	2	3	4	5
1. Information Sharing	5.50	2.72					
2. HRIS Adoption	2.1382	.69	.07				
3. Log of Educational Attainment	3.77	.78	.23	-.02			
4. Economic GDP per Person	23134.80	6555.59	.16	.08	.44		
5. Power Distance	39.23	19.43	-.12	-.03	-.44	-.58	
6. Uncertainty Avoidance	53.97	21.41	-.21	.01	-.31	-.50	.43

Notes:

1. Means and standard deviations are calculated with the full sample, n = 6411.

2. The Pearson intercorrelation coefficients are presented in the last five columns. Coefficients above .04 are significant at the p < .001.

worker empowerment. Thus, HRIS have evolved from manual or non-IT based record system to independent information systems to, finally, an integral part of firm's enterprise system. These three types (manual, independent, and integrated) of HRIS describe the development stages of HRIS (Hendrickson, 2003; Hustad & Munkvold, 2005; Shani & Tesone, 2010). The HRIS integrated into a wider enterprise information system represents the highest form of HRIS adoption.

National cultural values scales. Our analysis used the most recent country scores for Hofstede's two national culture dimensions: uncertainty avoidance and power distance. These scores are available at www.geert-hofstede.com. The same country scores are also reported in Hofstede and Hofstede (2005).

National economy and education levels. Economic performance, as measured by gross domestic product (GDP) per capita, and educational attainment levels are two key indices of the larger institutional context that firms within a country face. The data for national economic performance (GDP per capita) came from the World Development Indicators (WDI) by the World Bank. Since our study uses the 2004 CRANET survey data, we chose the 2003 WDI data, which is close to the year that the CRANET survey was conducted. The average national education attainment level is measured by an index available from the United Nations. Both skewness and kurtosis problems were present with this scale. We were able to eliminate these distributional problems by using a logarithmic transformation in all of our analyses. Many previous studies using an institutional theory framework have considered these economic and education attainment measures in their analysis (Erumban & de Jong, 2006; Parboteeah & Cullen, 2003; Zhao et al., 2007).

Analysis Procedures

Our analysis combines two statistical tests: ANOVA and regression. We used the ANOVA and the related Tukey Honest Significance Test (Tukey HSD) to assess the simultaneous multiple pairwise comparisons proposed in the first two sets of hypotheses (that there is variation in information sharing and HRIS adoption between countries). Regression analyses were used to assess a positive or negative relationship between predictors (national culture and institutional arrangements) and dependent variables (information sharing and HRIS adoption) predicted by Hypothesis 3 through 7.

RESULTS

Table 2 displays the results of ANOVA and Tukey HSD tests for Hypotheses 1a-1c (the variation in information sharing by country). These sets of hypotheses found some support. There is significant variation in country-based means in information sharing (Hypothesis 1a) over these 22 countries. Table 2 ranks the countries from low to high and presents homogeneous subsets of countries where information sharing levels are not statistically different. For example, such countries as Israel, Turkey, and Greece represent a group with low information sharing while such Scandinavian countries as Denmark, Sweden, and Finland report a high level of information sharing. As anticipated by hypothesis 1b Scandinavian countries have high levels. Finland is statistically higher than all other countries than Sweden (both of those countries are in the subset with the highest means). Similarly, Norway and Denmark, while significantly lower than Finland and have similar information sharing levels compared to their geographic neighbors, are significantly higher than the other countries noted in hypothesis 1b. Specifically, all Scandinavian countries have significantly higher levels than seen in the United Kingdom and the Germanic countries (Germany, Austria, and Switzerland). The only result inconsistent with Hypothesis 1b is that the means of Spain (5.10) and France (5.13) are not significantly lower than the UK

Table 2. ANOVA & Tukey HSD: the variation of information sharing between countries

Country	Homogeneous Subgroups of Country Means										
Israel	3.4133										
Turkey	3.7372	3.7372									
Greece	4.0060	4.0060	4.0060								
USA	4.2140	4.2140	4.2140	4.2140							
Bulgaria		4.2878	4.2878	4.2878	4.2878						
Austria		4.3925	4.3925	4.3925	4.3925						
Slovakia		4.4902	4.4902	4.4902	4.4902						
Italy		4.5357	4.5357	4.5357	4.5357						
Germany			4.7704	4.7704	4.7704	4.7704					
Switzerland				4.9900	4.9900	4.9900					
Spain					5.1000	5.1000	5.1000				
Canada					5.1198	5.1198	5.1198				
France					5.1250	5.1250	5.1250				
Australia					5.1423	5.1423	5.1423				
New Zealand						5.6255	5.6255	5.6255			
United Kingdom							5.9021	5.9021	5.9021		
Belgium								6.0132	6.0132		
Norway								6.2284	6.2284	6.2284	
The Netherlands								6.3727	6.3727	6.3727	
Denmark									6.5483	6.5483	
Sweden										7.0590	7.0590
Finland											7.5350

Notes:

1. The F-value from the one-way ANOVA was 48.336 and is significant at the p <.001 level indicating that there variance between country means are significant.

2. The columns present the country-based means. Country means that are in the same column are not significantly different from one another while countries not included in a common homogeneous subgroup are significantly different at the p <.05 level based on the Tukey HSD test.

mean of 5.90 as all three countries are in a common homogeneous subset. We also found partial support for Hypothesis 1c. Turkey and Greece means are significantly lower than all Northern European countries, except Austria. While Bulgaria, Slovakia and Italy means are significantly lower than the UK and Scandinavian countries, they are in a common homogeneous subset with Germanic countries and France.

Table 3 displays the results of ANOVA and Tukey HSD tests for Hypotheses 2a-2c (the variation in HRIS adoption by country). There is significant country-based variation in HRIS adoption (Hypothesis 2a) over these 22 countries. Table 3 shows that there are several distinct country groupings in terms of the level of HRIS adoption. For example, such countries as USA, Austria, Denmark, Turkey and Greece represent a group with high HRIS adoption while such countries as New Zealand, Australia, UK, Bulgaria and Sweden have low levels. We found only partial support for Hypothesis 2b. USA (2.41) reports the highest level of HRIS adoption and is significantly higher than the first 12 countries on the Table 3

Table 3. ANOVA & Tukey HSD: The Variation of HRIS adoption between countries

Country	Homogeneous Subgroups of Country Means							
New Zealand	1.8655							
Australia	1.9407	1.9407						
Finland	1.9441	1.9441						
Bulgaria	1.9568	1.9568	1.9568					
Slovakia	2.0314	2.0314	2.0314	2.0314				
United Kingdom	2.0656	2.0656	2.0656	2.0656	2.0656			
Sweden	2.0697	2.0697	2.0697	2.0697	2.0697			
Belgium	2.0877	2.0877	2.0877	2.0877	2.0877	2.0877		
Israel		2.1467	2.1467	2.1467	2.1467	2.1467	2.1467	
Germany		2.1480	2.1480	2.1480	2.1480	2.1480	2.1480	
Norway		2.1624	2.1624	2.1624	2.1624	2.1624	2.1624	
France		2.1691	2.1691	2.1691	2.1691	2.1691	2.1691	
The Netherlands			2.1864	2.1864	2.1864	2.1864	2.1864	2.1864
Canada				2.1980	2.1980	2.1980	2.1980	2.1980
Spain				2.2000	2.2000	2.2000	2.2000	2.2000
Italy				2.2143	2.2143	2.2143	2.2143	2.2143
Switzerland				2.2292	2.2292	2.2292	2.2292	2.2292
Greece				2.2335	2.2335	2.2335	2.2335	2.2335
Turkey					2.2756	2.2756	2.2756	2.2756
Denmark						2.3156	2.3156	2.3156
Austria							2.3208	2.3208
USA								2.4163

Notes:

1. The F-value from the one-way ANOVA was 11.48 and is significant at the $p < .001$ level indicating that there variance between country means are significant.

2. The columns present the country-based means. Country means that are in the same column are not significantly different from one another while countries not included in a common homogeneous subgroup are significantly different at the $p < .05$ level based on the Tukey HSD test.

(i.e., those not included in the homogeneous subgroup in the last column). Canadian organizations (2.19) are also significantly higher than the first four countries list. While this is not a strong result, it was anticipated by 2b. However, the results with Scandinavian countries report, at best, mixed support for hypothesis 2b. The mean for Denmark (2.32) is relatively high and is significantly higher than the first seven countries. However, those including Sweden (2.07) and Finland (1.94) which are both in the lowest homogeneous subgroup are not significantly higher than any

other country mean. This result is also inconsistent with hypothesis 2c. Hypothesis 2c is not supported. While Slovakia and Bulgaria are in the lowest homogeneous subgroup, this is not the case for the other countries (Greece, Turkey, and Italy) as they are in the highest homogeneous subgroup, and, contrary to this hypothesis, those three country-based means are significantly higher than a Scandinavian country, Finland.

In addition, there are several countries where firms tended to have contrasting high versus low patterns of information sharing and HRIS adop-

tion, which is consistent with the low intercor-relation of these two variables at the firm level. For example, firms in the USA have relatively high levels of HRIS adoption while having relatively low levels of information sharing. Sweden had the opposite profile.

The regression analyses presented in Table 4 suggest that Hypothesis 3a is supported. That is, there is a negative relationship between uncertainty avoidance and information sharing (β = -.160 and -.165). As predicted, uncertainty avoidance levels seen in an organization's home country is significantly and negatively related to the level of information sharing practiced. However, contrary to Hypothesis 3b, there is a modest, but significant, positive association between power distance and information sharing (β =.048 and.048). While there is a significant negative zero-order correlation (r = -.12) noted in Table 1, this relationship became positive when the inter-correlation with national GDP (-.58) and educational attainment level (-.44) and uncertainty avoidance (.43) is controlled. Thus, contrary to Hypothesis 3b, power distance was not found to have a negative relationship with the use of more information sharing to lower non-managerial levels of the organization. Supplemental stepwise regression analyses found that the inclusion of GDP and

uncertainty avoidance after power distance in the regression results in a change from a negative to positive coefficient for power distance.

We hypothesized that a country's economic performance (Hypothesis 4a) and education level (Hypothesis 4b) are positively related to the adoption of information sharing. The regression analysis results indicate that the level of national educational attainment has a positive significant relationship to the level of information sharing in organizations (β =.191 and.195). While the GDP per capita is significantly correlated to information sharing (r =.16), this relationship becomes non-significant (β = -.022/-.012) when its inter-correlation with educational attainment (r =.44) and uncertainty avoidance (r = -.31) is controlled.

The relationship between national culture, namely levels of uncertainty avoidance and power distance, and HRIS adoption (Hypotheses 5a & 5b), was hypothesized to be negative. However, Table 4 analysis shows a positive linear relationship between uncertainty avoidance and HRIS adoption (β =.061), and no relationship between power distance and HRIS adoption (β = -.004). Thus, these two hypotheses are not supported. In addition, we predicted a positive relationship between the level of a country's GDP or industri-alization (Hypothesis 6a) and educational attain-

Table 4. Regression analyses

	HRIS Adoption	**Information Sharing**	**Information Sharing**
Scales:	β	β	β
Educational Attainment(log)	-.062**	.191***	.195***
Economic GDP per Person	.139***	-.022	-.012
Uncertainty Avoidance	.061***	-.160***	-.165***
Power Distance	-.004	.048**	.048*
HRIS Adoption	---	---	.072***
Adjusted R^2	.013***	.075***	.080***

Note:

1. The first column presents the results for the regression on the HRIS adoption dependent variable.

2. The last two columns represent a two-step analysis using Information Sharing as the dependent variable. In that analysis, the first four variables were entered on the first step. The standardized regression weights (β) for that analysis are presented in the middle column. In the final step, the HRIS adoption variable was added and those results are presented in the third data column.

*p <.05 **p <.01 ***p <.001

ment (Hypothesis 6b) and HRIS adoption. The analysis confirms a positive influence of economic industrialization on HRIS adoption (β =.139), but the relationship between education and HRIS adoption (r =.22) become slightly negative (β = -.062) once the strong inter-correlation between GDP and education (r =.44) was controlled. This is contrary to Hypothesis 6b.

Hypothesis 7 predicted there is a positive relationship between IT availability and information sharing. The simple bi-variate relationship noted in Table 1 between these two scales is positive (r =.08). To address this question more substantially, information sharing was regressed on HRIS adoption after the other four predictors were included in the regression. As shown by columns two and three in Table 4, the addition of HRIS adoption (in column three) resulted in a significant increase in explained variance (ΔR^2 =.05; β =.072) and this supports Hypothesis 7.

DISCUSSION AND IMPLICATIONS

The results of our study clearly indicate significant differences exist in the degree of information sharing and the adoption rate of HRIS among countries. This finding suggests information sharing is an organizational practice that has been adopted with a wide variation among firms in differing countries. The adoption of HRIS as a technological innovation, while perhaps not as varied as the differences seen in information sharing practices, does vary significantly across these countries as well. Overall, it appears that the adoption rate of organizational and technological innovation significantly differs between firms based on home country differences. We attribute this variation to the difference in national culture and institutional arrangements, among other potential factors. This confirms the importance of including national difference in our understanding of the adoption of information sharing and HRIS. In addition, our results suggest management should pay keen

attention to the country's culture and institutional factors as they consider adopting new organizational and technological practices and innovations such as information sharing and HRIS.

Our analysis shows that social institutions have a more predictive power than national culture. This finding is similar to some studies, while differing from other studies examining innovation adoption. For example, several studies (Comin & Hobijn, 2004; Gooderham et al., 2006; Martinez & Williams, 2010; Neumayer & Perkins, 2005; Poutsma, Ligthart, & Veersma, 2006; Scott, 2008; Zhao et al., 2007) previously suggested that social institutions like politics, economy, and infrastructure explain why a new practice or innovation is adopted in one country earlier than in other countries. The findings from studies like Zhao et al. (2007) also indicate that the relationship of institutional variables with new practice/innovation adoption is more evident than that of cultural variables.

On the other hand, many studies using the Hofstede framework have shown a significant predictive power of cultural dimensions such as uncertainty avoidance and power distance (Black, 2005; Erumban & de Jong, 2006; Everdingen & Waarts, 2003; Parboteeah & Cullen, 2003; Straub, 1994). According to our study, however, national culture seems to have less explanatory power than what previous studies suggested and what we originally posited. This is particularly true with the power distance measure since our analysis revealed that the influence of power distance on information sharing and IT adoption appears to have marginal impact. This result appears to be quite consistent with Gerhart and Fang's (2005) recent conclusions about the limited explained variance provided by Hofstede's culture dimensions. Also, cultural differences explained more variance in organizational information sharing practices than in HRIS adoption.

However, in the context of technology adoption, previous studies (Png et al., 2001; Zhao et al., 2007) show findings similar to ours. One expla-

nation is that this may be due to the diminishing role of power dimension or "human inequality" (Hofstede, 1980, p. 92) in society as a whole and in many organizations as democratic forms of governance (and management) are more widely adopted in many countries and organizations. Also, the view of culture as "contested, temporal and emergent" (Myers & Tan, 2002, p. 11) and "not static" (Tung, 2008, p. 44) could be relevant to some of our findings. On a related note, the literature on institutional theory has increasingly appreciated that organizations have latitude in how they address the structural press of a country's institutional environment to conform. This is known as the "agency" perspective and is a counter-point to the "structuralist" press for isomorphism often associated with the institutional perspective (Heugens & Lander, 2009; Oliver, 1991).

Unlike power distance, uncertainty avoidance, which is "a basic fact of human life" (Hofstede, 1980, p. 153), has a higher level of explanatory power as shown in our analysis as well as in previous studies (Bagchi et al., 2004; Erumban & de Jong, 2006; Png et al., 2001; Straub, 1994; Zhao et al., 2007). This is because the divergence of uncertainty avoidance among countries appears to be persistent. Thus, it can be expected that information sharing will be continuously adopted as a new organizational practice by more organizations worldwide ("globalization" of new practices or innovations). At the same time, there is still a variation or difference among countries in terms of the way information sharing as a new practice is adapted by each organization ("localization" of new practices or innovations). HRIS is expected to display the similar pattern of adoption and adaption by organizations, as shown in other types of technologies (DeSanctis & Poole, 1994).

In addition, our findings suggest the explanatory power of national culture over HRIS adoption is not strong. This is different from the propositions and findings of previous studies using different types of technological innovation (Bagchi et al., 2004; Erumban & de Jong, 2006; Veiga et al.,

2001). We think this suggests that when it comes to explaining the variation of IT adoption, such as HRIS, the influence of national culture and institutional forces are less salient compared to the variation of the information sharing adoption. Information sharing has more direct implications for how employees are treated in an organization and, thus, the institutional press for legitimacy or "doing things the right way" in a given national context will be more salient than is the adoption of technological innovations (e.g., HRIS). Institutional environments may give relatively more latitude to variations in the adoption of these practices. This would be particularly true in the case of relatively less-expensive technologies such as HRIS. Unlike expensive technologies such as enterprise-wide systems (e.g., ERP), whose relationship with Hofstede's cultural dimensions are found to be more significant (Everdingen & Waarts, 2003), information systems for HR require relatively less investment and maintenance and thus they carry relatively fewer risks than other larger-scale enterprise technologies. For this reason, such systems are likely to be more easily adopted and it may take less time for broad diffusion to take place among firms. This said, we think that how a more extensive IT technology, such as an ERP, is implemented and used in an organization will be more likely to confront institutional pressures and constraints about what is the "right way to manage" in a given country.

Contrary to hypothesis 5a, the relationship between uncertainty avoidance and HRIS adoption is found to be positive. This finding is contrary to that of previous studies of technology adoption, such as the Internet (Zhao et al., 2007), ERP (Everdingen & Waarts, 2003), frame relay (a type of IT infrastructure) (Png et al., 2001), e-commerce (Chai & Pavlou, 2004), and others (Veiga et al., 2001). Agourram and Ingham (2007) found that people from different national cultures perceive the meaning of IT success differently. In this vein, one possible explanation of this result is that organizational decision makers may perceive the

"meaning" of HRIS differently due to different national cultures. High uncertainty societies prefer more planning and control systems (Hofstede, 1980; Hofstede & Hofstede, 2005). Organizations in high uncertainty avoidance cultures may see the use of more planning and control mechanisms (e.g., monitoring employee performance) as a means for uncertainty reduction. HRIS could be seen as means for increasing organizational control and planning capability, which will lead to less uncertainty in managing employees and organizational resources.

The finding of this negative relationship between education and HRIS adoption (6b) is also contrary to previous studies of innovation adoption in international contexts (Martinez & Williams, 2010; Tellis et al., 2003; Zhao et al., 2007) that education makes people more receptive to innovation.

An analysis of comparing Table 3 (the variation of HRIS adoption) and education index scores seems to shed light on two countries: New Zealand and Turkey. New Zealand, the country with the highest education index score, is found to be the lowest in HRIS adoption among all 22 countries in the sample. The opposite is Turkey, the country with the lowest education index in the sample, showing one of the highest in HRIS adoption. It appears that this is ascribed for much of the unexpected positive relationship found regarding 6b. Yet, the finding of 6b needs a more systematic analysis with other institutional dimension (e.g., legal regulations, average age of workforce). For example, the institutional development of a country like Turkey is described as "One of the main forces behind Turkey's economic momentum is the availability of young and educated human capital. More than half of Turkey's population (57 percent) comprises people under the age of 30" (Aycan, 2001, p. 254). Thus, maybe firms in a country with high young educated workforces, despite the low national education level, are more likely to adopt technologies like HRIS. Despite the findings on hypothesis 6b, however, economy-

related institutional contexts (GDP) (6a) tend to effectively explain variations in HRIS adoption among countries.

Finally, our analysis also draws attention to the relationship between information sharing and IT. It shows there is a positive relationship between the type of HRIS and the degree of information sharing. That is, organizations with HRIS tend to share more information than those without, and organizations with integrated HRIS share more information than those with standalone HRIS. At the micro level this finding would justify a continuing investment in communication and repository technologies by organizations and an increasing IT-enabled organizational change effort for organizational learning and knowledge management (Alavi & Leidner, 2001). At the global level, this may also suggest the presence of a potentially reciprocal relationship between technological innovation and organization/institutional practices. New organizational practices like information sharing influence and are often enabled by the adoption of informational technological innovations like HRIS.

The practical implications of our study are clear: Managers should understand the cultural context and other national institutional factors impacting organizations when initiating or expanding information systems in unfamiliar locations. This is especially relevant when strategic alliances involve information sharing among partner organizations in widely disparate locations. The result of not considering the factors examined in our study could result in lost investments and inter-organizational discord.

LIMITATIONS AND FUTURE RESEARCH

Understanding information sharing and IT adoption simultaneously from an international perspective is rare in the literature. This paper has aimed at responding to this need by surveying a broad

range of multi-disciplinary studies, developing relevant hypotheses, and analyzing organizations from 22 different countries. This study, however, is not without limitations.

First, we have not identified an exhaustive listing of other factors beyond uncertainty avoidance, power distance, economy, and education. While these are prominent factors in the literature, future studies can find additional institutional forces to understand country-based differences in practices. The tenets of institutional theory, for example, discuss various types of social institutions at different levels (Scott, 2008). Similarly, recent studies of international business present multi-layered models of culture (Karahanna, Evaristo, & Srite, 2005; Leung, Bhagat, Buchan, Erez, & Gibson, 2005) and cultural frameworks (Hampden-Turner & Trompenaars, 1998) other than those proposed by Hofstede. In a related vein, industries provide their own institutional press for member organizations for what is considered good practice. Analyzing both industry-specific patterns of practice across different country-based institutional environment will provide a richer interpretation of how organizations confront and manage the sometimes competing mandates from their multi-faceted institutional environments. Even in the case of information sharing, the variance explained in our analyses is not high. Broadening the scope of investigation to include more factors and levels of environment should increase the amount of variance explained and may help to disaggregate and understand the country effects seen in our results. This issue relates directly to the fairly low R^2 effect sizes obtained in our analyses. A more extensive evaluation of the additional institutional factors should provide more explanatory power.

Second, we believe that there are opportunities for future research in the interactions between various levels of culture and institutions and organizations (and potentially individuals). Culture and institutions influence organizational practices and IT innovations but at the same time organizations enact such practices and innovations with the culture and institutions at different levels (DeSanctis & Poole, 1994; Giddens, 1984). For example, around 40% of the organizations in the CRANET database are part of a larger organizational entity. The independence of each of those organizations from those larger entities cannot be determined. Logically, those larger entities provide, in varying degrees, their own set of institutional influences. These are potentially contradictory to the regional and country-based institutional and cultural mandates. These effects were unmeasured and likely limited the effect sizes (R^2) achieved in this study. Organizations can be "viewed as knowledgeable and reflexive, capable of understanding and taking account of everyday situations and routinely monitoring the results of their own and others' actions" (Scott, 2008, p. 77). The result, as discussed earlier in this paper, is expected to be the simultaneous presence of globalization and localization of organizational practices and innovations in countries (and organizations). Future study is necessary to shed light on these potentially dynamic and nonlinear relationships among social structures (e.g., culture, institutions), new organizational practices and IT, and organizations in international contexts. This will be best done with a more intensive study of a few organizations rather than a large survey of many organizations.

Third, another limitation and opportunity for future investigation relates to the data set employed. While our study analyzed a large data set of international HR management practices, the data is largely from Western countries. This limits being able to generalize our findings to non-Western regions, including countries in Asia-Pacific, Africa, and South America. In this regard, future study could apply our proposed research design and testing hypotheses to a data set covering more diverse regions of the world.

Finally, while much of our analysis avoids analyzing independent and dependent variables from a single source, the observed relationship

(hypothesis 7) between information sharing and HRIS adoption come from the same source. As such, it is vulnerable to common method bias. Wright and Gardner (2009) in addressing this potential bias argue that this data gathering process may be biased by the implicit theory of human resource management that respondents have. However, we believe the "yes-no" response choice contained in the CRANET database used in this study, compared to the typical verses Likert-type response scale (see the Appendix), make the responses less subject to the impact of respondents' implicit theory.

APPENDIX

Information Sharing Scale

Which employee categories are formally briefed about the following issues? (Please tick as many as applicable).

Strategy Financial Performance Organisation of Work

Professional/technical ❏1 ❏1 ❏1
Clerical ❏1 ❏1 ❏1
Manual ❏1 ❏1 ❏1

Note: A tick or check in a box indicates that the row designated groups of employees are formally briefed on the issue noted in the column heading. The information sharing scale is the sum of checks for Professional/technical, clerical and manual employees. A zero sum means that none of these groups are formally briefed on any of the three issues. The highest possible score of nine indicates that all three groups were formally briefed on all three issues.

Chapter 6

IT Human Resources:
Experts at Talent Management and Critical Partners to the CIO

Phil Schneidermeyer
Heidrick & Struggles, USA

ABSTRACT

In this chapter, IT human recourse professionals will find confirmation of the important role that they play in ensuring the creation of a high performance department. They develop, recommend, and then lead the talent management strategy. As leadership needs arise, HR works with IT leadership to assess internal candidates, and if they do not fit, then they can assess and recommend external staffing firms with the appropriate expertise and reach. The human resources/CIO partnership will include leading the effort to develop a position specification, managing the candidates through the interview process, and negotiating an offer that often times must be customized to attract the ideal candidate. Finally, once selected, human resources will manage the on-boarding process to ensure that the recent hire has the support they need and can get up to speed quickly.

INTRODUCTION

The success of an IT organization is dependent upon the quality of its leadership. Leadership quality is assessed by human resources professionals supporting the IT organization, but assessment cannot take place in a vacuum. The human resources professionals need to start with a Talent Strategy. This roadmap will include the Chief Information Officer, the CIO's direct reports and the staff below them, and therefore will need to be customized to fit each level. As this is being developed a clear understanding of the company's culture and, if it exists, the sub-culture within IT must be defined. Without understanding the culture an appropriate fit and assessment of personal characteristics cannot be made. On the other hand,

while qualifications and experience are critical they are fairly straight forward to assess.

Developing a Talent Strategy

Talent management has been a point of discussion for companies of all sizes and across all industries for many years. Human resource organizations play a critical role, but all managers and business leaders must commit time and resources to the process.

A talent strategy has many components that when tied together create a cycle. To be successful companies must follow the defined path and aggressively support the respective processes. Different points in the cycle emphasize external talent, while others focus on internal talent that may have been recently hired or have been with the company for some time. To begin, the talent management process the organization must have the capacity to target and be attractive to the relevant pools of talent. At the entry level where technical skills are critical this can mean offering an opportunity to work with leading edge technologies, continuous education and training programs, and flexible work hours.

As human resources moves forward with the selection, recruitment and hiring of talent behavioral characteristics and technical skills must be aligned. Next, on boarding is the induction process for new hires. Going forward, to maintain a competitive advantage, organizations must have a talent management strategy that offers continuous learning. Best of breed companies offer not only training but have formal mentoring programs as well. Defining roles that leverage an individual's competencies, communicating a career track and providing performance feedback is known to engage and retain talent. Through promotion and rotation the organization creates a leadership pipeline. Hiring at the technical, manager and Vice President level gives the CIO an external benchmark against the internal team.

Following the identification of future leaders, the talent strategy cycle comes full circle establishing process to secure effective and smooth successions. Finally it is generally accepted that to be successful the talent management strategy must be employee centric. An annual review with a formal 360 evaluation is a tool, but this tool must be part of a broader talent management strategy.

For example, in <u>Compensation Today</u>, Barry MacLean (2009) writes that a Talent Strategy is employee-centric and is focused on recruiting, training, aligning performance, planning for growth and development and identifying high-potential employees, and charting a course for their career growth. However to be comprehensive, measurable, and have impact the Talent Strategy must also include compensation management "which by contrast is all about jobs: what grades or bands they fall into, and what target incentives are associated with varying levels of jobs within the company." To retain and attract the strongest talent, a good Talent Strategy will go beyond the internal comparison of jobs and will include a market valuation of individual employees.

There are many approaches to determining market valuation and some require more resources (e.g., time, money, staff, etc.) than others. For managers and directors, entry level management, job posting and career web sites can provide quick but un-scrubbed data. Recruiting firms (generally contingency) will also have helpful data points and should be willing to offer an opinion based on their current view of the market. Do not look to online resources for data at the senior management level (Vice President and above). If the organization has a relationship with an executive search firm (retainer-based) consultant specializing in IT they will offer an opinion. While this may be at no cost, a fee will be charged for a more detailed study and human resource consulting firms such as Towers Watson & Co. and Hewitt Associates are specialists. Further discussion of market valuation follows in Compensation Management section.

Recruiting

As the Talent Management strategy identifying and recruiting, whether IT HR is assisting with the recruitment of a new CIO or direct reports and their staff, they must take a lead role in defining the selection process, aligning technical skills with behavioral characteristics, understanding and setting expectations, and measuring outcomes; each goes hand in hand to create a recruiting cycle within the talent management cycle. If for example the expectations are for a very tight job specification (narrowly defined qualifications) then, since there are fewer qualified candidates, the search will likely take longer and success can depend on available, affordable, qualified talent – either internal or external. While the position specification outlines day to day responsibilities it should also be the roadmap for the search and represent the ideal candidate however the HR business partner should counsel their IT client that trade-offs will need to be made. Should the ideal candidate not be available an upfront understanding of the trade-offs or flexibility in the position specification will be a time saver. IT recruiters will provide examples of how other companies have approached the market, what they found and the trade-offs they made.

Trade-offs are a natural and therefore expected aspect of the recruiting process. When a media company recently went to market to recruit an applications team leader, the first requirement was for experience in this specific application. The question, is this truly a "must have" or is it an "ideal". In this case it was the later as individual team members were experts in the application and therefore the leader needed to bring process, mentoring and communication skills.

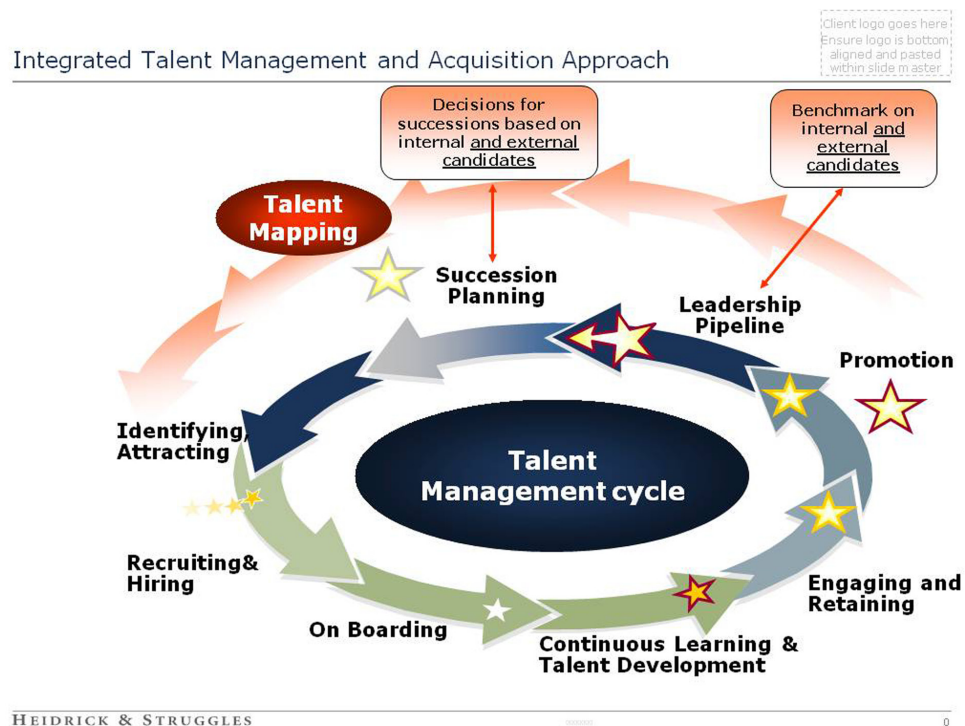
The internal recruiting process should also emphasize the importance of managing the scheduling and handling of candidates as they interview with the company. One person should be the lead on setting up the schedules of the interviewers. It takes someone on the "inside" with access to calendars and support staff to bring several people together on the same day. The recruiter will provide the candidate's availability and work with them on travel when necessary. The interviewers will have the candidate's resume and need to know what position the candidate is coming in for as many organizations have multiple positions to fill. Both candidate and interviewer should be aligned. The company is not viewed well by candidates when there is confusion on their end. Also biographical information on the interviewers should be provided to the candidate in advance. At a minimum a title should be included and where possible the recruiter will use public sources like LinkedIn and Google to gather information as well. Interviews are ideally an hour but can be as short as 30 minutes; so that there can be a more strategic discussion both sides must prepare in advance.

At the end of the hiring process when an insurance company recruiting a Network Manager looked at the length of time it took to close the search and found that it took twice as long as other recruiting projects, drilling deeper they realized that it took weeks to go from identifying the candidate to first round interview. The culprit, the hiring manager's administrative assistant gave the recruiter the contact information for the interviewing team and had the recruiter trying to find time on the interviewer's calendar. Based on the process they did not see this as a priority and dates of availability kept slipping out into the future.

As a best practice many companies split the position requirements up amongst the interviewers. Assessment templates with rankings or areas for comment should be distributed to the interviewers in advance and then feedback gathered quickly. The recruiter will be seeking feedback from the candidate at the end of their interview day and the candidate will be expecting a turnaround of a day or two. Managing the recruiting and interview process gives a company a competitive advantage as candidates are likely interviewing with other companies and this initial exposure is the first

Figure 1. Integrated talent management acquisition approach

Integrated Talent Management and Acquisition Approach

HEIDRICK & STRUGGLES


impression that will stay with them throughout the process.

Assessment and Alignment

The assessment of an IT professional's qualifications and experience can be rather straight forward especially at lower levels where hands-on technical knowledge is required. This would include education such as degrees and certifications; years of experience; functional experience; prior staff and budget responsibility; and business, or industry knowledge. At the management level business acumen goes beyond budget responsibility to include strategic thinking, analyzing, diagnosing, decisiveness, financial acumen and risk taking.

Some of the softer skills include leadership and management behavioral competencies such as being performance driven. That is, being considered to be a self-starter, assertive, goal oriented as well as having tactical planning and tracking abilities.

Responsiveness and follow through are measures of one's customer-centric style and personal characteristics such as values, motivation, personality traits and personal style can be more important than technical qualifications and experience. Finally and equally important soft skills include, team leadership and personal effectiveness. This includes the ability to build relationships, listen and be receptive, collaboration, influencing, motivating, developing talent and self development.

A not-for-profit emphasized this aspect of the position specification when recruiting a new Chief Information Officer. Knowing that the organization had such strong cultural values that they knew the successful candidate could only come from an organization with a mission and shared values. Otherwise the ability to build relationships with other C-level executives was going to be difficult and there was added risk in the transition to the new organization.

Just as an organization would assess technical skills by comparing them to the current technology environment (e.g., platforms, operating systems, applications, etc.), interpersonal style and culture fit will be compared to the organization or department's culture and the hiring manager plus peers and possibly the interpersonal style of direct reports. For some organizations articulating culture may not be as straight forward as identifying technical competency. In terms of identifying different cultures, in one example a company grows through the acquisition of other companies and they are at various stages of integration or choose a strategy not to integrate them at all. The result could be multiple cultures within a company. In another scenario, information technology departments that are working off shore whether captive or not are managing through a diverse set of cultures. Assessing a candidate's fit must take this into consideration as well. Still many other organizations have cultures that they are looking to change and therefore are looking for change-agents. Not only will these individuals come from a different organizational culture they will have a demonstrated track record of driving change. On the business and process side these changes may include a move from a decentralized to a centralized structure; the integration or divesture of businesses, and; globalization. On the technology side change may be a move toward more outsourcing or the reverse; SOA, implementation of ITIL or a move from one CMMi level to another and; common enterprise resource planning. Where organizations have gone wrong is when they expect the new hire to be the driver of change without the support of key leaders. Tenure for this individual will likely be short and is referred to by some as "organ rejection". There are many examples of this more at the top of the house, Chief Information Officer or their direct reports than at lower levels. Driving change within your own information technology department has a greater chance of success as the head of IT has direct control of budgets and people. Since information technology touches all business processes the risk increases when the CIO must drive change on the business side where budgets and people naturally report to the head of the business. Here relationship building and influencing skills are critical success factors.

Compensation Management

A good Talent Strategy includes not only an internal comparison of jobs and an alignment of skills but also market valuations. A decade ago when the Internet bubble was expanding, talent was attracted using equity and salary could be fixed at both the VP and the Manager level. Equity became was variable with Chief Executive Officers taking three to five percent of the outstanding shares and then direct reports to the CEO being offer approximately one to three percent. If the role was Chief Financial Officer and the goal was to go take the company public then having this previous IPO experience would earn the CFO the upper end of the range. As an Internet company the Chief Technology Officer (who may be also managing information technology to run the business) tended to be one of the founders but when the company grew and the role demanded more managerial skills a new CTO could be brought in with both technical and managerial capabilities. Here too the combined skill set would earn the incoming CTO the upper end of the equity percentage range.

In many companies equity was offered not just to vice presidents and managers but to all employees, from the secretaries to programmers. The belief was that this would create a culture of "ownership" resulting in a more committed workforce and had the added affect creating "golden handcuffs" where it would be too expensive for another company to recruit the talent.

It has been almost ten years since the Internet bubble burst and one lasting change in the long term component of a compensation package is a shift from stock options to restricted stock or a

mix of both. Depending on level the number of shares may be fixed. If the finalist candidate is leaving some equity on the table then the candidate will look for an off set. Most companies only consider equity that is to vest in the near-term (perhaps one or two years). Black-Scholes (see e.g. Katz & McCormick, 2005) is not a perfect model but a generally accepted way to value the shares. Attempting to keep the candidate "whole" hiring companies may prefer to offer a cash or stock sign on bonus or again it can be a mix of the two. (Note: sign on bonuses generally include a claw-back term (12 months or less) and are pro-rated.) When working with a recruiter it is important to share the range within which the hiring company must work; this is for base salary, annual bonus and equity. Avoiding surprises on both sides is a key goal. An understanding of the prospective candidate's current compensation is done immediately however a full accounting of their equity may take longer as most candidates need to research this information. Three years of history is ideal and W2s should be requested from the finalist candidate at offer. A break out of bonus structure, individual versus company performance, must also be noted as well as when the bonus is earned and when the bonus is paid. These are generally two different dates and candidates will want a hiring company to take their accrued bonus into consideration when structuring an offer. On base salary it is important to know when the candidate last had or expects a review and therefore salary adjustment.

Other aspects of compensation and benefits that the hiring company may consider when trying to "close" the finalist candidate include, accelerating an annual review so that a salary increase might occur sooner, guaranteeing some or all of the first-year's performance bonus (But first agreeing on deliverables, goals and objectives.), and for information technology professionals technical training, telecommuting, ability to attend conferences or participate on standards boards can carry some weight as well.

For example a media company had no internal candidates for a Vice President role within the information technology group and went to market through a search firm. From a technical perspective the specification was very narrow in that the company was looking for experience with an application that is limited to a small industry. As a small industry there was an equally small candidate population and across the candidate slate base salary ranged from the low $200k to the low $300k range. The company stated a base salary range at the launch of the search and while $300k was beyond that range the company brought those candidates in as well. This gave the hiring manager an opportunity to consider a mix of skills, experience and compensation before making a decision. The finalist's base salary and bonus fit within existing parameters but coming from a private company the internal equity was difficult to value. The CIO worked closely with the information technology group's head of human resources to lay out an equity structure that is easily understood with a value that can be assessed and a plan for future equity. The candidate took a holistic view of the opportunity and accepted.

Always be aware that there are two different base salary figures to keep in mind. One is the current salary and the other is "what it takes" (base salary) to get them to accept the risk of leaving their current company. The first will be within the target range and the second may not. Organizations that recognize the importance of attracting and retaining the best talent will customize an offer or compensation structure to meet the individual's needs. The balance that the hiring manager and human resources professionals need to maintain is parity within the peer group. Of course compensation is only one component. Work environment, potential for career growth and other non-financial factors will be considered by the ideal candidate.

Measuring Outcomes

Measuring outcomes is critical for the success of any human resources organization and this is not simply 'was there or wasn't there a hire.' Other important metrics to track include days to complete the search, number of candidates interviewed, number of days from identification of the candidate until first round interview, and diversity of candidate slate. If internal candidates were considered then they need to have clear feedback as to why they were not selected, the appropriate training and performance management should be put in place to keep them engaged. Financial resources are finite and should be tracked as well. Larger organizations with dedicated internal staffing resources are also maintaining a database of the candidates interviewed. The value-add in the database is when interviewer feedback is captured and stored for future reference. Here again the assessment sheet or template can be saved electronically for future reference. If the candidate was interesting enough to consider for an immediate position there is a good chance that they will be a fit for others positions in the future.

On-Boarding

Once a candidate is hired on-boarding, assimilation and transition support, is critical. New hires have to be introduced to the company and IT department culture, and be informed about their supervisor's management style. Further, pre-hire references should have highlighted areas of development for the individual and support should be provided and progress tracked. The goal is to position everyone for success. A public technology company that did this well began by creating a binder of relevant documentation and providing it to the new hire in advance of the start date. Most candidates must give notice to their current companies but can make time to participate on important conference calls and to review materials. Lastly, organizations operating without an on-boarding program

may be losing the opportunity to leverage and secure competencies that the new hire brings to the company.

FUTURE RESEARCH DIRECTIONS

This chapter is a primer for human resource executives supporting information technology organizations as they develop their staffing and talent management capabilities and strategies. Additional research into continuous learning, talent development, retention, promotion and creating a leadership pipeline that provides for better succession planning is warranted. Finally, with many companies growing their internal staffing capabilities a look at the success rates between this model and leveraging external providers would be helpful as both have their pros and cons.

CONCLUSION

The demographics are clear, with the aging population there will be a worker shortage. There may have been a truce in the War for Talent during the recent economic downturn, but combatants on both sides are nearing agreement that the battle has been engaged once again. Combine this with a generally accepted notion that a skills gap remains for entry level workers and that at both middle management and the senior executive level there aren't enough "born leaders" to fill all of the needs and the evidence becomes clear, human resources plays a critical role in the information technology department's talent management value chain. Couple this with a rising demand for a more diverse IT leadership team and human resources should find no shortage of challenges.

One of the lessons learned over the last ten years is that the employees of all companies are easier to identify which of course is the first step in recruiting. It started at the top when companies built their web page and included a list of senior

management. Some companies pushed back on this but they soon found themselves fighting a losing battle as social networking sites like LinkedIn expanded rapidly creating a virtual employee directory with biographical and contact information. Couple this with an end to the "one company for life" expectation and IT Human Resources need to make sure they have a visible talent management approach that includes the complete cycle: continuous learning to engaging and retaining to promotion that creates a leadership pipeline and emphasizes succession planning. If not, human resources will find themselves spending more time on recruiting as employees resign to take what they perceive to be companies offering better career growth opportunities.

KEY TERMS AND DEFINITIONS

Assessment: Determine the candidate's fit against the position specification requirements.

Chief Information Officer: The most senior executive responsible for information technology in the company.

Company Culture: A description of the company's style.

Position Specification: Describes the requirements for being qualified for a position and the responsibilities of that position.

Recruiting: The process by which a company attracts talent.

Talent Strategy: A comprehensive approach to managing internal talent and attracting external talent.

Chapter 7
Strategic Human Resource Management and Organizational Performance

P.C. Bahuguna
University of Petroleum & Energy Studies, India

P. Kumari
Kanya Gurukul Mahavidyalaya, India

ABSTRACT

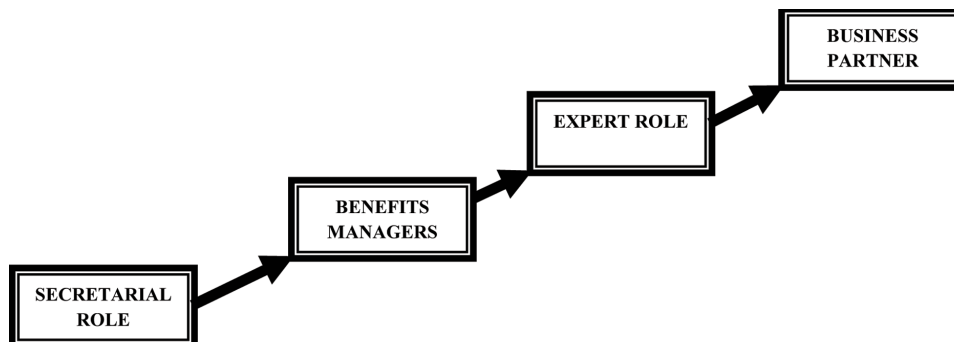
The discipline of human resource management has progressed significantly over a period of time. Today it is being considered as the most critical source of competitive advantage to the firm. It has progressed to a strategic business partner. Various approaches and models of strategic human resource management have been developed within the framework of strategic human resource management. Like many theories of organization, none are complete. Rather being right or wrong each approach points to different aspect of the process needed to develop effective strategic human resource functions. The issue of fitting HR practices to business strategy has become increasingly relevant over few years. Therefore in the present study we have made efforts to highlight various issues which are relevant to the strategic HRM in the changing scenario of business environment. The present chapter has been divided into five sections. In the first part, the changes occurring in the business environment and its implications for human resource functionaries have been discussed. In the second section we have highlighted the changing role of human resource management. Historical background of strategic human resource management, its role in addressing the challenges of changing business scenario and determinants of strategic fit have also been presented in the second section. In the third section issues regarding the relationship of strategic human resource management with business performance have been discussed. In the fourth section we have made efforts to bring into notice those emerging future trends which might become key issues for high performance in the organization of new era. At last conclusions have been drawn that what needs to be done on the part of the HR functionaries and the organization itself to enhance the strategic fit between the various HR practices and the overall organizational strategic plan.

INTRODUCTION

The industrial revolution in the nineteenth century brought about the automation in the manufacturing process putting the muscle power to the back seat and focusing mainly on production of goods. The focus later on shifted to marketing considerations putting customer satisfaction on the top. The information technology revolution of the twentieth century along with globalization has brought the drastic changes in the working environment i.e. putting people as the most important resource. The importance of human resources can be traced back to ancient Hindu texts such as Kautilya's Arthashastra, which provides the evidence of existence of systematic management of people as early as 320 B.C. (Khanka, 2003). However, the first evidence of origin of human resource management (HRM) practices has its roots in the industrial revolution of the 17th century. The technical advancements during this period created the need for better work methods, productivity and quality. Smith (1776) in his book 'An Enquiry into Nature and Causes of Wealth of Nations' talked about the economic advantages of the division of labour. He proposed that work could be made more efficient through specialisation. From the division of labour he saw three advantages: the development of skills, time saving, and the possibility of using specialised tools. The importance of people in the business performance can be traced from the work of Owen (1825). He argued that money spent on develop-

ing people was one of the best investments that management can make. Babbage (1832) examined and expanded upon the division of labour in his work and concluded that it allows a more careful matching of people's skills and physical abilities with specific tasks. Land mark revolution came in the field of people management practices when Taylor (1911) attempted to formalize the processes, methods, workers experiences and tacit skills into objective rules and formulae. The path breaking studies that revolutionized the human resource management practices were conducted from 1927 – 1932 by Mayo and his associates to study the relationship between productivity and the working environment followed by the studies carried out by Barnard (1938), and others. All these studies have identified commitment, communication, employee motivation, leadership and learning as the antecedents of organizational success. The nature, status and role of human resource management have progressively become broader and strategic since the days of industrial revolution (Figure 1).

Today human resource management is not just about hiring and firing people, administering wages and salaries, designing and implementing benefit programmes, and implementing the strategic intentions of the top management, rather it is playing an active role in formulating the business strategies. The advent of the era of globalization and liberalization accompanied by the information technology revolution has transformed the world around us. This has made possible the

Figure 1.


free flow of people, technology, and goods across the globe. Business activities are no more limited and confined to the geographical boundaries of the countries. According to Ulrich and Brockbank (2005) there has been exponential growth in international movements of goods and services. The traditional jobs have become blurred. The economies across the globe are experiencing new order. Globalization is an important factor that influences organizations that compete for customers with high expectations for performance, quality, and low cost. The most pressing competitive issues facing firms are globalisation, embracing new technologies, managing change, developing human capital, responding to the market and optimization of costs. As more and more companies go abroad or operate internationally, the impact on various business functions and in particular on human resource management have become more evident. Effective and strategic human resource management is essential as the international businesses place additional stress on human resource functionaries. Human resources are being viewed as an input, which can provide sustained competitive advantage to the organizations. Over the years, organizations' expectations from their HR champions and departments have changed considerably. The function was and still is expected to ensure that its policies, practices and procedures shape the culture of the organization in a way that is consistent with its values and vision. People management practices need to acknowledge and work within the context and reflect a broader perspective. Human resource policies and practices need to facilitate the work process across time, distance and cultures. The reality today is that most companies consciously or unconsciously experience one or more aspects of international management. Despite the fact that the core principles of human resource management also apply to global human resource management, it presents some unique challenges. Managing people in global settings requires human resource professionals to address broader range of issues

such as taxation, exchange rates, compensation plans, dealing with foreign governments and religious groups. Recently terrorism added many anxieties to employees, their families and the employers which further had accentuated the need to manage human resources effectively to gain competitive advantage in the global market place. To achieve this, organizations require an understanding of the factors that can determine the effectiveness of various HR practices and approaches. This is because countries differ along a number of dimensions that influence the attractiveness of investments in each country. These differences determine the economic viability of building an operation in a foreign country and they have a particularly strong impact on HRM in that operation. There are a large number of factors such as culture, economic systems, political systems and the legal framework etc. that affect HRM in global markets. The objectives of the chapter are to highlight

1. The role of human resources as a source of competitive advantage.
2. Strategic role of human resource management in enhancing the organizational performance.
3. Strategic challenges and issues for human resource management to become a strategic business partner.

STRATEGIC HUMAN RESOURCE MANAGEMENT

Role of HR

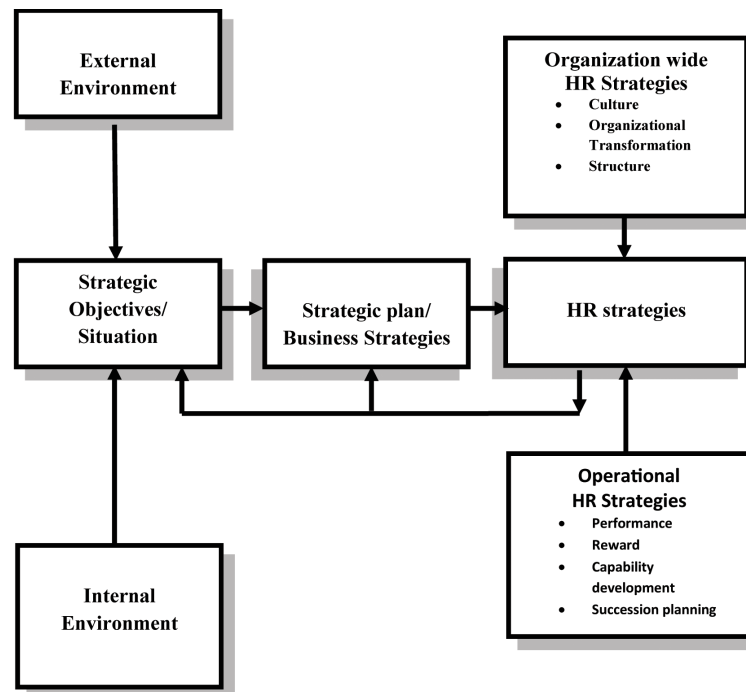
In the seventies and eighties the business function responsible for people was called "The Personnel Management." The responsibility of this function was to employ people, pay them, and fire them. Subsequently the ever increasing competition forced organizations to take the more planned and calculated approach to management as a result

there has been growing interest in the strategic management which further compelled the sub functions of the organizations to redefine their roles in this process. Since human resource management was no exception, it also had to re identify its role. Later efforts were made to integrate it into strategic management process and as a result the function progressed to strategic human resource management. In late eighties and early nineties it was realised that HR function has a much larger role: recruiting the right people, training them, helping the business design jobs and structures, develop compensation packages including benefit plans and serving as a central point of communication for employee health and happiness. In this role, the HR department now became more than a business function: it is a business partner, reaching out to support business processes. The strategic role of HR includes enhancing organizational performance, get involved in corporate planning, decision making on mergers, acquisitions and downsizing, redesigning organizations and work processes and ensuring financial accountability for HR results. In view of the soaring competition and increased expectations of the top management, HRM has certain strategic challenges. The fundamental challenge faced by HR community is to provide a set of services that are in line with the company's strategic plan. HR managers need to support the organizational productivity and performance management efforts and must be involved in designing strategic plans not just executing them.

Strategic HRM and Changing Landscapes of Business Environment

SHRM is considered a relatively new concept, despite its continuous development over the past two decades. Although there is no agreement on a precise definition of SHRM among researchers and academicians, broad consensus has been reached on its basic functions, which involves designing

and implementing a set of reliable policies and practices to ensure that the human resource of a firm contributes to the achievement of its business objectives (Schuler and MacMillan, 1984; Baird and Meshoulam, 1988; Jackson and Schuler, 1995). Essentially, SHRM emphasises developing the firm's capacity to respond to the external environmental threats through a better utilization of human resources. Since strategy is the course of action of a business firm to deal with and to meet the challenges of the environment, a human capital reservoir with a wide variety of skills that are complementary to the corporate strategy, is a catalyst for fulfilling the strategic goals through promoting desired behaviour among employees. Strategic human resource Management (SHRM) is a set of human resource strategies designed and implemented to ensure that business objectives are achieved (Baird & Meshoulam, 1988; Delery & Doty, 1996; Huselid, et al., 1997; Jackson & Schuler, 1995). Strategic human resource management (SHRM) is a strategic approach to manage human resources of an organization. It is the linkage between the HRM and strategic goals and objectives to improve business performance and develop organizational culture that foster innovation and flexibility. By combining the HRM function with business strategy, SHRM reflects a more flexible arrangement and utilisation of human resources to achieve the organizational goals, and accordingly help organizations gain a competitive advantage (Wei, 2006). Hendry & Pettigrew (1986) view, SHRM as a logical approach to people management which is based on the organizational philosophy and the strategy wherein people are considered as the strategic resource for creating competitive advantage. The linkage between HR practice and business strategy has been emphasised in studies related to SHRM (Miles and Snow, 1984; Baird & Meshoulam, 1988; Wright and McMahan, 1992; Kazmi and Ahmad, 2001; Devanna et al., 1981; Torrington and Hall, 1995). Strategic view of HRM can be explained as shown in Figure 2.

Figure 2.


Theoretical Foundations of Strategic HRM

A number of theoretical models have been developed for the design and implementation of human resource practices and processes. There are general models named as universalistic, the contingency and configurational (Delery and Doty, 1996) or as best practice and best fit and configurational (Richardson and Thompson, 1999) and particular models namely high performance management, high commitment management and high involvement management. As emphasized by Armstrong and Baron (2004), the best practice approach focuses on adopting a set of universally effective HR practices whereas the best fit focuses on situational factors as there cannot be any universal prescription for HRM policies and practices. The configurational approach is concerned with adopting a set or bundle of HR practices rather than any single HR program or policy. MacDuffie (1995), Richardson and Thompson (1999) concluded that

a firm with bundles of HR practices should have a higher level of fit with its corporate strategy. But the problem with this approach is how to decide which bundle of HR practices better suites the organization. High performance working model involves the development of a number of interrelated approaches, which together make an impact on the performance of the firm through its people. The organizational effectiveness is achieved by enhancing the skills and engaging the enthusiasm of the employees (Stevens, 1998). The high commitment management model emphasizes on the importance of enhancing mutual commitment. Walton (1985) and Wood (1996) define high commitment management as a style of management which aims at obtaining a commitment so that behaviour is primarily self regulated rather than controlled. The high commitment management model is concerned with creating high levels of trust within the organizations. The high involvement management model involves treating employees as partners in the enterprise whose interests are

respected and who have a say in the matters related to them. Scholars have identified a clear evidence that high involvement work practices result in superior performance. Which theoretical model is correct and practically possible, probably answer to this question is not simple. Each model points out the different aspects of the process needed for developing SHRM. Best fit is perhaps more useful in developing the HR strategies. Strategic fit refers to the utilisation of human resources to help the organization to achieve its goals. It is the pattern of planned human resource deployments and activities intended to enable the firm to achieve its goal (Wright and McMahan, 1992). Scholars suggest that there are two kinds of fit: straight or horizontal fit and upright or vertical fit. Horizontal fit is the fit among the number of HRM practices and policies. It refers to the alignment among the various HRM practices (Baird & Meshoulam, 1988). The vertical fit refers to the alignment of HRM practices with the strategic management processes of the firm (Schuler & Jackson, 1987). Vertical fit is viewed as a vital step towards attaining the organizational goals through formulating the human resource practices that are aligned with firm's objectives, while horizontal fit is essential when making good use of these resources. The concept of fit can be explained as shown in Figure 3.

The linkage between HR practices and strategy has been studied by various researchers and scholars (Wright and McMahan, 1992; Wright and Snell, 1998). Due to the lack of in depth empirical evidence, it is debated that this linkage is weaker as compared to the relationship ps among internal HR practices. However, from the perspective of the resource based view (RBV) of the firm (Barney, 1986, 1991), researchers advocate that the HR system which is aligned with the firm's strategy is helpful for creating competitive advantage. Resource based model (Barney, 1995) is based on the idea that organizations gain competitive advantage when they possess resources that are valuable, rare and difficult for competitors to imitate. The aim of the RBV is to improve the capability of resources. It can develop strategic capability i.e. achieving strategic fit between resources and opportunities and obtaining added value from the effective deployment of resources (Barney, 2001). Furthermore, the linkage of organizational resources and firm strategy cannot be easily identified and imitated by other firms due to the complexities and causal ambiguity (Barney, 1991; Boxall, 1998). Thus, the integration of human resources with the appropriate strategy can generate a sustained competitive advantage for the firm. A fundamental problem faced by a firm is: how to decide and formulate the bundle or package of human resource prac-

Figure 3.

HORIZONTAL FIT- A CONGRUENCE BETWEEN VARIOUS HRM PRACTICES

VERTICAL FIT- THE ALLIGNMENT OF HRM PRACTICES WITH THE STRATEGIC MANAGEMENT OF THE FIRM

tices necessary for its strategy and overall performance. Now the question is what are the issues or factors influencing the achievement of horizontal fit and vertical fit? Since achieving both kinds of fit is necessary for the performance of the organization, an examination of the relevant determinants of fit is helpful to better understand the nature of SHRM as well as its contribution to organizational performance.

Determinants of Fit

An apparent question here is: How can organizations effectively adopt, implement and make best use of HRM practices for significant firm level outcomes? i.e. how can firms increase the probability that the HRM practices, they adopt and implement will lead to organizational performance. There are a number of factors that influence the congruence among the various human resource practices as well as the alignment between HR practices and the organizational strategic plan. The determinants of fit can further be classified as HR system related factors, individuals related factors and organizational level factors. The system related factors refer to the factors that are related to the HR subsystem – its philosophy, policy and position in the organization. The individuals related factors refer to the personal capabilities or strengths, weaknesses, leadership style, conceptual skills, business orientation etc. of the individuals who are responsible for formulating and implementing the HR strategies. The organizational level factors refer to the overall organizational focus, the organizational objectives, structure and the organizational culture. Bundle or choices of the practices available with the human resource department provide the options to the human resource functionaries to decide upon the best suitable practices. Bhattacharya and Wright (2005) suggested that human resource option could be useful in this regard. Investment (direct and indirect) in human resource development is another important factor that determines the congruence among various

HRM practices (Pfeffer and Slancik, 1978). With regard to individual or personal factors, the various researches (Lado and Wilson, 1994; Lado, Boyd and Wright, 1992; Wie and Lau, 2005) suggest that personal factors such as personal capabilities, leadership style, commitment, knowledge and skills are important factors that determine the strategic fit among the various HR practices as well as the business strategic plan. To ensure that HRM plays an important role in achieving the strategic objectives of the organization, the human resource professionals need to have certain competencies. Members of the HR function should have the appropriate competencies to increase the likelihood of effective implementation of HRM practices (Huselid, et al., 1997). The concept of determinants of strategic fit can be explained as shown in Figure 4.

The figure clearly outlines the various factors or determinants of strategic fit that influence the congruence among different HR practices and their alignment with the over all organizational strategic plan. With regard to vertical fit, besides system and individual related factors, the organizational factors also play an important role. The types of strategy, organizational culture, the value system, and the organizational philosophy are important determinant of vertical fit (Schuler and Jackson, 1987). The influence of nature of strategy has been demonstrated by Martell, Gupta and Carroll (1996). Organizational culture and values shape the HRM practices (Wie and Lau, 2005). The strategic fit is also influenced by the economic conditions, structure of the industry, the supply of human resources etc. (Lengnick and Hall, 1998). Truss and Gratton (1994) refer to the external environment as the one that provides opportunities and constraints for HR managers. Sparrow & Pettigrew (1987) identify the external factors like technology, political, social and economic conditions as that influence the HR practices. They also point out that organizational philosophy, culture, structure interact with the external environment in the process of HRM.

Figure 4.

DETERMINANTS OF STRATEGIC FIT

STRATEGIC HRM AND BUSINESS PERFORMANCE

Researchers have evidenced the strong relationship between HRM practices and organizational performance (Huselid, 1995; Pfeffer, 1998). A survey conducted by Guest et al (2000b) revealed that there was a strong association between human resource management and performance of the organization. In consistent with the aforementioned objectives to investigate the key dimensions of strategic human resource management, besides the analysis of the various models of SHRM, a pilot survey was also carried out through an unstructured interview with the executives of Oil and Gas industry. After analyzing the interview findings, we have concluded that strategic human resource management is not just about procuring, developing and retaining the high potential individuals rather it is about creating a system that aligns the organizational strategic plan with the human resource strategies of the organization. In essence it entails creating a strategy centric organization. Coherent and integrated strategic human resource

management system is likely to be developed only if the organization recognizes and proceeds with the strategic importance associated with management of people in the organization. Strategic human resource management addresses organization wide issues (cultural priorities, structural priorities and transformational issues) along with the core areas of human resource management. From the discussions, the following issues emerge.

1. There is considerable evidence that HR has the strategic value for the organizations.
2. There is a considerable relationship between strategic HRM practices and employee behaviour.
3. There is a considerable relationship between strategic HRM practices and organizational performance.
4. There is comparatively high degree of strategic fit between HRM practices and the organizational objectives in the high performing firms from those in the low performing firms.

5. Finally, environmental context variables like firm size, technology and union status affect the extent of implementing HRM practices.

Essential elements in developing strategic human resource management and thereby contributing to the organizational performance are:

1. **Transforming the HR functionaries** - Based upon the resource based view of the firm, Huselid, Jackson and Schuler (1997) differentiated traditional HRM activities from strategic HRM activities. In the traditional role, staff members need to be specialist in certain personnel functional activities such as attracting high quality employees, placing them in appropriate positions, training them to work in the firm's specific way, and motivating them to devote more efforts to organizational goals. Strategic fit will be enhanced if the HR staff members and other functionaries are well equipped with the organizational development concept, tools and techniques. They need to share responsibility for performance and profitability, be customer driven, focus on solutions not on activities, be strategic, initiate, and lead.

2. **Restructuring of HR department and enhancing administrative efficiency** – As with many other forms of organizational restructuring, a key issue in designing strategic human resource is to determine which activities should be centralized and which should be decentralized. Companies like Warner – Lambert, Motorola, and Coca cola have created new organization structure to realign the roles. Beer et al, (1984) and Walton (1985) describe a high level of functional flexibility, with the abandonment of potentially rigid job descriptions, a heavy reliance on team structure, structuring work and problem solving are some of the ways for high commitment. Restructuring of HR department and enhancing its administrative

efficiency is very essential for effective strategy formulation, strategic fit and strategy implementation.

3. **Integrating HR into strategic planning** – In order to achieve the strategic fit (Horizontal as well as vertical fit) HR must play a role of the partner in the strategic planning or strategy formulation process. Ulrich (1998) is of the view that HR executives should impel and guide serious discussion of how the company should be organized to carry out its strategy. Tyson (1985) discusses HR should integrate their activities closely with top management and ensure that they serve a long term strategic purpose. HR people have the capability to identify business opportunities, to see the broad picture, and to see how their HR role can help to achieve the company's business objectives. The same is also evidenced by Armstrong (2001). One important aspect of integrating the HR with strategic planning is to decide about the role, position and status of the HR executives in comparison to other top executives. The strategic fit will be enhanced when the HR functionaries play a role of a partner in strategic planning process.

4. **Developing partnership with line managers** – It is impossible for HR activities to have a significant impact of HR practices and to enhance the strategic fit if those performing the HR functions do not work closely with line managers. Development of partnership between line managers and HR staff is critical. Lucent Technologies provide a very good example of partnership between HR and line management. To become a business partner the HR managers must learn the firm's business, be more responsive about the needs and direction of the business and demonstrate how critical HR is to the success of the business.

5. Measuring and benchmarking the HRM impact. **–** In order to make the contribution

to the organizational performance or to enhance the contribution of HR practices to the organizational performance, the HR activities or practices are to be measured in terms of return on investment. Customer reaction approach can also be a useful tool for this purpose. It is very important for HR to carry out a customer (other departments) survey to evaluate the effectiveness of its practices. An example of Kodak is very relevant to mention, it uses a variety of measures and approaches to measure the impact of its HRM practices.

FUTURE TRENDS

The organizations have entered a new era: the emergence of talent management**,** wherein the business is facing a new set of strategic issues that have stemmed out of the changed landscapes of business environment. Shift in the demographic composition of societies, increase in the expectations of people from the business, political and economical instability in certain regions, terrorism, inadequate infrastructure and substandard quality education in the developing countries are some of the critical issues faced by the organizations that have led them into the war for talent. There is a great need for systems and processes that can address the challenges.

Since 1997 when McKinsey coined the term war for talent, it has become a buzz word in the board rooms, among consultants, service and technology providers etc. A survey conducted by Society for Human Resource Management reports that, as many as 53% of the organizations have specific talent management initiatives in place. Out of these companies 76% have talent management on top priority and 85% of human resource functionaries in these companies work in close coordination with top management to implement talent management strategies. Every organization irrespective of the industry is talking about talent management and its contribution in creating high performance work system. Talent management is now being viewed as a key business process and a driver for organizational success. Over a decade since McKinsey initiated the talk on talent management, a lot has been written by the consultants, practiceners and the technology providers without much understanding and clarity about the topic. The term has been defined from different perspectives. All of which give different establishment of meaning to the same set of practices within different organizations. Therefore a need emerges for the future research in the area of talent management. Besides this, the technological advancements such as mobile computing and pervasive computing have also changed the nature of business, as a result new terms like E-Business and pervasive business have emerged. Human resource management being the integral part of business has to embrace such technological advancements if it really wishes to be considered as a strategic business partner. These advancements further open new areas of research such as human centered pervasive computing i.e to make the interactions of human beings and computing devices very natural. The time is not very far when the vision of Mark Weisers will become a reality. Many projects on pervasive computing have already begun. Oxygen at MIT, Aura at Carnegie Mellon, and Endeavour at UC Berkley are some of the examples of recent research work in the area of pervasive computing. Pervasive computing soon may help the organizations to make their human resource practices more efficient so that they have the right talent at the right place at the right time so that everyone performs at their highest standard. There is a great possibility that pervasive computing may help the human resource function to become a pervasive function. Research on the application of pervasive computing in human resource management will help to develop new models of strategic human resource management.

CONCLUSION

On the basis of overwhelming evidences we may conclude that progressive human resource practices improve business performance. Organizations gain competitive advantage when they adopt a strategic and rational approach to people management. The new economic order has provided an opportunity as well a challenge to human resource management and its functionaries to play an important role in achieving the strategic objectives of the organization. They are not required to implement the organizational strategies only but to play an active role in designing and formulating the strategies. For this they need to have a multidisciplinary approach and an understanding of the business goals. HR functionaries have got to play significant role in addressing challenges of fast changing business scenario as well as enhancing the strategic fit between the HR practices and organizational strategic plan. Taking the strategic approach to human resource management involves making the function of managing the human assets the most important priority in the organizations and integrating all human resource policies and procedures with the company strategy.

KEY TERMS AND DEFINITIONS

Competitive Advantage: An edge that a firm enjoys or has over another firm. It is an inimitable or incomparable ability of the organization that creates the value and distinguishes it from the competitors.

Human Resource Management (HRM): HRM refers to the people management practices that the organizations adopt to ensure that people perform at the optimum level. Human resource management encompasses all the activities that are undertaken right from recruitment to separation of the people. It is concerned with the initiating a system (Policies, plans and practices) to ensure effective and efficient utilization of the human

capital to accomplish the strategic intentions of the organization.

Human Resource: Refers to all men and women working in the organization. It includes the qualitative (knowledge, skills and abilities) and quantitative (numbers) aspects of people.

Strategic Fit: Refers to the appropriateness of various organizational strategies to achieve the strategic intentions of the organization. In case of strategic human resource management, it refers to the suitability of human resource management policies, practices and strategies to achieve the overall organizational objectives. Generally there are two types of strategic fit; vertical and horizontal. Vertical fit refers to the alignment of HRM practices with the strategic objectives of the organization whereas horizontal fit is the congruence among various HRM strategies.

Strategic Human Resource Management (SHRM): Designing and implementing a set of internally consistent policies and practices that ensure the human capital of a firm contributes to the achievement of its business objectives. Essentially, SHRM emphasises developing the firm's capacity to respond to the external environment through a better deployment of human resources. SHRM seeks to link the human resource management practices with strategic goals to improve business performance.

Strategy: A plan of action that the organization assumes based on its strategic position and intentions.

Chapter 8
Knowledge Worker Profile:
A Framework to Clarify Expectations

Gulgun Kayakutlu
Istanbul Technical University, Turkey

ABSTRACT

One of the major reasons for economic crisis of 2008-2009 is determined as value delivery. Major resource of value creation is the knowledge worker who works at different levels of an organisation. This study analyses knowledge worker studies in diverse disciplines, in order to determine the requests. The goal of the study is to propose a framework to clarify the skill requirements by integrating the requests at operational, team, organisational and inter-organisational levels with drivers provided by educating, attracting, motivating and retaining strategies. The framework facilitates employing the right employee for the right post while balancing the requests and the performance measures. This new vision will be beneficial for managers, human resource experts, and educators.

INTRODUCTION

Global economic crisis in 2008-2009 hit the service companies as well as the manufacturing enterprises. One of the major reasons of failure is seen as the lack of full-value delivery from the existing resources expressed in finance and intellectual capital (Hsiao & Lee, 2008). Politicians, CEOs and Managers are warned to have new mechanisms to institutionalise organisational systems and are invited to be rational on the critical

resources rather than following the footprints of brand owners (Arvidsson, 2009). Economists suggest solutions by focusing on system innovations instead of technology and product innovations (Mavrotas et al., 2007). The attention is drawn to knowledge workers who are accepted as the major resource of innovation and competitiveness (Chen, 2008). Contrary to cost-focused approach to employ less skilled but increasingly global and virtual knowledge workers (Tucker et al., 2005), the skill revolution is observed while moving into a more demanding cognitive age (Brooks, 2008). New economic models are in process for

proposing sustainable frameworks, guardianship of intellectual property, impact of intellectual quality, more knowledge production based on more reliable performance of knowledge workers.

Wider range of skills is to be recognised and supported for knowledge workers in new business models. The challenge of developing sustainable models in value chains request more than just higher education and more company-based training. The impact of intellectual quality is to be enhanced (Cope & Kazantsis, 2009); person-to-person skills or soft skills are to be developed (Warhurst, 2008). Individual knowledge facilitators are to be motivated and retained in order to achieve effective collaboration (Garcia, 2007). As an impact of all these improvements, not only individuals will be more innovative but the entire system within a company, within a city, a region or nation as Helbrecht (2004) has stated. Besides, knowledge workers are the main organizational asset that cannot be imitated and therefore create a sustainable competence (Livanage et al., 2008).

This study aims to propose a conceptual framework to define realistic expectations from a knowledge worker within the new business models. The proposed model will integrate the achievements of the previous research in diverse fields and complete a vision of a whole. The study is based on analysis of expectations in operational, team, organisational and inter-organisational work levels driven by education, attraction, motivation and retention. Requests and contributions are combined to determine the competence created in terms of personal, relational, technical and professional skills.

This chapter is so organised that next section will define the knowledge worker and summarise expectations and drivers in different dimensions. The third chapter will present the proposed framework. Final section will be the conclusion and suggestions for further studies. This new vision will open a new dimension for managers, human resource experts and educators.

BACKGROUND

Studies on knowledge worker take place mainly in information technology and management fields. In order to define a new profile for the knowledge worker, analysis in education, epistemology, psychology, economics and political science fields are reviewed as well. Previous research will be analysed grouped in common focus.

Definition of Knowledge Worker

The term Knowledge Worker was first used by Peter Drucker in his 1959 book, *Landmarks of Tomorrow* to identify the workers in the information technology fields. Today, anyone who works for a living at the tasks of developing or using knowledge is named to be a knowledge worker. Davenport has summarised the background and the operations of the post: "Knowledge workers have high degrees of expertise, education or experience, and the primary purpose of their jobs involves the creation, distribution or application of knowledge. One third to two thirds of any company workforce are included in this definition" (McKellar, 2005). This definition includes tasks of planning, acquiring, searching, analyzing, organizing, storing, programming, distributing and marketing goods and services in addition to transformation and commerce of data, information and knowledge. Hence, the term includes lawyers, teachers, scientists of all kinds in addition to programmers, system analysts, technical writers, academic professionals, researchers.

A knowledge worker is a participant of the knowledge economy where intangible products are as important as the tangible objects with raw material and physical goods. To create, produce and disseminate intangibles, knowledge workers are expected to have high level skills and high technology literacy. Greene (2006) adds characteristics like high cognitive power and abstract reasoning as well as new perspectives and insights. Gurteen (2006) mentions the responsibility feature in the

following words: *"Knowledge workers are those people who have taken responsibility for their work lives. They continually strive to understand the world about them and modify their work practices and behaviours to better meet their personal and organisational objectives. They are self-motivated. Knowledge workers cannot be coerced, bribed, manipulated or rewarded and no amount of money or fancy technology will incentivise them to do a better job. Knowledge workers see the benefits of working differently for themselves. They are not wage slaves; they take responsibility for their work and drive improvement."*

These unique features cause the knowledge workers to be the ones to find and solve difficult problems. They use the books, web and their network effectively to design solutions. They use the knowledge support to take decisions. Furthermore they are to be productive, efficient and effective to prove to be assets but not costs for the business and society. A metaphor that comes from mythology like Ulysses or Icarus, knowledge worker is somebody burnt in the process "somebody losing his old identities in this process of constant transformation and of expanding further and exploring further as an ultimate goal (Nicolopoulou & Karatas-Ozkan, 2007).

Education of a Knowledge Worker

One critical feature in Knowledge Worker definition is the high education. Drucker (1989) highlighted this characteristic by emphasizing "the level of qualification acquired during formal and informal learning". This comment changed the programs of high education and encouraged current education experts to suggest a liberal education with the professional qualifications required in a global economy (Rowley, 2000; Johnson, 2006; Stromquist et al., 2007). Quality is to be developed based on goals and content of education.

First goal was the productivity. This is why industrial engineers of Taylor are pointed as the first knowledge workers (Drucker, 2001). Educating knowledge workers was mainly technology focused. As Rowley (2000) identified the high education was requested to include how:

- to create knowledge repositories
- to enhance knowledge access
- to manage knowledge as an asset
- to measure knowledge within intellectual capital

As the e-business and supply chains gained importance, more education is requested on virtual organisations in addition to the team work (Larsen & McInerney, 2002).

The increase of globalisation caused knowledge worker to have an important role in the organisational efficiency. The universities are expected to be both local and global. Implications have been drawn for building up a networked human and technology environment to support formulation of learning communities. The aim is fostering local knowledge and human development pursuing social and organisational values (Cheng, 2004). Research and creativity have become important issues in business schools; while the learning is facilitated as individual learning, and organisational learning improves. The race among the nations has started to educate the talented workforce (Cornuel, 2007).

Improvements in education style changed universities to become learning systems for skill development instead of being profession builders. In order to respond to the goal of global effectiveness, customer oriented approaches in the courses are increased (Nayeri, et al., 2007). Furthermore, new programs are developed consisting of life-long learning schemes, personalisation in education to take into account demands of tutoring and mentoring on an individual basis (Garcia, 2007).

Organisations expected better educated people to give the flexibility needed to switch production, better accommodate innovation, retraining and relocation (Roffe, 2007). In order to respond

to these expectations, knowledge workers are to be educated or trained in all the knowledge processes including knowledge acquisition methods (Psarras, 2006), knowledge development context and tools (Magnier-Watanabe & Senoo, 2008) as well as knowledge dissemination algorithms (Norhani, 2008).

APPROACHES TO A KNOWLEDGE WORKER AT WORK

Knowledge-based economy caused the war for talent; companies are battling for those knowledge workers that will take roles in productivity, efficiency and effectiveness of the company. Achievements can only be realised by attracting, motivating and retaining of the high skilled workers with learning ability.

Attracting the Knowledge Worker

Knowledge management blogs and magazines mention the difficulty of employing the knowledge worker. Recruitment of the knowledge worker is less dependent on the professional knowledge and instead depends on a range of factors that build up the reputation and social capital of the applicants (Moore & Taylor, 2009). It is widely known that they cannot be attracted by high salaries or rich benefits alone.

The human resources departments have difficulties to detail the competence searched for. They have to identify product, process and relational skills that will add value to the organisation. Technology related, operations related and market related knowledge is in demand as well as leadership, problem solving, communication and learning capabilities (Ahn & Chang, 2004). Employing the right talents have become an important management skill. Horwitz (et al., 2003) identified the best employers to have three important attributes:

- matching the talent with the business goals;
- finding the ability to grow and adapt in a rapidly changing environment;
- giving the flexibility to balance workplace demands and the needs of business.

Commitment to empowerment, relaxed hierarchy, flexible timing, and decentralised decision making are the recommended features of attractive managers (Magnier-Watanabe & Senoo, 2008). Encouragement for knowledge management and collaboration are the preferences of the most recent winners.

Motivating the Knowledge Worker

Even if the best workers are attracted, it is hard to retain them unless they are motivated. The comfort of the work place, the challenges of the tasks, relations with the peers and rewards form the basis of motivation. High-skilled workers love to share visions and realise thinking together. Developing mental models and learning systems throughout the organisation will help motivation. Specifically, knowledge-enhancing activities must be openly valued and acknowledged, while failure to participate in knowledge sharing must be discouraged (Lee-Kelley, 2007). Individual workers must have the freedom to interact with both internal and external peers. Since knowledge is the only asset that grows when shared (Kayakutlu, 1998), interactions should be rewarded. Sharing organisational mission and business issues to generate revenue will make the result-oriented knowledge sharing more satisfactory (Henard & McFadyen, 2008).

Motivation can also be increased by the behaviour of managers. Several suggestions for managers are summarised as below (Lee-Kelley, 2007; Rusette et al., 2007; Erickson, 2008; Stephen et al., 2008; Davenport & Iye, 2009):

- Managers would allow face-to-face interaction, while being flexible in workplace;

- Dedication to work should not be asked for without being a model;
- Free flow of opinion among the knowledge workers is to be allowed with trust;
- Knowledge workers should be involved in decision processes;
- Quality of the knowledge work should be measured and shared;
- Better insight is to be given to the excitement of creativity;
- Appreciation for self employed attitude must be shown.

Rotation on various responsibilities takes place in the must do list for motivating the knowledge workers.

Retaining the Knowledge Worker

High turnover of knowledge workers is both risky and costly. Job satisfaction is the key to keeping critical employees. It was based on the conditions of work-place, task definitions and communications with the managers and the peers. Classical approaches of giving services like health-related programs or being generous with benefits are not good enough in cases where employees are highly knowledgeable and skilled. Challenging work assignments are accepted more satisfactory than competitive pay packages (Hewitt et al., 2003). Treating any knowledge worker as an individual and making him/her feel unique is only possible with the opportunities given to enhance the skills (Fawcett et al., 2004). The importance of developing critical success factors and using relevant performance factors have always been the lead for retaining the knowledge workers (Terziovski & Morgan, 2006).

These are the employees who know they are distinctive and have an important economic value. They are aware of residing in the core competence of the organisation (Horwitz, 2006). Besides, retaining the knowledge workers means retaining the innovation lead competitiveness.

The new organisational culture is to be adaptive to change (Roffe, 2007) by developing the team-work spirit and collaboration (Lee-Kelly, 2007) to develop existing knowledge. Even in a tough economy as today, organisations are deemed to keep continuous improvement (Hamidizadeh & Farsizani, 2008).

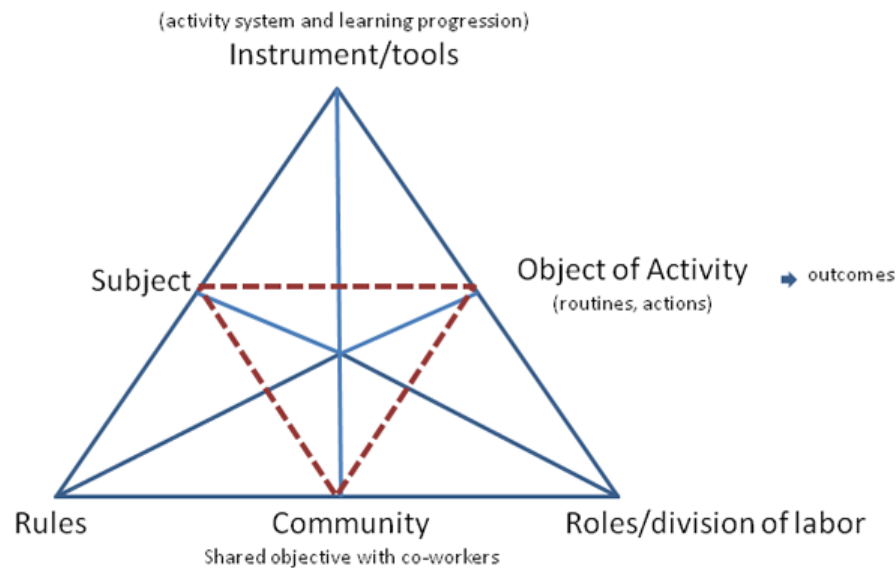
EXPECTATIONS AT DIFFERENT BUSINESS LEVELS

Progression of knowledge worker at work continues at different levels of the organisation. Engestrom's model for the structure of human activity is redesigned for knowledge workers by Gvaramadze (2008). The structure in Figure 1 gave us the lead to define expectations from a knowledge worker at different work levels. Investigation will be held at four work levels defined as operational, team, organisational and inter-organisational levels.

Expectations at Operational Level

Knowledge operations are defined repetitively to be generalised as knowledge acquisition, development and dissemination. Knowledge workers including engineers and medical doctors will start the work life at the operational level where they are expected to accomplish efficient knowledge processes in addition to professional performance. Knowledge-intensive and task-based environments such as research laboratories, consulting firms and high education workers are expected to fully reuse the knowledge assets in process of achieving the goals of business tasks (Liu et al., 2005).

Knowledge acquisition is gaining new knowledge from either inside or outside the organisation. It includes addition of new knowledge to the existing one by making the accumulated knowledge accessible. Explicit knowledge is easier to transmit and efficiently use and therefore it is easy

Figure 1. Structure of interactions for the knowledge worker (Gvaramadze, 2008)


to duplicate and may not always create competitive advantage. In any organisation, the challenge is to accept that not all knowledge is in a form to be readily shared, diffused, or implemented (Magnier-Watanabe & Senoo, 2008).

Knowledge development is the effective use of the knowledge accumulated in order to increase the organisational competence. This is a process that depends on workers' readiness to use and share individual knowledge. Creating knowledge repositories through collaboration of different teams will allow improvements in using the existing knowledge (Delen & Al-Hawamdeh, 2009).

Knowledge dissemination includes knowledge sharing, knowledge diffusion and knowledge marketing. It is the process that changes a lot when the workers change (Huang et al., 2007). Effective knowledge sharing is not only dependent on the skill of knowledge workers; but it requires cultural change, new management practices and investment in network technologies. Knowledge workers however are expected to be well equipped with the appropriate cultural values to facilitate the exploitation of knowledge in line with the business objectives (Norhani, 2008).

Indifferent of the field of work the expectations of knowledge worker in operation are to include the following (Psarras, 2006):

- Transform data or information into knowledge;
- Identify and verify knowledge;
- Capture and secure knowledge;
- Organise knowledge;
- Retrieve and apply knowledge;
- Combine knowledge;
- Create knowledge;
- Learn knowledge;
- Distribute/sell knowledge.

In all the business sectors profit-oriented enterprises show a tendency for limited time employment and decrease the salaries for the knowledge workers which could emerge the "just-in-time knowledge worker" (Stromquist et al., 2007). Yet, observations show a strong positive relationship between the operational and organisational performance (Fugate et al., 2009).

Expectations at Team Level

Knowledge work is typically project based defined by memos, contracts or agreements for different activities. An engineer works in a team to develop a new product; a chirurgical doctor works with a team in each surgery; an information technology expert works in software, hardware or network projects. Knowledge workers are to be leaders as well as team workers simultaneously. That is why they have to be evaluated process specific, team based and firm specific (Swart, 2006). They have to remain self-employed as well as assisting or leading other employees (Fenwick, 2007). They are expected to perform research, analysis, learning, informing, advising and guiding in team processes (Laycock, 2005).

All the team actions, transitions and interactions define and force team effectiveness. Knowledge teams are to create high performance as well as member satisfaction in accordance with the integration power and energy in the team. Members in the team are brought together primarily for their operational expertise, relational skills and contact networks (Le Pine et al., 2008).

Building knowledge teams starts with understanding the team's objectives to complete the requested services for a specific project. Developing a model and structure for the team will enable defining the skills required for the members and the leader. The last step for building a successful team will be to set the right measures to ensure that team members are in the proper job level based on skill and performance (Schell, 2008). One of the unique features of the knowledge teams would be the collaborative thinking process that will need the mindset for each project (Armstrong et al., 2008). Shared visions would allow team practices like brainstorming, improvisation and co-creation by using project management tools and methodologies (Ditkoff & Moore, 2005).

Knowledge teams are expected to be structured with definite purposes within the organisation's business mission (Henard & McFadyen, 2008).

To make teams perform well, the following are to be realised (Cabrera & Cabrera, 2005):

- Cross functional interactions- possible by self-driven workers with good communication skills;
- Communication skills- enabled by training programmes geared to articulate and communicate knowledge;
- Communities of practice- caused by formalised orientation and socialisation programmes and events;
- Performance appraisals that recognise knowledge sharing;
- Incentive programmes that reward effective knowledge sharing;
- Group and firm based compensation systems;
- User friendly communication and group sharing technology;
- Open and trusting culture with strong norms of knowledge sharing.

The performance of knowledge teams are measured in the team and among the teams of different projects (Gloor et al., 2007).

Expectations at Organizational Level

Majority of the research is focused on the organisational impact of the knowledge worker. As Liebowitz (2004) stated, an organisation's accumulated value is found in the intellect, knowledge, and experience of its workforce. Firm specific power is the essential basis for sustainable competitive advantage. Required organisational synergy is created only if financial and knowledge investments are combined (Osterloh & Frey, 2006).

The innovation process that is unavoidable for today's industries, need knowledge collaboration of the work force in initiation, development and implementation phases (Gordon and Traftar, 2007). Making knowledge workers collaborators in the work environment will benefit entire

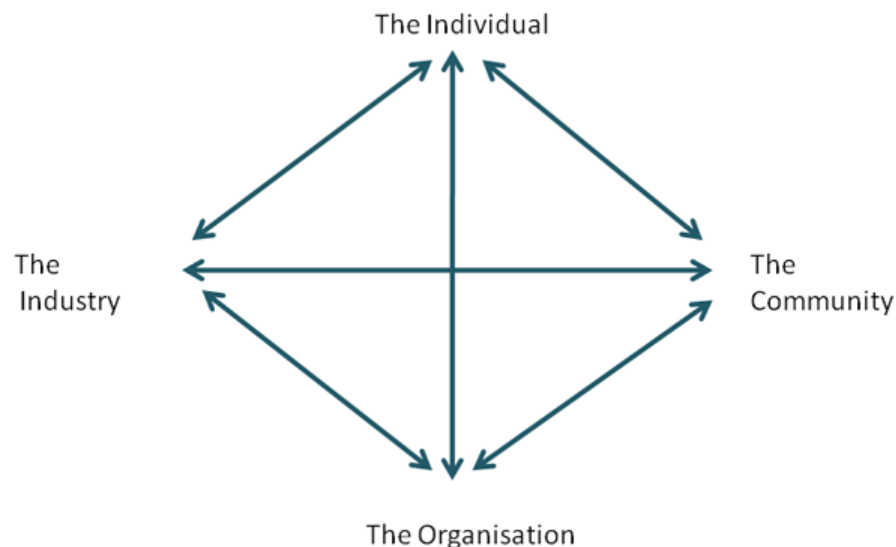
organisation (Praner, 2008). Yet, the goal satisfaction by creation of the synergy depends on size, technology, environment, culture and the strategies of the specific organisation (Jafari et al., 2008). In order to measure company performance specific to intellectual capital, employee based factors are to be clarified (Tan et al., 2008). Green (2008) has enlightened the organisational studies by giving a broad list of employee based factors influential on performance. Green's work specifies both features of employees (competencies, education, experience, relationship, productivity, profitability) and organisational drivers for the workers (assignment, retaining position, motivation, training, and turnover) among the intellectual factors. A range of technology applications are used for investigations, collaborations and communications to develop the organisational learning. It is integrated with the knowledge processes, but to be articulated in terms of the business needs and to be designed as embedded with business performance (Roffe, 2007). Organisational effectiveness is provided by the capability development and capacity planning in addition to alignment of knowledge resources with the business strategies (Spratt, 2007). Cultural

and personnel controls are to be implemented to increase the firm performance (Teo et al., 2008).

Expectations at Inter-Organizational Level

Strategic alliances in the global supply chains are focused on knowledge based collaborations. Business models are designed to emphasize personal interactions that bind companies in the same industry and other industries together. Ramachandran (2003) analysed the impacts in three levels. Primary impact is defined as the information and technology diffusion to form an information society; secondary impact is the capability and capacity building and improving the knowledge usage to feed into a knowledge society and the tertiary impact is the knowledge based culture development in order to develop a value creating society. Similar interactions are simplified in the model of Arthur et al. (2008) by using knowledge mapping.

No matter what the industry is, the value chain is to create and sustain a culture that fosters innovation, creativity and learning as in any single

Figure 2. Interactions binding collaborations (Arthur et al., 2008)


company today. This new mindset is enabled by pro-active strategies and handling human resources in the chain as an investment (Thite, 2004). Suppliers and buyers are working together to create and transfer knowledge more effectively. Comprehensive and flexible strategies are to be developed to create learning and sharing culture in the value chain (Jafari et al., 2008; Yeh, 2008). Virtual teams of knowledge workers play an important role in trust building. This important role requires the abilities of critical thinking, ethical problem solving, stakeholder analysis, and comprehensive expression (Larsen & McInerney, 2002). Moreover externalisation of the collaborative knowledge worker has to contribute for the society as well as the value chain (Ehin, 2008).

Although multinational companies play the key role to accumulate an immense volume of knowledge, there is more need to expand specialised knowledge customised to the region or industry. That is why independent knowledge workers will have a growing importance for the performance of the value chains even in agricultural industries (Nicolopoulou & Karatas-Ozkan, 2007). Unlike the collaborators in the value chain, independent knowledge workers should accept themselves as connectors. Their activity is generating and linking but not transmitting the knowledge, through which organisations grow (Fenwick, 2007).

KNOWLEDGE WORKER SKILLS

If the innovation cycle is to be managed effectively value of knowledge workers will continue to grow. New challenge for managers and leaders is to take greater risks for the management of new skill set (Terziovski & Morgan, 2006). Wolff (2003) had classified skills for knowledge workers in three groups: substantive like synthesising, coordinating, analysing, verbal and numeric intelligence developed by education and training; interactive, like mentoring, negotiating, instructing, supervising and serving based on organisational

culture; motor like coordination, machine operating, materials handling or technology utilisation. Johnson (2005) classified almost the same skills as basic, discipline/profession specific and technology skills. In parallel to the growth of network business and value chains, relational skills have become as important as the rest.

"Business knowledge is practical knowledge, or useful knowledge for management, production, service and innovation in industries, rather than broader social and scientific knowledge" (Gao et al., 2008). This definition gives a general idea about what is the basic professional requirement for any knowledge worker. Professional education is expected to give basic capabilities that will be enhanced by practice in industry. If the critical business issues are defined and knowledge is treated as process rather than product, know-how of activating these processes will be the responsibility for the knowledge worker (Massey et al., 2005). Professional effectiveness will be based on familiarity of the current tasks and amount of progress at the given task (Liu & Wu, 2008).

As knowledge continues to be mobilized, the cost benefit analysis of social ties is given a growing importance. A knowledge worker takes responsibility of tasks which consists of relation with all the stake holders. Hence they have influence and impact on other employees and peers, on customers, on competitors and on partners (Green, 2007). It is business critical to balance the economic values created and to strengthen the social network (Fliaster & Spiess, 2008).

Knowledge is viewed as a multifaceted resource. Management experts note that the ability to create new knowledge is dependent on an individual's ability to recognize and obtain valuable new knowledge and subsequently integrate that knowledge with existing knowledge (Henard & McFadyen, 2008). As an individual who performs in teams, a knowledge worker is expected to accumulate the acquired knowledge, use the creative knowledge, and develop unique knowledge for competitiveness. All thinking styles are to be

used to embrace logical and technical skills as well as conceptual, imaginative planning and organisational abilities (Amadi-Echendu, 2007). Unlike the human resource and knowledge experts Johnson (2006) has summarised individual skills of a knowledge worker by abilities to design, to create stories, to show empathy, to play well, to create symphony and learning in order to develop meaning.

Most recently Cobo (2008) defined a knowledge worker in nineteen features:

1. Not restricted to a specific age.
2. Highly engaged, creative, innovative, collaborative and motivated.
3. Uses information and develops knowledge in changing workplaces (not tied to an office).
4. Inventive, intuitive, and able to know things and produce ideas.
5. Capable of creating socially constructed meaning and contextually reinvent meanings.
6. Rejects the role of being an information custodian and the associated rigid ways of organizing information.
7. Network maker, always connecting people, ideas, organizations, etc.
8. Possesses an ability to use many tools to solve many different problems.
9. High digital literacy.
10. Competence to solve unknown problems in different contexts.
11. Learning by sharing, without geographical limitation.
12. Highly adaptable to different contexts/environments.
13. Aware of the importance to provide open access to information.
14. Interest in context and the adaptability of information to new situations.
15. Capable of unlearning quickly, and always bringing in new ideas.
16. Competence to create open and flat knowledge networks.
17. Learns continuously (formally and informally) and updates knowledge.
18. Constantly experiments new technologies (especially the collaborative ones).
19. Not afraid of failure.

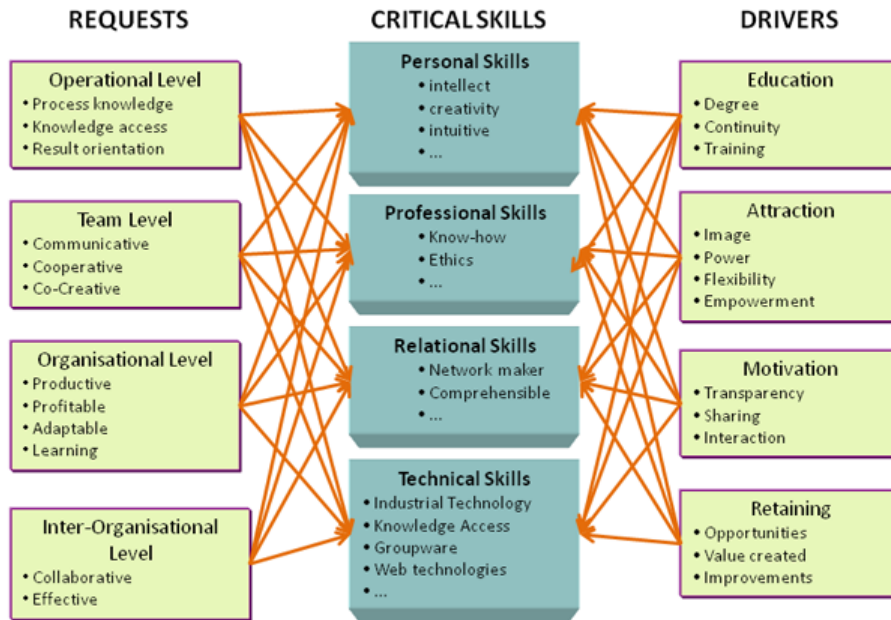
A knowledge worker is a professional who ensures that the gaps between the different levels of an organization are removed, if task is done at his or her most efficient capacity (Scott, 2005).

FRAMEWORK FOR EVALUATING THE SKILLS OF A KNOWLEDGE WORKER

Knowledge worker is always defined to be highly skilled. However the difficulty to define these skills increases as the requests grow. As stated in the literature survey in section 2, the expectations are diverse and immense, as if the managers are looking for a magician. To avoid the expectations to reach a point that a knowledge manager will create a rabbit in an empty hat, the uprising in performance measures should be applied in skill detection. In large companies managerial performance is linked to the business success rather than individual performance as in Toyota (Bryan & McKinsey, 2006). This measure without any doubt includes employing the right person for the right job to ensure the organisational competence.

We designed a new framework for defining the profile of a knowledge worker, to reduce mistakes in engagement, team building, collaboration and success of knowledge workers. The skills requested are to be defined integrating what is needed from the knowledge workers and what can be given to the knowledge workers. As it is shown in Figure 3, the framework combines drivers and requests to determine skills. Literature review helped in specifying all three dimensions in a clear way.

***Requests*:** As detailed in section 2, despite the interactions of different work levels, the knowl-

Figure 3. Framework to determine Knowledge Worker skills


edge worker needs to know his tasks in detail. Operational, team, organisational and inter-organisational definition of skills will enable both the worker and the manager to recognise the criticality of the tasks. At the operational level, result orientation, knowledge about the processes and ability to access knowledge are requested. In team level, all team features are in demand; worker has to be good in communication skills, knows to co-operate and to add value by co-creation in a team. In the organisational level productivity and profitability are to exist besides the ability to adopt the new culture and changes as well. Learning from organisational operations and achievement is a plus. Knowledge workers are expected to build the trust and collaboration. Therefore they are expected to be ethical and collaborative.

Drivers: Education, attraction, motivation and retaining are considered as the drivers for the knowledge worker, since they will add more to the features brought to the company. Hence, the organisation has to see what they can provide for the high skilled employee to balance the requests.

Degree of high level education and lifelong continuity should be considered as a benefit by the organisation as well as on-the-job-training. The worker wants to be impressed by market image, financial power and adoption to change. Structural flexibility with flexible timing and work place allows empowerment and decentralised decision, which are attractive for the knowledge worker. Transparency of the mission and goals will motivate the talented employees as much as encouraging knowledge sharing and managerial interaction. They prefer to work in companies where they have more opportunities to improve and informed about the value they create. Continuous improvements in the company will support sustainability of the work force.

Critical Skills: Competence of a knowledge worker is grouped in personal, professional, relational and technical skills. The personal skills consist of individual abilities that will support his business performance. Professional skills include basic knowledge that is gained in education, industry and operational accumulations obtained through experience. Relational skills comprise of

networking, communication, knowledge sharing and collaborative creation. Technical skills will not be limited to utilisation of specific professional technologies (both software and hardware) but the literacy in using groupware and web technologies is required. Continuous follow-up of the technological changes both in information technologies and professional technologies are expected from a knowledge worker.

A good example is determining the requests for a planning engineer. The education is defined to be industrial engineering, information engineering or operational management that brings only basic professional skills. If a planning employee is needed, he is expected to know all the definitions, concepts and methodologies used in planning as well as project planning and scheduling software utilisation. Tasks will be part of a product or service project; hence will interact with other planners. Planning teams are continuously in contact with the production, purchasing, sales and quality teams either internal or external to the organisation. Plans are to be correlated with supplier and customer plans. The requests can already be defined in skills with so much information. However, the organisation has to guarantee that overwhelming candidates do not show up, since they will have a short work life. Therefore, the organisation has to go over what the company specific attractions are, how much motivation can be provided and what retaining strategies should be applied. Only then the organisation is ready to announce for a new post of planning engineer.

Application of this framework will provide benefits in any industry. It is also not specific to technology people and will bring the following benefits for an organisation:

1. Clarify the request hence deal with fewer candidates in recruitment;
2. Ability to determine the salary and the benefits based on critical skills;
3. Balance the critical skills and the performance measures;
4. Reduce turnover by starting retaining strategies in recruitment;
5. Facilitate managerial success.

CONCLUSION

High-performing enterprises are now building their competitive strategies around data-driven insights that in turn generate impressive business results. Their secret weapon is defined to be analytics (Davenport & Harris, 2007). That is why knowledge workers are given an increasing value for the improving role in innovation. New organisations even redesign processes as knowledge workers would carry out, rather than measuring their performance (Bryan & McKinsey, 2006). Leadership, talent and culture are accepted as the basis for knowledge worker skills. In a world where knowledge is a quality introduced, created and developed by the employees, the right person in the right position has more importance. In a tough economy of reducing work durations, income depends on the worker's position relative to the peers in the same knowledge level (Saint-Paul, 2007).

This study proposes a new framework to depict the exact skills requested by any company independent of the company. It was newly stated that the knowledge worker is highly skilled, who is able to convert knowledge into tangible innovative products and services. The firm in search for the talent has to find the right skills and know to keep them in the company for a long enough time to benefit. Intellect, wisdom and ideas of knowledge workers can be converted to economic and competitive values. That is why the integration of the requests are to be combined with the drivers in determination of the skills. Knowledge worker is not only the one who thinks how to work. Knowledge worker can communicate, cooperate and collaborate for the creation of innovative value adding products and services (Daugėlienė, 2007).

Future works will include the application of the framework in different industries. Validation will include utilisation of variety of methodologies like Bayes network, Analytical Network Processing and fuzzy clustering. This new state of thinking integrating both expectations and the drivers to determine the skills will be beneficial for managers, human resource experts and educators.

Chapter 9
Knowledge Strategy:
Its Mitigating Effects on the Organization

Joseph Kasten
Dowling College, USA

ABSTRACT

Knowledge strategy is defined as the set of guidelines and philosophies that guide an organization's knowledge-based activities, such as knowledge gathering, development, storage, and utilization. Much of the early literature describing knowledge strategy suggests that its role in the organization is to drive, and be driven by, organizational structure and the human resources and technology strategies. This paper derives a model that places the firm's knowledge strategy as a mitigating factor between the decisions made by management and the manner in which they are communicated to the rest of the organization. The present research is an update to a previously published paper and extends the research that first generated the metaphor of the KS as a lens.

INTRODUCTION

The importance of knowledge to the success of firms in many industries has become well-rooted in the literature. It is necessary now to address the manner in which the strategic management of knowledge manifests itself within the day-to-day operations of the firm. This understanding is crucial to the useful application of knowledge and the success of systems utilized to manage it. This foundation ensures that the knowledge

obtained, developed, stored, or applied by the firm is derived from, and supports, the business strategy currently in place.

A Knowledge Strategy (KS) is the linkage between the business strategy and the knowledge activities of the organization. It is defined as the set of guidelines and rules that help to define and steer the organization's knowledge-based activities and processes (Kasten, 2006). It can be difficult to define and quantify how the KS influences the manner in which the firm utilizes knowledge in its daily operations. Knowledge strategies, like other strategic plans, can take many forms

(explicit vs. implicit, prescriptive vs. emergent, etc.), making its expression and dissemination to the firm challenging.

This remaining paper is comprised of five parts. The next section will briefly review some of the extant literature that frames the study of knowledge strategy. Next, this literature is used to create a preliminary model of the internal interactions that drive, and are the result of, knowledge strategy. This model is transformed by the results of the first round of empirical data collected in the study, and in the penultimate section that revised model serves as a starting point for another round of empirical research. The final section concludes the paper and points to some future research directions.

LITERATURE REVIEW

After briefly discussing some of the foundational literature in the field of KS, the literature utilized to construct the initial research model forms the majority of the literature review. Both theoretical and empirical literature has been included as the basis of the model.

Some of the earliest writings regarding the strategic use of knowledge come from the business strategy development literature. Feurer, Chaharbarghi, and Distel (1995) wrote about the part played by knowledge in the implementation of business strategy. Their research stresses the importance of matching the type of knowledge maintained in the firm with its proper level in the firm. Zack (1999) explicitly defines KS as "balancing knowledge-based resources and capabilities to the knowledge required for providing products or services in ways superior to those of competitors." This definition directly links the knowledge characteristics of the organization with performance and competitive advantage. Bierly (1999) takes a similar approach to KS when he defines four basic drivers involved in the creation of a KS: internally vs. externally sourced knowledge, enhanced vs.

new knowledge, fast vs. slow speed of learning, and depth vs. breadth of knowledge base. These seminal papers provide the groundwork for the research that follows.

There is a significant amount of literature describing the organizational drivers that help to shape KS. One important driver of a firm's KS is the environment within which it operates (Buckley & Carter, 2004). These variables might include the type of product or service the firm produces, the level of turbulence or instability in the industry, and the degree of fusion that exists between the industry and those that complement it (Bierly & Chakrabarti, 2001). A good understanding of the environment will then influence how and where knowledge is developed (internal vs. external, broad vs. narrow, etc.).

The external environment will also direct the development of business strategy, which in turn will define the KS (Ursic et al., 2006). There is a significant literature describing the importance of linking business strategy with knowledge strategy and how the business strategy should be the main determinant of KS (Bierly & Chakrabarti 2001; Nickerson & Silverman 1998). Southon, Todd, and Seneque (2002) describe how the KS is influenced by the board of directors while Lane and Probert (2007) analyze the effects of internal and external knowledge acquisition on firm performance.

Due to the interdisciplinary nature of knowledge, KS cannot be created in isolation. It must be informed by other aspects of the organization's plans. Three of the most important drivers of KS, in addition to the business strategy, are the organization's human resources strategy, technology strategy, and the organizational structure. Human resources policies dictate the incentive plans, training structures, and retention plans, all of which contribute directly to a firm's ability to retain tacit knowledge (Kim, Yu, & Lee, 2003). Using data collected by the Danish government, Laursen and Mahnke (2001) are able to show that the human resources practices of firms vary with respect to their KS. Firms whose knowledge strategies call

for an emphasis on external learning and linkages (e.g., consultants or universities) have a greater propensity to employ human resource practices that encourage knowledge sharing such as quality circles and job rotation.

Knowledge, especially in its explicit form, is often shared through the use of information technology. The relationship between information technology and knowledge sharing and transmittal requires that the approach to technology taken by the organization has a significant impact on its ability to capture, store, and transmit knowledge. Most firms still lean on the technology group to make their knowledge management tools work properly (McLaughlin, 2010). This means that the creation of a KS cannot take place without a clear understanding of the firm's IT capabilities and plans (Kim, Yu, & Lee, 2003; Nickerson & Silverman, 1998; Shankar et al., 2003). Syed-Ikhsan and Rowland (2004) find a significant correlation between the IT infrastructure and the creation and transfer of knowledge within the organization.

Liebeskind (1996) discusses the impact of the organization on KS creation, which is extended by Shankar et al. (2003). The organizational structure dictates the location and flow of knowledge stores by dictating the location of people, both geographically and organizationally, and their prescribed interactions. The management processes in place within the organization also affect KS creation, such as those that determine access to resources and employee mobility.

Since KS is influenced by the business strategy, human resources strategy, technology strategy, and the organizational structure, the organization must allow the KS to influence these other aspects of the firm's strategic infrastructure, as well. In order for the influence to travel both ways, there must be some manner of feedback between the various layers of the organization as well as between functions. Thus, a firm's ability to foster internal communications will have a direct affect both upon KS creation but also KS imple-

mentation. Therefore, the technology strategy must also be influenced by the KS. Johannessen, Olaisen, and Olsen (1999) describe in detail how the technological capabilities of the organization directly affect its ability to collect, control, and disseminate knowledge.

Changes in the manner in which knowledge is acquired and managed within a firm often call for a revision in structure or management processes. Organizational knowledge flows, or internal processes that encourage the free flow of knowledge, will enhance the ability to implement most knowledge strategies. Some organizational changes that are made to encourage knowledge flow are small such as title changes and department realignments, but others might be very large such as restructuring entire divisions (Chase, 1997). Girard (2005) shows that the organizational approach to knowledge sharing, including the use of such techniques as social networks, tend to be preferred over any other knowledge-sharing strategy. Jang et al. (2002) find that the socio-cultural aspects of the firm as well as the processes that were mentioned earlier influence the knowledge management strategy. After surveying 195 Spanish firms, López, Peón, and Ordás (2004) find a significant link between the organizational culture of a firm and its learning capabilities. These learning capabilities, in turn, are linked to the firm's performance.

The knowledge management (KM) processes undertaken by the firm are driven by the KS in place. In practice, the KM system is the primary means through which the KS manifests itself. The KS drives the development of the knowledge management tools, organizational processes, system content, and development cycle (Maier & Remus, 2003; Snyman & Kruger, 2004). It is important that the form taken by the KM system is truly reflective of the KS and not just in existence to check off a box on a management "to do" list.

The literature reviewed in this section forms the basis for the place of KS within the organization's strategy creation and implementation

process. The authors contributing to this stream of literature illustrate the network of influence within the organization, as well as the influences that originate from outside the organization, that help to shape the KS.

INITIAL MODEL

The literature reviewed in the previous section is codified in Figure 1. The model represents the various entities, both internal and external to the organization, which the literature suggests drives the creation of KS. Each of the works cited in the literature review was selected because it describes, theoretically or empirically, a driver of knowledge strategy. The arcs between the entities represent the influence of those entities on KS and, in the case of some, the influence of KS on the entity.

The specific literature driving each arc shown in the model is given below:

1. External environment's (turbulence, industry type, competition) influence on KS (Buckley & Carter 2004).

2. The influence of business strategy on KS (Nickerson & Silverman, 1998).

3. The influence of the human resources strategy on KS (Kim, Yu, & Lee, 2003).

4. The influence of technology strategy and technology infrastructure on KS (Kim, Yu, & Lee, 2003; Nickerson & Silverman, 1998).

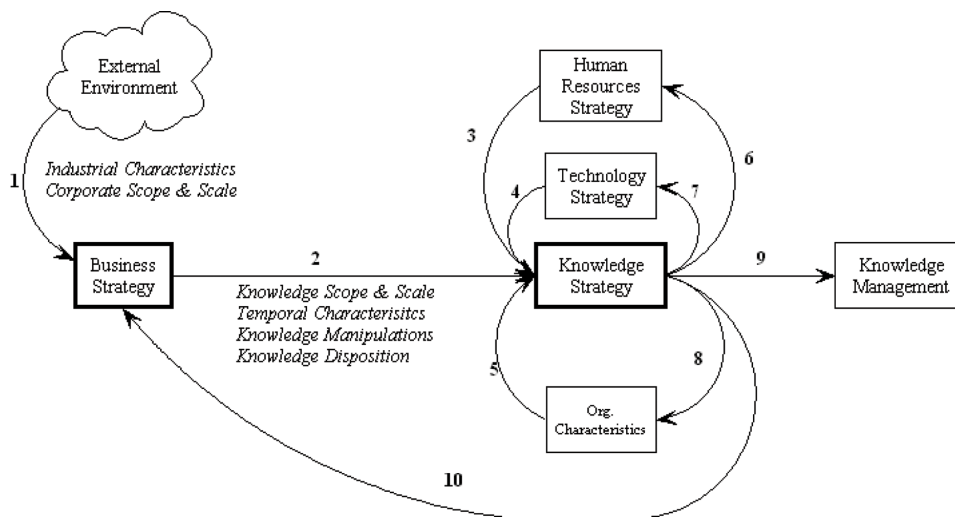
5. The influence of the organization on KS (i.e., management processes, organizational structure, organizational culture, and political climate) (Shankar et al., 2003).

6. Knowledge strategy's impact upon human resources strategy and processes.

7. As KS develops, the requirements of the IT infrastructure will continue to evolve based on communication needs of the knowledge-based community (Felton & Finnie, 2003; Hughes, 1997).

8. Organizational characteristics will often change as a result of KS development (Chase, 1997). These might include size, geographical spread, or internal processes.

9. The influence of the KS on the knowledge management processes ensures that the knowledge management tools and techniques are applied to properly support the

Figure 1. Drivers of knowledge strategy


business strategy (Maier & Remus, 2003; Snyman & Kruger, 2004).

10. This link ensures that the knowledge needs of the organization are aligned with the business strategy as well as ensuring that the business strategy is developed in keeping with the knowledge capabilities and assets of the organization (Huang, 1997; von Krogh & Roos, 1995).

METHODOLGY AND RESEARCH FOCUS

How should the set of relationships between the KS drivers and the KS, which is described in the literature, be modified to reflect the practices of actual organizations engaged in the application of knowledge as a competitive asset? With a better understanding of the actual role of knowledge strategy in the organization, a research model more reflective of reality can be created and act as a foundation for future research.

This portion of the study consists of semi-structured interviews with nine top executives from a number of industries: banking, healthcare (one standalone hospital and one healthcare system), financial services, insurance, software development, and government. The research subjects are all at the highest levels of the organization: CEOs, CTOs, CIOs, Senior Vice-Presidents, and a County Executive. Each interview lasted approximately one hour. The interview included questions regarding the existence of their organization's KS, how their organization's knowledge strategy was created, its characteristics, and its manner of application. The interviews were transcribed and analyzed using content analysis. Initial coding consisted of identifying KS drivers and influencers, with subsequent coding for identifying underlying causal relationships as well as indicators of departure from those relationships noted in the literature. Throughout, linkages and differences within firms, within industries, and

between industries were noted and explored with numerous follow-up questions via telephone and e-mail. As the data revealed differences between the suggestions of the literature and actual events, these differences were compiled and formed the basis of the revised research model, introduced in the next section. In most cases, the revisions to the initial model are based upon multiple observations of similar results.

A qualitative methodology was chosen for two primary reasons. First, qualitative methods are very effective at uncovering relationships between concepts that do not lend themselves to direct measurement, such as the KS. Second, qualitative methods are particularly useful when a field is relatively new and has not generated a great deal of empirical studies or theory upon which to base quantitative methodologies.

REVISION OF THE INITIAL MODEL

The data collected during this study suggest that the initial model can be revised to better reflect the reality of the role played by the KS. Five specific changes were made and are described in this section.

The first change is to remove the direct link between the external environment and KS. Rather than show this as a separate influencer, the data suggests that this influence is brought to bear through the business strategy. The KS of the two hospitals illustrate this well. Both face similar external environments as far as regulations and demographics are concerned. When faced with the need to develop internal knowledge regarding process improvement, one turned to internal training and the other initially turned outward. The character of the training programs also differed, with one being quite formal and the other taking the form of informal, after work gatherings. Ultimately, these responses differ because the strategic outlook of the institution differed. The difference is only slight, because both hospitals' strategies

were to be low-cost providers of healthcare to the community. The difference in their responses was due to management decisions about the best way to meet both the strategic imperative of cost control and their mandate to serve their population. The difference is in the beliefs of the individual management teams as to how to deal with the environment in which they operate. Thus, the revised model reflects the importance of the business strategy in dealing with external issues.

Though not shown on the original model, there are direct linkages between all three sub-strategies and the business strategy, and much of the interplay between them does not involve knowledge, so to show the connection through the KS is unduly limiting in describing their relationship. A further modification to this aspect of the model is to make the arrows connecting the business strategy to these three elements double-ended, reflecting the two-way flow of influence between them.

The labels for human resources strategy and technology strategy have been revised to read simply human resources and technology, respectively. None of the organizations in the study created an explicit human resources or technology strategy. However, technology was acquired by most of the organizations to perform a specific task that was identified as a means to meet some strategic goal. A good example of this is the knowledge

management system implemented by the financial services firm. It is not driven by any technology strategy that the CTO could identify or articulate, but its development was instrumental in supporting a business strategy of improved customer service.

The removal of KS as a central element and its placement as a modulating factor in the relationship between business strategy and the sub-disciplines of human resources, technology, and organizational structure and culture is the most important revision to the model. KS is an abstract, informal, emergent set of beliefs or guidelines that helps to shape the manner in which knowledge is handled by these organizations (Kasten, 2006). KS should not occupy a central position in the model, but rather a position that allows it to exercise some influence on the way in which the other disciplines noted are used to carry out the business strategy. Figure 2 displays the revised model.

The role of KS in this model is to tune the business strategy's influence on business decisions. This is similar to how decisions are influenced by fiscal or human resources strategy. Rather than exist as an explicit set of rules or guidelines, it is the underlying set of fundamental beliefs that guide the decisions made by the various sub-disciplines. The KS is usually implicit and informal and is as much a part of organizational culture as it is a strategic direction.

Figure 2. Revised research model
One hospital's decision to implement Six-Sigma illustrates the revised role of KS. Top management decided that a strategic goal was to streamline the patient care process and reduce the number of information disconnects experienced by the patient as he or she transited the system from admissions to discharge. To accomplish this, the CEO recognized the need for advanced process analysis tools as well as a change in the way his employees addressed their duties. Had there been a formal KS in place, the CEO could have used these guidelines to introduce and implement Six Sigma. However, the KS is an implicit entity, reflecting the beliefs of the top management team about knowledge acquisition and utilization.

The KS of this management team, led by the beliefs of the CEO, supports the viability of an organic learning organization in which organizational knowledge is developed from within. Thus, while the initial training of key team members was accomplished externally, the vast majority of the Six Sigma training was accomplished internally by hospital employees who had been thoroughly indoctrinated.

Moreover, the culture of the organization has also become part of the knowledge acquisition effort; employees are excited about the new tools and their language now focuses on the improvement they can make in quality and patient care. This success is largely due to the manner in which the new knowledge was acquired by the organization and spread throughout the ranks. The knowledge building program had unequivocal support from upper management, though the financial support was minimal due to the cost reduction strategy of the organization. But, this limitation was overcome by the strategic use of career-centered inducements and CEO-provided pizza.

A different KS might be less aggressive in the development of knowledge, preferring to make use of the knowledge that naturally occurs in the organization. It might place more reliance on explicit knowledge within the firm and spend less energy worrying about their ability to apply it. Though it

might have reduced the value of the knowledge, a firm following this type of KS might have relied on external trainers to introduce the employees in the use of certain analytical tools. If the funding for external trainers was not available, they might have relied on books or documents on the intranet as a substitute for training, even though these methods have certain obvious drawbacks, especially for very complex material. Thus, knowledge would be much less widespread, the excitement generated by the increasing awareness of the importance of analysis, and the substantial improvements in patient care might have been replaced by a situation where only a few people in the organization had enough training, education, and initiative to utilize the new analysis tools and the organization would not have witnessed the change in the level of conversation regarding quality and process improvement. The manner in which the human resources, technology, and organizational structure was used to implement the business strategy was strongly influenced by the KS.

The revised model shows a different pathway for the influence of the organization, technology, and human resources on KS. Rather than directly driving the KS, these other organizational factors shape the KS as the results of decisions are digested by the organization. In other words, the KS is the result of decisions made regarding knowledge; each decision produces some change in the KS. This mechanism supports the emergent nature of many knowledge strategies.

Every organization is a system, and any interaction between the components of the system is a subsystem. The nature of these interactions is usually the passing of influence and information between them. When the management team passes directions to the human resources discipline, for instance, it passes through a number of lenses before reaching the intended recipient. As it does so, these lenses impose certain influences or policies upon these directions, such as those that shape the role of knowledge. These lenses shape the message to reflect the view of upper manage-

ment regarding the use of knowledge within the organization. When there is a clearly defined set of policies regarding a particular aspect of the operation, there will likely be only one set of lenses for the message to be passed through. However, when the set of policies is not common throughout the organization, middle level management might impose their own lenses upon the incoming messages, thus transforming them in some way and possibly changing the message's ability to support the organization's goals.

The messages sent by upper management to the functional areas result in some activity taking place, which in turn generates feedback. The feedback might be explicit in the form of reports, or implicit in the form of observation. The feedback should include some measurement of the outcome of the directive as this will form the basis for future management directives.

The second area of feedback is that of process. The evaluation of the effectiveness of any set of instructions or directives provides guidance for future decisions. It is in this aspect that we find the influence of the functional area upon KS. By recognizing the role played by knowledge in the implementation of the directive, the functional area is able to provide adjustments to the KS lens that can be used to shape future decisions. The extent to which this adjustment can take place is dependent upon three things. First, the functional area's ability to recognize the role of knowledge in the execution of the business strategy is crucial to the revision of the KS. Without this, there is no basis for any internally directed analysis based upon knowledge. Second, the number of lenses in existence will also have an effect on the degree of adjustment made, since the functional area might only recognize its own KS lens and not have any idea that others exist. Third, the degree of flexibility in the lens, a metaphor for organizational and managerial flexibility, plays a large role in determining the ability of the organization to adjust its approach to knowledge.

The KS is also changed by the business strategy in the form of adjustments made by upper management. Results from previous decisions, changes in the external environment, and the knowledge lens through which they view future business decisions will drive these adjustments. As with the functional areas, there are also limitations in place to mitigate the amount, direction, and rate of change from the business strategy side. These adjustments are driven by the characteristics of the business environment, the organization's business strategy, the manager's background and style, the degree of alignment between the existing KS and the business strategy, and the number of different lenses between the upper management and the functional area.

The system, then, consists of the KS (represented by the lens and embodying the business strategy), the functional areas of the organization, and the information and direction that pass through the lens. As these messages of guidance and feedback pass back and forth between the parties and through the lenses, they adjust the shape of these lenses such that subsequent decisions will be based upon the newly contoured lenses. The KS forms an organic element in the system. It grows and changes in the system and its environment, rather than acting as a bolted-on filtering mechanism as portrayed in much of the previously reviewed literature. Unlike the business strategy, it does not exist as a discrete entity; KS is an integral part of the relationships within the system and is often only evident as an influencer of decisions rather than as a decision in its own right.

Some important distinctions can be drawn between a KS and other organizational characteristics, such as culture, which also act to modulate internal activities. Whereas entities such as culture grow organically due, in large part, to organizational composition and environment (e.g., demographics, location, industry, etc.), a KS tends to result from decisions made by the organization's leaders and members. A more important distinction is that organizational

characteristics tend toward significant levels of inertia, in that once created they can be very difficult to change. This is evident in the difficulty many firms face in changing company culture to respond to changes in technology, market requirements, or global competition. However, a KS is, by definition, a dynamic construct. It is created as a result of decisions made during the course of doing business, and continues to evolve even as it influences subsequent decisions. Thus, organizational characteristics such as culture do not exist to further the goals of an organization and often tend to hinder more than help the flow of ideas and knowledge. A KS, on the other hand, is created and shaped by the organization to promote the productive use of knowledge toward the attainment of strategic goals. Therefore, while they might both exist in a manner such as Figure 2, only one of them is the result of a reasoned approach to knowledge flow and is expected to evolve based upon organizational decisions and their results.

A few examples from the data are in order at this point to help illustrate this concept. I start by finishing the hospital example begun earlier. Influenced by the external marketplace and the strategic objective of operating within strict cost constraints, the hospital decided to acquire certain process analysis tools to enable them to design better, more efficient processes. The KS in place with the top management team, especially the CEO who was the driving force behind the project, was to provide as much training as possible internally, to embody the knowledge within the people as widely and as thoroughly as possible, and to change the culture such that the language of quality and process improvement would become the language of the organization. Thus, the KS in place was concentrated very sharply on the human resources and organizational structure and away from technology.

Large organizations being what they are, and healthcare institutions are no exception, these initiatives were met with some resistance, much of

which centered on the acquisition of new knowledge as well as the sharing of existing knowledge (in other words, power). Thus, certain areas of the organization had their own lens through which they viewed knowledge-based decisions, and it was very different from the CEO's lens. However, through the recruiting of key people into the process, a critical mass began to emerge. This group, who had become believers in the ideas of the CEO, began to change the lens through which their portion of the organization viewed knowledge and with those changes, it moved closer to that of the CEO. Human resources also saw the benefit of these new processes and began changing their procedures for evaluation and promotion to include in their decisions the employee's knowledge activities such as training and knowledge sharing. Thus, the organizational structure and culture, as well as human resources, began to influence the organization's KS.

As the results of his decisions were observed, the CEO continued to adjust his KS by taking steps to encourage interdisciplinary knowledge sharing in an effort to remove the silos of knowledge that have formed the foundation of organizational culture in healthcare for years. The strategic directions of the hospital as well as that of the system, along with his observations of the organization, caused the CEO to adjust his approach to knowledge by taking steps to encourage the formation of a culture of continuous learning and process improvement. As it digested these initiatives, the organization continued to adjust its KS until, at present, the institution has a relatively coherent and uniform KS.

A contrasting example is found in the software firm. The KS of this organization is to depend heavily upon technology to gather and distribute knowledge, tending to avoid reliance on the tacit knowledge of individuals. This is the result of the need for many people within the organization to have access to the same customer and market-based knowledge simultaneously to maintain the pace of development as well as a protection

against knowledge loss when people leave the company in an industry known for its turnover. The KS lens is thus oriented toward technology and represents a low degree of variability within the organization's approach to knowledge.

The last revision to the original research model is the position of the knowledge management system. Originally driven directly from the KS, as per the literature, it appears that the knowledge management system is almost completely an artifact of the information technology area with guidance from the human resources and organizational structure. The technology function creates the knowledge management system in response to direction from upper management through the KS lens. The evidence from each organization in the study that has a knowledge management system suggests that very little influence comes through either human resources or the organizational structure.

The influence of the KS upon the decision to implement the knowledge management system is apparent in most of the firms that have one. The role of the KS here is to modify the manner in which the business strategy is implemented. For the bank, the financial services firm, and the software development firm, the KS includes a strong inclination to house organizational knowledge in some explicit form as opposed to allowing it to reside within the employees. Thus, it is not surprising that these are the firms that either have, or are creating, a knowledge management system. Organizations that seem to value the tacit knowledge within their employees do not have, or did not stress, a knowledge management system. These organizations, including both healthcare institutions and the insurance firm, approach knowledge as a human asset and view the use of a knowledge management system as an unnecessary tool, at best, or an impediment to the useful application of knowledge in the worst case.

ADDITIONAL DATA COLLECTION AND ANALYSIS

To further explore the analogy of the lens as the representation of knowledge strategy, additional interviews were performed. These interviews took place with different participants in different firms, although one firm in the second set of interviews was the result of the merger of one of the firms from the first round of interviews with one if its competitors. The participants were selected from a slightly different population. These interviews took place with managers from a somewhat lower organizational level. This change was made for two primary reasons. First, the exploration of the KS as lens should take place at a level where the results of the knowledge-based decisions being made are readily visible. This is not always the case when they are viewed from the top of the management chain. The second reason is so that we can explore the characteristics of this metaphor at the point of its primary impact. In other words, the interest is not only focused on what decisions are made, but also on how they are made. The interest is on both the process of decision-making as well as the product of the decision.

To obtain the proper data, participants were selected from the level of middle manager up to director. These positions have sufficient visibility on the operational level of the organization to be able to discuss the results of various decisions, but also have visibility into the strategic levels if necessary. Moreover, they are usually the people making the decisions, so data collected from them is the best way to see the KS in action. These participants come from the banking and finance, cosmetics, and electronic manufacturing industries. One other adjustment made for this second round was that all of the participants come from the information system design and implementation function in their respective companies. This was done so that their responses could be more easily compared.

The questions asked during the second round of interviews focused on the manner in which the KS manifested itself in decision-making and whether these decisions can be traced back to an identifiable aspect of the KS. The analysis of the data obtained from this second round of interviews was treated in the same manner as the first, utilizing several rounds of content analysis of the transcribed interviews to distill the applicable themes. The analysis brought forth three themes regarding the existence and usefulness of KS in these organizations.

Theme 1: Knowledge Strategy Varies Widely with Time and Circumstances

The lens metaphor tends to depict the KS as a relatively stable aspect of a firm's strategic portfolio. However, the findings of this study show it to be more flexible and, perhaps, unstable. The data shows a firm's KS to be greatly, and quickly, affected by changes in competitive environment, customer relationships, and organizational structure. In the case of the cosmetics manufacturer, the KS employed by the upper management, and consequently by the IT manager, was adjusted often and by significant amounts. A sudden negative change in the competitive landscape brought about a sudden tightening of internal knowledge passing requirements, especially having to do with project costs and processes. The reason for the sudden increase in these reporting and analysis requirements were thought to be aimed at reducing costs, but this was an inference by the manager. No directive from management was ever brought forth to explain the change in procedures and priorities.

In the same firm, decisions controlling the exchange of knowledge with outside entities were also revised. The changes were brought about by an agreement between the manufacturer and a major customer to share marketing data in the hopes that the manufacturer would be better able to meet the needs of the customer more ef-

fectively and efficiently. Though useful to the customer, it was also hoped to greatly benefit the manufacturer, however without a clear strategic plan in place for the use of these data, it is unclear whether these benefits were achieved. Changes in the way knowledge is shared with outside entities also took place during the outsourcing of certain IT tasks. External knowledge sharing, long considered a detrimental activity to the firm, had suddenly become part of the manager's daily routine, as was the extraction of knowledge from the outsourcing firm.

None of these issues are particularly noteworthy on their own. Firms make these decisions quite often and there are many more examples in the data collected. Moreover, we expect well-run firms to respond to changes in competitive environment and organizational structure. Storey and Hull (2010) and Wang and Belardo (2009) all discuss the importance of flexibility in KS to meet a changing environment. What is important to this study is that the lens used as a metaphor must be flexible to deal with changes in the firm's knowledge environment, but not so malleable as to make changes in firm processes that are detrimental to internal performance. Decisions that take place without any apparent strategic reasoning can sometimes pose more of a problem for employees because of their inability to grasp the underlying reasons for the decisions. In a knowledge-based environment such as IT system design, knowledge of the underlying reasons for changes that are being made often spell the difference between a successful, smooth course change and a chaotic period of readjustment.

Theme 2: KS can Differ within Departments, Divisions, and at Different Levels

The lens metaphor developed above suggests that the lenses in a firm should align to form a single, coherent KS. However, evidence gathered in this study points out very clearly that there are

likely to be multiple KS working simultaneously. Moreover, these simultaneous knowledge strategies are not the same and can even work against each other. At the cosmetics manufacturer, each project team within the same division was allowed to select its own way of managing internal knowledge stores, though there was some pressure from above to do something to preserve internal tacit knowledge distribution. However, the directive from upper management could hardly be called a knowledge strategy as it had no direction or goals attached to it. Thus, each department was left to its own to develop processes to retain its valuable IT development knowledge. Without a strategic direction to work with, this effort has met with mixed success, with most departments showing only cursory efforts and results.

At the financial services firm, the picture is much more complicated and with much higher stakes. The two organizations that were combined to form the current firm each had drastically different approaches to the use and management of organizational knowledge. These differences are quite apparent at the IT development function, where each project manager is, like at the cosmetics manufacturer, responsible for developing his or her own approach to knowledge retention. In this case, there is no direction from above to do this, but each manager recognizes the need to retain knowledge, though to widely varying degrees.

As the two merged companies have only begun to mix their operations, a typical IT development project is staffed with employees from only one of the two firms, depending upon which side of the house has taken the lead in the effort. In these cases, whatever KS is developed and employed on the project, though it might vary from other projects the employees have worked on, will be somewhat consistent with the overall culture of the organization. However, as the two merged firms become more closely linked, more employees are being assigned to work on projects led by former members of the other firm. This forces employees to adapt to widely varying approaches to many

aspects of their job, including the handling of knowledge and knowledge-based objects such as documentation. This has led to certain issues within these projects such as misunderstanding of requirements and loss of lessons learned.

Simultaneous or parallel knowledge strategies are not necessarily a problem. In some instances, it is beneficial for a firm to pursue knowledge differently at various levels or in different functions, especially in complex or dynamic environments (Revilla, Prieto, & Prado, 2010). However, when different strategies are employed they must be coordinated and linked to an overall business strategy. In the case of these organizations, the knowledge strategies were completely uncoordinated to the point of working against each other, and neither firm's KS showed any direct linkage to the business strategy in place at the time. In these cases, the lack of complementarity between knowledge strategies was the problem, not the existence of multiple knowledge strategies.

Theme 3: Knowledge Strategy is Largely Invisible

It is widely known that strategies can be either explicit or emergent and that sub-strategies such as manufacturing strategies and technology strategies are usually much less explicitly stated than a firm's overall business strategy. It has also been shown that knowledge strategies are almost entirely emergent in nature, with little evidence that they are ever codified to any extent (Kasten, 2006). Hopefully, as the usefulness of knowledge strategies becomes more apparent, we can expect some solidifying of knowledge strategies in the future. However, the data collected for this study shows that, in many cases, the process of strategically considering knowledge activities has hardly begun.

The firms analyzed for this study probably had some manner of knowledge strategy, in some cases many knowledge strategies, in place, though evidence of this is sometimes scarce. While these

strategies performed as mechanisms to modulate business decisions, there was no evidence that any of the participants knew they were there. In other words, the lens only represented a local KS. Whether or not a firm-wide knowledge strategy actually exists is largely immaterial as none of the participants interviewed was aware of it. Current research has demonstrated the value of a knowledge strategy that is aligned with the firm's business strategy (Revilla & Rodriguez, 2010), but this alignment does not benefit the firm without some form of communication, even a very informal one, that communicates the knowledge strategy in place to the rest of the employees. The inability of upper management to communicate an existing knowledge strategy might be worse than having none at all if the actions of the employees are in conflict with a KS that forms part of a competitive posture.

CONCLUSION

Previous studies have shown the KS to be emergent, implicit, and a moving target (Kasten, 2006). Because of its nature, it will necessarily take different forms in different organizations and industries. This paper has taken the first step to document these variations. By portraying the KS as a lens that modulates the decisions and information passing through various parts of the organization, it provides a different framework through which other researcher can begin to better characterize the impact the KS has on the organization as well as the organization's impact on the KS.

The research was extended with a second round of interviews that were performed with the lens metaphor as a research focus. The findings indicate a fledgling understanding of KS in many organizations, as well as a much more complicated view of KS within many firms. To add to the list of KS characteristics already noted, the KS might be multi-leveled, divergent between various levels and parts of the organization, or totally invisible.

Each of these issues poses certain challenges to those trying to obtain the benefits of a KS.

This study represents just the first steps in a research program that is aimed at gaining an understanding of how the KS shapes decisions and the results of those decisions. As an exploratory study, it has significant limitations in its ability to provide generalized conclusions, but the purpose of the study is more to provide a framework for the study of organizational issues surrounding KS. These might include analyses of the role KS plays in modifying internal interpersonal influences and technology choices.

Chapter 10
Assigning People as Number One Priority:
Engaging With Disadvantaged Communities in Healthcare Research

Walid El Ansari
University of Gloucestershire, UK

ABSTRACT

Notions of the "expert patient," user choices about where care is provided and by whom, and enhanced understanding between patients and healthcare workers for continuity of care all have implications for workforce planning and human resources. Modern health systems and care require a range of patient and community inputs if they are to be relevant for their users. However, partnering with disadvantaged communities for such purposes is not an easy undertaking. Such partnership efforts need to be premised on a participatory approach and face multiple challenges. Given the range of the stakeholders involved, the sharing of turf, risks, and resources that are usually part of such efforts requires careful consideration of all the partners. Further, there is always the possible exhaustion of the communities from being repeatedly over-researched, as well as the frequently encountered initial lack of trust between partners-to-be who have not previously collaborated. In such circumstances, the sharing of assets and a focus on enhancing the mutual capacities for a common purpose needs to be spelled out clearly from the start. Notwithstanding these and other challenges, over the past decade partnerships have become a frequent requirement for government and funding agency assistance. Research partnerships that incorporate community assets and values are among the defining approaches to social problem solving, where partnering has become the fundamental and strategic component of efforts aimed at promoting community health.

INTRODUCTION: PARTNERSHIPS AND THE RELEVANCE FOR HEALTH CARE

Patients, clients or individuals are now assigned the number one priority for health systems and healthcare human resources planning (Hartzband & Groopman, 2009; Kobberdahl & Porter 2009). A prerequisite for such importance is that the views of patients will need to be heard and considered by healthcare practitioners, administrators, and policymakers. Indeed within the healthcare sector, recent decades have witnessed several features that have had a direct impact on confirming that people/patients are valued as the main and essential constituents of effective health systems. One aspect is that, with the move to patient-centered care delivery, patient engagement and patient education and the "expert patient" (where patients participate and are involved in their traditional "formal" care) has now become the centre-stage of health and social care systems. Such patient involvement comprises many activities, ranging from their involvement in individual treatment decisions and regimes, through patient consultation to the collective lobbying of organisations to influence health policy decisions (Andersson & El Ansari, 2008; Andersson, Tritter, & Wilson 2006). The aim is patient engagement and patient-focused interventions (Coulter, 2006; Coulter & Ellins, 2006). But health has traditionally been an expert-dominated field, and hence patient involvement has been a controversial development that has been resisted by some professionals (Shaw & Baker, 2004). Successful patient involvement builds on increased health literacy. Thus, interventions to build the capacity and health literacy of user groups are of growing importance (Kickbusch, 2001) and information is vital to make choice meaningful (Godolphin, Towle, & McKendry, 2001). Indeed health systems will need to provide a great deal of information to users of these health services. In health care, efficient information management is fundamentally critical to assure high quality and cost-effective patient care (Jaspers et al., 2000). All these features present challenges to healthcare systems and to the traditional role of healthcare professionals.

A second aspect is the significant growth in choices about where care is provided and by whom: the provision of non-traditional care by non-traditional practitioners (e.g. using a variety of complementary therapies), and a range of community care services (Mavundla, Toth, & Mphelane, 2009; Zavradashvili et al., 2009) This has implications for health information, human resources and workforce planning, where informed patients provide inputs into decisions that are mutually agreed upon between them and their practitioners. A third challenge is the aging population, with the corresponding increase in chronic diseases, long-term conditions, and various extents of a range of disabilities. In such situations, the patient is not a transient client but one whose self-management skills are critical. Thus patient knowledge and information about the condition(s) is vital and patient-professional understanding for care continuity is critical (Greenhalgh, 2009; Griffiths, Foster, Ramsay, Eldridge, & Taylor, 2007).

All these challenges and demands have manpower and workforce implications. On the one hand, there is a definite increased need for well-educated medical and health informatics specialists (Jaspers et al., 2000). This requires proactive initiatives to train graduates in information and communications technologies that are increasingly needed in the healthcare field (Jaspers et al., 2000). National health care systems are increasingly required to deal with global problems and solutions (Ball, Garets, & Handler, 2003; Hasman, Safran, & Takeda, 2003). An "information inequity" has also been suggested, where those with the most severe health problems are often those with the weakest health information systems (Stansfield, 2007). In developing countries, the problems of health information are exacerbated due to: the absence of standards and identifiers; medical

records that are largely irretrievable; data that are often not aggregated and analyzed; the existence of a profusion of indicators for each disease; and health information system investments that are donor- driven, rather than system-building (Stansfield, 2007).

Tailored care is premised on the importance of the individual (patient) voice for treatment and concordance with regimes. What follows is that strategic and health information management and medical/health informatics will require partnerships in order to provide the impetus for the increasing sophistication of health care and health systems (Jaspers et al., 2000). There is little doubt that collaborative efforts in health and social care are essential (Social Exclusion Unit, 1998) if targets are to be reached (Statham, 2000). It is now also evident that health and healthcare problems are rarely a result of one single isolated factor, but rather a consequence of multi-factorial etiologies. Hence no one agency, ministry, or player can remedy such problems. As the well-being of people has multiple environmental, cultural, economic, and social contexts, the solutions for better health are all joined, interweaved, and interlaced together. This requires that all stakeholders (including the patients) need to work together in a coordinated manner (El Ansari, 2008). However, generally in health and health care, many of the voices of patients and people that are aired and heard are channelled through service or research collaborative conduits between academics, health service personnel, and lay people and patients (Erwin, Blumenthal, Chapel, & Allwood, 2004; Maurana, Goldenberg, & Hathaway, 2000).

For today's healthcare and social systems, the examples of the variety of challenges that could benefit from collaborative-initiatives are plentiful. They range from disease prevention to health promotion and from health education and disease management to social issues. These include: immunization; HIV/AIDS; teen pregnancy; violence in communities; intimate partner violence; street gangs; Healthy Cities; drug or alcohol abuse (Hallfors, Cho, Livert, & Kadushin, 2002; Mansergh, Rohrbach, Montgomery, Pentz, & Johnson, 1996); physical inactivity; and positive youth development (Kegler & Wyatt, 2003). They also include obesity and weight management; community-based and community-sensitive interprofessional health professional education; child injury prevention; infectious diseases (El Ansari, 2006); and promoting maternal health, amongst others. Partnerships are also common vehicles for addressing health and social disparities (Wynn et al., 2006), and are generally employed for community health improvement (Shortell et al., 2002). As healthcare systems worldwide struggle with the increasing demands for limited healthcare resources, the call for alliances, collaboration, and partnerships can be heard (Popay & Williams, 1998).

Research Partnerships

The consequence of such a state of affairs is that engaging in a collaborative manner with the patients and communities that we serve is a critical pre-requisite for any joint initiative that involves these people. A common channel for such activities is in the form of collaborative research partnerships. A research partnership is defined as a "community-centred" (Singer, 1993) participatory approach to research that equitably involves community members, agency representatives, and researchers (Israel, Schulz, Parker & Becker, 1998). Such partnerships aim to enhance the evidence base for practice; however, many overlapping difficulties underpin these efforts (Israel, Schurman, & Hugentobler, 1992). For instance, one needs to be aware of the value systems of the partners (Richards, 1996). Similarly, the foreseen costs and the expected benefits that could accrue to the stakeholders from such partnership arrangements need thorough consideration. The multi-directional empowerment processes (McMillan, Florin, Stevenson, Kerman, & Mitchell, 1995) and the capacity transfers between all the

players involved in a partnership necessitate reflection and deliberation. In addition, the interlacing relationships of the partners, the ensuing rules and procedures, the roles of the collaborators and stakeholders, as well as leadership issues (Alexander, Zakocs, Earp, & French, 2006; Jooste, 2004) require a good deal of awareness of the intricacies of working partnerships. Multidisciplinary, ethical research that is of relevance to the participating patients and communities needs to be designed in a consultative manner where all partners are genuinely involved in the "ground floor" of the initiative. The effort must be agreed upon to the satisfaction of all the partners, successfully implemented in an empowering manner, and the processes and the outcomes widely disseminated at relevant forums.

What emerges is that it is critical, in order to achieve a synergistic effect of the partnership (Weiss, Anderson, & Lasker, 2002), that these factors and others need to be in place (Zakocs & Edwards, 2006). Not surprisingly, the whole system approach to health has encouraged working in partnerships (Department of Health, 2000a), and particularly in the healthcare sector "Partnership in Action" has been promoted by government health policies (Department of Health, 2000b). Similarly, successful partnerships between indigenous communities and researchers have become increasingly important (Barnes, 2000). Understandably, such initiatives come with a set of challenges (Gil de Gibaja, 2001).

This chapter outlines the building of research partnerships between academic researchers and participating communities with regard to issues of manpower and workforce planning. It describes collaboration in research with five different, previously disadvantaged communities in South Africa (SA). The research was undertaken soon after SA's first democratic elections; where collaboration, consultation and equal status, voices and inputs were all new concepts for everyone involved in the initiative.

The chapter begins with an introduction that highlights partnerships and the relevance for health care. It then considers some of the issues that need attention when researchers partner with patients and with communities. It moves on to describe a multi-site partnership initiative in South Africa that was funded by the Kellogg Foundation, and provides a conceptual model to guide partnerships between researchers and patients. It then details the challenges that were encountered in the planning and implementation of a research partnership between the author and these partnership initiatives. It provides ideas and examples of how such a research partnership can be undertaken. It also draws on the author's real life experience in living and working with rather isolated communities in five provinces in South Africa for some years. Finally it highlights, by way of a reflective discussion, the many issues as to how such research partnerships need to privilege the people's voices, be respectful of local traditions, and be culturally safe.

RESEARCHING WITH PATIENTS AND WITH COMMUNITIES

Partnering with patients and with communities is an increasingly important strategy for successful public health research, despite the fact that partnerships between lay people/ patients and researchers are difficult (Klein, Williams, & Witbrodt, 1999). Nevertheless, health practitioners and community activists appreciate the value of working with communities (El Ansari & Phillips, 2001) and the virtues of patient engagement. As a result, a range of research partnerships and partnership models have come to the fore. These include participatory action research (Klein et al., 1999), collaborative community research consortia (Sanstad, Stall, Goldstein, Everett, & Brousseau, 1999), partnering with youth in collaborative research (Harper & Carver, 1999), or research-focused joint efforts between academic researchers and lay people (El

Ansari, Phillips, & Zwi, 2002). Collectively, these efforts challenge social, structural, and physical environmental inequities by the active involvement of community members, organisational representatives, and researchers in all aspects of the research process. There are well-defined sets of challenges that face such efforts.

For research partnerships between academics and communities, the community is, factually, where research, prevention, and intervention take place (MacQueen et al., 2001). However, it is often in these same communities that, regrettably, resistance to research is stumbled upon in terms of suspiciousness, conflict, or unfriendliness. These feelings, in themselves, do not represent a great starting point for a budding partnership initiative, where the aim is to increase grassroots empowerment, promote civic engagement, enhance diversity, intensify advocacy, and augment change (Wolff, 2001). In SA such feelings were complicated by a history that was characterised by separation politics and by variations of interpretation. Previous strategies, segregation practices, and separate racial development resulted in incongruent provision of resources, facilities, education, and jobs. Such historical geographical, social, and political separations generated consequences in relation to the partnership efforts for development and health in SA. Nevertheless, underprivileged communities and lay people are often willing to make sacrifices to become involved in such collaborative activities (El Ansari & Phillips, 2004).

PARTNERSHIPS IN SOUTH AFRICA

The focus of this section is the Partnerships in Health Professions Education (HPE) initiatives in SA. In the 1990s, seven partnerships were initiated in various provinces of SA, as joint initiatives between the local/ regional health service providers, the academic training institutions, and the local communities. The W.K. Kellogg Foundation supported these partnerships as collaborative efforts

to influence health professionals' education to be more community-sensitive. They involved university-community; university-local health system; and local health system-community relationships. The participating partners jointly determined the priority issues and planned the educational bases for HPE (El Ansari, 2002). For a sense of equality, each partnership's steering committee comprised 25% health services, 25% academic institutions, and 50% community members. However, there was one critical snag.

At that time of SA's history, there were no local models to draw upon. The partnerships needed guidance in implementing their activities and programmes, and support in the evaluation of their functioning and performance in order to gain insight into their shortcomings and successes. Incidentally, at the same time, in another continent, the author was focussing his doctoral work to develop appropriate methodologies for researching and evaluating partnerships in disadvantaged settings.

The lay people's aspiration to assess the partnerships, review their collaborative efforts, and enhance their expertise in evaluating their joint enterprise was met with the author's desire for partnerships that could keenly engage with the evaluation work. This was the basis for the exchanges upon which a reciprocal collaboration would later be premised. The partnerships and the author went through a year's regular communication. During this time most of the issues both to the partnerships and the author had come out in the open for debate, clarifications, and where possible, consensus. Hence, the prospect of a research partnership based on equal input from the lay citizens and the author was commencing to materialize. Together the partnerships and the author worked, in a steady and incremental approach, on mutual concerns in order to spell out, resolve, and consent upon the rules of engagement. Many issues surfaced. and were interlaced and provide empirical guidance for conducting the

various activities when researchers engage in collaborative work with their respective communities.

A CONCEPTUAL MODEL

The intrinsic and extrinsic groups of factors that are vital to a successful research partnership are illustrated in Figure 1. The figure depicts that effective partnership functioning builds on many interacting pillars. The multiple features address personnel factors and barriers; organisational factors and barriers; human and personal traits; power-related factors; time factors; and outcomes. Given that the variables are intricately interlaced, this makes the various factors difficult to isolate,

and when evaluations are commissioned difficult to attribute what has led to the effectiveness of a partnership. The multiple features highlighted in the figure collectively enable partnerships to fulfill their common objectives.

A very important point to note is that the factors illustrated in the model are generic, interacting, and flexible. Indeed they are! There is definitely no single blue print for partnerships, and it would not be desirable (and perhaps even counterproductive) to have fixed blue prints as that could hinder creativity, innovation, originality, and inspiration which are the salient aspects that characterize working partnerships. Rather what is available from the published literature is a range of factors, a variety of pre-requisites, an array of

features, an assortment of principles and attributes, a pool of elements, a collection of characteristics, and a mixture of qualities that collectively work together in an intricate manner to generate an effective partnership. Unsurprisingly, partnerships have been set up in different continents and countries, with different stakeholders and diverse partners, with different aims, goals, and objectives, and with very different outcomes, but one feature always remains the same. That is the challenges that face such partnerships are usually always identical regardless of country, stakeholders, aims, or outcomes. This is because many more of the challenges that face partnerships are generated by the simple fact of people from different agencies and organizations and with different values and traditions working together. Conversely, far fewer of the challenges that face partnerships are attributed to what the partners are actually trying to accomplish and achieve. The implication is that while establishing a working partnership is a science with a growing evidence base, it is also as much an ''art'' in that it requires imagination, foresight, and experimentation. This highlights the importance of simultaneously understanding the ''processes'' of partnerships rather than focusing solely on outcomes (Granner & Sharpe, 2004), and acknowledging the complexities of such a way of working (Grice, 2001; Mitchell & Shortell, 2000; Mizrahi & Rosenthal, 2001).

THE CHALLENGES OF RESEARCH PARTNERSHIP

Tensions

An early challenge was that service-oriented community agencies and organisations might perceive evaluative research as insensitive, irrelevant, or a threat to privacy, staff, or programme funding (Goede & El Ansari, 2003; Klein et al., 1999). Researchers need to be mindful that collaboration between service providers and researchers

is difficult (Butterfoss & Kegler 2002), that the cultures of the service and research worlds might be conflicting, and that community–campus unions require a good deal of ground work (Cavanaugh & Cheney, 2002). Hence, the investment of time and effort in establishing and maintaining contact, and building rapport and trust is important, even before potential partners actually meet each other in person for the first time. A researcher needs to clarify, that as an external researcher, he or she poses minimal or no threat to the partnership. Similarly, researchers need to frequently try to identify and abolish any social or cultural distances between themselves and the participating lay people. Thus, collectively both parties have to define the terms of their engagement in research; to come to consensus when their visions differ; to maintain respectful attitudes all through the effort; to build sustainable relationships with each other (Polivka, Dresbach, Heimlich, & Elliott, 2001); to create work groups that would contribute to the various components of the research work; and to negotiate collaborative ownership and leadership (TurningPoint, 2001). All these mean receiving advice and input from all partners and avoiding duplications. In doing so, the author had to consider a range of multi-stakeholder perspectives and viewpoints: the academic medical and nursing training institutions; a range of national, provincial, municipal, and local health service providers; a variety of other volunteer and statuary agencies and non governmental organisations; and the beneficiary lay communities and civic groups. In the case of these South African partnerships, it was clear that the research purpose was to provide information that could facilitate positive changes, rather than to verify accomplished outcomes against initially stated objectives. The intent and goal of the partnering was to improve, not to prove. Generally in partnerships, such tensions as described above can be decreased when researchers, people, stakeholders and patients feel that they have collective ownership for their partnership.

Collective Ownership

In partnerships, a collective sense of ownership is critical. It is necessary to decrease both the marginalization of other forms of peoples' knowledge and the distance between the university and the community (El Ansari et al., 2002). It is moving away from a "them and us" mentality (Pietroni & Chase, 1993). Hence researchers need to seek to involve the lay people and patients in co-responsibility from the ground floor formation of their partnership. A collective ownership is crucial to gain the benefits of the participatory approach in public health research. During the year prior to the study, the author consulted the partnerships for their views of the research aims, questions, and the potential roles of each partner. The community's views and research agenda were critical if a longer-term mutual commitment was to be achieved. Researchers also need to be attentive to joint ownership of decisions, and when the community is engaged at the partnership's inception, ownership is incrementally developed. Partnership success depends on co-ownership and co-responsibility. Individuals are sceptical about whether being equal partners can become a reality of shared ownership. Thus early in the field at each partnership, it is essential to develop jointly agreed research norms and fair division of labour that promote sensitivity and respect. Moreover, for constituencies to feel that they have a collective ownership for their partnership, the visions of all the involved parties need to be congruent and to be included in the planning and implementation of the partnership, and the power bases of the parties (the author/researcher, the "professional" partners who are involved in the partnership and the lay people) need to not be disparate.

Vision and Power

Congruency between the communities' and the researcher's own agendas needed to be struck. In order to achieve this both parties had to explicitly recognise that there are power imbalances between the professionals and the underprivileged groups with whom they work. It is important that secular knowledge is taken seriously. Power embraces the knowledge gained to influence resources and policies (knowledge power); competencies in utilizing data and information (information power, the "know what"); capacities of the stakeholders (technical power, the "know how"); and access to resources and funds (economic power) (El Ansari et al., 2002). Very early in the process, the author aimed to prevent (and deal with) any suspicion, caucus meetings, or possible mistrusts (El Ansari & Phillips, 2001). In doing so researchers need to recognise the fact that it is the recipient and the patient, rather than the provider, that is the central figure. Hence control need not be in the professionals' hands. Consequently, it is critical to hold early and lengthy negotiations for optimal congruency between the research topic and the community needs. Together lay people and researchers should undertake multiple refinements of the research objectives. Together they need to decide whether the research purpose will focus on operational, day to day programmatic features (important to lay community) or on policy questions seeking answers across multiple funded sites (appealing to donors). The idea is to display flexible negotiations of both the scientific and community priorities as well as the utility of this collaborative research evaluation. To ensure the partners' visions and an equalised power base, the partners' value systems and their unique ways of "doing business" need to be considered.

Value Systems

The diversity and multiplicity of stakeholders are likely to generate different value systems, philosophies, assumptions, and beliefs about research that require a value-based conceptualisation (Buchanan, 1996). When the researcher is accustomed to designs based on principles of scientific practice, partnerships with lay patients

require a change to including and integrating local community values (Allison, 1996). This sharing of mutual values and aims with a broad-based and diverse membership is a critical task. The vocabulary that is employed between researchers and service providers needs to facilitate dialogue, communication, responsibilities, and action plans (Binson, Harper, Grinstad, & Sanstad, 1997). The partners' value systems also determine what costs are acceptable to them and what benefits would be appreciated, based on stakeholders' preferences and priorities. Hence, it is necessary for a researcher to engage in multiple exchanges and refinements of mutual ideas until the purpose of the work is agreed, and until the steering groups of the participating partnerships consent to the research. Collectively both parties work together so that the research questions are of interest and of relevance to the stakeholders, and gradually, a feeling of co-ownership of the research needs to emerge, especially when there was no previous direct interaction prior to the research.

Hence, in order to better appreciate the culture, the author spent several months at each of the five South African partnerships, where with the engagement of the lay people, the author began to collect the agreed data. A researcher's interactions with the community are made possible by a deeper comprehension of their settings, contexts, and values. By sharing their cultural festivities, visions, social occasions and gatherings, successes and special events, the distance between the author and the lay community would get thinner. Hence all along, the author was careful of any professional domination or community fears that would represent barriers to a joint ownership. It is indeed true that peoples' power together with professional authority can maximise the impact of collaboration (Harper & Carver, 1999). Furthermore, the values of each partner (whether researcher, practitioner or patient) will ultimately influence each stakeholder's perceptions of the costs that each incurs in their partnership and the benefits that accrue from their involvement.

Costs and Benefits

The costs and benefits of research collaboration to both the researcher and the lay people have to be assessed from the beginning (El Ansari & Phillips, 2004). The partnerships' participation would provide the researcher access to their constituencies and agencies, help in data collection (and basic analysis), and when feasible would provide transportation across their multiple programmes that were dispersed in various localities. These represent costs for the community. In return, within each partnership, the author trained some lay members on data collection and some fundamental data scrutiny, held talks and debates on partnership-working and the challenges associated with it, shared some of the published literature, and disseminated examples of lessons learnt from the other partnerships that the author was also researching. Moreover as the research progressed, the author fed back the research's provisional findings to the partnerships in order to enhance their policies and practices. These represent benefits to the community. Such participatory actions contribute to transferring research skills to the partnerships' lay people regarding data collection and analysis techniques, computer software applications, and other research challenges (benefits to the community). These collaborative contributions to empowering a local expertise base would, in turn, enhance the research capacity of the collaborative effort after the researcher leaves the projects.

In connection with real expenditure, there were no monetary costs to the partnerships in terms of evaluation charges, as the author had previously secured some moderate research funding from the U.K. (no real costs to the community). In order to realistically evaluate the multiple aspects of the partnerships, the author spent considerable time with the partnerships to collect the data, enter it into the computer, analyse it, and write up the findings (costs for the researcher). In return the author wrote his doctoral thesis based

on the work, and would disseminate the results (benefits to the researcher and the community). In summary, researchers have to think about the time taken from other obligations for the partnerships to participate in the research. This and other issues required support from the partnerships' leadership, an appreciation of the joint working effort, and a recognition of the potential skills that could accrue to the partnerships without pressure for additional commitment. Researchers also need to think about both the influence of the partnerships' staff turn over and the instabilities in community organization on the evaluation, as well as the impact of limited funding of some of the partnerships' programmes for the whole research endeavour. A common cost that deters people from involvement in a partnership is the potential of an unpleasant feeling that the partnership is not actually playing a role in effectively narrowing any gaps between the professionals and the lay people in the community. Conversely when such gaps are being narrowed or abolished altogether, this represents a definite benefit and incentive for further committed participation from the patients and lay people.

Narrowing the Gap

Bridging any existing cultural (and social) gaps between the community and the researcher is another factor (Vega, 1992). When working with communities, researchers need to reflect about where best they should be physically stationed during the execution of the research. When the author stayed, lived, and worked within the community neighbourhood, he observed and learnt more about the issues and contexts than would have been possible if he was stationed elsewhere (e.g., on the university grounds, or in a health service department). Hence, researchers need to be geared up to move away from their "ivory towers" in order to learn more about the patients and people they are working with. This has the added advantage of emphasizing the even-handed

relationships between all as equal research partners, hence allaying any sense of professional domination. Through interactions and dealings in the community the researcher creates connections and nurtures the budding relationships. An inter-dependence is being created where the researcher's knowledge and research base are being amalgamated with the community's insights and understandings. Through recurring exchanges both parties, as partners, collectively narrow the gap, with no command from the professional or worry from the lay people. This is important for community and patient engagement.

This process of purposely living among the people in the localities that were participating in the research may not always be an easy one. Some areas had no running water or electricity, while others were risky, given the prevalence of weapons and violence in SA. Still it was the most direct way to truly understand what these people were actually concerned about, and what their collective inspirations were. Given the literacy rates in SA at that time, and in order to narrow the gap, it was also important that we collectively consider what the written, verbal, or other means of dissemination will be and when they will be released; as well as the nature of any interim analysis of the data that would be undertaken and the advice that would be provided while in the field. However, for any established gaps to be narrowed or abolished, empowerment and capacity transfer act as the "equalising conduit."

Empowerment and Capacity Transfer

A common misconception is that empowerment and capacity transfer is something that flows, in a unidirectional manner, usually from the researcher to the community. This is very untrue. In genuine partnership efforts, it is not only the community capacity that is developed, but rather a co-learning and empowering process that is initiated and maintained that facilitates the reciprocal transfer of knowledge, skills, capacities, and power to

all partners (Nyden & Wiewel, 1992). In many instances academics have over-valued their own talents and abilities and conversely, communities and oppressed groups have underrated their skills in a range of areas. Empowerment is a two-way process, where thinking, behaving, capacity building, co-learning, communicating, facilitating, innovating, experimenting, as well as the transferring of expertise, is reciprocal in order to achieve healthy and just communities and public systems. It is a flow that goes recursively back and forth in order that lay participants and patients do not perceive research as an elite university "business" that happens "over there" and is undertaken by "those people." In the same way that university researchers need to find supporting ways to empower and encourage potential community scholars to engage in creative, problem-solving community research, community members similarly need to transfer their long-earned lay familiarities in community organising, reaching target communities, and working with community groups to academic researchers. It is indeed a responsible and innovative dyadic process with the duty of problem-solving and strengthening the research abilities of all the partners. Hence, both the researcher and the community have to judge the language and technical jargon that is used between the stakeholders. Similarly, besides the journals and other academic outlets, there needs to be a debate about the use of local meetings and opportunities that use non-technical language in order to communicate the findings.

In the research partnership with the South African communities, the author and the local people collectively employed and expanded a repertoire of multi-disciplinary, pluralistic methods to examine problems that were of concern to them. This included aspects of naturalistic inquiry (interviews) that are appropriate in providing in-depth information and context, as well as processes and outcomes to the providers and the communities. In addition, both parties also utilised a quantitative approach (survey) in order to capture and gain

an understanding of the many facts on the range of facets of their partnerships. As partners, they used pluralistic evaluation that employs evidence from many sources, using different methods to generate conclusions concerning outcomes (Billings, 2000). But using several methods at several sites to bear on a research question is not an easy process. On the one hand, such cluster research is useful in the aggregation of data to find commonalties and/or contrasts. On the other hand, how quality assurance mechanisms would be implemented, monitored, and maintained, especially in multi-site research consumed a good deal of the partners' deliberations and time. The difficulties are also further augmented when a community comprises several competing factions, or diverse voluntary, civic agencies and non-governmental organisations. Nevertheless, engaging the multiple viewpoints increases the political feasibility of the research. Hence, it is critical that researchers be attentive in maintaining equality and neutrality all the time while preserving honesty, integrity, trustworthiness, empathy, compassion, confidentiality, respect, responsibility, critical self-appraisal, and commitment. Thus, a high degree of ethical awareness is truly essential when engaging with communities.

REFLECTIVE DISCUSSION

Partnerships are a critical component in setting up collaborative agreements to accomplish improved outcomes. Partnerships are required now more than ever (Wolff, 2001), particularly in the present times of critical economic turbulence, where sustained economic hardship has led to poorer physical, psychological, and cognitive functioning (Lynch, Kaplan, & Shema, 1997). Public health and public health informatics offer precious and timely individual health information systematized in an array of information systems. It needs to be noted that partnerships for health and health informatics are not only for the function of acting

as a storehouse of valuable health information, but also for bringing about and achieving improved individual patient and population health. This can truly happen when the voices and opinions of individuals/patients and people is assigned as the top priority.

Besides the challenges inherent in the collaborative approach, particularly partnerships that aim to strengthen human resources for public health informatics pose separate challenges. These include the appropriate use of information technologies; the cultural, social and political impediments; the evaluation metrics for public health information systems; the standards for data exchange; and the education and training of public health informaticians and researchers (Detmer, 2007). This is further complicated by the wide variety of informatics domains: applied clinical informatics; clinical research informatics; public health/population informatics; translational bioinformatics; nursing informatics; and public policy informatics (Detmer, 2007). All these highlight the need to create a skilled informatics workforce by way of partnerships and pairing of universities and actual implementation sites. Such an "informatics" workforce would include physicians; nurses; pharmacists; computer, information, and behavioral scientists; biomedical engineers; academic researchers; educators; information technology managers; and related corporate partners (Detmer, 2007). Hence, partnerships are inevitably required between many stakeholders. These might also include health ministries (district, regional, and national); researchers and evaluators; legislators and policy analysts; NGOs and consumer organizations; advocacy groups; communities and patients; journalists; private sector health providers and insurers; and donors and international agencies (Stansfield, 2007). Such partnerships will need to meet many challenges in order to leverage private sector expertise; identify standards for the core information architecture; capture distributed innovation for information technology tools; evaluate and docu-

ment that information technology speeds access and improves quality of care; enhance web-based dissemination of micro-data; build capacity for data analysis; reward transparency and accountability; and deliver evidence that access to better information does mean better decisions and better health (Stansfield, 2007).

CONCLUSION

When public health, hospitals, and health care agencies and patients work together in a collaborative mode, the process is a complex one. Partnerships to evaluate complex interventions is a challenging process, given the range of concerns, the contingencies of programme content and delivery, and the multiplicity of outcomes (El Ansari & Phillips, 2001; Klein et al., 1999). This chapter has detailed the development of healthcare research partnerships to promote and privilege the voice of the patients and lay people from the perspective of processes, dealings, and day-to-day difficulties. It has teased out many concepts related to ideas and practical activities that require attention from researchers and lay members who take on research partnerships. The author has sought to highlight and exemplify the concepts underlying some challenges of collaborative research based on the author's SA experience, and to suggest ways of preventing similar pitfalls.

Researchers need to have a strong understanding of the community's, the problems' and the localities' culture, history, tradition, context, and setting. For instance, it was difficult to collect the demographic (ethnic) data required for any inquiry in the very highly politicised atmosphere of the immediate post-election South Africa. Hence, data collection about ethnicity was difficult and had a low response rate. The sample's ethnic profile was useful, but SA was emerging from a deeply entrenched ethnic segregation, hence the author learned that sensitivity to cultural community issues and non-verbal clues is as important. Researchers will need to

frequently ask themselves: is it ethical and feasible to collect the data that they are collecting? In addition, research and evaluation are time consuming businesses; researchers need to minimally disrupt any of the community's normal functions during the research process. They need to quickly learn to blend in with the partnerships' activities. Data is best collected amidst daily activities, e.g., after partnership meetings, where many members are present and available. Transport to the multiple sites that are being researched will also frequently be a difficult task. Hence the author capitalised on visits that were already scheduled to the projects, where he could go along to collect the data. Thus, a good deal of flexibility is required as schedules change, people change, and priorities change. Similarly, a good deal of self-control is required when our own schedules as researchers suffer as the immediate consequence of such changes.

A major lesson is that partnering requires patience and flexibility among partners who, despite their common research agenda, differ in other ways. Within this realm, researchers need to learn that letting go of egos and agendas must be worked out on a regular basis. Lay involvement in evaluation of programmes is also important. In order to gain community trust, communication, truth telling, transparency (not concealing information), accountability, reliability, and reciprocity are all required. Researchers should not miss the opportunity to learn from the communities and people as to what might serve them best and what approaches to research can produce the most useful information in the least intrusive ways. Partnering and community engagement in research is about identifying and meeting the challenges. It is about creating innovative strategies. It is about negotiations and deliberations for a collective purpose and mutual benefit. Most importantly it is about co-learning with an open and receptive heart. Collaborative research connections offer one real model of how to move away from the real division between research and service toward the ideal partnership between these two worlds.

Chapter 11
Human Resource Development and Technology Integration

Jia Wang
Texas A&M University, USA

ABSTRACT

In the information age, technology is rapidly becoming an integral part of organizational life. Ever increasing technology applications have significantly reshaped the day-to-day practices of human resource development (HRD). This chapter explores the role of technology in HRD. Specifically, it addresses three issues. First, it identifies the challenges that technology has brought to HRD in the twenty-first century. Second, it analyzes the impact of technology on HRD practices with a focus on emerging HRD practices in virtual environments. Third, it provides insights into the future of virtual HRD in training and development, organizational development, and career development.

INTRODUCTION

Modern-day organizations are facing a number of challenges: intensified globalization, increased market competition, changing workforce demographics, rapidly changing technology and e-business, just to name a few. Of these, technology has perhaps made the most profound impact on organizational practices. Take a moment and reflect on the following questions: How many work-related emails do you receive on average, every day? How often do you receive electronic invitations to meetings, social events, free Webinars or professional development workshops? What types of automated reminders do you set up to remind you of an approaching deadline for a project or mandatory online training? Do any of your work meetings occur on social networking sites (e.g., Facebook™, LinkedIn™, Twitter) or in virtual worlds (e.g., SecondLife™ or ActiveWorlds™)? When was the last time you used Skype to communicate with a colleague or business partner in another part of the country or world? Did you turn to Blog, Wiki, online discussion forums or chat rooms to exchange knowledge? How many times did you use the Internet to search for new information? Does your company use the Intranet

and/or Listserv for internal communication or social networking sites for recruitment, sales and marketing, operations management, and customer support? What's your reaction to these questions? Are you surprised or perhaps even overwhelmed? As Carroll and Wager (2010) so aptly summarized, "technology has further revolutionized the ways in which many companies do business, forcing a paradigm shift for management that has resulted in new and innovative approaches to carrying out business with customers, employees and other stakeholders."

For the field of human resource development (HRD)—whose primary goal is to improve organizational effectiveness by developing individual knowledge, skills, and expertise—technology has significant implications. Not only has it provided exciting opportunities for HRD, it also presents difficult challenges for HRD professionals in promoting individual and organizational learning and performance improvement (Benson, Johnson, & Kuchinke, 2002). For example, almost a decade ago, Hronec (1993) projected that the role of information, in driving and evaluating initiatives related to HRD, is more significant than ever before. As a result, the successful application of HRD interventions and tools has become increasingly dependent upon the use of technology.

Despite wide recognition of the importance of technology to organizations, there has been little systematic research on its impact on HRD practices. As Bennett (2009) noted, "how important new technologies have been to HRD is an open question" (pp. 362-363). Furthermore, discussions about technology in HRD, while not devoid in the field, have not been adequately emphasized. Consequently, how organizations integrate technology into their work processes remains unclear. To fill these gaps, this chapter explores the role of technology (primarily Internet and Web-based) on the practice of HRD. Specifically, it addresses three issues. First, it identifies the challenges which technology has brought to HRD in the twenty-first century. Second, it analyzes the impact of tech-

nology on HRD with a special focus on emerging HRD practices in virtual environments. Third, it provides insights into the future of virtual HRD.

BACKGROUND

Current literature on the role of technology in the field of HRD (e.g., Benson et al., 2002; Githens, Dirani, Gitonga, & Teng, 2008) suggests that it is increasingly becoming a critical component of not only the day-to-day practice of HRD, but the effective completion of organizational tasks. The increasing emphasis on knowledge creation and technology application in HRD has led to the burgeoning concept of virtual HRD (VHRD). What follows is a discussion of the notion of technology in organizations, as well as two emerging concepts in HRD which point to a continuing evolution of the role of technology in HRD—VHRD and Web 2.0.

Technology

Information technology (IT) has grown exponentially, and globally, during the past two decades, leading to changes in nearly every field of practice, including HRD. And the term *technology* has been loosely used in our language. Technology is generally viewed as the application of the sciences to the objectives of industry, business, government systems, and human endeavors. As a process, technology is a "socio-technical means of defining and solving problems" (Swanson & Holton, 2001, p. 382). In the field of HRD, technology has been defined as open space technology (Owen, 1997), or human performance technology (International Society for Performance Improvement, 2000), or technology-based training (Kruse & Keil, 2000).

The technology revolution has brought forth an evolving and increasing set of IT tools for use in the digital workplace: e-mail; mailing lists; instant messaging; bulletin boards; newsgroups; Internet search engines; and Web databases are

some. While IT provides access to static forms of data and simple exchanges with others, it is information and communication technology (ICT) that has added the interactive (communication) dimension (facilitated by technology) into the workplace. According to Lewis (1998), the innovative impact of ICT lies in its ability of enabling operational communications in organizations through electronic interaction, which "not only removes the constraints of time and place, but also leaves a trace which forms part of the often missing organizational memory" (p. 13). More recently, Bastiaens (2009) described how ICT has enabled the virtual organization, organization development, e-learning, and performance improvement. As organizations respond to factors such as globalization and new world financial constraints, they often utilize ICT to accomplish work tasks; hence work becomes more 'virtual'. Examples include employees working from home while being connected to the company, multiple company locations being connected to one another through ICT, or a network of professionals in geographically disbursed locations communicating via ICT.

The potential of IT to transform organizations has been a persistent theme in both management, and information systems literatures since computers were first introduced commercially in the 1950s. Leavitt and Whisler (1958) first envisioned that organizations would leverage their mainframe computing power to reduce middle management levels and push decision making upward to a small executive elite. With the advent of desktop computing in the 1980s, this vision shifted the focus on a workforce of autonomous knowledge workers and an empowered clerical staff. During the 1990s, as computers became networked within and across organizations, predictions of "virtual organizations" emerged. More recently, the World Wide Web has spawned still another set of projections for electronic commerce among "boundary-less" organizations and "intranet systems" within them. Business process reengineering has given way to

broader agendas for organizational transformation and knowledge management. Five decades following Leavitt and Whisler's projection, IT is being seen as a powerful force enabling radical new designs for organizations.

Technology has enabled a multitude of virtual tools and the integration of diverse systems which connect people with one another and with rich sources of information. It is estimated that 300 million people worldwide have registered for participation in some type of progressive virtual environment (King, 2009). In the organizational context, technology has transformed workplaces from physical spaces into virtual environments (Chalofsky, 2010) where bandwidth, networking, collaboration and innovation become essential. For example, Intranets make it possible for organizations to engage in proactive internal communications and leverage technology for flexibility in terms of work pace, work flow and work location (Bennett, 2009). These tools contribute to reduced costs, improved products, and better work-life balance. In capturing the impact of IT, Benson et al. (2002) made the following remarks:

"IT represents an evolving social transformation with profound implications and severe challenges and issues…IT is not a value-neutral instrumental innovation but rather a profound force on our lives." (p. 401)

As a result, organizations which adopt fewer IT tools and resources may lose out on significant education and development related opportunities (Teng et al., 2009).

Human Resource Development (HRD)

HRD is a multidisciplinary field of practice with core focus on learning and performance. It is a process of building the capacity of human resources through training and development, organization development, and career development

for the purpose of improving performance at the individual, team, work process, and organizational levels (Swanson & Holton, 2001). McLagan (1989) argued that HRD is "something everyone does" (p. 52). In recent years, the focus of HRD has been expanded from organizations only to communities and nations. Situated in the national and global context, HRD is viewed as a process of developing adults' work-based knowledge and expertise for the benefit of the individual, group, organization, community, nation, and ultimately, the whole of humanity (McLean & McLean, 2001). As a discipline, HRD has grown to encompass more than the traditional domains and includes issues such as ethics, diversity, human and social capital development, strategic change, policy development, secondary and postsecondary education reform, and nonprofit business development (Torraco, 2005). In addition, the HRD function is shifting from being preoccupied with individual performance and training-dominated activities to becoming more strategically oriented in practice (focusing on learning and knowledge creation to enhance individuals' competencies and collaboration with organizations (Wang & Ellinger, 2008). It is this integrated perspective that positions HRD in a critical role in developing an organization's competitive edge.

VHRD

As a result of the organization's quest for technology enhanced knowledge, there is the emergence of the concept of virtual HRD (VHRD). VHRD is in the early stages of development; few definitions exist. Currently, this concept has been defined from two perspectives—adult learning, and knowledge management. McWhorter, Mancuso, and Hurt (2008) first introduced the notion of VHRD through their empirical study of instances of adult learning in a virtual world. Building on Swanson and Holton's definition of HRD, these authors defined VHRD as "a process for developing and unleashing human expertise through training and

development (T&D), organization development (OD), and career development (CD), by utilizing a technology-enabled environment for the purpose of improving learning and performance" (p. 1150). From a knowledge management perspective, Bennett (2009) defined VHRD as "a media-rich and culturally relevant Web environment that strategically improves expertise, performance, innovation, and community building through formal and informal learning" (p. 365). This definition views VHRD as a combination of people and technology, wherein many of the traditional areas of HRD become computer mediated. Core to both of these conceptualizations is learning (driver), technology (facilitator for learning), interaction between human and technology (process), culture (context), and innovation and effectiveness (intended consequence).

VHRD has the potential to revolutionize HRD by more directly connecting learning and performance initiatives within organizational systems (Bennett, 2009). It corresponds with calls for the field of HRD to become more strategic, business-savvy, and future-oriented (Ulrich, 1997). Ulrich identified four areas which can help HR professionals move in such a direction: (a) strategically managing human resources; (b) developing administrative expertise to manage organization infrastructure; (c) managing employee contribution; and (d) managing transformation, change and organization renewal. VHRD requires HR professionals to contribute to all four areas through the creation of virtual systems which, hopefully, will enhance organization performance and development. To accomplish these activities requires integration with information technology.

Web 2.0

What is extraordinary about the emerging concept of Web 2.0 is the apparent resulting shifts in practice—new labels such as *enterprise 2.0* (Paroutis & Al Saleh, 2009), *health 2.0* and *medicine 2.0* (Hughes & Joshi, 2008), and *library*

2.0 (Liesegang, 2007). These emerging practices perhaps suggest a twist in the traditional practices of organizations, health care, medicine, and library services, respectively. Similarly, the field of HRD appears to be influenced by Web 2.0 as it carries out VHRD. Web 2.0 is described as an environment or a platform, a set of services, or set of tools enabling collaboration, communication, community-building, co-construction, interaction, participation, and sharing (Engeström & Sannino, 2010; Hatakka, 2009; Obi, 2008; Paroutis & Al Saleh, 2009). Critten & Moteleb (2008) described Web 2.0 by referring to the collectively generated knowledge "where emphasis moves from individuals using the web to improve their own knowledge (Web 1.0) to Web 2.0 where individuals both share their knowledge with each other and, more crucially, through their sharing change and add to the body of knowledge shared by them all" (p. 57). The Web 2.0 technologies or tools typically cited included blogs, RSS feeds, social bookmarks, social networks, tags, and wikis.

Integrating Technology into HRD: Critical Issues

Advances in technology play a pivotal role in work, learning, and research affecting HRD. In this regard, Swanson and Holton (2009) outlined three tiers of technology which have greatly impacted the field. The first tier, *Workforce Technology*, encompasses trainers who analyze job-specific skills and subsequently target training to assist employees in getting work done proficiently. The second tier, *Technology within HRD,* looks at how HRD activities are delivered. The third tier, *Information Technology and HRD*, is considered a paradigm shift in which information technology (IT) has dramatically altered the way work is accomplished and shifted the locus of control from HRD professionals to individuals and work groups thereby enabling development wherever and whenever needed. This notion is supported by empirical evidence. For instance,

the results of Ford's (1990) study suggested that employees trained adequately on the use of a personal computer (PC) raised productivity in organizations where technology was valued and yielded positive outcomes. Peterson (1997) argued that developments in technology may help business professionals prepare for cross-cultural experiences. More recently, Church et al. (2002) demonstrated through a case study how an organization used Web-career tools to drive cultural change successfully. Gardner, Lepak and Bartol (2003) surveyed 455 HR executives and found that the integration of IT impacts HR roles by changing demands for information and the need for IT support. In this case, IT enabled HR professionals to provide improved information responsiveness, have more information autonomy and more external professional links. IT has also allowed more efficient access and dissemination of information while shaping and changing job expectations. In sum, technological tools have proved to be useful for learning, performance enhancement, and organizational change and development (Benson et al., 2002).

The wide array of technologies can be exciting and promising when they contribute to the expediting of internal and external communications, standardized business and human resource processes, and organization change and development (Church et al., 2002). They can also be daunting and overwhelming as the constant and rapid technology changes increasingly make organizational and individual knowledge obsolete. Technology presents numerous challenges, which will only increase as the rate of technology change continues to accelerate.

HIGH-TECH VS. HIGH-TOUCH

The first challenge is how to balance high-tech interventions and high-level human interaction. Historically, HRD has functioned at a low-tech level. The twenty-first-century challenge for

HRD, according to Swanson and Holton (2001) is, therefore, be engaged in high-tech means of developing and unleashing human expertise in response to the demand for conducting HRD activities in a more efficient and cost-effective manner. Apart from its own technology, the HRD profession has been characterized by "sensitive engagement of client and participation high-touch" (p. 384). The new challenge for HRD, then, is to leverage technology without losing the human touch. HRD professionals need to learn more about how to effectively harness high-tech and high-touch interventions.

Changing HRD Roles and Skills

Technology has changed the role and skill requirements of HRD professionals. Twenty years ago, McLagan (1989) identified 27 core HRD competencies in four broad categories: (1) technical competencies (e.g., knowledge of adult learning and career development, computer competence, evaluation skill, media selection skill, training and development theories and techniques); (2) business competencies (e.g., budget and resource management skill, knowledge of business and organization behavior, OD theories and techniques); (3) interpersonal competencies (e.g., coaching skill, feedback skill, group process skill, negotiation skill, presentation skill; and (4) intellectual competencies (e.g., data-reduction skill, information-search skill, vision skill). Ten years later, Dare and Leach (1998) found that three competencies identified by McLagan were perceived as significantly more important as they were before. These include the technical competencies of research and electronic-systems skills, and the intellectual competency of visioning skill. In addition, these authors found two technical competencies (competency identification skill and objectives preparation skill) were seen as significantly less important than they were before. In today's virtual workplace, it is not difficult to project that the skills needed for effective virtual

interaction would be drastically different from those in the 90s (Bastiaens, 2009; McLean, 2006; Torraco, 2005). HRD professionals will not only have to help others cope with the consequences of new technologies, and help organizations create new strategies for developing and retain knowledge talent, they must also continue to transition their own roles as virtual knowledge workers. Below are examples of new or different competencies required for virtual HRD in the twenty-first century.

- Knowledge of current technologies available to organizations (e.g., Internet and Intranet communications, video conferencing, web conferencing, search engines, instant messaging, podcasts, blogs, wikis, and virtual worlds)
- Ability to leverage existing technology and virtual environments for strategic advantage
- Systems thinking and intuitive thinking
- Visual-spatial skills
- Ability to communicate and interact in non-face-to-face (virtual) environments;
- Knowledge of context-sensitive motivation strategies (face-to-face, hybrid, virtual environments)
- Knowledge of diverse cultures represented by virtual teams which are geographically dispersed
- Management skills for supervising employees in a virtual environment
- Requisite skills for evaluating virtual environments

Unintended Consequences of Technology

The next challenge concerns leveraging the unintended consequences of technology application. Ample literature has chronicled the side-effects encountered when introducing technology into organizations. Robey and Boudreau (1997) pro-

vided a few examples of the "seemingly polarized pairs of social outcomes" (p. 170): empowered employees and oppressed employees; extended hierarchy and reduced hierarchy; organizational rigidity and organizational flexibility; and increases in staff and radical downsizing. Stephens and Szajna (1998) raised concerns about whether telecommunicating could lead to exploitation of people if organizations give them reduced pay and benefits, or treat them differently from traditional employees. Ardichivili (2002) identified several unexpected barriers leading to low online community participation, including barriers associated with individual psychology (e.g., fear of losing face, being criticized, letting colleagues down, or misleading others), and barriers associated with corporate security restrictions. Similarly, Church et al. (2002) outlined unintended consequences of technology in organizational development initiatives: decreased employee participation or lack of adequate representation; lack of faith in the system and confidentiality; and technological glitches. More recently, Morris (2008) identified increased stress associated with the use of technology, including disruption of work-life balance, physical health issues, and psychological stress. In addition to the inability of anticipating or managing these unintended consequences, organizations often overlook variables such as age, gender, and ethics in their technology adoption related decision making processes. Using age as an example, research suggests that age has an important influence on technology use in the workplace. Specifically, age differences in information processing impacted the older workers' performance of computer-based tasks (e.g., data entry, file maintenance, and inventory management (Morris & Venkatesh, 2000). Unintended consequences such as these, if not considered or managed carefully, "can seriously threaten the quality and validity of any data or information collected, the integrity of an entire process, and ultimately, the value of the overall organization

development and change effort" (Church et al., pp. 503-504).

Ethical Issues

Finally, shifting of practices from face to face to virtual environments requires new ethical considerations. As virtual systems create significant opportunities to store vast amounts of confidential information, policies must be developed to protect the privacy of workers as well as protect the sensitive data that organizations now have in digital forms. Ethical conduct and trust play a critical role in the development of virtual organizations in the global market (Grydzewski, Hejduk, Snkowsda, & Wantuchowicz, 2008). HRD professionals must insure that HRD practices in virtual environments are congruent with accepted ethical codes of conduct.

EMERGING VHRD PRACTICES

This section discusses some of HRD related activities which have already been implemented virtually or discussed by HRD researchers. These activities include: virtual learning; virtual mentoring (Bierema & Hill, 2005); virtual teams (Workman, 2005); virtual learning communities (Birchall & Giambona, 2007); virtual communities of practice (Ardichvili, 2008); virtual knowledge management (Bennett, 2009); virtual organizations (Henderson & Provo, 2006); and virtual worlds (McWhorter et al., 2008). These, however, do not represent an exhaustive list.

Virtual Learning

Facilitating learning for individuals and organizations has been an essential role for HRD. Chalofsky (1992) projected, almost two decades ago, that computer-assisted learning (CAL) would be a new form of learning in the information age. Now, given the sophistication of media available

today, people can learn in a richer, more integrated, and potentially more creative way. Technologies for learning range from asynchronous e-mail, weblogs, bulletin boards, and distance learning platforms, to more robust synchronous environments of virtual chat, virtual classrooms, and virtual worlds. These virtual environments can enable learning engagement by providing flexibility and accessibility (Sambrook, 2005), as well as tools tailored to different learning styles, different learning pace, and different levels of participation (Macpherson, Elliot, & Homan, 2004). Further, the technology-enabled cognitive tools for learning allow individuals to develop higher-level skills (e.g., logic, computation, and analysis) rather than mere memorization. As a result, virtual learning is no longer merely a cognitive process but also involves human emotions, imagination, and intuition (Bouras & Tsiatsos, 2006). And, intuition is an unconscious activity important for creativity (Torrance & Safter, 1999).

Virtual Mentoring

The concept of virtual mentoring was championed in the field of HRD by Bierema and Hill (2005) who claimed that technology can facilitate the relationship between the mentor and the protégé. They noted that despite some drawbacks, virtual mentoring has the potential to foster a "deliberative, reflective, and thoughtful exchange" (p. 559). Virtual mentoring is also cost saving compared to traditional mentoring practices which may require frequent traveling for the mentors and protégés who are geographically apart. Last, and perhaps the most important, given the elitist nature of traditional mentoring, virtual mentoring can be a valuable alternative career development strategy for the underrepresented workforce (e.g, women and people of color) who are often excluded from mentoring programs (Wang, 2009). In fact, the topic of e-mentoring has received increasing research attention, and its value for the development of professional women' careers has already

been established (Headlam-Wells, Gosland, & Graig, 2005).

Virtual Teams

With the unique feature of allowing interdisciplinary activities to cross traditional unit boundaries and geographies, virtual teams are rapidly becoming the norm in many organizations today (Reine & Trompendaars, 2000). Workman (2005) examined virtual teams in a transnational organization where members who were geographically dispersed used contemporary technology for communication and coordination of teamwork. Interestingly, he found that tightly controlled teams outperformed loosely structured and managed virtual teams, and he called for virtual team members to "communicate, plan, problem solve, derive products or solutions, and monitor their performance" (p. 436).

A number of variables are found which affect the success of virtual teams, including: communication (Dewey & Carter; 2003; Johnson & Jeris, 2004); trust (Colky, Colky, & Young, 2002); knowledge of technology (Benson et al., 2002; Church et al., 2002); socio-emotional capability of virtual workers (Jones & Ruona, 2006); and leadership (Moran, 2005). Jarvenpaa and Leidner (1999) studied global virtual teams where the participants had never met before, and found that teams with leaders who used traditional control mechanisms, such as weekly status reports, seemed to have lower level trust within the teams and therefore reduced the likelihood of success. They also identified two factors which contributed to successful virtual team practices. One was having enthusiastic social communication at the outset which gave way to high task focus. The other was providing timely responses to communication without being negative. Therefore, identifying strategies to encourage self-organization and trust building are essential for virtual work.

Virtual Organizations

Technology advancement, together with globalization, has shifted traditional organizations toward virtual organizations (Beck, 2003; Henderson & Provo, 2006 p. 275). Knowledge workers are crucial to virtual organizations where employees need to understand how to manipulate computer systems to perform tasks effectively. One issue for HRD professionals to consider is how to motivate employees in a virtual environment where face-to-face interaction is minimum or not present. Henderson and Provo (2006) urged HRD professionals to seek strategies to deal with the new complexities that will be generated by continuing technology advancements. Lewis (1998) called for the need for investment in understanding current practices and human behavior in order to create virtual learning organizations, because "the returns could well be enormous" (p. 13).

Virtual Learning Organizations/ Communities

In virtual learning environments, information and communication technology enables the exchange of tacit knowledge, and provides new members with a means of gaining knowledge about the organizational culture (Lewis, 1998). Birchall and Giambona (2007) stated that a virtual learning community offers several advantages over traditional means for knowledge sharing, and that trust plays a significant role in virtual learning communities. However, building trust can be challenging given the absence of non-verbal cues in a computer mediated environment. Since communication is a key factor of trust building, it is critical how and what communication mechanisms are selected to trigger meaningful and sincere dialogues.

Virtual Communities of Practice

Virtual environments enable the co-creation of knowledge which promotes the formation of virtual communities of practice. A community of practice is "a group of people informally bound together by shared expertise and passion" (Wenger, 2002, p. 1). Virtual communities of practice are usually distinguished from virtual teams because they are normally organized around community members' common interests, but are not usually working toward achieving specific performance goals as observed in virtual teams. Communities of practice are "important vehicles for collective learning in the workplace" (Ardichvili, 2008, p. 541) and have the potential to lead to "the most intensive interaction and knowledge generation and exchange" (Ardichvili, 2002, p. 456). This view is consistent with Lien, Hung, and McLean's (2007) case studies of organizational learning within six high-technology firms in Taiwan. In this study, the authors found that virtual communities of practice contributed to the linkage of knowledge sharing and knowledge management.

Virtual Knowledge Management

Knowledge management (KM) is a social activity aided by technology, therefore, essential for developing VHRD, Bennett, 2009). KM analyzes how knowledge is acquired, created, and distributed in organizations (Lengnick-Hall & Lengnick-Hall, 2003). Specifically, it focuses on understanding the interactions between tacit and explicit knowledge, the process of knowledge creation and conversion. As Ardichvili (2002) observed, "contemporary Web-based KM systems integrate real-time information sharing and coordination between: various departments; knowledge sharing and discussion between individual employees and teams and communities; skill databases; company yellow pages; product and service information; and Web presence for customer information gathering" (pp. 455-456). These features make a contemporary

KM system an ideal tool for promoting organizational learning, a central theme of HRD.

Virtual Worlds

Virtual worlds are "a three-dimensional world where multiple people can interact in real-time while using avatars (virtual icons) as representations of themselves" (Chapman, 2008, p. 917). Virtual worlds emphasize team play and community, giving a sense of presence lacking in other media, thereby simulating a high-level of involvement and immersion in a virtual environment (Johnson, Vorderstrasse, & Shaw, 2009). The most popular virtual worlds are *Active Worlds* and *Second Life*. Virtual worlds have the ability to take online collaboration and interaction to new levels, break down hierarchies, and eliminate geographic boundaries (Chapman, 2008; Gronstedt, 2007; Hutchinson, 2007). Furthermore, learning in virtual worlds is learner driven (built by users), rather than instructor driven (built by owners); therefore, virtual worlds hold great promise for new, exciting, and innovative learning experiences (Crites & Homan, 2009). Organizations such as IBM, Cisco, and Manpower have leveraged virtual worlds to "cut travel, training, and meeting costs, gain substantial access to global talent, trim back internal redundancy, and increase communications among departments that were once isolated from one another" (King, 2009, p. 12).

FUTURE TRENDS

This section discusses some broad implications of technology integration in the three domains of HRD: training and development; organization development; and career development. As McLagan (1989) argued, HRD is "something everyone does" (p. 52). This speaks to the importance of understanding future trends of HRD in a technology dominated era. And the implications, although not yet fully understood, point to some specific areas into which technologies can be integrated within organizations. These areas, therefore, may be guides for organizational leaders, managers, trainers, and human resource developers in their effort to use technology for enhancing individual, group, and organizational effectiveness.

Technology-Enabled Training and Development

Training at work, a core domain of HRD, is increasingly becoming a Web-based activity (Benson et al., 2002). Examples of IT tools used to support both formal training interventions and informal learning activities include e-mail, bulletin board messaging systems, wikis, discussion boards, video conferencing, simulations, and chat rooms. Web-based training offers flexibility, a consistent delivery of training materials, and self-paced learning opportunities. Both learners and organizations can benefit from reduced travel and other expenses associated with attendance in training sessions (Schooley, 2009). This potential for reducing costs will likely lead to an increased participation rate and meaningful self-directed learning. One of the challenges for HRD professionals in this area of training and development is how to deal with the changing nature of instructional design and assume the new role of delivering instruction using a wide range of Web-based technologies (Benson et al., 2002). These new roles require greater skill in areas which are not typically within the repertoire of expertise of HRD professionals, such as technology management, troubleshooting, graphic design, and media production. One way HRD professionals can address this challenge is to partner with professional instructional designers and technologists to ensure the virtual learning environment is user-friendly and usable—two critical factors influencing online learning (Sambrook, 2005). In addition, HRD professionals must be certain that learning is integrated into an organization's work processes and reward systems (Holton & Baldwin, 2003) which can

be managed electronically (Bennett, 2009). The advantages of using technology for training and learning has been recognized by HRD scholars both conceptually and empirically for more than twenty years, including facilitating self-directed learning, and enhancing adult learning (Manz & Manz, 1991), increasing interactions between the instructor and the learner (Russ-Eft, 1994), saving costs (Harp, Tayler, & Satzinger, 1998), and boosting trainees' self-efficacy (Christoph, Schoenfeld, & Tansky, 1998).

Technology-Enabled Organization Development

As Benson et al. (2002) and Church et al. (2002) pointed out, to be successful in any change initiative, organizations must adopt the perspective that OD is a data-driven process for change; hence, the successful application of OD interventions is becoming increasingly dependent upon the use of technology. According to Church et al. (2002), direct attention to the role of Web-based technology in OD must be given to three areas: (1) data-based assessment tools and techniques (e.g., survey, 360-degree feedback, selection tests); (2) team building (e.g., virtual teaming, information sharing); and (3) management and employee development (e.g., career tools, interactive training, self-paced learning). This focus requires organizations to develop employees who are comfortable with technology and have access to the data and tools they need to support change (Benson et al., 2002). In their study, Milton, Watkins and Daley (2005) found that the virtual environment provides opportunities for facilitators to be deliberate in how they intervene in group situations, using reflection on the results of the interventions, and be flexible in responding to group needs. Further, they posit that the virtual environment is a powerful tool for modeling OD interventions. And, HRD professionals have a tremendous opportunity to use IT tools to enhance learning, job performance, and organizational decision making

(Benson et al., 2002). In addition, organizations must also conduct careful assessment of their decisions about the effectiveness of their use of Web-based technologies, as well as how those decisions affect the organization's bottom line. Given the limitations of the existing approaches to evaluation, HRD professionals must develop new measures to adequately evaluate the impact of technology application on organization change and development (Benson et al., 2002).

In sum, technology allows OD initiatives to be structured not only into communication channels but into daily virtual work. Action technologies, virtual team development, innovation, and change processes may be accomplished through VHRD. A research area HRD professionals can explore is whether and how VHRD fosters high-performing and healthy organizations (Bennett, 2009).

Technology-Enabled Career Development

The role of technology in management and employee development has increased significantly (Church et al., 2002). Such application has enabled many new approaches to individual development. Examples include online career management tools, internal and external job posting worldwide, customized interactive training and work simulations online; and sophisticated software programs that assist the design of learning objectives, link content to objectives, and assess learning outcomes (Tippins, 2002). Pierce and Pitts (2005) predicted that virtual career development is a likely avenue for assisting individuals and organizations with career development efforts (Pierce & Pitts, 2005). They urged HRD professionals to seek ways to leverage this valuable career development resource.

However, career development in virtual environments will have a different complexion reflecting different organizational values (Bennett, 2009). Several issues are important to consider here. One is about the management of career development data. Organizations need to

set priorities about the use and reuse of career development data. For example, virtual mentoring leaves a record of communications that could affect the attitude about openness a mentor and a protégé feel toward sharing information (Bierema & Hill, 2005). Organizational assumptions about how to judge merit for promotion are also an issue. And, how important face-to-face time is for advancement opportunities will affect career development in virtual work. Organizations also need to develop a new generation of leaders and prepare them for working and managing within virtual environments. Additionally, the methods we use to promote people in virtual work become another issue. Both likability and competence are important factors for career progression. In the past, women have often been at a disadvantage because their personal and social obligations have restricted their ability to participate in informal networking, particularly events after business hours (Wang, 2009). In a technology-enabled environment, this issue may be somewhat mitigated if informal networks, such as virtual social networking, meet on-line. Further, technology has long been considered a male-oriented domain, which could disadvantage females using technology tool for communication or working with technology development. Heilman, Wallen, Fuchs, and Tamkins (2004) found, through a series of studies, that women who show competence in mail-gendered tasks tend to be disliked for their success, which is problematic for promotion. Each of the issues identified above warrants systematic research efforts.

CONCLUSION

New forms of information and communication technology (ICT) provide an abundance of options for work and learning today. This trend is likely to increase as the millennial generation enters the workforce holding an unprecedented technical savvy. In the technology-enabled environment,

students will be able to follow personalized learning pathways which allow greater flexibility for different learning styles and intrinsic motivational factors (Christensen, Horn, & Johnson, 2008). The future workforce will be increasingly comfortable with learning and communicating using technology. As individuals assume a bigger responsibility for directing their own career development paths, the traditional employer-employee relationship will be redefined. As far as HRD is concerned, technological development and corresponding change in the workforce will continue to move HRD activities to a more virtual process. VHRD, as a paradigm shift for the field, will continue to transform organizations and alter many of the core HRD practices and skill sets. The reach of HRD can be greatly increased as virtual work crosses space and time boundaries.

Mitroff and Linstone (1993) suggested a set of guidelines for managing social and technical change in organizational settings. They proposed that organizations should: (1) strike a balance among technical, organizational, and personal perspectives; (2) foster a culture holding a variety of perspectives; (3) recognize that organizational and personal perspectives require greatly different methods than do technical ones; (4) pay attention to the mutual impact, interdependencies, and integration of perspectives; and (5) beware of thinking statistically in dynamic environments. These guidelines would also work well as guiding principles for holistic thinking about learning and knowledge management in organizational settings. Certainly, these suggestions can be useful in guiding future VHRD practice.

KEY TERMS AND DEFINTIONS

Human Resource Development: A process of enhancing individual, group, and organization effectiveness through training and development, organization development, and career development.

Virtual Community of Practice: A group of people who are informally bound together by common interests and communicate virtually.

Virtual Environment: A technology-enabled environment that requires no face-to-face human interactions.

Virtual Human Resource Development: A process of using Internet- or Web-based technologies to enhance individual, group, and organization effectiveness through training and development, organization development, and career development.

Virtual Team: A team where members work in geographically disbursed locations and communicate virtually.

Virtual Workplace: A work environment where organizational members perform tasks in the virtual environment enabled by Internet- or Web-based technologies.

Virtual Worlds: A 3-D environment where multi-users interact in real time using avatars as representation of themselves.

Section 2
Development and Design Methodologies

This section provides in-depth coverage of conceptual architecture frameworks to provide the reader with a comprehensive understanding of the emerging developments within the field of Human Resources Management. Research fundamentals imperative to the understanding of developmental processes within Human Resources Management are offered. From broad examinations to specific discussions on methodology, the research found within this section spans the discipline while offering detailed, specific discussions. From basic designs to abstract development, these chapters serve to expand the reaches of development and design technologies within the Human Resources Management community. This section includes 10 contributions from researchers throughout the world on the topic of Human Resources Management.

Chapter 12
HRM Adaptation to Knowledge Management Initiatives:
Three Mexican Cases

Laura Zapata-Cantú
Tecnologico de Monterrey, México

Jacobo Ramírez
Tecnologico de Monterrey, México

José Luis Pineda
Tecnologico de Monterrey, México

EXECUTIVE SUMMARY

Organizational knowledge and human capital are increasingly regarded as key levers of competitive advantage in today's global, dynamic and complex business environment. People are the ultimate knowledge creators and bearers; although organizations may have memory systems, they do not think by themselves. Human resource management (HRM) has a strategic role facilitating knowledge management (KM) initiatives, specifically in activities such as: recruitment, training and compensation. Although many studies raise the question of how HRM shapes KM, limited research in Latin America has explored this matter. This chapter aims to explore how HRM policies and practices have been designed in three organizations located in Mexico, in order to support KM initiatives. The findings suggest that the strategic role of HRM in supporting KM initiatives must be expanded. HRM policies, practices, and compensation systems, such as incentives and bonus packages to motivate employees to create and share knowledge, need to be redefined. Recruitment, selection and, training and development must be tailored to obtain a successful implementation of the KM program.

BACKGROUND

Nowadays, firms are facing a more dynamic environment, where uncertainty and technological changes dominate. As a result, organizations have to base their strategy and competitive advantage on intangible resources and capabilities. Managers should know how to administer the challenges and advantages that the environment presents, particularly in cases where the time factor is vital to develop, implement and transfer innovation systems for their survival. Furthermore, firms must develop flexible, administrative capacity to effectively coordinate their internal competence. The more dynamic the environment is, the more firms focus their strategy on resources and capabilities (Grant, 1996). In this context, one must take into account that while some organizational resources are easy to transfer, such as processes and equipment, others, such as knowledge, an intangible asset that is usually tacit and organization-specific, are less mobile. Knowledge is a valuable, generally essential, rare and inimitable resource (Barney, 1991:112.), and it constitutes a source of competitive advantage (Grant, 1996:376). The key resource is knowledge, which is intrinsic to human capital. People are the critical creators and bearers of knowledge. Organizations do not think by themselves; they need employees to leverage their knowledge. In this particular framework, it is relevant to explore how HRM policies and practices have been designed to manage this intangible resource.

Lado and Wilson (1994, p.699) in Minbaeva (2005:126) suggest that HRM practices "can contribute to sustained competitive advantage through facilitating the development of competencies that are firm specific, produce complex social relationships, … and generate organizational knowledge." Managing HR to achieve better knowledge-related outcomes means "retaining personnel, building their expertise into the organizational routines through learning processes, and establishing mechanisms for the distribution of benefits arising from the utilization of this expertise" (Minbaeva, 2005:126).

As emphasized by Huselid (1995), HRM practices influence employees' skills and competencies through the acquisition and development of a firm's human capital. The competitive advantage of a firm is dependent on the existence of HR with relevant competence profiles. An analysis of the competencies needed for different positions, along with an analysis of a firm's current pool of employee competencies, helps the organization hire people with the desired skills and knowledge (p. 590).

The emergence of new forms of working practices, such as flexible working practices, reflects that need. Most traditional KM systems rely on the assumption that knowledge can be conceptualized as an object that can be identified, separated from its initial context, and handled in information systems (e.g. Nabeth *et al*, 2002). Thus, managers need to understand the meaning of knowledge in order to plan knowledge handling processes and to enable them to judge how knowledge affects people, organizational culture, management activities and other processes within the organization. Managing knowledge is not the same as HRM. KM involves managing intellectual property; that is, managing the development and transfer of organizational know how. It is more multifaceted than simply managing people (Teece, 2000:147). Organizational structures and management practices are changing to facilitate the implementation of KM in organizations.

The Study and its Methodology

In KM literature, there is relatively little consideration of cultural and human issues, even when the key obstacles exposed as knowledge transfer inhibitors are those related to the "human" side of KM. The main purpose of the present study is to determine the HRM practices and policies that 1) enhance the generation of knowledge and 2) support knowledge transfer in an actual busi-

ness environment in Mexico. The present chapter explores the cultural and social embeddedness of knowledge from the evidence obtained through exploratory case study research from three Mexican firms, one in manufacturing industry and two in the service sector.

Exploratory qualitative research has been designed to investigate how HRM has had to adapt to KM initiatives in three Mexican enterprises. The case study method was used given that it fits well with the maturity stage of the theory involved and with the relative emergence of the phenomenon under study. This allowed us to establish detailed evidence and interpretation (Yin, 2009).

The three case studies were not chosen randomly; companies were selected on the basis of having innovative processes that contribute to their competitive advantage. Our interview protocol was designed around these issues: (1) knowledge generating activities, (2) knowledge transfer mechanisms, and (3) HRM practices that support KM initiatives.

The interview information was complemented with internal documentation provided by the firms. Face-to-face semi-structured interviews were held with HR managers and employees at different levels of the organization. The interviews lasted 60 and 90 minutes each and were audio-recorded. The interviews were transcribed verbatim and were circulated among all the authors in order to construct the full write-ups of each case. The interviews took place in 2008. In the following section, each case is analyzed separately.

SETTING THE STAGE

Information and Knowledge

Most traditional KM systems rely on the assumption that knowledge can be assimilated to objects that can be identified, separated from their initial context, and handled in information systems (Nabeth et al., 2002). Thus, organizations, and in particular managers, need to understand the meaning of knowledge, in order to plan knowledge handling processes and to enable them to judge how knowledge affects people, organizational culture, management activities, and other processes within the organization.

Knowledge as a business resource can be a source of sustainable competitive advantage, if it has two important properties: (1) it derives from accumulated experience, rather than specific tasks, meaning that it largely consists of tacit knowledge, which makes it difficult to transfer from one firm to another or for competitors to imitate it; and (2) it is not only connected to individuals but also to the way these individuals interact (Nonaka & Takeuchi, 1995).

Most people think of knowledge as a recipe - a predefined procedure - for dealing with a concrete, routine situation. However, in a dynamic environment few situations are repeated, which means that most situations are novel, particularly in their details. Knowledge must provide people with the ability to envision ways of handling different situations and to anticipate their future implications. Knowledge - in the form of mental models, scripts, and schemata - enables people to work in novel situations. They are thus able to assimilate not only concepts and predefined methods and judgments, but also to make connections between these and other complex concepts, meta-concepts, and mental models (Wiig, 2000).

Personal knowledge cannot be shared directly. This explains why people can carry out the same task differently from their colleagues even when a standardized process exists. The answer lies in personal knowledge, experiences, attitudes and context (Polanyi, 1962). Everyone has his or her own way of internalizing and making sense of the information received in order to interpret it and turn it into new knowledge. Knowledge is built through a complex learning process and results in highly individual mental models and associations. However, even under the best circumstances, only a small fraction of an individual's applicable exper-

tise can be articulated and shared. Frequently, only concrete, operational or routine knowledge can be communicated. Deep, broad insights are generally not available and may not even exist, except as the abstract ability to reason. Significantly, when experts disseminate knowledge openly and widely, they tend to be considered important by their peers and gain status and recognition (Szulanski, 1996).

In sum, information needs to be interpreted, analyzed and transformed by people–knowledge workers. There should be an understanding of what knowledge workers do and in what ways they use knowledge and information to create value in organizations (Davenport, 2003). Most debates on KM depart from the premise that organizations do not recognize the full value of the knowledge "created" by their employees. The following section presents our definition and view on knowledge workers.

The New Work Force: Knowledge Workers

In 1969, the definition of knowledge worker proposed by Peter Drucker sought to describe the successors of factory workers: "*The most valuable asset of a 20th century company was its production equipment. The most valuable assets of a 21st century institution (whether business or non-business) will be its knowledge workers and their productivity*". However, knowledge workers can be defined as participants in the knowledge-based economy. This definition has the advantage of being cross-sectoral but the disadvantage that it is far from specific (Brinkley, 2006:16). Brinkley (2006) suggests three ways to define knowledge workers:

- All those who work in the top three standard occupational classifications (managers, professionals, associate professionals).
- All those with high levels skills, indicated by degree or equivalent qualifica-

tions (professional diplomas and/or higher education).
- All those who perform tasks that require expert thinking and complex communication skills with the assistance of computers.

On the other hand, Rüdiger and McVerry (2007) explain that neither definition perfectly captures what knowledge workers really are about, how they differentiate themselves from non-knowledge workers or how they perform their jobs.

Today, knowledge workers comprise the majority of the work force. While at the beginning of the 20th century, unskilled labor accounted for about 90% of the work force, today that figure is closer to 20% (Spira, 2005). Taylor showed that manual work consists only of simple, repetitive activities. Knowledge, that is, the way in which these simple, unskilled motions are put together, organized and executed, can make these activities more productive.

In the context of emerging economies, the example of Mexico is presented. In 2004, 17% of the total Mexican workforce consisted of knowledge workers (Brinkley, 2006). This may sound rather high, but if we compare it with the Netherlands (48%), Canada (39%) and Spain (31%), it is not high enough. This means that in Mexico, the majority of production results from manual work rather than knowledge work.

The shift from factory to knowledge workers represents a significant challenge to managers, who manage workers in more traditional roles. The basic difference is that a greater stock of knowledge supports a higher level of productivity (Grant, 2000). Different workers use different types of knowledge; this knowledge takes different lengths of time to acquire, and without knowledge, the employee is completely unproductive.

Besides, it is difficult to compare the knowledge intensity of different occupations. For survival in competitive environments, all employees, especially HR managers, have always worked to build the best possible knowledge base within

their area of responsibility and to ensure that it can be easily disseminated to all organizational levels (Wiig, 2000:3). The HRM department has to provide a kind of storage space so that all workers can access most of the firm's knowledge. This storage space may be located within the firm's Intranet or a database containing documents that describe important processes and activities.

In Mexico, it is mostly transnational companies that use the Intranet as a space where employees can access information about the enterprise's main activities, including information about who has expertise in a specific area. For employees, the Intranet is a convenient means to establish virtual contact with other members of the organization and to keep up to date with the organization's activities. Effective KM depends on an explicit understanding of the complex ways in which people use their knowledge – their thought processes - to conduct their work. It means understanding what people have to know and how they access this information so that they can act effectively in different situations. The following section will elaborate on the knowledge management process.

Knowledge Management Process

Knowledge-based economies, which are directly based on the production, distribution and use of knowledge and information (OECD, 1996), challenge the basic processes of KM: how to create, share, transfer and store knowledge. These processes may pose a threat to traditional productive processes, and this is in part what KM research studies.

Organizations have always managed knowledge, even if they have not always talked about it in those terms (OECD, 2004). Nevertheless, there is an urgent need for KM to be seen as a corporate strategy and as a key precondition for increased productivity in the knowledge economy more broadly (Brinkley, 2006).

Early KM initiatives approached the challenge of improving knowledge workers' productivity

from an organizational perspective by treating knowledge as an object. Reviewing the studies that have dealt with the theme of KM and its contribution to a firm's competitive advantage, three main aspects can be identified. First, at the individual level, it is the individual employee, who is responsible for knowledge creation within the firm (Nonaka & Takeuchi, 1995; Grant, 1996). Second, at the organizational level, the knowledge that has been created within the organization by some of its members should be transferred to other individuals so that it may be known to all. Third, once transferred and received, the knowledge generated should be integrated into the existing organizational knowledge base (Zárraga & García-Falcón, 2003:81).

Knowledge processes, such as generation, transfer and utilization, are interrelated and often cannot be separated. In the following sections, each phase of the KM process- generation, transfer and utilization- is described.

Knowledge Generation and Utilization

The knowledge generation and utilization processes are presented together in this section, given that when an organization utilizes knowledge, it can also generate it, and vice versa. Knowledge generation is mainly an institutionalized activity, so each organization must be able to establish its own creative routines and human intervention to make this process possible. The challenge is building systems that collect the learning processes acquired during projects and ongoing activities, capturing that knowledge in a database or document, and then spreading it throughout the entire organization (Grant, 2000).

Enterprises mainly create and utilize knowledge through social interaction. Socialization, as Nonaka and Takeuchi (1995) have explained, is a process of converting new, tacit knowledge into tacit knowledge through joint formal and informal activities, such as spending time together, working

in the same office and chatting. In the knowledge generation process, organizational culture, which results from experience based on tacitly shared norms of coordination and collaboration, can influence the way in which individuals interact within an organization. In fact, a culture that promotes intensive communication, accepts new ideas, and is prepared to explore new processes and activities favors the generation of knowledge (Zapata, Rialp and Rialp, 2009).

This knowledge generation process leads to increased firm competitiveness. It may be stimulated through non-hierarchical organizational structures, an active general management, and by motivating employees to innovate and learn lessons that allow them to obtain new and better knowledge (Nonaka *et al.*, 2000).

The dynamic environment, which firms are currently facing, not only provides employees with the motivation to generate new knowledge, it also gives them the opportunity to learn. At the same time, the experience that the employees can obtain and the possibility of applying their knowledge in diverse activities within the organization, motivates them to learn new tools and create new processes or ways of doing things. As it can be seen, the creation and utilization of knowledge requires human intervention. Few organizations pay much attention to the creation of knowledge, but many emphasize its utilization through information technologies.

Knowledge Transfer

For Gooderham (2007:36), knowledge transfer can be referred to as the accumulation or assimilation of new knowledge in the receiver unit. However, researchers like Minbaeva et al. (2003:587) argue that pure transmission of knowledge from the source to the recipient has no useful value if the recipient does not see the potential of the new knowledge and hence, does not utilize it in his or her own activities.

Besides reaffirming the importance of communication, this suggests that there is another important aspect that influences which tools knowledge workers choose in order to support their work; they prefer to use *personal* tools, i.e. tools that they can control and customize to their own needs. Cognitive tools, such as mind mapping software, other visualization tools or personal information management tools are designed for the solitary worker and do not address the social context of knowledge creation (Efimova, 2004). That said, one tool has become the dominant support for knowledge work–email. Email is successful because it is *personal* and *social* at the same time.

Informal communication mechanisms, such as face-to-face interaction, corridor chats and IT systems, facilitate interaction among colleagues and improve the knowledge transfer process. Meetings are another appropriate way to transmit complete messages.

On the other hand, technology alone is clearly not enough to induce a person with knowledge to share it with others. Technology can improve access and help bring the right knowledge to the right person at the right time, but this is not sufficient. Document management systems are only helpful in locating information. Using information, sharing it, making sense of it and discussing it are all done elsewhere.

There are also several important contextual dimensions of knowledge transfer. First, firms must seek to operate with an open culture that facilitates knowledge transfer. What is needed is an organizational culture that motivates the members of the organization to search for new ways of doing things and where these efforts are facilitated by flexibility and interaction among colleagues. Such a culture should be open in order to encourage employees to share their knowledge with colleagues, even in contexts where time is at a premium. Time is vital for firms that operate in dynamic environments; hence the knowledge to be transferred must be assigned a high priority

within the organization. That is, its transfer should be planned just like all the firm's other important activities (Zapata, Rialp and Rialp, 2009).

Other significant contextual elements within the organization include management support and close proximity among employees. As Cummings (2004) comments, great physical distances make communication among members of a group difficult since opportunities for informal contact are reduced.

Knowledge as part of intellectual capital is the key to a competitive advantage in the knowledge economy; hence HRM should seek to become an integral part of corporate strategy, enabling knowledge to be managed in the interests of organizational performance (Thite, 2004).

Knowledge Management and Human Resource Management

The importance of KM lies in the knowledge possessed by individual employees, even if this is an inherent social construct. The increased reliance on knowledge workers is changing the role of HRM (Beatty *et al.,* 2003). Managing knowledge is not the same thing as just managing human resources. KM involves managing intellectual property; that is, managing the development and transfer of organizational know-how. It is more multifaceted than simply managing people (Teece, 2000: 147).

In order to begin discussing the different approaches to HRM adaptation to KM projects, it is important to give an account of HRM's principal activities. HRM functions have emerged parallel to the economic shift from agrarian to manufacturing to services and now, to information and knowledge (Beatty *et al.,* 2003: 107). One factor in the changing role of HRM is the increased reliance on knowledge workers (ibid). Under this perspective, HRM involves a series of organized activities conducted within a specified time and designed to produce behavioral change. Within HRM, the most common activities are recruitment and selection, training (learning for the present job), compensation and incentives, and performance evaluation, as well as staffing, career development and internal communication and compensation (e.g. Nadler, 1994).

Organizational structures and management practices are changing to facilitate the implementation of KM in organizations. The following section presents the different configuration to recruitment and selection, training and compensation in the context to support KM initiatives.

Recruitment and Selection

Employee selection is a fundamental aspect of HRM and assumes that individual differences make a meaningful difference in job performance. Therefore, what is needed to maximize performance is a good match between personal characteristics and job requirements (Huo *et al.,* 2002). The following sections present an analysis that shows how recruitment and selection processes have changed.

Employee Profile

According to academic literature, the employee profile in firms where knowledge is relevant has been modified. Intangible skills refer to a workforce with tacit or difficult to measure capabilities, such as the ability to work in a team-based system, innovation, flexibility, problem solving capability and good interpersonal relations (Ramirez and Fornerino, 2007).

Recruitment and Selection Tools

Methods of recruiting employees can be a good indicator of management style and, at the very least, can tell us something about the formality of the employment relationship (Cully *et al.*, 1999: 60). Therefore, in terms of recruitment tools, the Internet and assessment centers were the primary means analyzed. The Internet was chosen because it has become a leading recruitment tool for po-

tential employees and employers searching for positions with a highly intensive use of knowledge (e.g. Buckley *et al.,* 2004).

Training

It is argued that training shapes the skills and knowledge of the workforce. Knowledge management projects tend to be proactive for training purposes; they try to anticipate the training needs for their workforce (Cascio, 1990). Training programs in KM tend to focus on problem solving, communication, technical skills, job rotation and mentoring relationships (Lepak and Snell, 1999; Ramirez and Fornerino, 2007).

Compensation

In a KM environment, one important policy and practice to review is the compensation system, as a function and as a motivator to knowledge sharing, especially in the Latin American context, where people are afraid to share their knowledge and, in some cases, employees may mistrust the source (Davila and Elvira, 2007). It is argued that incentives should be introduced to promote knowledge generation, effective knowledge sharing, learning and the application of the best knowledge for work purposes (e.g. Tayeb, 2005).

Other important factors include the employees' perception of freedom and their willingness to share knowledge with others inside and outside the organization. This dynamic reflects the quality of management of the enterprise as a whole (Barrett, *et al;* 2004). As Hislop (2003:185) point outs, there is an inherent tension between workers and the organizations for which they work over who owns and controls their knowledge.

MULTIPLE CASE STUDIES

In order to explore the phenomenon under study—how HRM is adapting its activities to support KM

initiatives—three Mexican cases were selected. The selection was based on their innovative processes, even if they do not have a specific KM project. The first case, Systems, is a medium enterprise whose main activities are related to the implementation of telecommunication solutions and applications. The second case, Snacks, is a large firm that manufactures food and snacks. Finally, the third case, Satellital, is a medium enterprise that provides solutions and consulting services for the optimization of the supply chain.

Case Systems

Systems enterprise was founded in 1991 by a visionary Mexican, who focused on the way in which telecommunication tools facilitated and optimized processes that, at the same time, had been successfully implemented by firms. It began its operations in western Mexico with six employees and is currently a medium-sized firm (140 employees) with coverage across Mexico. *Systems* provides consulting services for projects related to the design and implementation of solutions and to advanced applications in telecommunication. Additionally, it is strongly oriented to business process optimization.

Among its services, *Systems* offers a range of solutions, from convergent network applications to complete solutions for contact centers and CRM (customer relationship management) applications. In the field of convergent networks, the main products are voice and data transfer applications in local and wide area networks, IP telephony and unified messenger. Other services are the contact centers, which range from conventional call center solutions that consist of the intelligent distribution of phone calls, to sophisticated multi-channel contact centers, where interactions via telephone, email and instant messenger can coexist and integrate into different CRM systems to provide customers with a consistent response no matter what contact channel they use. Regarding CRM business applications, *Systems'* approach

is a complete integration with the contact center to automate and improve customer service processes and increase customer retention. These services are used by universities, hospitals, public administration offices, financial institutions and manufacturing enterprises.

Systems' IP telephony solutions are used today by its customers as a competitive edge and provide appropriate flexibility and scalability across the firm.

Knowledge Generation

Organizational culture in *Systems* has played a key role with respect to knowledge generation. As the operations manager pointed out: *"employees work in a place where they feel free to innovate, to change the way they do things."* As it is widely recognized, more intensive communication along with an accepting culture opens up to new ideas, which is also prepared to explore new processes and activities, favors the generation of knowledge.

This dynamic knowledge generation process, which will improve the firm's competitiveness, is favored by a non-hierarchical organizational structure and makes visible an active role played by general management. *Systems* has four levels in its organizational structure: 1) the Board of Directors – headed by the founder, 2) the Top management team –comprising four functional areas, 3) the Middle management team – comprising the operative supervisors, and 4) the Operative team.

Systems employees' motivation to innovate and learn lessons allows them to obtain new and better knowledge. According to the interviews, *Systems'* employees describe the firm as an organization that makes it is possible to learn continually. The dynamic environment, which *Systems* has created, provides its employees not only with the motivation to create new knowledge but also with the opportunity to learn. Employees consider that they can learn a great deal about the work they carry out and from the experience achieved by applying their knowledge. This knowledge

arises from the fact that they are informed about the areas in which services should be improved both for internal and external clients.

Systems has realized that its clients are the main focus of its business—its reason for being in the market. Consequently, it has initiated a strategic drive to highlight their customers' knowledge.

Knowledge Transfer

Systems' employees use different communications channels to interact and share their knowledge. One of them is a knowledge base, which makes the response time to customers (internal and external) more efficient, specifically in the area of maintenance. Employees working on a customer report first need to access the knowledge database in order to find out how the same problem has been solved in the past. The knowledge database works as a decision tree. All maintenance reports are entered into this database.

Another current communication method involves distribution lists that enable employees to interact with all members of the organization. This communication channel is frequently used to share experiences or seek assistance from another member of the firm in order to solve a problem. At the same time, *Systems'* employees have other means of sharing their knowledge, such as the telephone, messenger, face-to-face chats and formal and informal meetings. The use of formal means of communication, which facilitates interaction among employees, in addition to the informal mechanisms of physically present communication, such as face-to-face and hallway chats, can also improve the knowledge transfer process.

Effective knowledge transfer requires an organizational culture that motivates the members of the organization to search for new ways of doing things. The *Systems* case shows how culture is a relevant factor in the knowledge transfer process, especially in creating a sharing atmosphere. The employees are committed to sharing their *know-how* with their co-workers. At the same time, the

top management has committed itself to acquiring the media that makes knowledge transfer possible.

As regards the contextual factors affecting knowledge transfer, the maintenance manager pointed out,

"Here in Monterrey we do not have a problem with sharing our know-how. Our challenge has been deciding when we should share it with coworkers in other cities. Before the creation of knowledge database, we had to phone the expert to try to resolve a specific situation. IT introduction has diminished geographical distance limitations; in this case, through the knowledge database."

Another important aspect to consider is that people are often afraid to share their knowledge. They believe that they will lose the advantage that their expertise gives them among their peers and within the organization. In *Systems*, top management is attempting to introduce a commitment letter. The employee who has been given the opportunity to attend a training course outside the firm has to disseminate this new knowledge throughout the firm. The firm is clearly actively thinking about how its employees can become trainers. In this way, HRM plays an important role in knowledge transfer.

KNOWLEDGE MANAGEMENT AND HUMAN RESOURCE MANAGEMENT

Recruitment and Selection

The industrial sector in which *Systems* operates depends on the creation of specific knowledge needed for quality work in the telecommunications sector. *Systems* recruits highly qualified engineers, certified by its business partners, and graduates of Mexico's most prestigious universities. *Systems* does not have a special method for recruiting employees but believes that employee retention is related to commitment and trust. Nevertheless,

in some cases, employees have left the company for a higher salary.

Training- *Systems* invests in more than 60 hours of training per employee per year. Training is primarily focused on state-of-the-art technologies developed around the world. Knowledge itself plays a tacit role, and even when it cannot be codified in the form of a written document, it can be taught by means of *mentoring* and learning. In this sense, organizations have to consider specific ways to ease the training process, for example, formal training of workers in the workplace, e.g. by their coworkers, as in the case of *Systems*.

Compensation- A high pay package with performance incentives motivates personal knowledge creation, sharing and use, and it also helps to attract and retain employees. In this sense, *Systems* is thinking of developing incentives for employees to share their knowledge among coworkers. Even though employees are committed to transferring the knowledge obtained in training courses, they will receive a bonus for this activity in the future. The employee will benefit doubly: first, by receiving the opportunity to take a course outside the firm; and second, by receiving payment just for transferring this new knowledge to coworkers.

CASE SNACKS

In 1921, *Snacks* was founded by three brothers in the northern Mexican city of Monterrey. In 1991, the company was taken over by an American multinational, turning *Snacks* into a global leader in the cookie market and into Mexico's largest cookie manufacturer. The company offers its consumers a wide variety of high-quality products for every lifestyle, producing pastries, oats, cereals and other related products. It has production facilities in five states across Mexico.

Snacks has achieved sustained growth to become the cookie market leader in Mexico, as well as consolidating its leadership in the US Hispanic market. It has also reached this market position

by being fully customer oriented, constantly offering innovative, high value-added products and anticipating its customers' needs.

Its accomplishments include one of its greatest sources of pride: its people. *Snacks* has always taken an interest in its employees' well-being. Consequently, the company obtained the highest level of employee satisfaction of all the companies that comprise the international corporation to which it belongs.

In March 2005, *Snacks* was certified as one of "The Top Ten Places to Work in Mexico," awarded by the Great Place to Work Institute México.

Knowledge Generation

For *Snacks,* external professional consulting is a highly important source of knowledge generation. It resorts to these services in two very specific situations: to deal with a situation that is unusual for the organization and to anticipate changes in the environment. An example of the former situation is described by the human resources coordinator,

"From the bird flu to the current influenza crises, we have had to have a contingency plan in place. Consultants shared their knowledge on how the viruses are transmitted, the medical side, the consequences of the virus, how long it takes to transmit the virus, the different stages of an epidemic and a pandemic, the WHO website. All of this information has been useful for organizing informative workshops and defining alternative strategies. In human resources, in particular, we had to decide which positions were indispensable for the organization to continue its operations and how employees could work remotely from home."

A source of internal knowledge creation stems from the corporation's and employees' own initiatives. The company is currently focusing on promoting a culture of innovation. In fact, the organization has named this year the Year of Innovation. *Snacks* has allocated funds specifically

to highlight and support this initiative. At the beginning of the year, all the employees, regardless of their organizational level, could disclose any innovation idea they had for the products and/or processes. HRM sends graphs every month on their progress and the contributions to innovation made by each area, and an award ceremony is held every three months. The employees who have contributed the strongest innovation ideas receive the innovation bracelet.

At *Snacks*, the organizational culture and the support of the senior management are fundamental to the generation of knowledge. Moreover, one of the coordinators interviewed commented that the customers themselves are an indispensable source of knowledge generation; "*I believe that since our organization is 100% market-oriented, our only boss is the customer. We always focus on thinking about what the customer is thinking.*"

Knowledge Transfer

Even though *Snacks* is a large international company, knowledge transfer is possible with formal, informal and technology-based communication mechanisms. For example, when the company's values were made official, this was shared in a cascade, from one hierarchical level to another, from one boss to another in person. Human Resources trained and empowered directors from all areas, and they, in turn, trained their managers and collaborators in person, face to face. Since the information being transferred was related to values, it was important that it be carried out face to face, so that the boss could share his or her vision of and commitment to said values.

When the new compensation system was designed by the external consulting firm, this new knowledge was transferred in person with the area heads and their work teams. The program was called "Ticket to a Safe Future."

Technology-based communication media is predominantly used when the company wants to share new knowledge that does not involve all of

the organization's employees or when it does not entail a radical change in operations.

The commitment shown by the senior management to informing employees about new ways of operating is an organizational component that facilitates knowledge transfer. This commitment is reflected in the attendance by every single employee when specific sessions are held to transfer new knowledge, such as the "Ticket to a Safe Future" program. Moreover, all the relevant information that was shared in person was documented and disseminated through the organization's Intranet.

Knowledge Management and Human Resource Management

Recruitment and Selection

Since the philosophy of permanent innovation to compete in the marketplace and the start of the "Year of Innovation" at *Snacks*, modifying the recruitment and selection practices has been imperative for this organization. As one of the *Snacks* employees mentioned, "It would be illogical for a group of directors, managers and collaborators to have certain initiatives but not the personnel to support them in their implementation because they lack the competencies to do so. Moreover, the creativity assessment that has been included is very important."

Training. In a continually transforming organization, training is a critical topic for *Snacks*. As mentioned in the knowledge transfer section, any new knowledge that arises in the organization, either as the result of consulting or an internal initiative, is shared with employees through training so that they can understand and use the same knowledge. HRM has technological mechanisms as protocols so that training can be face-to-face, in person.

Compensation / performance evaluation. The year of innovation at *Snacks* has resulted in employees, who have participated with initiatives,

being rewarded and recognized. There is even a bonus for each idea implemented. Moreover, one of the variable compensation bonuses was redesigned to ensure that almost 10% of an employee's total compensation is related to performance-related innovation.

"For example, the percentage of the innovative products sold out of the total sales. So, of all the products you sold, how many were innovative products? You can see that we are committed to innovation as far as possible. We even link it to compensation."

CASE SATELLITAL

Satellital is a medium enterprise that is part of an international group headquartered in Monterrey, Mexico. It was created from the merger of three strategic business units as a solution integrator for the supply chain. *Satellital* concentrates on services based on satellite telecommunications. It provides services in two main fields: remote asset monitoring and mobile satellite telecommunications. Additionally, *Satellital* develops high value-added business solutions based on the integration of information and wireless telecommunication technologies, which are aimed at optimizing its customers' core business processes in Mexico, North America and Central America.

This enterprise has instituted a philosophy with guiding principles and values that leads its personnel towards achieving clear objectives and fosters daily interaction and the development of each individual. Its mission is to develop high-growth business services based on information and telecommunication technologies.

Its main activities are: (1) Solutions for controlling and optimizing the logistics of land and sea mobile assets through remote monitoring. (2) Reliable solutions for mobile satellite communications (radio, telephony, broadband) for work teams operating in remote locations where conventional

means of communication are inadequate. (3) Technological solutions to drive automotive financing through enhanced risk control and better portfolio management. *Satellital* offers concessions to exploit the transmission and reception rights of frequency band signals associated with the foreign satellites MSAT and Inmarsat. Furthermore, it also has the concession to install, operate and exploit a public telecommunications network using those satellites. All the equipment used for the provision of satellite services that it offers under its public network has been approved, which currently, makes it the only company in Mexico that has these authorizations, as granted by the Ministry of Communications and Transport.

Knowledge Generation

External knowledge stems predominantly from the supplier through its equipment and training in the use of the same. Nevertheless, *Satellital* has sometimes discovered faults in the supplier's equipment and, when this occurs, it conducts a diagnosis, documents it and shares it with the rest of the organization. It also shares this new knowledge with the supplier.

The customers offer another form of external knowledge as they too identify faults, and *Satellital* undertakes to share this knowledge with the supplier. As one of the area coordinators said,

"We all learn from mistakes. However, we don't exactly change the world; we leave that to the supplier. So, the supplier has to make changes and then generate new documentation and this documentation is valid and we retrain on the basis of said documentation."

Likewise, customers offer *Satellital* feedback on improvements to their systems and processes. A clear example of the creation of internal knowledge is the development of its own software.

"In terms of software applications, we have developed software that offers a point on the map, so to speak, in very simple terms... that involved numerous functions. There is a whole series of reports stating that it generates value for customers, ranging from those who exclusively request the location of their equipment to those who require more detailed information, such as arrival time estimates, productivity, fixed-asset location and trip start dates and times."

The development of applications implies training all the members of the organization in their use. This ensures that all the members of the company participate in the new knowledge.

An important component in *Satellital* that facilitates the creation of knowledge is the prevailing organizational culture. The creation of knowledge and innovation are encouraged and must be presented in writing for authorization. In this document, designed to request new ways of doing things, employees must notify why they want to do it, how they will do it and whether it can be feasibly done in the company.

Furthermore, a high level of self-directed learning exists. The company has to keep up to date on telecommunications and value-added legislative topics, particularly since customers always want to be on the cutting edge of this field.

Knowledge Transfer

Document processes, or descriptions of equipment technical, are the main formal communication media used at *Satellital* to transfer its knowledge throughout the organization. An area coordinator commented,

"Personally, I have had to create documents that offer a technical description of certain services or pieces of equipment so that we can all have the same vision of what we are offering."

Training is another medium for transferring knowledge. This practice comprises two components that clearly inhibit the transfer process: technical language and people's attitudes. With regard to the language, one of the members of the company commented,

"I have realized that it's very hard for everyone to reach the same level of understanding. I need to bring what I know as a technician down to a common language, where a person from the retail area with no technical knowledge and who manages customer services can understand the advantages of the technology, in order to assist customers."

In relation to people's attitudes, employees do not feel comfortable asking questions if they have a query. "*Handing out documents is very easy, but you have to have the humility to say I don't understand it and come and ask.*" Gaining people's trust has been very difficult.

Organizational culture, rather than being a component that facilitates knowledge transfer, as mentioned in the literature, limits this process at *Satellital*. With all the changes in the organizational structure, it is not clear what the positions entail and which managers should direct and foment training or knowledge transfers. One of the coordinators said,

"We haven't been able to generate a knowledge transfer and assimilation methodology. It's not that we don't have enough systems, and even though the knowledge is in a computer ... the computer won't transfer it per se. A culture should be created for this."

Knowledge Management and Human Resource Management

Recruitment and Selection

As a result of the changes in organizational structure and the dependence on headquarters in functional support areas, such as human resources and finance, *Satellital* has opportunity areas in human resource practices and, above all, in the management of its tacit knowledge.

Recruitment and selection are key practices for the effective management of knowledge. There is a high staff turnover rate in *Satellital's* customer service area. One of the possible reasons for this is the lack of job descriptions. In fact, even the coordinators do not have job descriptions. "*It's incredible. I provide services for the administrative area, the retail area; I am working on a project we have with the government. I know what I have to do and government participants ask me to do other things, but since they don't say I can't do them... it's not in writing anywhere.*"

Training - Training is of utmost importance for *Satellital*. As mentioned beforehand, in knowledge generation and transfer, all the knowledge, both external and internal, generated, must be shared with the entire organization. Training is provided internally, that is to say, the employees themselves offer courses and assess learning, mainly for technical matters, value-added and returns on investment that could be obtained by the customer. Training is offered in both the retail and the customer service areas. Moreover, the headquarters offers courses, since certain competencies must be fulfilled.

External training is mainly for the telecommunications technicians who have to keep up to date on this topic. A specialist is sent to training courses and then that person is responsible for sharing this knowledge with his or her colleagues through cascade training.

Performance evaluation - Performance evaluation depends on the areas in which the employees work. For instance, field personnel are evaluated for following the established protocols. While customer service employees are evaluated by means of a customer satisfaction survey on the way in which they solve customers' queries. Customers evaluate them on their knowledge, not their attitude. In this way, customers will be more objective.

People become more aware of the relevance of training; training becomes a work tool.

CURRENT CHALLENGES FACING THE ORGANIZATIONS

There is no doubt that both knowledge and human capital are increasingly regarded as key levers of competitive advantage in today's global, dynamic and complex business environment. More importantly, people and knowledge are inextricably linked. Individual human beings are the ultimate knowledge creators and bearers. Organizations do not think by themselves, although they may have "knowledge enabling" contexts and memory systems. In fact, both people and knowledge should be regarded as having special potential as scarce and idiosyncratic resources, consistent with the premises of the resource-based approach to strategic management. Indeed, a significant amount of rigorous, resource-based scholarship exists that also deals with KM or HRM.

Figure 1 summarizes the results of our research obtained after the cross-case analysis was concluded. In the first column, the knowledge generation process is strongly supported by employees' motivation to innovate and learn lessons that allow them to obtain new and better knowledge (Nonaka et al., 2000). According to our cases, *Systems* and *Satellital* employees describe their firms as organizations that make it possible to continually learn. The role that the employee plays as the bearer of initiatives, suggestions, voluntary effort and greater commitment is very relevant. Thus, organizational structures should be less hierarchically structured and management style more participatory so that the necessary con-

Figure 1. Cross-case results

Firm	Knowledge Generation	Knowledge Transfer	KM & HRM
Systems	▪Organizational culture ▪Less hierarchical organizational structure ▪Opportunity to learn	▪Capacity to assimilate ▪Attitude to share ▪Common language	▪Recruitment and selection ▪Train the trainer ▪Performance evaluation-*customer*
Snacks	▪Top management initiatives ▪Innovation year (2008)	▪Organizational culture – *technological communication media*	▪Position profile ▪Cascade training ▪Compensation: High performance bonus
Satellital	▪Organizational culture ▪Top management support ▪Less hierarchical organizational ▪Opportunity to learn	▪Organizational culture - *knowledge base and distribution lists* ▪Physical distance ▪Afraid to share	▪Recruitment and selection ▪Training ▪Compensations

ditions are created, which allow the individual's flexibility to be preserved.

In terms of knowledge transfer, column two exposes how firms operating in dynamic environments face three main challenges pertaining to the reproduction of their: 1) internal competencies, 2) abilities and 3) collective learning developed and its *storage* within the firm over time. *Systems*' employees use different communication channels to interact and share their knowledge. One of these is a knowledge base, which makes the response time to customers (internal and external) more efficient, specifically in the area of maintenance. Employees working on a customer report first need to access the knowledge data base, in order to find out how this same problem has been solved in the past. The knowledge data base works as a decision tree. All maintenance reports are entered into this data base.

Another current communication method involves distribution lists that enable employees to interact with all members of the organization. This communication channel is frequently used to share experiences or to seek assistance from another member of the firm in order to solve a problem; this is the case of *Satellital. Systems*' employees have other means of sharing their knowledge, such as the telephone, messenger, face-to-face chats and formal and informal meetings. The use of formal means of communication, which facilitates interaction among employees, in addition to the informal mechanisms of physically present communication, such as face-to-face and hallway chats, can also improve the knowledge transfer process.

Effective knowledge transfer requires an organizational culture that motivates the members of the organization to search for new ways of doing things. Flexibility in the employees' performance and interaction is required, in order to facilitate this search (Zapata, Rialp & Rialp, 2009). This culture should be open so as to encourage employees to share their knowledge and communication among members of the firm, even when time is at a pre-

mium. The three cases under study expose how this is possible and is vital in the knowledge transfer process. For example, the *Systems* case shows how culture is a relevant factor in the knowledge transfer process, especially in creating a sharing atmosphere. The employees are committed to sharing their *know-how* among their co-workers. At the same time, the top management has committed itself to acquiring the media that makes knowledge transfer possible.

As regards the contextual factors affecting knowledge transfer, another important aspect to consider is that people are often afraid to share their knowledge. They believe that they will lose the advantage that their expertise gives them among their peers and within the organization. In Mexican organizational culture, knowledge transfer is only possible if the director or top management asks somebody to share or transfer his or her knowledge to somebody else. In some enterprises, the organizational culture supports knowledge transfer. This can mainly be observed in transnational companies. Mexicans are very possessive about what they know because a lot of effort was required to obtain it. In *Systems*, top management is trying to introduce a commitment letter. An employee, who has been given the opportunity to attend a training course outside the firm, has to disseminate this new knowledge throughout the firm. The firm is clearly actively thinking about how its employees can become trainers. In this way, HRM plays an important role in knowledge transfer.

Finally, column three summarizes how KM initiatives are beginning to be supported by HRM. Although managers are usually keen to recognize that human and social issues underpin the success of KM initiatives, a number of structural, organizational embedded factors hinder the KM efforts, and they are quite difficult to overcome, despite the initial managerial commitment to solving these problems. This has been observed in the three Mexican cases described above, specifically, how HRM is transforming its traditional activities.

In reference to recruitment and selection, firms have the possibility of generating a human capital advantage through recruiting and retaining outstanding people: "capturing" a stock of exceptional human talent, latent with powerful forms of "tacit" knowledge (Svetlik and Stavrou-Costea, 2007) by designing a competitive compensation system. The industrial sectors in which *Systems*, *Snacks* and *Satellital* operate depend on the creation of specific knowledge needed for quality work. Only *Snacks* has *a* specific method for recruiting employees, but it believes that employee retention is related to commitment and trust. *Systems* and *Satellital* are beginning to develop operational programs to select the best employees, regarding salary as a relevant method of doing so.

Training is a relevant HRM activity in our three cases that show how knowledge transfer is critical. As has been observed, these cases reveal that training is vital as a mechanism to share new knowledge throughout an organization. Depending on the size of the firm or its geographical presence, this HRM activity is supported by different media communication mechanisms, but face-to-face is still the most useful.

Concerning knowledge workers' careers, Evaggelia (2007:322) points out: *"The old career ladders are gone. The old lifetime employees are gone. If career ladders do not exist within one company, they must exist across different companies if they are to exist at all."* Here is where HRM practices have to change in order to retain or maintain employees for a long time. The most popular retention strategies are related to compensation. A high pay package with performance incentives motivates personal knowledge creation, sharing and use, and also helps to attract and retain employees. In this sense, *Systems* is thinking of developing incentives for employees to share their knowledge among co-workers. Organizations must find incentives both to encourage knowledge transfer and to generate knowledge. These incentives could be both monetary and non-monetary.

SOLUTIONS AND RECOMMEDNATIONS

This chapter shows cultural and social drivers, such as management and personal behaviors, should be changed to create environments of trust, and efforts should be made to find the root cause of problems without assigning blame. New management practices must focus on combining understanding, knowledge, skills and attitudes when assembling work teams; analyzing requirements for performing work and establishing new work settings are a huge component of tacit knowledge, or knowledge that is mainly embedded in people.

Hence, to enable successful knowledge transfer, knowledge should be taught in a more practical and appropriate manner and adapted to each firm's specific processes. The use of mentoring systems can help to minimize knowledge uncertainty by informing the members of the organization about each other's respective competencies. Besides that, the internal transfer of knowledge requires that the receivers be willing and committed to adopt the activity and that they have the capacity to assimilate, understand and adopt the recently acquired knowledge.

A central challenge for firms operating in dynamic environments is how best to manage their employees. This can be achieved by ensuring that HRM strategies facilitate the creation and transfer of knowledge. HRM strategies may therefore include: external talent acquisition, internal talent development, job rotation and action learning, and contractually binding the most desired and talented employees to the organization (Evaggelia, 2007). However, in addition to a traditional contract, a new psychological contract (Dávila and Elvira, 2009) is needed to promote loyalty and retention.

HRM deserves an explicit mention in the people-centered KM debate. In leading organizations and industries, people management is assumed to be one of the top strategic priorities. It is worth mentioning the increase in research dealing with the relationship between HR prac-

tices and organizational performance (e.g. Arthur, 1994; Huselid, 1995; Guest, 2002). Although from different perspectives and with notable differences in specific practices, empirical support for the positive impact of HRM on organizational performance can be assumed.

Finally, managers must find and develop an environment for learning, knowledge-sharing and knowledge integration procedures (e.g. Teece, 2007), given the fact that people are afraid to share their knowledge, and in some cases, employees may mistrust the source. Knowledge as a part of intellectual capital is the key to a competitive advantage in the knowledge economy; hence, HRM should seek to become an integral part of corporate strategy, enabling knowledge to be managed in the interests of organizational performance (Thite, 2004).

KEY TERMS AND DEFINITIONS

Human Resource Management: Management of practices and activities related with the wealth of organizations' most value asset: human capital.

Informal Communication Mechanism: are methods utilized to transfer knowledge without

being scheduling or mandatory by top managers. These methods such as face-to-face interaction, corridor chats and IT systems, facilitate interaction among colleagues and improve the knowledge transfer process. Knowledge workers prefer to use *personal* tools that they can control and customize to their own needs such as informal communication mechanism.

Knowledge Generation:: Institutionalized activity, so each organization must be able to establish its own creative routines, processes and human intervention to make possible to have new knowledge.

Knowledge Management:: Process that involves planning, coordination and (KM) control of knowledge generation, knowledge transfer and knowledge utilization

Knowledge Transfer: Process that involves sharing of knowledge from a source and accumulation or assimilation of this knowledge in the receiver unit. This process could be useful value if the recipient does see the potential of the new knowledge and hence, does utilize it in his or her own activities.

Knowledge Workers:: participants in the knowledge-based economy, those persons who work in the top three standard occupational classifications (managers, professionals, associate professionals), with high levels skills, indicated by degree or equivalent qualifications (professional diplomas and/or higher education), and perform tasks that require expert thinking and complex communication skills with the assistance of computers.

Tacit Knowledge: is an intangible resource and difficult to transfer from one firm to another or for competitors to imitate it; and it is not only connected to individuals but also to the way these individuals interact. Barney (1991) has defined as a valuable, generally essential, rare and inimitable resource.

ENDNOTE

The capacity to assimilate refers to the ability of the firm to recognize the value of new information, assimilate it and apply it to further its commercial goals.

Chapter 13
An Integrated Methodology to Detect the Evolution of Virtual Organizational Communities

Marco De Maggio
University of Salento (Lecce), Italy

Francesca Grippa
University of Salento (Lecce), Italy

ABSTRACT

This chapter describes an integrated methodology developed to combine two analytical approaches, social network analysis and content analysis, to investigate the organizational mechanisms responsible for the emergence of social capital within virtual communities. This integration is proposed to overcome the main limitation of social network analysis: the analysis of the content of the information flows and the organizational and cultural aspects of their exchanges.

We propose a methodology applied to virtual communities operating in an organizational context. We aim to demonstrate how such an integrated approach may help understanding the way new ideas spread within and across networks, helping to recognize the emergence of informal roles, community phases and the network structure.

The proposed methodology has the potential to enable the analysis of virtual communities' overall composition, evolution and social structure, characteristics and organizational behavior of the "project related sub-communities", informal members' roles and their contribution to the development of project's task.

INTRODUCTION

As the focus of competition moves from the firm to the network, and from rigid organizational structures to informal networks, communities are presented in literature as the most flexible governance model to build a value-creating organization. New organizational forms – such as communities of practice, communities of innovation, industry consortia, knowledge-sharing networks - are now emerging in response to new environmental forces that call for new organizational and managerial capabilities (Dyer, 2000). The success of these new organizational forms depends on the ability to behave as integrated networks, where different stakeholders gather in an open and flexible interaction, inside and outside the company boundaries (Ghoshal and Bartlett, 1997).

The diffusion of the Internet allowed communities to benefit from virtual networking, and delocalization, and to become more capable to afford the challenges of a more complex business environment (Cothrel and Williams, 1999; Hildreth et al., 2000). The effectiveness of these new forms of collaboration and knowledge creation explains the growing interest of scholars and managers to understand how communities really work, how they organize internally, how they produce value (Schultz et al., 2003; Mitchell, 2002; Burt, 2000).

The main contribution of the present work is to map the subject matter of the information flows within virtual communities, to match the community's social structure with the emerging ideas or topics. It also provides empirical evidence from the application of the integrated methodology to a "longitudinal study" looking for the organizational facets of a global, dispersed community.

A case study analysis has been conducted on a large Virtual Community developed at a global scale, involving a high number of members and a wide range of different organizations located all over the world.

The achievement of the presented goal has been conducted under the guide of the following question: *How to detect the evolutionary structure of a virtual community by following the diffusion pattern of a new project idea?*

The main limitation of the Social Network Analysis, that is to treat all the connections in the same way, without differentiating the topics of discussion, might represent an obstacle in the analysis of large communities. It would be hard to understand communications referred to friendly personal ties or projects-related ones. This can prevent the development of a more comprehensive picture of the community, making it difficult to disentangle the web of many interactions, 5431 in our case, that can provide no meaning and possibly lead to misinterpretations.

While SNA was able to point the "who" and the "how" of the social capital structural dimension, the integration with the Content Analysis revealed the "who", "how" and "what" of the social capital overall dimensions, structural, cognitive and relational. The integrated methodology provided a more complete picture of the Community, useful to improve the understanding and the monitoring of such "hidden organizations", and to offer useful insights for their management.

The main managerial implications of the outcomes of this research can be classified following some key managerial processes, related to the organizations' capability to better:

1. Understand Communities: the application of the integrated methodology showed its suitability to describe the main characteristics of a project-oriented community, identifying several aspects such as: the topics associated to emergent sub-communities, the role of the original core group in leading all the projects; the impact of a strong leadership built around few coordinators.

2. Analyze and Monitor Communities: the use of the methodology as a monitoring system able to detect and map:

a. the most involved actors, the way in which they interact with the others and the spontaneous emerging of unpredicted roles;

b. the trend in organizational behaviour, in density level, and centralization dynamics and the involvement of task-related subgroups, in the "operative" phase of the lifecycle.

3. Manage Communities: the application of the integrated methodology and the use of the frameworks and tools used to present results might be useful as a managerial tool for identifying step by step the areas of intervention for each project, helping to avoid the failure of project development activities. They can also support the activity of recognition of the best contributions to be rewarded, and the identification of knowledge experts who play a crucial role in speeding up the process of innovation.

THEORETICAL BACKGROUND

The emerging phenomenon of Virtual Communities finds its roots in the concept of Community of Practice (CoP) introduced in 1991 by J. Lave and E. Wenger in the book "Situated Learning: Legitimate Peripheral Participation." This concept was further developed by E. Wenger in 1998 in the book "Community of Practice: Learning, Meaning and Identity" and then elaborated with W. Snyder in 2000 in the Harvard Business Review. Communities of Practice are considered groups of people informally bound together by shared expertise and passion for a joint enterprise. People in Communities of Practice share their experiences and knowledge in free-flowing, creative ways that foster new approaches to problems (E. Wenger & W. Snyder, 2000). Sawhney and Prandelli (2000) propose a similar concept, *communities of creation*, representing the governance mechanism

particularly crucial for the organizations operating within knowledge intensive industries.

Over time this concept was further developed and assumed different connotations depending on the properties of the groups involved. New concepts were introduced such as "Knowledge Community", "Community of Interest", "Learning Community", "Communities of Creation". Simultaneously, the explosive development of information and communication technologies and their pervasiveness in the organizational and managerial processes of the community, have enabled the introduction of a virtual dimension within the traditional mechanisms of functioning of an Organizational Community.

The diffusion of Information and Communication Technologies had a deep impact on several community features. We propose eight dimensions to characterize the nature of virtual communities in an organizational context, highlighting the main differences between virtual and physical communities.

Purpose: virtual communities, similarly to the physical ones, may emerge for several reasons, having different characteristics based on the rate of environmental uncertainty, strategy or operation management goals. Virtuality represents an important advantage when the community is formed in emergency conditions, when rapid organizational changes are required following unpredicted alteration of the business environment.

Size: Community size is widely variable, in physical as well as in virtual settings. The more the number of people increases, the more evident is the distinction between the intellectual organizational *core* of the community and the periphery, or extended community (Wenger and Snyder, 2000; McDermott, 2000). The main distinction between physical and virtual communities is that the latter grow easily and fast, facilitated by web connection and the rapid diffusion of aggregative movements on the web-sphere. They can reach very large dimensions and high dispersion, which might introduce the risk to neglect the common

goals and reduce internal motivation (Van Krogh, 2000).

Physical Proximity: in virtual communities the employment of information technology to communicate and to exchange content allows people to interact in an ubiquitous way. Although their voluntary nature that defies managerial intrusion, Virtual Communities need a strong management commitment to encourage interaction, and to coordinate common actions toward the achievement of the community's goals.

Membership: in virtual communities membership is more critical than in physical contexts, provided the low level of control exerted on the community. Selection principles can be initially shared, but they can change as the community grows. When membership is almost mandatory, the organization can establish requirements for the access. When the process is free and voluntary, a sort of natural selection may emerge making potential entrants aware of the "entrance rules" (Mitchell, 2002). Being virtual communities more fluid, membership might vary quicker than in situation of physical co-location.

Leadership: leadership creation and distribution throughout community's life cycle can change according to different factors: evolution of the community, organizational dynamics, management intrusion in the community life. Although it is common for virtual communities to have a flexible not hierarchical organizational structure, some scholars suggest to create the conditions for a more stable leadership, to provide members with the required recognition of their contribution and a precise landmark for the community identity (Lesser, Storck, 2001; Fontaine, 2001; Gretchko et al., 2002).

Diversity: The degree of diversity in the community represents the primary source of innovativeness and one of the main sources of competitive advantage created for the organization (Aral and Van Alstyne, 2007, Hofstede, 1993). The community diversity may be attributed to the individual background and idiosyncrasies of each

member (e.g. cultural differences and geographical origin that shape collaboration and relationships). Another source of diversity comes from different organizational behaviours and corporate culture, which can create suspicion and difficulty of collaboration (Hesselbein and Johnston, 2002). A third source of diversity comes from the individual professional background, which helps avoid the "groupthink effect", but can create problems in interpreting individual contribution.

Lifecycle: Virtual communities have no definite boundaries, both in time and space, but they can change in composition and goals (Gloor, 2006). Though they are generally considered constant settings of knowledge sharing and collaborative work, when created for strategic purpose or to face unpredictable events, they can be planned to have a short duration to concentrate energy and efforts (Wenger et al, 2000). While several models have been developed to describe the hypothesis of lifecycle of a community (Tuckman, 1956, Wenger and Snyder, 2000) virtual communities show a high rate of variability in phases of development, depending on their vision, size, cohesiveness and goals (Gongla and Rizzuto, 2001).

Sponsorship and Institutionalization*:* the last feature of virtual communities regards the relationship with the organization, one of the most critical issues related to the creation and evolution of a virtual community (Brown and Duguid, 2001). Because of their voluntary and open nature, factors like the involvement of management, the dependence on the organizational structure, culture and practices may represent strong constraints to creativity and innovativeness for virtual communities (McDermott, 1999). This relationship can assume different shapes (Wenger et al., 2000), from total independence, to some degree of organizational support, until the total institutionalization of the community as an operative program within the organization structure.

VIRTUAL COMMUNITIES: A SYSTEMATIC TAXONOMY

In the attempt to define a systematic taxonomy of virtual communities that interact at a global scale, Peter Gloor (2006) proposed in the book "*Swarm Creativity*" three types of networks (see Figure 1):

1. Collaborative Innovation Networks (COINs): made of self motivated people that share a common vision, meeting on the web to exchange ideas, knowledge, experiences and to work in a collaborative way to achieve a common goal.
2. Collaborative Interest Networks (CINs): composed by people sharing the same interests who do not perform a common task in the virtual team; this kind of community is very frequent on the web, has a lot of silent members, who collect information from web sites, forums, and a few active members who are keen to share their knowledge and experiences within the community.
3. Collaborative Learning Networks (CLNs): a community made of people inclined to share knowledge and practice to benefit reciprocally from personal mastery and the collective knowledge accumulation of experiences.

These three types of virtual communities are intended to form what is called Collaborative Knowledge Network (CKN), a "*high-speed feedback loop in which the innovative results of COINs are immediately taken up and tested, refined or rejected by Learning and Interest Networks, and fed back to the originating COINs*" (Gloor, 2006, p.128).

COINs are the creative base of the CKN, the enabling factor for the creation of fluid organizations, characterized by organizational creativity, productivity and efficiency because of its key principles of "creative collaboration, knowledge sharing and social networking". Generally, a COIN is formed around a new interesting idea absorbed outside organizations, brought inside and discussed in a "swarm" collaborative and

Figure 1. Components of Collaborative Knowledge Networks (adapted from Gloor, 2006)

Community Type	Category	Focus	Mode of Participation	Example
COIN	Innovation	Fundamentally new insights	Peer group of Innovators	Linux kernel developers, creators of Web
CLN	Best-practice knowledge stewarding	Shared Knowledge	Active sharers of knowledge as experts; active seekers of knowledge as students	Xerox repair technicians, oneFish, Web masters
CIN	Helping	Shared Interest	Few sharers of knowledge as experts, many silent seekers of knowledge, lurkers	The Motley Fool, Internet Users

creative way to improve individual knowledge, capabilities and organizations' performance.

Virtual Communities and Social Capital

Communities began to be observed as the natural expression of employees seeking time and place to connect with others, to exchange opinions and ideas about common work, and to built a sense of identity to praise the human dimension of organizations. Over time they have been recognized as actual organizational assets (Lesser and Stork, 2001), able to:

- exploit the potential of the issues linked to the crucial passage from the slow and linear traditional hierarchies to the new fast, unpredictable and complex global economy;
- positively affect the organizational performance;
- handle unstructured problems;
- share knowledge outside traditional organizational boundaries;
- develop and maintain the organizational memory.

The difficulty in assessing their contribution is that communities are often hidden assets, appearing neither on the organizational chart, nor on a balance sheet. To understand how communities create organizational value, we suggest thinking of them as engines for the development of "social capital". Some studies indicate how social capital developed within virtual communities leads to behavioural change, change that results in greater knowledge sharing, which then positively influences business performance (Lesser and Stork, 2001, p.2).

Central to the Social Capital theory is to recognize the importance of "networks of relationships" considered valuable resources to support social business, able to provide the community members with "*the collectivity, owned capital, a credential*

which entitles them to credit, in the various senses of the word" (Bourdieu, 1986, p.249).

One of the most widely recognized contributions to the theory on Social Capital is represented by the work of Naphiet and Ghoshal (1998). They move from the work of Bourdieu (1980, 1993) and Putnam (1995), accepting a comprehensive concept of Social Capital including the actual or potential resources becoming accessible through networks of relationships. Accordingly they define Social Capital as "*the sum of the actual and potential resources embedded within, available through, and derived from the network of relationships possessed by an individual or social unit. Social capital thus comprises both the network and the assets that may be mobilized through that network*" (Naphiet and Ghoshal, 1998, p.248). They propose a model of Social Capital based on three key dimensions:

1. Structural Dimension: it is related to the individual capability to connect with other people; the value that derives from exploiting this capability is represented by the opportunity to reduce time and costs related to have access to new information, avoiding redundancy and dispersion.
2. Relational Dimension: another aspect related to the attitude to build connections is the personal human management of interpersonal relationships, that create trust and reinforcement in community networks; this dimension is intended to be based on four factors: obligations, norms, trust and identification, that affect the network behaviour, building rules and standards that give the group a deep sense of identity.
3. Cognitive Dimension: it regards the process of sharing information and knowledge, that create a common context, with common codes and a "common language" (Naphiet, Ghoshal, 1998, p.253), intended to be a virtuous cycle of shared practices and models that grows over time.

To avoid confusion in the wide range of definitions of Social Capital available in literature, Lesser and Storck (2001) provided a first classification of the positive impact of Communities on organizational performance. Their work has been based on the study of seven companies in which Communities had been recognized as value creating mechanisms for the organizations (Lesser, Stork, 2001). Among these benefits we recall the following:

1. Decreasing the learning curve of new employees
2. Responding more rapidly to customer needs and inquiries
3. Reducing rework and preventing "reinvention of the wheel
4. Spawning new ideas for products and services

After discussing the nature and the importance of virtual communities for organizations, it is important to answer an important managerial question: "how to monitor the evolution of social capital within virtual communities inside and across organizations?". Next paragraph refers to Social Network Analysis (SNA) as a possible first answer to address this question.

SOCIAL NETWORK ANALYSIS: AN ANALYTICAL APPROAH TO INVESTIGATE SOCIAL CAPITAL CREATION

Social Network Analysis has been defined as "*the disciplined inquiry into the patterning of relations among social actors, as well as the patterning of relationships among actors at different levels of analysis*" (Breiger, 2004). This methodology was widely employed since the 1960s to highlight the link between the network structure of communities and the creation of social capital, represented by organizations' competitive advantage.

The application of Social Network methods and tools within organizations had a great impact on the diffusion of SNA theories. Today, many scholars and practitioners refer to the field of Organization Network Analysis (ONA) as a tool that enables companies to map the information exchanges among employees and determine how to support information brokers, gatekeepers and boundary spanners, and to integrate isolated groups (Foster and Falkowski, 1999).

In general, social network analysis focuses on the relationships between people, rather than on actors' characteristics and attributes. These relationships may comprise the feelings people have for each other, the exchange of information, or more tangible exchanges such as goods and money. By mapping these relationships, network analysis helps to uncover the emergent and informal communication patterns present in an organization, which may then be compared to the formal communication structures. These emergent patterns can be used to explain several organizational phenomena (Burt, 2000). Since the patterns of relationships bring employees into contact with the attitudes and behaviors of other organizational members, these relationships may also help to explain why employees develop certain attitudes toward organizational events or job-related matters.

Network analysis techniques focus on the informal structure of an organization, which can be operationalized into various aspects. Structural features that can be distinguished and analyzed through the use of network analysis techniques include the formal and informal communication patterns in an organization and the identification of groups within an organization (cliques or functional groups). Moreover, communication-related roles of employees can be determined (e.g., stars, gatekeepers, and isolates). Special attention may be given to specific aspects of communication patterns: communication channels and media used by employees, the relationship between information types and the resulting communication networks,

and the amount and possibilities of bottom-up communication. Additional characteristics that could, in principle, be investigated using network analysis techniques are the communication load as perceived by employees, the communication styles used, and the effectiveness of the information flows.

The main benefits of applying Social Network Analysis within organizations can be summarized as follows (Cross, Borgatti, Parker, 2002, Wellman, 1996, Cumming and Cross, 2003)):

- Supporting strategic partnerships (e.g., joint venture, alliances, consortia).
- Assessing strategy execution (e.g., core competencies or market strategies).
- Improving information and decision-making in top leadership networks.
- Integrating networks across core processes (e.g., commercial lending or software development).
- Improving innovation (e.g., new product development, research and development).
- Finding and supporting communities of practice (e.g., promoting connectivity or finding opinion leaders).
- Ensuring integration post-merger or large scale change (e.g., targeting collaboration and correcting over time).

As scholars and practitioners have pointed out, social network analysis is applied in a lot of application scenarios:

- Bridging strategically important disconnects between departments or organizations
- Improving a network's ability to sense and respond to opportunities
- Aligning the organizational context to energize and support networks
- Identifying overburdened employees and redistributing workloads
- Identifying and eliminating information bottlenecks

- Recognizing and supporting key "connectors"

All the previous benefits might be merged into the unifying goal of reaching a suitable level of collaboration among people. With reference to this specific aspect, it is essential to distinguish between collaboration and interaction, since our study will often refer to the way people interact using different channels and creating different kinds of ties. According to Ramesh and Tiwana (1999), interaction refers to formal, transactional communication links, while collaboration refers to informal, cooperative relationships that build a shared vision around common objectives. In the context of this research, we will refer to "communication ties" as a concept bonding the ones we have previously mentioned: people communicate by continuous interactions trying to establish contacts functional to collaboration, so to reach a mutual benefit.

According to Burt (2000), *closure* and *brokerage* are the foundation of the Social Capital research, and the starting point for every empirical research on the organizational mechanisms responsible for Social Capital creation. If *closure* is operationalized with the social network indicator "density", *brokerage* is a concept connected to the advantage provided by the presence of "structural holes" within social structures. Structural holes are an opportunity to broker the information flow between people, and manage the project that brings together people from opposite sides of the hole (Coleman, 1988).

The great contribution given by Burt (2000) is in that his work points of the correlation between network measures and performance: although several contingency factors usually affect the network evolution and behaviour and the organizational performance, his study was able to outline the main network conditions that explain a positive performance. The *three-dimension model* of social capital was considered as composed by the structural capital, representing the connections among

members, the relational capital, embracing cultural aspect and motivation of the relationships, and the cognitive capital, regarding the content of the information flows (Naphiet and Ghoshal, 1998).

As Goodwin and Emirbayer (1999) pointed out, Social Network Analysis is a framework useful to investigate the information structure of groups. In their work, they stress how SNA is able to understand only the "structural dimension" of social capital or the connections developed, disregarding the content of relationships and neglecting the other social capital dimensions. It considers all the ties in a network as comparable, indistinguishable and homogeneous in content. In this perspective, members of large, dispersed communities, monitored over time while performing different activities, can only be observed in their interaction without differentiation of content-related clusters.

Stinchcombe (1990) expressed the need to articulate a systematic theory of social network relying on both quantitative aspects, based on SNA metrics, and qualitative aspects, in terms of content of ties or discussion topics. This perspective provides meaning to the "relational" and "cognitive" dimensions of social capital, explaining what people are doing, what they are working for, how much they are involved in a specific activity, who decides for what and who proposes a new idea.

SEARCHING FOR A VIABLE CONCEPTUAL FRAMEWORK FOR THE METHODOLOGICAL INTERGRATION

In this theoretical perspective, the proposal of a methodological combination of two different approaches aims to advance our understanding of the relationship between communities implementation and organizational performance, by detecting the organizational behavior of community members with reference to the "topic" of the ties.

To describe the content of the ties and propose an integrated methodology, we mined an email database to approximate the organizational ties within a global virtual community. In this context, different opinions emerged during the last years about the use of email datasets as unit of analysis to represent a network. Email has been established to be a reliable indicator of collaboration and knowledge exchange (Wellman, 2002, Whittaker, Snider, 1996). As argued by Tyler et al. (2003) it is a tantalizing medium for research as it provides plentiful data on personal communication in an electronic form. Different insights come from Ducheneaut and Bellotti (2002), who conducted an in-depth field study of email behavior and found that membership in email communities is quite fluid, but depends mostly on organizational context.

A recent study on Social Networks inside research and business communities (Grippa et al., 2006) identified some biases of e-mail mining methods when applied to monitor a community with a strong physical proximity. According to Aral and Van Alstyne (2007) the network study based on email databases is advisable to address a "methodological puzzle" that historically troubled network research: the trade-off between comprehensive observation of whole networks and the accuracy of respondents' recall might create a bias that impacts the research validity. (Kumbasar et al., 1994).

Finally, in the perspective of the Content Analysis, email messages seem to satisfy the seven criteria proposed by Beaugrande and Dressler to define the text to analyze: cohesion, coherence, intentionality, acceptability, informativity, situationality, intertextuality (Beaugrande, Dressler, 1981).

The case study described in this paper is an "embedded" case study, that is particularly suitable for analysis in organizational field, since it involves different ontological dimensions: the community as whole, especially in the definition of lifecycle, and trends detectable through group

centrality metrics; the different sub-communities related to the development of a project; the single members of the community observed in their role evolution and level of involvement in each project.

This study is based on the following assumptions:

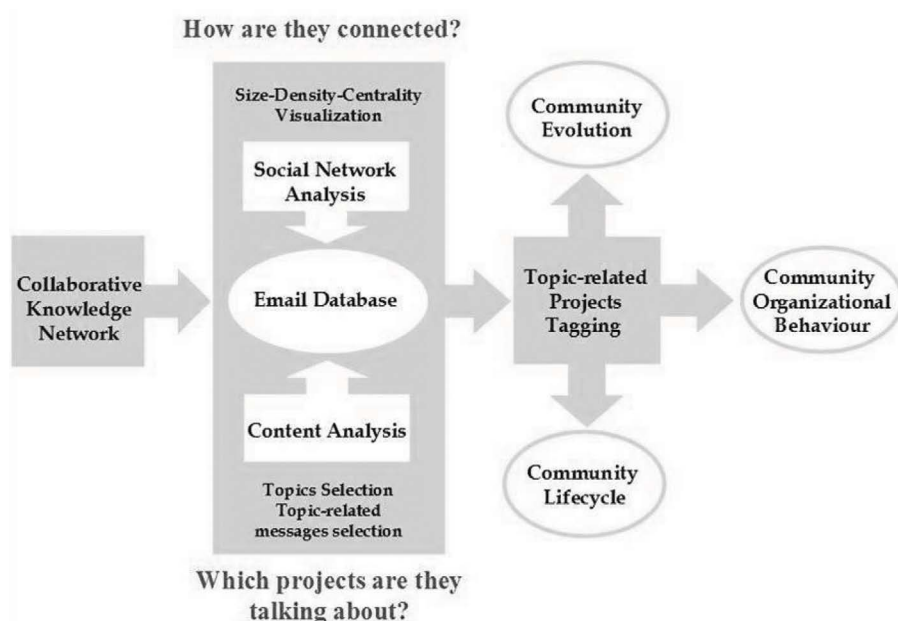
- **Assumption 1:** The social structure of a community is detectable applying *Social Network Analysis* methods, by mapping the community members' interactions and applying the centrality and contribution metrics.
- **Assumption 2:** The email database is a reliable source of data to approximate a community's network characterized by a low physical proximity (highly dispersed community).
- **Assumption 3:** The *Content Analysis* of the exchanged messages can track the diffusion of an idea and its lifecycle within a project-based community.
- **Assumption 4:** The combination of a *Social Network Analysis* and of a *Content Analysis*

of the email database of a dispersed project-oriented community allows to identify the individual role of the community members in developing each project, defining the community members that cover the central roles for the development of each project in a stated period of time analysis

- **Assumption 5:** the application of *Social Network Analysis* and of *Content Analysis* to a dispersed project-oriented community allows to define its characteristics and evolution, as well as lifecycle, organizational behaviour and informally defined roles. Based on these assumptions we propose the conceptual model represented in Figure 2.

COMBINING CONTENT ANALYSIS AND SOCIAL NETWORK ANALYSIS

Content Analysis (CA) is "a research technique for making replicable and valid inferences from texts or other meaningful matter to the context of their use" (Krippendorff, 2004).

Figure 2. Conceptual Model


Highly flexible methodology diffused in library and information science, it is conceived to identify the presence of certain words or concepts within texts or group of texts, following the basic communication model "sender/message/receiver". The concept of *Inference* is a fundamental component of the methodology: the researcher uses analytical constructs or rule of inference to move from the text to the answer to the research question (Marsh and White, 2006).

Different CA typologies are described in literature; a research developed within the project of the Writing Center at Colorado State University, clarifies the differences between two fundamental categories of CA, the Conceptual and the Relational Analysis. Both kinds of research start with the identification of concepts present in a text or a set of texts; the fundamental difference is that Relational CA, also known as Semantic Analysis, focuses on the semantic, meaningful relationships between concepts: concepts individually are considered without any inherent meaning. Indeed Conceptual Analysis, also known as thematic analysis, is designed to recognize the existence and frequency of concepts, generally represented by single words: a concept is chosen and the analysis is articulated on quantifying and tallying its presence.

To differentiate ties on the basis of their discussion topic, and provide meaning to the "relational" and "cognitive" dimensions of social capital, we chose a Conceptual Analysis, focused on the analysis of Manifest Content, that resides on the surface of the communication. The CA applied to Manifest Content presents some advantages: it is easily observable, sufficiently formalized to be operationalized in an automatic way, and needs few interpretative efforts from coders (Rourke et al., 2000). "*The requirements of scientific objectivity dictate that coding be restricted to manifest content*" (Holsti, 1969).

In 1979 Tichy, Tushman and Fombrun stated that Network Analysis represents an underutilized framework for analysing and conceptualizing or-

ganizations. In the last two decades, an increasing interest towards application of SNA application to study inter and intra organizational relationships followed the identification of the community dimension of actors working in a collaborative way for reaching common goals (Wenger and Snyder, 2000; Gloor, 2006).

Some important measures at a Group level like distance and density (Wassermann and Faust, 1994), as Betweenness, Closeness and Degree Centrality (Borgatti and Everett, 1999) give a quantitative description of the social network structure, while the same measures of centrality at the Individual level identify the most prominent actors, extensively involved in relationships with other network members. Using these measures and a network representation, (Krackhardt, 1994) is a reliable way to obtain the identification of the network structure. As for the representation, Social Network Analysis rests upon the development of the Graph Theory, a complex framework able to translate in formal language the characteristics, dimensions and peculiarities of a network. The main elements that form a graph are nodes, representing actors, and the lines, or edges, representing their relations; the sociogram, or the graph of networks, describes the qualitative patterns of connections among actors as a translation of the data contained in a matrix, drawing a representation of each row or column in a visually simple and intuitive way.

A recent classification of the individual roles of members within virtual communities has been recently proposed by Gloor (2006) who identified four different role patterns inside the networks: creators, in a position that allows them to see the entire knowledge flows; communicators, whose network role is to link external members to the rest of the community; collaborators, who have the task to coordinate others' activities; and knowledge experts, usually the subject matter experts in certain domains. The author suggests this classification by utilizing a social network metric defined Contribution Index (Gloor, 2006).

The contribution index is +1, if somebody only sends messages and does not receive any message. It is –1, if somebody only receives messages, and never sends any message, and 0 if somebody has a balanced communication behavior, sending and receiving the same number of messages.

Recently the concept of density has been associated to the concept of cohesion (White, Harary, 2001): a group is intended to be cohesive "*to the extent that the members are pulled together when confronted with disruptive forces*" (Kadushin, 2004). To evaluate the level of cohesiveness of a network it is sufficient to remove one or more members and to report the emerging dynamics in terms of disconnectedness.

Density is a core concept and metric to the objective of the present study. Following the findings of Burt's research (2000), the identification of the clear negative correlation between density and performance makes its evolution a relevant indicator of the performance evolution of the network.

In our contribution, we referred to the trend in density evolution to discover the organizational change in the community as related to the most evident change in density value. The assumption that "as density decreases the community performance improves" might drive the observation of the periods in which the network assumes a clear and effective organizational structure.

THE METHODOLOGICAL INTEGRATION

The proposed methodology is articulated in three main phases:

1. Initial audit to acquire contextual information on the case study. It may consist of an interview to a community member, preferably in a strategic network position to behave as a key informant. This information must be integrated with other documents and data,

to guarantee the differentiation in terms of sources of evidence.

2. Content analysis of the exchanged messages within the community, with the general goal to divide large communities in sub-groups, differentiated on the basis of the project they are working on. It consists of processing the overall messages stored in a database to associate each project to a unique word, or a set of words, unequivocally representative of the project itself. The final goal is to "tag" the communication flow for each project.

3. Social Network Analysis: Starting from the results of the content analysis, each "project-related sub-community" can be observed under the Social Network Analysis view. The outcome of this process is twofold:

   ◦ Identify each sub-community boundaries, by investigating the network structure (i.e. network size, number of organizations involved, overall density/cohesiveness, core-periphery structure); the project Initiative features (i.e. project idea appearing date, promoters, project development temporal length); the emerging characters and positions for each project, mainly through the application of the actors contribution index.

   ◦ Recognize the sub-community evolution over time, choosing a temporal unit, based on both the quantitative evidence (i.e. network growth, number of organizations involved and density/cohesiveness evolution by month) and the qualitative visualization (i.e. actors positions, centrality; emerging roles and hierarchies; organizational dynamics).

The application of both Content and Social Network Analysis required the support of an automated system. For the purpose of the study we adopted the Condor software, formerly known as

TeCFlow, a tool developed over the last 5 years at the MIT Center for Collective Intelligence and the Dartmouth Tuck Center for Digital Strategies (Gloor and Zhao, 2006).

This research posed the challenge to use the applications of Condor software in an original way, rather different from its original use. Our study helped refine and improve the functionalities of a software tool designed to observe only the information flow emerging from the network position of actors exchanging emails. Our research was able to illustrate the benefits of implementing improved functionalities within the Condor software in order to integrate structural and semantic observation of the network.

Consistently with the construct validation strategy, the present work relies on the convergence of multiple sources of evidence (Patton, 1987): archival records, that is the email database; documentation, such as articles, deliverables and reports about the community events.

The use of open-ended systematic *interviews* to a key informant, who was one of the leading coordinators in the community, allowed tracking a path of evidence during the development of the study and the design of the methodology. The final audit with this strategic member was the final test of the study.

THE CASE STUDY

The described methodology was applied to a large virtual Community, shaped as a Collaborative Knowledge Network (Gloor, 2006), created in 2001 by a global consulting firm. This organization is composed of 70 firms distributed in 140 Countries, providing professional services in several areas of expertise, like accounting, consulting and other professional services. Today it is one of the Big Four auditor firms, and a very important advisory company. With a strong culture of cooperation, it employs about 95.000 people, has customers in about 150 Countries, and a large

number of partners with whom it develops consulting services, IT solutions, methodologies and products to maximize shareholder value.

In October 2007 the company reported a record financial performance on a global scale, showing a general growth in all the service fields, in all the geographic areas. Consulting services, that are the core areas of the Company overall services offer, recorded a growth of 16.5 percent, suggesting the CEO to plan and increase in the number of employees of a whole 50.000 units, in four years, recruiting them in 140 Countries. This positive trend started in 2002, a crucial phase of changes within the Company life, marked by important international awards like:

- *SAP America Services*, leader in business software solutions, awarded the Company with the "*Partner Award of Excellence*";
- *Workforce Magazine*, leading US human resource publication, awarded the Company with the "*Workforce Optimas Award for the Global Outlook Category*";
- *Fortune*'s ranking included the Company in the prestigious list of "*100 Best Companies to Work For*".

The Company performance during the period 2000 – 2002 was the result of a Company project aiming to create a cross-boundary community, recognized as a good practice to support their customers and partnering organizations.

The company's top management considered the "Collaborative Knowledge Network" the most suitable shape for a community to be developed: a very large group spanning geographical and organizational boundaries to embrace several communities of practice linked electronically in the same circuit.

The idea to create and support a CKN was shared among two promoters, namely the key informant and a colleague in the same Company, who met while working on a new service development.

Emails, and rarely virtual meetings, were the main channels of communication within the virtual community. The language was primarily English, sometimes German.

CKN could count on a Knowledge Management Portal and a repository, that constituted the basic infrastructure to make it possible to store data, and to provide an "organizational memory" for all the production of the community.

Some relevant positions and roles naturally formed during the CKN life cycle: for each service, product or practice developed, at least one coordinator, one consulting manager and a group of volunteers emerged. None was ever appointed for any role.

This community was a suitable setting for testing the methodology because of the following features:

- the actual amount of messages: 5431
- the size of the community: 1141 actors
- the diverse involved organizations: 85
- the wide geographical distribution: 100 different countries
- the length of the period of observation: 19 months
- the availability of a key informant to test step by step the reliability of the research findings

The Content Analysis Phase was articulated as follows:

1. Direct observation of the sample messages: 30 messages over 5431 were read to understand the main characteristics of the language used in the email exchange, and to facilitate the developing of "inference rules" aimed to identify project-representative words.
2. Development of "Inference Rules": the "coding schema" derived from the recognition that in the exchanged messages the projects were identified always by their "proper names" or "titles" and by the recurrent com-

mon features of these terms: never common words; always expressed in English independently from the conversation languages, English or German; generally composed by two terms merged; sometimes composed by a letter (e.g. "e") and a common word (e.g. "ehome").

3. Coding process: It was the result of a semi-automated process, consisting of two phases:
   - Data collection and refining through the Condor software
   - "Preview terms" selection through the human involvement

The use of the two "stopword lists" in the automated data processing let us to extract from 5135 messages 3807 words to be analyzed. The analysis was conducted "by hand" on the basis of the developed Inference Rules, and articulated in an iterative process. Five iterations were made, with a continuous further selection, obtaining a gradual reduction from 3807 to 652, 141, 62, 27, 11 words. The extracted 11 words were supposed to be the "topics" representative of the projects, products, services, methodologies, that the community had developed during the period of observation. From a second interview it resulted that 9 out of the 11 terms were the searched tags, that is to say that each tag was unequivocally representative of a project.

The Social Network Analysis was used to monitor the large community composed of the 9 sub-communities, each one represented by the topics extracted through the Content Analysis. These topics were employed as "tags" to differentiate in the software aided analysis the community in subgroups.

The Condor software was used to select the communication flows related to each topic, to highlight the network nodes "talking about" the chosen project. To each of these sub-communities the intended set of measurements and visualizations of the analytic approach were applied, on

a monthly scale, to give an approximation of the development of each project.

While the only application of Social Network Analysis would have provided the picture of the community evolution and its network structure as a whole, the integrated methodology allowed us to discover the 9 sub-communities, and to analyse each of them separately and in comparison with the others.

The analysis of each "project-related sub-community" and the cross-project analysis comparison allows to recognize the overall community evolution in terms of four dimensions: size, organizational chart, project initiative and organizational dynamics.

Size: the overall community made of 1141 actors carried on 9 projects over a period of 19 months. The 9 project-related sub-communities varied in size from 16 to 605 actor. Project 3 with 605 actors was the most participated, involving more than half of the overall community's members. It has been defined by the key informant "the most complex and important one". The monthly distribution of actors per project is summarized in a "Actor–Projects Table" (Figure 3).

Organizational Chart: while the application of SNA could have provided only the identification of the most central actors, through the application of indices like Betweenness Centrality and Contribution Index (Gloor, 2006), the integrated methodology allowed a segmentation of the community in 9 sub-communities associated to 9 projects. This helped to recognize an emergent "organizational chart" of the community, a hidden organizational structure of the Collaborative Knowledge Network, with the localization of the central actors across all the projects, and those central only in few projects. Combining CA and SNA brought to define a five levels organizational structure, as represented in Figure 4.

Project initiative: the first five projects were the most important ones, and also the most successful, as showed by the density trend of the study. They were developed under the proposal of the two leading coordinators, probably because of their relevance for the leading organization, and the temporal distribution of the proposals. The first four projects are attributed to the same month, August 2001, the fifth one to October, two months later. The others came out from the con-

Figure 3. Monthly distribution of Actors per Project (Actor-Projects Table)

tribution of other actors but always within the 10 most central ones.

Figure 5 shows in detail the Cross Project Analysis Matrix, where the nine projects conducted by the community and identified through the Content Analysis are matched with cross-project factors like Network Structure, Project Initiative and Network Evolution and behaviour.

Organizational dynamics: the community showed evidences of a clear trend in maintaining a fixed core group of actors, coordinating the CKN, and a wide variety of consultants, engineers, researchers, marketing experts who contributed in different ways to the projects' development, justifying the *high rate of turnover* of the different groups. When the goal was clear to the whole community and the project activities started, the involvement of new resources was generally concentrated in few months. This has been observed by the trend in *size* and *density* values, by

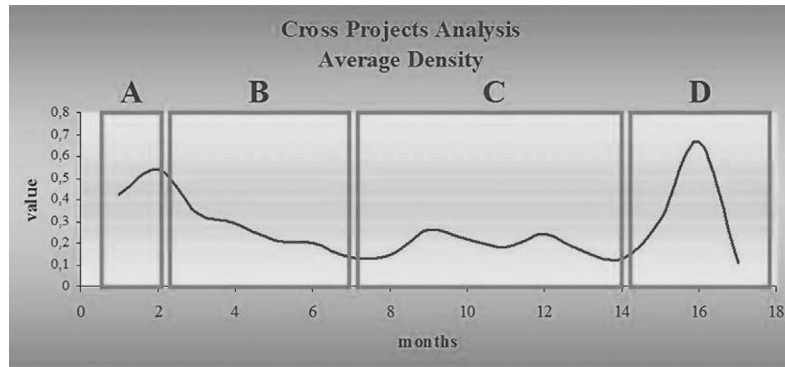
analyzing for each project the months in which it decreased under the value of 0.1. Figure 6 provides an example of organizational dynamics in a low density month.

The Community Lifecycle

The SNA implemented through the utilization of the Condor software makes it possible to draw the Community lifecycle starting from the evaluation of the trend in *centrality metrics for the overall Network*; the result is a sort of "structural" lifecycle, based on the shifts in the structural features of the network, but without any further investigation on the reasons that could give meaning to the identified structural shift.

Applying the integrated methodology we have been able to recognize what changed in the community evolution when the trend in the *Group Betweenness Centrality, Group Degree Centrality, Average Weighted Contribution Index Value* indicated a shift.

The information flows detected through the application of Social Network Analysis indicated a cycle in the CKN life: it was evident from the evolution of the community size, launch and

Figure 7. Cross Project Analysis. Average Size
Figure 8. Cross Project Analysis. Average Density


ending with no more than 10 actors (see Figure 7 and 8).

As illustrated in Figure 9, four stages of development have been recognized thanks to the application of the integrated methodology:

- **Stage A:** the period from June to August 2001 was an *introductory phase*, where no project was proposed, started or carried on.
- **Stage B:** from August to December 2001 it was a period of intense interaction, marked by an "*idea generating*" activity: it saw the emerging of almost all the project-ideas

and the launch of the most important projects (i.e. projects 1, 2, 3, 4, 5, 6, 7).

- **Stage C:** from January to July 2002 the group changed completely in shape and organization, working on different topics, realizing the first results of the first projects. We called this the "*operating*" phase. March 2002 was the most intense month: all the projects were activated, and the CKN core group decided to start with a marketing campaign to launch the services and products that the community was developing.

Figure 9. Community Lifecycle compared with Cross Projects Average Size and Density, and with Actors-Projects Table.

	Months	Project 1	Project 2	Project 3	Project 4	Project 5	Project 6	Project 7	Project 8	Project 9
A	1	0	0	0	0	0	0	0	0	0
	2	0	0	0	0	0	0	0	0	0
B	3	5	8	4	5	0	0	0	0	0
	4	2	4	8	6	0	0	0	0	0
	5	26	2	50	24	12	0	0	0	0
	6	8	4	36	16	9	0	0	0	0
	7	23	10	116	31	7	28	21	0	0
C	8	11	13	95	83	41	32	25	6	0
	9	19	11	91	99	24	34	24	18	0
	10	151	25	86	97	33	171	194	12	3
	11	13	9	102	78	21	57	50	15	2
	12	14	17	85	189	28	77	34	5	12
	13	4	13	218	111	184	96	26	9	9
	14	3	36	135	119	58	116	20	18	2
D	15	0	3	146	127	55	102	13	19	0
	16	0	0	52	23	31	20	0	24	0
	17	0	0	0	8	4	0	0	0	0
	18	0	0	3	0	4	0	0	0	0
	19	0	0	19	19	0	0	0	0	0

- **Stage D:** from August to December 2002 was the "*organizational memory*" period; all the projects came to their conclusion, the results were evaluated, best practices were collected and knowledge for the organizational memory of the community was stored.

MANAGERIAL IMPLICATIONS AND RESEARCH LIMITATIONS

The concurrent application of the experimented "tagging" system and of the Social Network Analysis allowed to identify within the global virtual community 9 sub-communities, one for each of the projects that over time had been proposed.

The main limitation of the Social Network Analysis, that is to treat all the connections in the same way, without differentiating the topics of discussion, might represent an obstacle in the analysis of large communities. It would be hard to understand communications referred to friendly personal ties or projects-related ones. This can prevent the development of a more comprehensive picture of the community, making it difficult to disentangle the web of many interactions, 5431 in our case, that can provide no meaning and possibly lead to misinterpretations.

The application of the integrated methodology represents a useful attempt to evolve from a structural analysis of the community toward a more complete understanding of the community dynamics, merging the observation of the social capital's structural dimension with the cognitive dimension of the common interest or objective shared through their interaction

However this research presents some relevant limitations to be overcome.

The first is related to the applicability of the same methodology to other kind of virtual communities. The successful application of the presented methodology relies in some parts on the features of what we have defined a "virtual community operating in organizational context", by which we can identify different project-oriented activities and groups, and count on the email as the main kind of message to be analyzed. In particular the email message is particularly suitable to be the unit of the Content Analysis, since it presents characteristics like directionality, timeline, clear definition of sender and receiver, and structured text content. Other kinds of virtual online communities, as the community of interest developed around a common and abstract focus changing over time, made of ever new people, and interacting through different kind of media are a different context to which this methodology could be hardly applied.

Secondly, the application of this methodology to this kind of communities requires the intervention of an analyst for the observation and the interpretation of the elaborated data.

The third limitation to take into consideration is related to the cognitive and relational dimensions of the social capital analysis. The application at the document-level or at the sentence-level of a sentiment analysis (Wilson et al., 2005) could improve the quality of the findings of this research helping to identify positive and negative opinions, emotions, and evaluations, and to map the learning path of the community during the development of the project-based activities.

Another critical point of the research is related to the application of the Content Analysis, as it is a very flexible and inferential approach. Since the *direct observation* of the sample messages could be affected by some degree of subjectivity, it is recommended to involve multiple researchers in this phase. Moreover, the analysis of the social capital of a community requires attention to the cultural, relational and organizational context, which means the involvement of an internal actor, preferably one of the central members, to better frame the dynamics and emerging behaviour of the community.

Managing Communities is a peculiar task, and a strange game: the self-organization principle,

the spontaneity of their nature, their being non-hierarchical structures make them something difficult to be mandated into action until they are not effective, traditional approaches to implementation and deployment don't work with them (Gloor et al., 2002).

Understanding and recognizing the emerging communication dynamics represented an important element for the observed virtual community. These dynamics, with all the managerial implications that might follow, were still in the "black box" for the sponsoring companies, hidden in a large, spontaneous flow of information exchange among the actors.

KEY TERMS AND DEFINITIONS

Virtual Organizational Community: Virtual community developed within or across the boundaries of an organization, characterized by a mission, objectives and organizational culture.

Social Network Analysis: Analytic methodology that views social relationships in terms of network theory consisting of nodes and ties (also called edges, links, or connections): nodes are the individual actors within the networks, and ties are the relationships between the actors. Social networks operate on many levels, from families up to the level of nations, and play a critical role in determining the way problems are solved, organizations are run, and the degree to which individuals succeed in achieving their goals.

Content Analysis: Methodology in the social sciences for studying the content of communication. It is generally referred to as the study of recorded human communications, such as books, websites, paintings and laws; it is also considered a scholarly methodology in the humanities by which texts are studied as to authorship, authenticity, or meaning.

Social Capital: Sociological concept, which refers to connections within and between social networks. For this research, it is followed the definition provided by Naphiet and Ghoshal in 1998, by which it is considered as the sum of the actual and potential resources embedded within, available through, and derived from the network of relationships possessed by an individual or social unit. Social capital thus comprises both the network and the assets that may be mobilized through that network". They propose a model of Social Capital based on three key dimensions, Structural, Relational and Cognitive.

Collaborative Innovation Networks (COIN): Networks created from the interaction of like-minded, self-motivated individuals who share the same vision. An innovative idea is pushed forward by charismatic leaders, who assemble a group of highly motivated collaborators. These people share a common vision, and want to be part of the innovation that "will change the world." They typically bring a broad range of skills and expertise to the COIN and are not necessarily related in terms of the corporate hierarchy, as they work outside of the formal organization.

Collaborative Knowledge Network (CKN): According to the taxonomy provided by Peter Gloor (2001) it is an ecosystem of interconnected communities that shaped as COIN (COllaborative Innovation Networks), CLN (Collaborative Learning Networks), and CIN (Collaborative Interest Networks).

Community Lifecycle: The sequence of the phases of evolution of a community, whose map is based on the shifts in the structural features of the network according to the change in the values of the centrality and density measures. This research considers the lifecycle of the community as a four stages development: an introductory phase, an idea generating phase, an operating phase, and an organizational memory phase.

ABSTRACT[1]

This chapter presents findings of a study devoted to investigating the factors that influence successful implementation of e-Government at a local level in a developing country context. The study is based on the case study of Yogyakarta Local Government, Indonesia. Using qualitative methods of data gathering, the study developes a conceptual model with 27 items that were used for developing the questionnaire distributed into conducting in-depth interviews with 200 government officials in Yogyakarta, who adopted Information and Communication Technologies (ICTs) as a platform for their daily work activities. The study also conducted desk research that explored many documents on ICT implementation in the public sector. The results reveal that the most significant factors that influence success in e-Government projects are corporate culture and e-Governance competency. The other factors, in order of importance were users' willingness and competency in using ICTs, Information quality and human resources competency, and system quality, which was moderated by information quality and human resources competency.

INTRODUCTION

ICTs influence the way government and citizens interact throughout the world. Even in developing countries, many governments have been trying hard to implement ICTs in order to meet the needs of citizens. In developing countries, the impact of ICT projects, especially in the public sector, is not commensurate with the amount of ICT infrastructure investment (Heeks, et al., 2002; Ferran, et al., 2005). Even, recent survey reports on e-Government readiness also place many developing countries in the lower ranks compared to developed countries (UNDESA, 2008; EIU, 2009).

A lot of approaches designed to improve implementation of ICT projects in the public sector in developing countries have been developed. But most of these approaches are based on the experiences of developed countries where the technology was developed. Heeks (2002) has revealed that there are gaps, related to infrastructure, information culture, procedure, management and human resource competence between developing and developed countries with regards to ICT project implementation. This has correspondingly negatively impacted on the level of penetration of e-Government in developing countries.

In developing countries, success in implementing an ICT project will not be achieved if the focus is on just making improvements to the technology (Ferran, et al., 2005; The Local Government of Yogyakarta, 2006).The approach developed by Mcconnel International (2001) shows that many factors including e-Leadership, human resources competence, business climate and ICT infrastructure influence the success of ICT implementation in developing countries. Similar findings in Indonesia, in 2007, show that although a lot of local governments have invested a lot to improve the ICT infrastructure, the quality of public services did not improve significantly (Kompas, 2007). Futhermore, other studies conducted in Indonesia emphasized that there were many factors, similar to the findings of the study conducted by Mcconnel International (2001), that influence the uptake and effective development of e-Government (Wijaya & Surendro, 2007). It is for this reason that this study sought to take a different approach in developing a framework that can be used to study factors that may influence successful implementation of ICT projects from the perspective of developing countries. The chapter attempts to address the question: Why does the implementation of e-Government in developing countries not improve the public services significantly?

This chapter is organized as follows. The first section is the introduction of the study. The second section presents the context of the study by outlining the Jogja Cyber Province Initiative, an e-Government initiative implemented in Yogyakarta Province. The third section presents the relevant literature related to e-Government in a developing country context. This section is followed by an outline of the research methodology and data gathering techniques. Our empirical findings and discussion are presented in the fifth section, and finaly, the last section, describes the limitation of the study and provides some recommendations for future research.

LITERATURE REVIEWS

Although the implementation of ICTs in developing countries has increased over the years, there is very little literature about ICTs in developing countries compared with experiences of developed countries. There are many research studies that present factors related to e-Government success (EIU, 2005; Liu, 2001). These studies have posited that e-Government development mostly depends on the organizational and institutional readiness to adopt ICTs to the core of the available business value chains or activities. For an organization to derive optimal benefits from implementing ICT projects, the organizational environment should be ready to adopt ICT (Chang & Kannan, 2002;

UNDESA, 2005). Chang & Kannan (2002) argue that optimal benefits of ICT implementation are influenced by organizational readiness and quality of the technology deployed. According to the United Nations Department of Economic and Social Affairs (UNDESA, 2005), e-Readiness can be defined as relating to factors that influence ICT implementation success. UNDESA (2005) identified indicators that can be used to measure e-Readiness that is necessary to attain e-Government success. These include Web Measure Index, ICT infrastructure and Human Capital Index. Other indicators of e-Readiness include leadership, ICT quality, human resources competency, and business climate (McConell International, 2001; Bridges.org, 2004; Ferran, et al., 2005).

The Government of Indonesia has decided to improve other factors cited above when implementing ICT projects to enhance public services (President Law, 2003). But empirical studies show that although many local governments in Indonesia have invested a lot in technology to improve public services, this has not resulted in adequate and appropriate improvement in service delivery (Kompas, 2007).

E-Government success can be defined as the use of ICTs which readily culminates into positive impact of technology on the organization. Delone & Mclean (2003) have developed a model for Information Systems (IS) implementation success using 6 indicators. These include quality of system, quality of information, frequency of use, user satisfaction, individual impact, and organizational impact. In this study, we measure e-Government success using 4 indicators including frequency of use, user satisfaction, individual impact and organizational impact. In our derived model, we combined quality of system and quality of information (ICT Infrastructure) as constituting part of factors which influence e-Government success (UNDESA, 2005; McConnell International, 2001; President Law, 2003). Based on the short analysis above, we developed an interdependency model which relates three factors and e-Government suc-

cess. In detail, beside quality of the technology, we propose that e-Government success is influenced by organizational e-readiness and user readiness factors. Our model can be postulated as follows:

1. ICT infrastructure quality can be measured by user's perception related with the quality of system and information. Whereas, organizatinal awareness and competence with ICT implementation influence the quality of system and information in entire the organization. In this chapter, organizational readiness can be defined as organizational awareness and competence related with ICT implementation. It can be seen that the orientation or awareness of the organization is related with the awareness of the IT user and the benefit of the technology will influence ICT implementation (Pasuraman, 2000). Then we develop a hypothesis that:
    ◦   There is a strong relationship between organizational readiness and ICT infrastructure quality.
2. ICT implementation success can be measured by use, user satisfaction, individual impact and organizational impact (Delone & Mclean, 2003). Chang and Kannan (2002) stated that there is an interdependency between e-readiness and ICT success factor. Then we hypothesise that:
    ◦   There is a strong relationship between organizational readiness and e-Government success.
3. ICT infrastructure quality can be measured by the user's perception related to the quality of the system and information. On the other hand, logically, user willingness and competence in using ICT influence the quality of information produced by the technology. In this chapter, we defined user e-Readiness as the safety and comfortable perception of the user when using the technology. Then we hypothesise that:

◦ There is a strong relationship between user e-Readiness and ICT infrastructure quality.

4. The user's acceptance the technology influences the actual use (Davis, 1989) and logically influences the impact of the technology into every user and organization. It can then be hypothesised that:

◦ There is a strong relationship between user e-Readiness and e-Government success.

5. Findings of an empirical study employing a competing value framework, which sought to identify the organizational culture of the Yogyakarta local government, revealed that its organizational structure is hirarchical (Wijaya, 2007). In hierarchically ordered organizations, the relationship among employees tends to become very formal and structured where procedures govern what people do. This finding led this study to hypothesise that organizational orientation has a strong relationship with how the em-

ployees conduct their work. We therefore argue that:

◦ There is a strong relationship between organizational e-Readiness and user e-Readiness

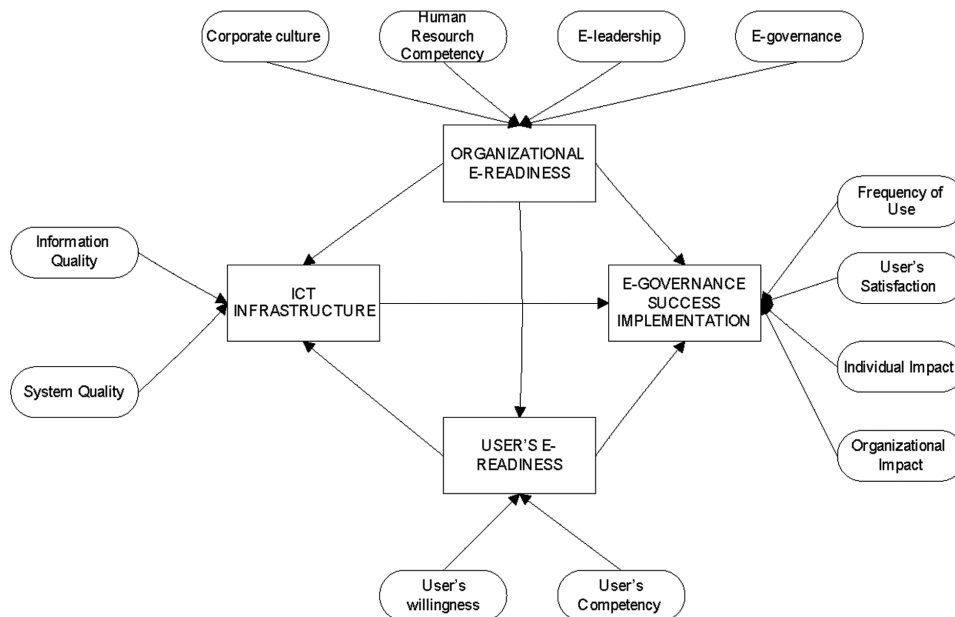
6. The better the quality of ICT infrastructure, the better of utilization and impact on the individual and the organization (Chang & Kannan, 2002). In the words, ICT infrastructure quality is a tool to attaining e-Government success (UNDESA, 2005). It can be concluded from this that:

◦ There is a strong relationship between ICT infrastructure quality and e-Government success.

The proposed conceptual model is presented in Figure 1.

The conceptual model has four pillars as follows:

• Organization e-Readiness: the overall capacity of the organization to accept glob-

Figure 1. Proposed conceptual model


al usage of ICTs in their business value chains;

- ICT infrastructure: The availability appropriate communication and technology platforms aimed at encapsulatin the various business opportunities;
- User's e-Readiness: the willingness of the individuals to utilize ICTs at a global scale in their daily activities; and
- E-Governance success implementation: the degree to which the laid out e-Government strategies and initiatives translate into actual implementation endeavors.

Organization e-Readiness

Organization e-Readiness is the state of preparedness by the organization to implement an ICT project. Organization e-Readiness is influenced by four factors: corporate culture; human resource capacity; e-Leadership and e-Governance. Corporate culture relates to how the organization conducts its business—where success or failure is dependent on whether there is an enabling organizational culture for successful implementation of an ICT project; human resource capacity, in terms of ICT skills of the organizational personnel, will also determine the level of readiness of the organization to successfully implement an ICT project where the presence of ICT skills among staff will enhance chances of success; e-Leadership has been defined as "…a social influence process mediated by advanced information technology to produce a change in attitudes, feelings, thinking, behavior, and/or performance with individuals, groups and/or organizations. (Avolio, Kahai, & Dodge, 2000, p. 617). This entails having people in the organization who have the vision for ICT and requisite ICT skills and capacity to drive the process in the organization.

UNESCO (2005) has defined E-Governance as "… the exercise of political, economic and administrative authority in the management of a country's affairs, including citizens' articulation

of their interests and exercise of their legal rights and obligations... via the electronic medium in order to facilitate an efficient, speedy and transparent process of disseminating information to the public, and other agencies, and for performing government administration activities…" Success of e-Government will be determined by the extent to which e-Governance is entrenched in the organization.

ICT Infrastructure

The state of ICT infrastructure is determined by two major factors: robustness of its design and/or deployment, including the percentage of tailor-made applications it can accommodate on its platform, and the capacity of the infrastructure to accommodate openness (heterogeneous access) and other non-functional requirements (such as scalability, allowing concurrency access, heterogeneity, reliability, and availability). These factors are further measured by factors such as system quality and information quality (content of the services). System quality envelops the responsiveness of the designed ICT applications to the specific needs of the users, its reliability and availability within a specified period of time. Information quality entails the level of accuracy and integrity of the different information resources obtainable or its amenability to manipulation by the available ICT infrastructure.

User's e-Readiness

E-Readiness of the users is crucial to successful implementation of e-Government. User's e-Readiness is influenced by two major factors: user's willingness to use the technology and user's skills (competencies to use the technology) and the perceived usefulness and usability of the technology applications.

Successful e-Government Implementation

The success of e-Government implementation can be measured by four major indices: frequency of use of e-Services, user's levels of satisfaction with e-Services, impact of e-Services on the individual, and the impact of e-Services on the organization.

RESEARCH DESIGN AND METHOD

The main objective of the study was to develop a causal model which can be implemented to attain e-Government success in developing countries. In order to achieve this objective, we conducted the following steps of analysis:

1. The first step was aimed at exploring and investigating factors influencing e-Government success by comparing literature on ICT implementation as described in the preceding section. The findings from the literature review were reinforced by interviews with government officials and policy makers;
2. Based on the findings from the first step, we proceded to the second step - that is developing an interdependency model which relates to the three factors that influence e-Government success;
3. The model linking four (4) latent variables namely ICT infrastructure, Organizational e-readiness, User e-readiness, and E-governance success implementation was developed. Because latent variables are, by definition, unobservable, their measurement must be obtained indirectly by using some indicators; and
4. Then, we developed a questionnaire based on seven (7) Likert scale which consists of the following items:
   ◦ Latent variable *ICT infrastructure quality* is measured by system quality and information quality percep-

tion. The first measurement uses five (5) indicators including adaptability, availability, reliability, responsivenes, and ease of use. Whereas the second measurement used seven (7) indicators including effectiveness, efficiency, integrity, confidentiality, availibility, compliance, and reliability of information;
   ◦ Latent variable *organizational e-Government readiness* is measured by organization culture, e-Leadership, e-Governance, and human resources competency;
   ◦ Latent variable *user e-Readiness* is measured by willingness and competency in using ICT; and
   ◦ Latent variable of *e-Government success* is measured by frequency of use, user satisfaction, individual impact and organizational impact.

The questionnaire also had questions about respondents' background, namely; education and their experience of using ICTs. To estbablish the validity and reliability of the instrument, we conducted a pilot study where the questionnaire was distributed to a sample of 20 respondents. This step aimed to check the degree of instrument consistency or repeatable instrument competency (Kerlinger, 1991). We used the Cronbach Alpha as reliability test method which is based on the correlation between each item in the research instrument or questionnaire. The results of the pilot study are presented below:

1. Reliability testing with 31 items was 0,978 Cronbach Alpha. Based on George and Mallery criteria, this value shows very good internal consistency.
2. Validity test results all of items were valid, with validity value ranging from 0.638 until 0.869. Based on both values, we concluded

that the research instrument could be applied to the larger sample size.

The final questionnaire was then distributed to more than 200 government officials of Yogyakarta Local Government. In order to minimize the possibility of errors, researchers assisted respondents in completing the questionnaire. The result of this step, was then used to test the reliability and the validity of the instrument.

Structural Equation Modelling (SEM)

Structural equation models are models of relationships among constructs that encompass and extend regression and factor analysis procedures (Hayduk, 1987). Why was SEM selected for the data analysis in this study? There are at least three main reasons. First, this study uses measures to represent constructs because this research has a corresponding interest in measurement and measurement techniques. SEM casts factor analysis in the tradition of hypothesis testing, with explicit tests of both the overall quality of the factor solution and specific parameters (e.g. factor loadings) composing the model. SEM deals directly with how well the measures reflect the intended constructs. Second, this study was principally interested with questions concerning the relationships among the measures. The focus of this study is on the mediational relationships (rather than the simple bivariate) and the causal processes that give rise to the phenomena of interest. Thirdly, SEM provides a flexible and powerful means of simultaneously assessing the quality of measurement and examining the predictive relationships among constructs.

Exploratory Factor Analysis (EFA)

As part of SEM, Exploratory Factor Analysis is used to test 27 items (indicators) in the questionaire that are part of the three (3) latent variables including ICT infrastructure quality, organizational

e-Government readiness, and user e-Readiness. The goal of EFA is to describe and summarize data by grouping together variables that are correlated. EFA proves useful for consolidation of numerous variables (construct validity). Therefore, by using factor analyses we may test whether the given indicators are a good measurement for the three latent variables. If so, the indicators must be grouped as independent factors or variables which were included in the three postulated latent variables. From the factor analysis we defined a factor structure which underlines the ICT infrastructure, Organizational e-Readiness, and User e-Readiness. When the necessary calculations were completed, we obtained the result that shows the degree of importance of each indicator to the related factor.

Path Analysis

After the factor structure had been defined from the previous steps, we then conducted the Path Analysis. In other words, the proposed structural relationship model (Figure 1) was now providing the underlying structural model which relates the three latent variables: ICT infrastructure, Organizational e-Readiness, and User e-Readiness to the latent variable e-Governance success implementation through a regression-type relationship. Before applying the Path Analysis, we conducted reliability tests by using the new sample size (212 respondents) to make sure that the instrument was still reliable. Reliability refers to the property of a measurement instrument that causes it to give similar results for similar inputs. From the Path Analysis we hoped to obtain the priority factors influencing e-Government implementation success.

RESULTS

The findings of the study are presented under the relevant sub-headings in the sctions that follow below. These include:

- Profile of respondents
- Structural analysis

Profile of Respondents

Yogyakarta Local Government has an ICT department which coordinates and manages ICT implementation in every Local Government's department. Although it has a central ICT departement, each department has a small ICT unit which is directly responsible for the management of its ICT implementation process. In order to arrive at a representative sample, we decided to choose respondents who work in the central ICT department, each IT unit, and other units that have adopted ICT in their operations.

The total number of respondents was 217 computer users in Yogyakarta Local Governments. These were ICT workers and managers. The findings show that the gender and education backgrounds of the respondents are generally good. It can be seen that 60% of the respondents were males and 40% were females. ICT workers and managers' educational backgrounds are dominated by bachelors and masters degrees, representing 47% of the respondents. The number of respondents who have diplomas was 12% of the respondents, while 41% of the respondents had attained junior and senior high school education.

Figures 2 and 3 provide a summary of educational backgrounds and gender of the respondents.

Figure 3 shows the respondents composition of gender.

The levels of ICT literacy among respondents were high. Most of the respondents (60%) had been using ICT since 2003. In addition, they had also been trained to use the Internet; many information system applications such as human resources information system; Windows application, MS Office, Oracle and had been exposed to the e-Government concept and policy. In general more than 50% of the respondents had used Websites and human resources information system; 56% had received training on use of the Internet, Windows, Microsoft Office, and Oracle; and 45.2% had been trained on e-Government. It can be concluded from this information that most of the sample respondents could comfortably use ICTs in undertaking their work.

Structural Testing

Structural testing entailed transforming the conceptual model presented in Figure 1 into a path model presented in Figure 4. The structural model wastested using the Structural Equation Modelling (SEM) which employed factor analysis and path analysis measures.

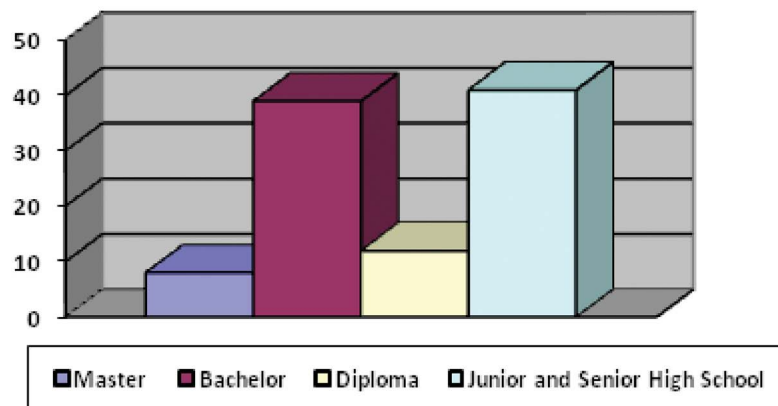
Figure 2. Educational background of respondents


Figure 3. Respondent's gender composition
The path model shows the different factors that were considered on each particular attribute.

Factor Analysis

In order to determine the dimensional structures from different instruments, a factor analysis was performed using SPSS version 11.0 for Windows. The loading rule was, choose a loading number greater than 0.5 on one factor, and less than 0.5 on all others (Hair, Anderson, Tathan, & Black,

1995). The result of factor analysis using 217 respondents is presented in Table 2. A summary of the factor analysis is shown in Table 1.

The results of factor analysis were used to analyze latent variables. It can be seen from Table 3 that Factor 1 is dominated by information quality items, including items INFO1, INFO2, INFO3, INFO4, INFO5, INFO6, and SYSTEM6, and human resources items including HR1 and HR2. We call *Factor 1 as Information Quality and Human Resources Factor.* Factor 2 is dominated by corporate culture items and e-Governance competency. Although Culture 2 has high factor loading on Factor 1 and Factor 2, this was done for the purposes of interpretation. We call *Factor 2*

25	WILLINGNESS2	0.388	0.393	0.281	0.595
26	COMPETENCY1	0.222	0.268	0.223	0.807

Table 3. Reliability test

Factor	Number of items	Cronbach Alpha
FACTOR 1	9	0.940
FACTOR 2	9	0.957
FACTOR 3	5	0.917
FACTOR 4	4	0.898

as culture and e-Governance competency of organization factor.

Let us take a look at the factor for *ICT infrastructure quality*. From the results of factor analysis, it can be concluded that most of the items can be used for the ICT infrastructure factor. Therefore, we call *Factor 3 as ICT infrastructure quality factor*. Whereas, if we take a look at Factor 4, we find that this factor is dominated by willingness and competency of user items. So, we call *Factor 4 as user e-Readiness factor.*

Path Analysis

Using the results from the factor analysis above, we conducted a Path analysis. The path model which is shown in Figure 5 was transformed into a path diagram as can be seen in Figure 6. This path diagram was used to analyze the interelationship among factors.

Before doing the path analysis, we conducted a realiability test using the 212 completed questionaires which had been filled by the respondents. The result shows that the Cronbach Alpha score reached more than 0,89. Therefore, it can be concluded that all the items of the instrument were reliable. This result was also similar to the pilot testing based on 20 respondents. The summary of the result can be seen in Table 3.

The Path Analysis was done by using AMOS 5 to examine the interrelation between the factors as shown in Figure 5. The results of the path analysis were as follows:

- The Model has chi square statistics 0.000 (df=4, p=1.000), GFI = 1.00, dan RMSEA = 0.000).

This data shows that the model has a significant degree of fit. The result of the path analysis among the factors can be seen in Table 4.

Table 4 shows that each of the factors has a direct influence on the e-Government success factor. Although the model has significantly fit,

Figure 5. Path diagram
Figure 6. The simplified model of path analysis
Table 4. Path analysis among factors

			Estimate	S.E.	C.R.	P	Label
FACTOR4	<---	FACTOR2	0.000	0.069	0.000	1.000	ns
FACTOR1	<---	FACTOR4	0.000	0.069	0.000	1.000	ns
FACTOR3	<---	FACTOR1	0.000	0.069	0.000	1.000	ns
FAC_E-govt Success	<---	FACTOR2	0.498	0.037	13.622	***	s
FAC_E-govt Success	<---	FACTOR1	0.409	0.037	11.176	***	s
FAC_E-govt Success	<---	FACTOR4	0.479	0.037	13.112	***	s
FAC_E-govt Success	<---	FACTOR3	0.271	0.037	7.408	***	s

ns = not significant, s = significant ----> = the direction of the causal effect

there is no interdependency among the factors (see the first three rows of Table 5). In summary, the above result can be simplified as Figure 6.

Based on the value of the estimates shown in Table 4, we conclude that Factor 2, namely cor-porate culture and e-Governance competency, is the most influential factor in reaching e-Government success compared to the others. The second highest ranked element is Factor 4, namely user's willingness and competency in using ICT. This

Table 5. Result of regression method

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	0.856	**0.732**	0.723	0.52619719	**1.968**

factor influences e-Government success less than factor 2 but more than the others. Factor 1, namely information quality and human resources competency, influences e-Government success less than Factor 2 but more than Factor 3. Finally, Factor 3, namely ICT infrastructure quality, has the lowest score which can be interpreted as having less influence in attaining e-Government success. It can also be seen that the four factors are independent of each other (the value of the estimate was 0).

After the Path analysis, the moderating variables (factors), including Factor 1, Factor 2, and Factor 3, that influence e-Government success, were examined. Using a schematic diagram (Figure 7), Factors 1, 2, and 3 can be assumed to strengthen or weaken the relationship between Factor 3 and Factor e-Government success.

To examine the assumption, we adopted an absolute deviation model which was proposed by Frucot & Shearon (1991) in Ghozali (2001). According to Frucot and Shearon, this model can be used to examine the interaction between Factor 3 and moderating variables including Factor 1, Factor 2, and Factor 4. This model can be used to reduce the impact of multicolinearity diagnos-

tics when adopting a regression method. Examining a model using a regression method requires a number of assumptions such as no multicolinearity (evident when the variables are strongly correlated [r = 0.9 and above]), no otocorrelation, normality distribution of the error, error variant homogeneity, and homoscedasticity. Based on the results of the test, it can be seen that all of the assumptions can be satisfied at 5% significance. Therefore, the regression method is assumed to be valid for examining the interaction.

From Table 5, the model has 0.732 determination coefficient. It means 73.2% the variance of the dependent variable (e-Government succsess) can be explained by the independent variables (Factors 1 to 4 and the interactions). Table 6 provides the result of the regression analysis.

From Table 6, it can be concluded that, according to the relation between Factor 3 and Factor e-Government success, Factor 1 has an important role as a moderating variable. Factors 2 and 4 have no important roles in influencing the interaction between Factor 3 and Factor e-Government success. Based on this conclusion, the final model is presented in Figure 8.

Figure 7. Moderating table
Table 6. Regression analysis

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Label

ns = not significant, s = significant

As a result of the multi-variate analysis performed in the study and shown above, the different factors that impact on positive development of e-Government in Indonesia are shown in the proposed e-Government development model shown in Figure 8. It can be seen that only five (5) factors have been identified as having a direct impact on the development of e-Government and these account for 73.2% variance ($R^2 = 0.732$)

impact on e-Government development for the case study of Indonesia.

The factors highlighted here can be one and the same factors that may impact on e-Government in developing world countries with a contextual environment as that of Indonesia. To conclude the discussion of the factors, the following section succinctly presents an in-depth discussion on the factors impacting on e-Government development in Indonesia.

Figure 8. Proposed model
DISCUSSION

The findings of this study show that four factors including corporate culture and e-Governance competency, user e-Readiness, human resources competency and information quality, and ICT infrastructure quality influence e-Government success in the Local Government of Yogyakarta, Indonesia. This finding is in accord with other findings which used similar factors to measure e-Government readiness (Mcconnell International, 2001; UNDESA, 2005). Although Mcconnel International (2001) does not provide statistical analysis to prove the relationship between the factors and e-Government success, this study has provided the statistical proof.It can therefore be logically argued that these factors influence e-Government success.. It can be seen that enhancing the ICT infrastructure alone does not siginifically improve the impact of ICT implementation success in the public sector. As observed by Feran and Salim (2005), technology on its own is not enough to improve the quality of e-business. Governments implementing ICT projects should prioritize other factors including corporate culture and e-Governance competency, user e-Readiness, and human resources competency and information quality. The result also supports the policy of Yogyakarta Local Government in enhancing their digital government services which emphasizes the role of other factors discussed above to attain e-Government success (Governor Regulation, 2006).

According to Zlatko (2005), national culture influences e-Government success. The need to imbed organizational culture in e-Government projects should be taken into consideration as this will enhance chances of successful implementation. One of the strategies that can be used to align organizational culture within e-Government projects is through organizational awareness campaigns in using ICT. In addition, the role of e-Leadership is crucial in achieving e-Government

success. COBIT (2000) has emphasized that competence in planning, executing, delivery and support, and monitoring should be developed by the organization to reach ICT implementation success. In the public sector, it can be seen that these competences play important roles when adopting digital government services.

The second important factor in this study, user e-Readiness, influences e-Government success. According to Pasuraman (2000) and Davis (1989), user's perceptions in using ICT have a close relationship with the willingness to accepting and using ICT. In this study, user perception, including safety and comfortability played important roles in promoting the adoption of the technology. Besides that, easy of use and easy of innovation when using ICT influences the e-Government success.

The study has also shown that information quality and technical competence among the ICT workforce were the third most important factor that influences e-Government success. This finding is in line with the findings of Mcconnell International (2001) and President Law (2003), where information quality was found to have a close relationship with ICT implementation success. On the other hand, competence of the ICT workforce plays an important role in the maintenance and implementation of the technology to resolve daily work problems which ICT users may face.

This study has shown that ICT infrastructure quality plays the least factor in influencing e-Government success. This finding is in agreement with the findings of similar studies by Feran and Salim (2005) and Heeks (2002). Statistical analysis shows that this factor is moderated by information quality and ICT workforce competence. It can be concluded from this finding that better ICT infrastruture without better quality ICT workforce and better information quality, is not enough to attain e-Government success. In other words, to ensure e-Government success, the quality of ICT infrastructure must be combined accompanied with better information quality and ICT workforce.

CONCLUSION AND FUTURE RESEARCH DIRECTIONS

Successful implementation of e-Government projects requires careful planning that takes into consideration a number of factors besides the technology. It can arguably be stated that most of the e-Government projects that have failed have taken a technology-centric approach where technology has been seen as the main driver for e-Government development. Studies, including the present one, have shown that other factors including corporate culture, e-Governance competence, ICT workforce, and information quality should also be prioritized to ensure e-Government success. In addition, e-Leadership that drives the implementation process through planning, execution, delivery, supporting, and monitoring the ICT adoption, should be prioritized when adopting ICT in the public sector.

For further research, we propose that similar studies, at local government level, should be conducted based on this model to measure its efficacy as a tool for measuring the factors that may influence e-Government projects success.

KEY TERMS AND DEFINITIONS

E-Government: The use of ICTs in government business processes in a view to interact with the citizens and business in the realm of business opportunities exchange and for e-Inclusion in the government processes.

Information and Communication Technologies (ICTs): Used as an umbrella term for all the technologies and platforms used in the generation, storage, retrieval, access, manipulation and transmission of information in various scientific, technology, socio-economic, and political frameworks.

Jogja Cyber Province: Provincial model which transformed its services into citizen-centric service delivery to reach based on business process, information, and knowledge by using ICT as a development accelerator to reach better competitive advantage, convenient, independent, efficient, and effective.

Structural Equation Modelling (SEM): A new concept employed in factor analysis and multivariate analysis in situations where the impact of multi-dimensional factors on a concept is being investigated.

ENDNOTE

Chapter 15

The Competency–Based Human Resource Management Model

Jorge Valdés Conca
University of Alicante, Spain

Susana de Juana-Espinosa
University of Alicante, Spain

ABSTRACT

It seems appropriate and coherent to start this study with a detailed description of the basic analysis unit in the human resource management model that constitutes the study object of this chapter: competency. With this aim in mind, the first section in this chapter is dedicated to three tasks the authors consider basic and introductory: (a) defining the concept of competency through the different approaches made by some of the most outstanding authors in this field; (b) dissecting that concept in its various elements or components so that it can be better interpreted; and finally (c) presenting a number of classifications thanks to which the treatment of certain competencies can be prioritised.

1. DEFINITION OF COMPETENCY, ELEMENTS, AND TYPOLOGY

Defining the concept of competency is a crucial aspect when it comes to implement a competency-based human resource management model; not only because it represents the analysis unit for the set of integrated policies within that functional area but also because a wrong interpretation or definition of the term might lead to fundamental errors with important consequences for the whole organisation. For example, an incorrect definition of the competencies that can describe a job hinders the promotion possibilities of the individual who holds that job (Kydd & Oppenheim, 1990). The definition of competency traditionally given by the literature presents it as an action tool but, in fact, the integration and development of the model into the firm can only be achieved if competency is understood as a decision tool, and not merely as an action tool (Rausch, Sherman & Washbush, 2001).

Since this is a model that encourages strategic cohesion with the rest of the organisation, the negative consequences derived from a bad definition of the model would not only extend to the area of human resources –where all staff-related policies would be affected because the model is comprehensive– but also to the company as a whole.

Nevertheless, no unanimous agreement exists in this respect despite the importance given by all the literature to the definition of the competency concept.

Searching for the origins of this model and, therefore, for those on which the definition of the term 'competency' is based, allows us to state that, although McClelland pointed out already in 1961 that it was necessary to identify the attitudes of individuals that lead to business success, the first definition of competencies as achievement components associated with "groups of human behaviours" appeared in 1973, when the same author published his pioneering work "Testing competencies rather than intelligence" (McClelland, 1973). Of course, the aforementioned achievement components are not present in all individuals but only in those who are able to reach a successful performance in their professional activity. But, what are those components? It is important to highlight an idea in this respect: competency is not the sum of a series of factors but their synergic combination. In other words, these components are related to each person's reasons, features, values, skills and knowledge, but only their adequate combination can lead to the development of a competency at a certain level. A competency is relatively stable over time; that is, competencies do not usually evolve in a natural way –specific development programmes for those competencies are often needed instead. From this moment, these ideas represent the starting point for the preparation of 'ideal' competency-based professional profiles for the management of recruitment and training policies.

The methodology for the preparation of these 'ideal' professional profiles consisted in drawing a comparison between two types of individuals: those who reached a normal performance in their professional activity and those who had an excellent performance. As a result, competencies start to be defined as a set of knowledge, abilities, skills and other characteristics which distinguish medium performance from high performance.

The reflection made by Le Boterf (2000) on the conceptualisation of the term 'competency' deserves a special mention. In his opinion, those definitions which refer to competency as a sum of knowledge items –'knowing how to do' or 'knowing how to be'– and their application are weak. Such definitions cannot be the basis for the establishment of a good competency-based management system, as the fragmentation of competency in its definition inevitably destroys it. There is more into a competency than a mere addition of individual attributes. In short, competency is a multidimensional concept; it is not an isolated attitude, knowledge item or skill, but the integration of them all in the context of a specific profession and its sphere of action. Each observable behaviour taking place in the performance of a specific competency results from the combination of knowledge, skills and attitudes associated with it.

Along these same lines, Córdoba (2004) claims that the concept of 'competency' has suffered an evolution which makes it become an effective performance catalyst, as it permits to adapt the knowledge, professional experience and attitudes of individuals towards the company's goals, and not as a mere aggregation of elements, but as an integrated, intertwined and synergic management of those elements at the implementation of the different human resource practices.

Le Boterf additionally draws a clear distinction between the concepts of 'resource' and 'competency.' Whereas 'resources' would be the attributes or elements of competencies (knowledge, talents, skills, behaviours, etc.) and even the sum of them all, the 'competency' would be something more complex, since the different individuals build

their competencies through the combination of the different attributes they own –which are not the same in all individuals and also evolve over time. In short –quoting this same author (Le Boterf, 2000)– "competency is a disposition and not an elementary gesture or an operation. A competency resides in the chaining or linking, combination and implementation of a sequence."

However, a conflict of interests arises at this stage regarding the definition of competency: unless a breakdown of the term is carried out, it will turn out to be too ambiguous and difficult to manage and, consequently, inoperative; and if, however, the fragmentation is excessive, we run the risk of applying a taylorist approach to competency. Therefore, finding that balance in the competency breakdown makes it absolutely necessary to deepen more into each one of the elements that it comprises. With that aim in mind, and taking as a reference the definitions previously formulated by different experts in this field, our conception of competency will from now on correspond to a set of patterns formed by characteristics which are underlying to individuals (knowledge, skills, disposition, conducts, etc.) and permit them to achieve an effective or higher performance in an activity or a job.

Once the term 'competency' has been defined, our next task will consist in dissecting this concept in order to identify the different elements it contains, so that they can allow us to clarify and specify the approach adopted for its definition.

In this respect, there are various typologies of elements and attributes which shape competency according to different authors. For instance, Pereda & Berrocal (2001) refer to knowing, knowing how to do, knowing how to be, wanting to do, and being able to do; for Arce, (2000) the elements or attributes in question are knowledge, attitudes and skills; in turn, Losey (1999) mentions intelligence, education, experience, ethics and interest; finally, Dirube (2004) speaks about a compendium of knowledge and skills, values and habits, and reasons. Nevertheless, most of them

can be summarised in a single category on which nearly all the authors agree: knowing how to act, wanting to act and being able to act.

In principle, knowing how to act would include the knowledge (knowing) and the individual's experience (knowing how to do) and would consequently be a resource incorporated into the person. Knowing is a highly volatile element from the competency-based management perspective (Bacq, 1996), as the instruments used to validate this element (diplomas, degrees, certificates, etc.) reflect a variety of knowledge items and capabilities acquired at a particular moment which can become obsolete –and even turn out to be insufficient– with the passing of time if they are not recycled. On the other hand, having all the knowledge required to act competently becomes useless if the individual is unable to use it properly. For this reason, the organisation's main role regarding this first element would definitely consist in ensuring its development through different means, as is going to be explained later on in this chapter.

In other words, this knowledge and experience must be complemented by a second component of competency: wanting to act. Our focus at this point is going to be on a number of aspects which are inherent to the individual's personality and, therefore, much more subjective than the previous ones; in short, we are speaking about what is known by some scholars as 'knowing how to be.' However, this component appears as the most important one within the 'knowing how to act' context from the competency-based point of view, since it becomes the differentiating element between individuals who perform the same roles with the same knowledge and the same experience.

We can find the individual's 'attitudes' as an emotional element, along with 'behaviours' as a conduct-related element, within 'knowing how to be'. Attitudes are directly related to knowledge. The more we know about a competency, the more positive the attitude shown towards it. In turn, behaviours appear as a result of the combination between knowledge and attitudes; that is,

we will adopt a behaviour that expresses greater acceptance or rejection depending on the degree of knowledge that we have about a certain issue and the attitude that this knowledge generates inside us (Arce, 2000). In other words, our way of thinking as well as our technical knowledge about the work to be performed will strongly influence our behaviour.

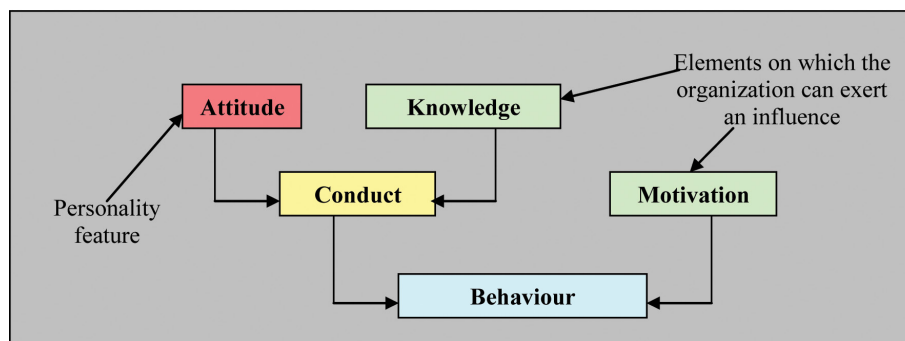
Therefore, as shown in Figure 1, there are specific circumstances where the configuration of individuals' behaviour will depend on their motivation and their conduct, the latter being in turn dependent on their attitude –as a personality feature– before certain situations as well as on their more or less thorough knowledge of those situations.

Other authors, such as Sagi-Vela (2004) add a fourth element –or rather, the combination of the preceding elements: the 'why' (Figure 2)– to the triangular competency system. This 'why' represents the purpose which gives sense to competent action on the part of the individual, and is closely linked to 'wanting,' since having a deep, detailed knowledge of the reason which leads us to perform a certain role and knowing what we expect to obtain with it will influence the individual attitude, which will eventually materialise in a specific behaviour. Therefore, even though the 'why' may indeed be linked to all three elements of competency, in our opinion, that link is closer with one of them: 'wanting.' On the other hand, this same author highlights that 'being able to act' does not constitute a competential element in itself, as it would be formed by the resources and instruments that the organization places at the individuals' disposal so that they can exercise their competencies and would thus fall outside the worker's voluntariness and personal action capacity. It is consequently an organisational element, and not a competential one.

After having defined the different competencies and analysed each one of their components, we are in a good position to classify them according to different criteria with the aim of relativising their importance and contextualising their application within the organisation. Our classification will start with one of the most frequently used typologies in the field of competency-based management, the one which draws a distinction between generic competencies and specific ones.

Generic Competencies vs. Specific Competencies

In this case, the classification criterion lies in the degree of relationship that the competency may have between different firms, sectors or even jobs. Generic competencies are those common to several organisational units. They coincide or are close to the concept of 'talents' used for selection and recruitment policies in the context

Figure 1. Configuration of behaviour


Source: self-elaboration

Figure 2. Elements of competency
of traditional human resource management (Levy-Leboyer, 1997).

On the other hand, specific or 'technical' competencies comprise the professional knowledge and talents needed to carry out the technical contributions defined for a particular profession; they are in keeping with the correct performance of functions within an organisational unit.

Generic Competencies vs. Vocational Competencies

Other authors contrast the generic competencies described above with vocational competencies, the latter being derived from a specific training acquired by individuals during their educational stage. In this respect, Heijke, Meng & Ris (2003) establish a model where an organisation's human capital availability is determined according to the vocational and generic competencies of its individuals.

They infer from this model that the exercise of generic competencies is not confined to a particular context or work post; in fact it allows individuals –through their learning capacity– to develop the competencies required within a wide range of jobs or functions. On the other hand, vocational competencies favour the connection of individu-

als with the work posts that belong to the area of knowledge where they have been trained and on which they will be able to develop a competitive advantage. Generic competencies consequently permit the adjustment of vocational competencies to the specific job requirements. We are therefore referring to two complementary –and not substitutive– competencies (Heijke *et al.*, 2003).

Threshold Competencies vs. Differentiating Competencies

A third classification allows us to draw a distinction between threshold and differentiating competencies, according to the performance level stemming from the use of those competencies. Thus, threshold competencies permit a normal or adequate activity performance. They are typical of traditional staff selection processes and seek an adequate performance at the work post –not an outstanding performance.

Differentiating competencies are those personal characteristics which distinguish a normal performance from an outstanding or successful one. This type of competencies justify why one person with the same training and in the same circumstances as another is able to perform the tasks inherent to a job more satisfactorily.

Primary Competencies vs. Secondary Competencies

Following this typology, primary competencies would be formed by basic personality features of the individual, attitudes and talents which suffice to shape a competency for the efficient performance of the functions associated with a work post. Instead, secondary competencies would arise from the combination of several primary competencies; in other words, they would be constructs of individual basic competencies which enable a person to exercise a secondary competency –if they are developed at a certain level. For instance, whereas self-confidence and emotional stability are primary competencies, they could simultaneously form part of a secondary competency such as leadership capacity (Sánchez de Dios & Valldeperes, 1998).

Simple Competencies vs. Combinatory Competencies

We can finally distinguish between simple and combinatory competencies depending on the degree of development and complexity reached by the competency within the organisation. In this sense, simple competencies would be the individual ones, no matter if they are generic or specific, threshold or differentiating; as for combinatory competencies, they arise from the interaction of different simple competencies that result in new competencies which are much more complex and, consequently, much harder to copy or imitate.

2. INSTRUMENTS FOR COMPETENCY-BASED HUMAN RESOURCE MANAGEMENT

The second section in this chapter has as its main aim to study three of the main instruments –recognised by the authors who are well versed in this field– for human resource management and its different practices related to the concept of competency: the dictionary, the map and the balance of competencies.

The competency dictionary is a human resource management tool which contains both the definition that the company can conceive for all the competencies that it regards as being relevant and their progression at its different levels.

Competency levels represent a scale-based gradation in the individual's execution of a competency according to the achievement of its elements (knowledge, skills, attitudes, talents, behaviours, etc.). As the *Confederación Española de Organizaciones Empesariales* [Spanish Confederation of Business Organisations] (C.E.O.E., 2002) has explained, competency dictionaries will include the behaviours associated with those competencies which can be directly observed. Therefore, the different levels for each competency, usually between 4 and 7, fulfil a twofold purpose. On the one hand, they describe the levels of achievement reached by the individual in the competency under assessment and, on the other hand, they represent the demand profile for a specific work post in that competency.

In any case, the aim sought is the adjustment of levels between the candidate's evaluation and the demand profile for the post. The comparative assessment of these two elements (the candidate's profile and the demand profile for the post) will provide the basis for the subsequent development of different human resource systems, such as selection, promotion, training, career planning, pay, etc.; or to put it in another way, of the three competency-based management dimensions that will be presented in chapter 3, namely: acquisition, stimulation and development of competencies.

The competency dictionary undoubtedly appears as one of the most important instruments for model management. However, there are others which, despite not having that basic and elementary character, actually turn out to be very helpful when managing the model. In this respect,

the importance assigned to the competency map derives from its geographical representativeness.

Competency maps are referential elements associated with specific work areas, posts, roles or occupations which become a highly useful reference framework and instrument both for the organisation and for the worker (C.E.O.E., 2002). It is advisable to show a small example that can help to clarify the process through which these maps are created.

The example shown in Figure 3 allows us to see the map of one competency, group leadership, which could belong to the human resource manage-ment role. In this map, the organisation includes the definition extracted from the dictionary, both for the competency and for the different levels used to grade it. Thus, the different jobs shaping the role –5 (A, B, C, D and E) in this case– are placed in a graph so that they can grasp the different competency levels required by the demand profile for the post. Finally, the relationships between the different jobs are established using arrows, thus clearly identifying the possible ways of promotion available to an individual within one particular role. This map –prepared for different posts within the same role under a competency– could also be

Figure 3. An example of a competency map for a specific role

	Level definition
Level 1	Establishing the group's objectives in a clear and balanced way, especially when those objectives affect their organisation
Level 2	Encouraging everyone's participation in reflection and decision-making processes
Level 3	Paying attention to enterprise external factors with the aim of detecting opportunities
Level 4	Exerting an unquestionable influence on the whole organisation, being recognised as a qualified opinion for decision-making in any issues related to their area or even in issues from other areas. It is perceived as a 'guide' and inspiration for strategic decisions in the organisation as a whole.

Source: adaptation based on De Ansonera (1996).

adapted to the different roles that share a specific competency within the organisation.

The present section is going to finish with one of the instruments that have received the least attention in the literature on competency-based management: the competency balance. Despite the limited importance assigned to this instrument, its validity regarding previsional management and competency development matters is hugely relevant.

The purpose of this management instrument is to favour the identification and assessment of the competencies developed by individuals in the different jobs and roles that they have performed throughout their professional career.

The orientation towards individuals is one of the essential competencies for any human resource manager. Competency balances appear as one of the main orientative instruments for that purpose, since they permit not only to orient the professional career of individuals but also to carry out a periodical follow-up of that career (Joras, 1996). The balance consequently becomes a starting point (initial balance) for the design of a professional career, and a compass that permits to locate the individual's professional 'north' at all times, so

that policies about training, promotion, pay, etc. can be oriented in the right direction (periodical balances) (Le Boterf, 2000).

3. APPROACHES TO COMPETENCY-BASED HUMAN RESOURCE MANAGEMENT

The specialised literature offers us two competency-based management approaches (Herranz & De la Vega, 1999): the Anglo-Saxon one and the Francophone one, the characteristics of both being presented in Figure 4. The most outstanding features in this dual approach are the focus of the model on generic or specific competencies depending on whether we adopt the Anglo-Saxon or the Francophone approach, respectively.

The first one of them is based on the assumption that, because generic competencies are the most widely used among companies, they will be more present in the strategic profiles of organisations than in the tactical or operational ones. This is so because the specificity of profiles increases as they go down the hierarchical ladder. Therefore, these are the competencies on which the attention

Figure 4. Anglo-Saxon approach vs. Francophone approach

Anglo-Saxon approach	Francophone approach
The main objective is to increase individual or group performance.	Oriented towards the person. It acts as an audit element for individual capacity and the efforts made by the enterprise to keep its workforce in optimum employability condition.
It is based on qualitative measures.	Competencies are an inseparable mixture of work-related knowledge and experiences.
It is focused on generic and universal competencies, presupposing that any organisation in any country needs very similar competencies. Competencies represent the links which unite or connect individual conducts and organisational strategy.	Competencies must be developed *ad hoc* for each organisation; it is impossible to identify generic competencies.
The fundamental competency is flexibility.	Use of mega-competencies, such as learning capacity and the different learning strategies.
Focused on job contents, as well as on their relation to the global strategy.	It focuses more on learning processes than on people.

Source: Canós, Valdés & Zaragoza (2003).

of the model must be focused for the purpose of achieving the organisational flexibility that has been set as an objective. This Anglo-Saxon approach is also known as 'conductist approach,' as it starts from the idea that there will be no competency unless we can prove the existence of an effective and/or superior performance. The most representative supporters of this approach or school are McClelland (1973), Boyatzis (1982) and Spencer & Spencer (1993).

In turn, the Francophone approach –also known as 'contingent approach'– defends the idea that specific competencies are the ones which must have a strategic character and weight within the model, since these are the competencies which can eventually become a differentiating element and a possible source of advantage precisely because of this specificity which is likely to make them exclusive to the organisation. Therefore, according to this approach, firms have to design their competencies *ad hoc*, which would leave generic competencies –worthless because they have not been exclusively designed in accordance with the characteristics of the organisation and its environment– out of the picture. This approach –also referred to as 'constructivist approach' due to the belief that competencies can ultimately be built giving individuals an opportunity for development even if they have not shown a successful performance yet– has its most representative supporter in Levy-Leboyer.

In this same sense, Mansfield (1996) draws a distinction between the two most common ways to develop and use competency-based management models: individualised for each job or common to all of them. However, in this author's opinion, neither of these approaches permits to differentiate the requirements for several posts or fit in the competencies for an individual profile with a wide range of jobs or tasks. In this way, a differentiation is made between the model based on specific competencies and that based on generic competencies.

- **The model based on specific competencies.** It was the first competency-based management model to be created and it is still quite widely used for its advantages, among which stand out the following:
  - ◦ It makes the key competencies in a post easier to identify and describe.
  - ◦ It informs workers about what they have to do to achieve better results.
  - ◦ The participation both of workers and of their superiors in the model favours their motivation.

Nevertheless, this model presents some inconveniences as well:

- Its cost –financially and also in terms of time– and the effort required to develop the model make it applicable to a small proportion of jobs in the organisation.
- Due to the constant changes suffered by work posts at present, the applicability of the model for a specific job does not usually exceed a two-year lifecycle.
- Sometimes it shows inconsistencies with the other organisational programmes implemented by the firm due to the emphasis placed by the model on the specific characteristics of each post.
- Also due to this individual character of the model, it is difficult to compare the competencies required for a post and those needed for another.
  - ◦ **The model based on generic competencies.** It has as its main aim to identify and define a set of competencies for a large number of jobs within the organization. Its advantages are listed below:
- They involve a high number of employees.
- There is consistency in the description of the effective conducts that describe the competency.

- The model is in keeping with the values, the mission and other key concepts for the organisation.
- The competencies of individuals managed with this model can be compared.
- Its cost is modest considering its scope and impact.
- Because it is not based on individual posts, the model does not need to be updated every time a job is redefined.

But it has some drawbacks too:

- It does not clearly define the needs for a specific post.
- Workers have to see competencies as a presentation of values rather than as the skills needed to obtain results.
- It is not useful to guide the selection process for specific posts.
- It ignores the skills and knowledge which are essential for the fit between individuals and job tasks.

Therefore, seeing the advantages and drawbacks of a model based on specific competencies –according to the Francophone or contingent approach– and those of the Anglo-Saxon-inspired model focused on generic competencies, the authors of this chapter suggest a model which can cover a multiplicity of posts within the organisation. This 'model for a multiplicity of posts' permits the construction of different models from a common set of competencies. These sets, which are going to include both technical or specific competencies and generic ones, will make it easier to compare jobs for assessment purposes and also to achieve a better fit between individuals and competential profiles as well as more efficient training and development processes.

4. DEVELOPMENT OF THE COMPETENCY-BASED MANAGEMENT SYSTEM

4.1. Objectives and Uses of a Competency-Based Management System

Competency-based management permits to work from people, with people and towards the strategies and objectives determined by the organisation. One of the most significant advantages and contributions entailed by competency-based management is actually the achievement of a greater degree of proximity and convergence between the organisation's interests and those of its workers.

For Le Boterf (2000), this concurrence of interests constitutes a necessity rather than an organisational advantage. It is necessary to have more trust in workers –and less trust in procedures– because outcome achievement as well as the building of competitive advantages lies in the former, whereas the latter are mere instruments placed at the service of the organisation. Along these same lines, Bayón (1994) mentions three premises about the importance that human resource management has for the organisation: human capital is an firm's greatest asset, the decisive factor is the human team who applies the processes and not the processes themselves, the growing superposition of work as opposed to the capital. This same author implicitly refers to the main objective in the competency-based management model, the convergence and integration of interests between workers and the organisation, when he defines the human resource management function as "the one which has as its aim to adapt the company's interests and goals and those of the worker so that the unity and integration of attitudes, along with the work-related, professional, human and economic development can take place simultaneously (Bayón, 1994).

In short, if the model permits the convergence of interests between the staff and the company, the implementation of that model will supposedly imply a number of advantages, uses and requirements for both parts.

We can consequently distinguish three sets of benefits (Figure 5) brought to the firm by the adoption of the competency-based management: uses of a strategic nature, those related to human resource management improvement, and the ones associated with savings and cost reductions in processes.

As for strategic uses, we can firstly mention a greater strategic orientation towards the model, since it permits to identify and cover the key functions in an organisation successfully. Another of the strategic benefits brought by competency-based management is a greater capacity to anticipate and adapt to changes in the environment by means of a more proactive approach; this is so because the model favours this type of behaviours through continuous training, greater professionalism among the staff, competency development, etc. Thirdly, there is the necessary flexibility which has to accompany competency-based management in order to permit human resource mobility and the adaptation to the above-mentioned changes in the environment. The strategic character adopted by the human resource function through the identification of behaviours which lead to excellent performances in functions is clearly one of the most important benefits that the organization can obtain from the model at a strategic level. Finally, a cultural change –along with a change in leadership style– becomes necessary for the implementation of the model. Indeed, the organisational culture must be more open and participative in order to permit the management and development of competencies as a strategic unit for the analysis of human resources. Similarly, the leadership within the organisation has to assume competencies in the areas of evaluation, motivation and development, but above all, in those of communication and dialogue with collaborators.

Regarding the uses provided by the model to the human resource management function, these are obvious because the model was born precisely to improve the management of this functional area and to give it a more strategic character. Although these benefits are going to be repeatedly mentioned throughout this theoretical presentation, we will briefly comment on them here. Firstly, an improvement is achieved in training and motivation practices. Human resources can only become a strategic element in the organisation through an increase in their added value if they receive a kind of training that makes it possible to reach that performance level along with a subsequent development: a polyvalent training –thanks to the flexibility described above– which is also conducive to the stimulating professional acknowledgement

Figure 5. Strategic, management-related, and process-related uses of the competency-based management model

Strategy	Management	Processes
Greater strategic orientation	Greater training, polyvalence and training	Time saving
A more proactive approach	A flatter organisational structure	Reduction of organisational costs
Higher flexibility	Achievement returns on labour costs	Reduction of 'non-quality' costs
Greater HR added value	Greater internal promotion	Savings in subcontracting
Cultural change and change in leadership style	Management and administration simplification	

Source: our adaptation from Sagi-Vela (2004).

of a successful performance. Internal promotion is another of the human resource policies bound to experience an improvement after the adoption of the model. Thanks to workers' polyvalence, together with their higher professional qualification, they will be ready to occupy posts of various kinds within the organisation with a broad business vision. On the other hand, exhaustive and rigid control mechanisms become less necessary thanks to the consideration of technical or specific competencies in an adequate combination with generic ones, thus favouring the increasingly common tendency to the reduction of hierarchical levels in the organisational structure of firms. Yet another improvement in human resource management would stem from making the most of labour costs, since the return on investment in this area increases, not because costs decrease but because there is an increase in productivity; a productivity which has to expressed in terms of added value on the part of the human factor –and not of productive volume– to the organisation's goals (Dalmau & Baixauli, 1989). The model ultimately permits a liberalisation of tasks in the human resource department, simplifying its management and administration, which in turn allows this area to focus its efforts on other functions with higher added value.

Finally, the implementation of the competency-based management model equally brings cost reductions and time savings in the corporation's activity processes. Thus, we can firstly observe a reduction in the process cycle due to the greater degree of professionalism and polyvalence among workers, which allows them to reduce wasted time periods, to simplify activities or to perform some of them simultaneously. Coordination costs will be reduced too, because the self-control that workers have in relation to a set of activities that they develop competently and with an overall vision of processes permits to simplify coordination mechanisms in the design of the organisation. For the same reason, the mistakes made due to the inability to reach a certain quality level in products

and processes will be downplayed. Finally, it will be necessary to resort to the subcontracting of activities which are considered particularly relevant to the organisation. Workers will be sufficiently qualified to develop these processes efficiently, eliminating the lack of profitability that might have previously occurred if the organization had not decided to outsource those activities.

4.2. Design of Competency-Based Work Profiles and Model Implementation

In the first place, and as a step prior to the preparation of competential profiles for the different posts, it is important to carry out a good information and communication campaign addressed to employees (Pereda & Berrocal, 2001). This informative action pursues a double objective. On the one hand, achieving workers' involvement in the model design and implementation process, as they would represent the basic informative source both to identify and to define the organisation's generic competencies along with the specific competencies associated with their respective work posts; on the other hand, a good informative campaign undoubtedly helps to soften the environment before potential expressions of distrust among workers towards the new model, conceptualising it as a motivating instrument and not as a tool used to monitor their performance at the work post. A situation of rejection and lack of credibility may arise if the model is not accepted by all organisation members, both in relation to the model itself and regarding the work team that has implemented it, a situation that is very hard to correct in the short run –or even in the medium run.

After obtaining the acceptance and collaboration of workers, the first step in the design of the competency-based management model consists in identifying the competencies, describing them, cataloguing them and elaborating the reference profiles for the firm. It will be possible to establish these profiles for each professional role or even for

each specific job (Gick & Pallares, 1997). These profiles comprise the set of competencies which the individuals occupying a work post have to own in order to perform their professional activity effectively, safely and satisfactorily (Pereda & Berrocal, 2001). Later on, workers will be evaluated with respect to the above-mentioned referential profiles, and the different human resource policies will be structured around the evaluation results, using the different instruments articulated by the company for these purposes, such as the competency dictionaries, balances and maps that we have referred to above.

As for the methodology used to define the competencies that will form part of each profile, two methods stand out as the most often used: top-to-bottom and bottom-to-top. In the first case, the decision-makers will choose the specific characteristics they want for each post; in the second, they will observe what the best people at each post are capable of doing and that information will serve as a reference to identify and define the competencies. In any case, working with a competency dictionary will make the task easier and will also permit to use more tools. Along these same lines, the III International Conference on Competencies, held in London at the end of 1998, highlighted the different methodologies for the identification and description of competencies and profiles depending on the management style applied by each firm. On certain occasions, competencies are actually defined by the top management; on others, they start taking as a reference what excellent employees do and associate their competencies with those corresponding to that post and that entity (control groups). In the first case, the imposition of competencies by the management over the rest of the organisation runs the risk of making them fall into clichés that will make their implementation more difficult. In the second case, the induced competencies may lack a future vision and fail to consider the foreseeable changes. Therefore, an intermediate methodology which takes both extremes into account and

makes the most of the advantages brought by both is most likely to achieve the best person-post fit (Dirube, 1999).

A variety of techniques can be used to identify the competencies that the organisation really needs. Thus, we can mention the interview about critical incidents, panels of experts, labour climate studies, analyses of areas and functions, the Delphi technique, benchmarking and databases elaborated by external consultants specialised in these matters, (C.E.O.E., 2002), surveys, direct observation, self-evaluation, 360-degree evaluation, etc. (Parry, 1996). Of all those, Gick & Pallares (1997) highlight work groups, panels of experts, interviews about critical incidents, surveys, dictionaries and databases elaborated by external consultants as the most frequently utilised ones. Of course, the gradual development and acceptance of the model has led to the proliferation of competency identification and management service offers by consultancy agencies (Bartlett & Goshal, 1997).

In effect, the identification of competencies can be carried out through the definition of the workers' most outstanding characteristics, starting at the executive levels of the organisation and going down through the hierarchical structure, or resorting to the use of work or control groups. These work groups make it possible to analyse the conducts shown by excellent individuals at a specific work post when compared to those developed by other individuals who only achieve a normal performance. In any case, if the corporation aspires to achieve trust in the model on the part of individuals, to trigger the appearance of informal communication about the project and reach model efficiency, the best way to define competencies is to permit the participation of workers.

Now we would like to focus on studying two of the most widely utilised methodologies, depending on the case: the panel of experts and the interview about critical incidents.

In principle, the panel of experts may represent an alternative to control groups. If a work post is new or does not have a number of workers high

enough for its analysis to be representative, the delegation of responsibility for the identification of competencies to a panel of experts seems to be the most advisable option. Furthermore, this methodology also permits the active participation and involvement of managerial levels in the competency identification and profile creation process.

In any case, a number of considerations must be taken into account when it comes to adopt this instrument. Firstly, it is necessary to ensure realism and functionality in the result obtained. In other words, the parameters according to which the panel of experts is going to identify competency profiles must be observable, measurable; otherwise, they will be impossible to assess and will therefore lose their functionality as instruments for the articulation of a comprehensive human resource management system. Similarly, if the profiles are excessively idealistic, they will create a demand for unreal performances with too high –or even unreachable– competential levels. On the other hand, this lack of realism in relation to competency profiles may derive from the lack of consideration towards the organization's values, beliefs, mission, objectives, etc. This means that, if the panel of experts does not take into consideration the firm's strategic plan and organisational culture, the outcome will be a set of competency profiles which remain distant both from reality and from the company's goals. For example, we cannot identify teamwork as a key competency for the organisation if the latter basically structures its pay policy around individual incentives.

Nevertheless, these inconveniences can be mitigated if the organization has previously created a dictionary from the observation and identification of the behaviour shown by excellent workers, or if it has acquired an external dictionary, always making sure that it is suited to the firm's organisational characteristics. In this way, the task for the panel of experts will be confined to choosing from the conducts and behaviours collected in the dictionary those which define the functions and responsibilities inherent to a job, but without needing to define and catalogue them.

As a final comment about the panel of experts' composition, it is worth highlighting that this panel can include a manager from the area corresponding to the competency profile that is going to be articulated, one or two direct superiors of the individuals who cover those profiles, three or four workers who develop their professional activity at the post around which the profile is going to be built, an expert or technician in human resource matters, a consultant, internal customers who receive the outcome produced by the job for which the competency profile is being designed and a representative of the works committee. The contributions made by each one of these panel members are the ones reflected in Figure 6.

Figure 6. Composition for a panel of experts

Member	Contribution
Area manager	An overall vision and connection with the organisational strategy and culture
Direct superior	Limiting the competencies defined to real behaviours
Worker	Completing the realistic vision of the post with the direct experience of daily work
Human resource expert	Vision of the work post from the formal organisational point of view
Consultant	Methodology for the definition of competencies
Internal customer	Establishing the requirements to be fulfilled with competency performance
Union representative	Making the subsequent negotiation of the model easier

Source: our adaptation from Sagi-Vela (2004).

Another of the most widely utilised instruments, not only for the identification of competencies but also in selection processes is the interview about critical incidents. The "Behavioural Event Interviewing" (B.E.I.) also known as "Competency-based interview" or "Critical Incidents Interview" is an instrument created by David McClelland in 1978 for the purpose of detecting the behaviours, feelings and thoughts which are typical of individuals and characterise their conduct (Donovan-Wright, 2002), avoiding opinions and hypothetical cases in order to prevent subjectivity-related biases in the information obtained. After all, the aim is to find out what leads people to act and not what they think or say that is encouraging them to act. These incidents are identified and registered by means of interviews, from which a pattern will arise that collects the most outstanding aspects in the performance of a competency that permit to distinguish a successful result from a failure result (Horton, 2000). With this aim in mind, the candidate goes through an in-depth interview structured around the individual's experience and training as well as the responsibilities assumed at the different work posts. The interviewees will have to specify three or four importance situations of successful results in their job, so that the competential elements related to 'knowing how' and 'wanting' to act competently can become visible, as well as others where the results obtained were unfortunately not as expected.

The conducts gathered through this type of interviews can be generalised by means of descriptions which reflect the main patterns, thus establishing a dictionary which facilitates a subsequent tabulation. However, if we already have at our disposal a good description of the competencies previously identified in the organisation, it will only be necessary to recognise the behaviours in the dictionary definitions, as it happened with the panel of experts. Moreover, as it allows the interviewee to make an open narration, the critical incidents interview makes it possible to reveal

those competencies which, despite not being included in the dictionary, could turn out to be important for the organisation by complementing and improving this competency-based management instrument.

Although the competency-based interview and the traditional psychological interview are not mutually exclusive –as is pointed out by Alles (2000)– some differences do exist between them. The most important one lies in the fact that, whereas the traditional interview tries to elucidate the individual's behaviour through a battery of tests with the assistance of a psychologist, the competency-based interview extrapolates observable behaviours from past professional situations experienced by the individual to new work approaches, without the need for the intervention of a psychologist. In addition to this, traditional interviews do not permit to identify a person's competencies, since most individuals are not fully aware of the performance level they can reach at a work post, and not even of the behaviour they are going to develop in relation to those functions. On the other hand, when people face a traditional interview, they give answers about what they regard as socially desirable, about what they assume that the interviewer wants to hear, and not about what they really do.

Anyway, the identification of generic competencies for the company must take as a reference the definition of the organisation's strategic model, its mission, its values, etc., even though the behaviours described in each one of them will be different depending on the demands posed by the jobs. It is worth highlighting in this respect that not all generic competencies are equally relevant in all the corporation's functional units; not even in all the work posts belonging to the same functional area (Pereda & Berrocal, 1999).

The report prepared by C.E.O.E. (2002) indicates that, as the model evolves within the organisation, and as a result of successive revisions, there is a growing tendency to reduce the number of competencies and to simplify their content.

Returning once again to the methodology for the identification of competencies, it is worth highlighting the study carried out by Wustemann (2003) among various UK companies as an example. This research study revealed that work groups were the method most frequently used to identify the most representative behaviours in each competency. Seeking to achieve this aim, a decision was made to create transversal work groups formed by workers from different departments but with the same hierarchical position who were consequently going to share a considerable number of competencies in the performance of their functions.

Another method for the identification of competencies –though from a different perspective– can be mentioned: control groups. As we explained in the previous chapter, this methodology consists in drawing a comparison between two groups of individuals belonging to the same role, some with a medium performance level and others who achieve a high or excellent performance. This is the way in which the behaviours, attitudes, knowledge, etc. which serve to distinguish an outstanding function performance from a merely satisfactory one can be identified.

On the other hand, interview-based surveys among the organisation's collaborators are another widespread method for the identification of competencies, especially for specific competencies.

4.3. Competency-Based Management Dimensions

Seen from the perspective of the competency-based management model, the objective sought by the firm's human resource management is to have available the adequate competencies at the adequate level and at the right time and place. It is important to highlight that a specific competency level will exist for each post; high levels are not always advisable, what we really need is levels suited to the post circumstances. For instance, individuals who are excessively enthusiastic in

the performance of their functions may prove to be particularly reckless in the decision-making process when they have to face highly complex and turbulent environments. That is why, although enthusiasm can be seen as a desirable primary competency for a managerial post, its development level will depend on the job to be occupied and its particular circumstances.

Competencies are a human resource management tool. If the organization is able to identify and define them in terms of conduct, they will make it possible to build a model that includes –under the same management system– the (internal as well as external) selection of people, the training and development of professionals, the preparation of succession plans, favouring a culture change, defining and assessing work posts, evaluating performance or even establishing pay criteria.

In order to achieve those aims, the company must pay attention not only to the staff acquisition or hiring for the preparation of a competency inventory but also to the set of policies that can contribute to their development, activation or de-activation depending on the organisational needs.

Competency-based management is therefore articulated in three basic dimensions which permit the integration of the different human resource management processes taking the concept of competency as the analysis unit (Ordóñez, 1995). Ramírez (1996) identifies a series of human resource management systems within each one of these dimensions which are collected in Figure 7.

We can place under the "*competency-based acquisition*" dimension those human resource management systems that we consider predominantly acquisitive; that is, which imply the selection of the competencies marked by the company's strategy (Cantera, García-Morán & Gómez, 1996). "*Competency stimulation*" –that is, how the pre-existing competencies are mobilised and motivated seeking to reach the corporation's goals– has as its aim to focus on the management of performance and pay according to the competencies. Finally, "*competency development*" pursues as its

Figure 7. Basic competency-based management dimensions

Competency-based management			
	Acquisition	*Stimulation*	*Development*
Human resource management systems	Recruitment, selection and hiring	Pay and incentive policy	Training management
	Short-, medium- and long-term previsional management	Work post assessment	Information and communication
	Career plans	Performance assessment	Promotion system
	Succession planning	Motivation and integration	Assessment of potential

Source: Canós, Valdés & Zaragoza (2003).

ultimate aim to develop formative itineraries taking as a reference not the work post –as it has traditionally been done so far– but the prediction of future competential needs.

Regarding Figure 7, it is worth highlighting that the membership relationships between human resource management systems and the human resource management dimensions described in them are by no means unique and pure relationships. Each one of the systems can contain aspects from more than one of the dimensions. Thus, for instance, the staff selection system, despite being a predominantly acquisitive system, may consider the candidate's professional potential, which means that it would include nuances typical of the competency development dimension.

Gick & Pallares (1997) also want to make one thing clear about this table. In their opinion, not all competencies have the same capacity for development; whereas some can be used as selection criteria (acquisition), others are more appropriate for the detection and identification of training needs (development).

In turn, Ulrich *et al*. (1995) simplify all these human resource practices in 6 categories: selection and hiring, development, evaluation or assessment, pay, organisational design and communication. This same author explains in another of his works (Ulrich, 1998) that these 3 competency dimensions can be developed by means of 5 instruments: external recruitment, internal recruitment,

'outsourcing' through consultants, dissociation of those individuals who are unable to reach a certain performance level in the exercise of their competencies and retention of those workers who own critical competencies for the firm through motivation or stimulation policies.

Among all these policies, pay is without a doubt the most controversial one when it comes to implement a competency-based management model. Most authors think that linking workers' salaries to their competencies raises serious problems both from an ethical point of view and in terms of productive efficiency. For these reasons, this human resource policy has traditionally been relegated to the last place when the time has come to implement a competency-based management model, choosing instead others such as performance assessment, training or career planning. A large number of authors –among them Whiddett & Hollyforde (2003); Zingheim & Schuster (2003) or Rankin (2001)– see this discrimination of the pay policy within the overall competency-based human resource management model as something obvious, the reason lying in the fact that this policy is not usually considered essential for the design and implementation of the model. Nevertheless, as is pointed out by Blanco Prieto (2007), the necessary flexibilisation of organisations should be extended to pay policies nowadays. Going even further, Rábago López (2010) claims that, although most current organizations have not incorporated

competencies into their pay policies yet for reasons related to caution, this position prevents them from taking advantage of all the potential offered by the comprehensive implementation of the competency-based management model.

On the other hand, as is suggested by Fernández López (2005), the pay pack should be broken down into three basic concepts: what the employee is; what the employee does; and what the employee achieves. The first one of these elements would possibly have to do with belonging to a specific professional group; the second one would be related to an occupational pay band; and the third one, to the variable part of pay.

In other words, performance assessment and pay are the most important human resource practices when it comes to trigger and reinforce desired behaviours among individuals and, consequently, to achieve the organisation's strategic goals. In fact, quite a few empirical studies have revealed the causal relationship existing between the human resource pay system and the strategic orientation of the firm (Collins & Clark, 2003). As is pointed out by Alles (2010), one of the main concerns among executives has to do with managing the company's organisational values so that they can be harnessed for practical purposes. In this sense, the adhesion of competencies to those values permits to turn them into real management indicators.

In any case, it is important to ensure that all these human resource practices, whether they are considered individually or grouped together around the three previous dimensions, are consistent with one another. On the one hand, this consistency will allow individuals to better understand what is expected from them and what they can obtain from the company and, on the other hand, it will give a response to the correlation of preferences, conducts and, of course, competencies shared by a group of individuals within the organisation, thus providing coherence to their treatment and favouring the formation of work teams (Baron & Kreps, 1999).

In short, employees' competencies are created and supported on these human resource practices (Wright, Dunford & Snell (2001), which contain important nuances in relation to the way of identifying and managing competencies.

KEY TERMS AND DEFINITIONS

Competency: The underlying characteristics of an individual (a motive, trait, skill, aspect of one's self image or social role, or a body of knowledge) which underlie performance or behavior at work.

Competency Model: Set of integrated Human Resource Practices (recruitment, assessment, compensation…) which takes the "competency" term as the basic analysis unit.

Human Resource Management (HRM): Is the function within an organization that focuses on recruitment of, management of, and providing direction for the people who work in the organization.

This work was previously published in Human Resource Management in the Digital Economy: Creating Synergy between Competency Models and Information, edited by Susana de Juana-Espinosa, Jose Antonio Fernandez-Sanchez, Encarnacion Manresa-Marhuenda and Jorge Valdes-Conca, pp. 187-207, copyright 2012 by Information Science Reference (an imprint of IGI Global).

Chapter 16

The Financial Related Analysis on Sales Management and Human Resources by Means of BI Type Solutions

Luminiţa Şerbănescu
University of Piteşti, Romania

Magdalena Rădulescu
University of Piteşti, Romania

ABSTRACT

All companies need information in order to make decisions. There is usually too much data spread in the IT systems of the company, but transforming the data into information that can be analyzed in order to make decisions is a difficult process. Considering the demands imposed by the knowledge society, each organization strives to become an intelligent organization and, by the means of new and innovative Business Intelligence(BI) strategy, to gain a market competition advantage. The new BI era integrates information into the decision process through the means of decision services, relates business processes to business rules that may be changed at any time, and integrates BI benefits to capabilities provided by teamwork, cooperation, and business process management. In this article, the authors present a BI solution, implemented through QlikView Application, thanks to which it is possible to analyse the employee expenses and for management sales.

INTRODUCTION

Valuable information has been registered in operational databases, as those of the accounting information system. But usually this information is

difficult and almost impossible to use. To perform the managerial duties of an organization (forecasting, organizing, coordinating, training and controlling-evaluating) on terms of competition and uncontrolled change of market parameters, means to use some information products able to meet the requirements of time in making decisions,

as well as to identify some possible decisions from which to choose the optimal one. Because the existing reporting systems did not cover all fields of interest within an in-depth analysis of a business process, some business intelligence solutions were developed.

The goal of BI solutions is to offer customized analyses to the right users, at the right time, enabling them to make better business decisions. The companies need to implement analyses to hundreds or even thousands of users, assuring, at the same time, that they all have access to the latest operations.

The demand for dynamic multidimensional systems used to support the intelligent and predictive decision making processes, has determined the development of the systems of BI type (Buytendijk, 1999). These systems become more and more complex, being able of a multidimensional analysis of data and display real abilities of statistics and predictive analysis in order to serve much more to the decision- assisted systems.

Business intelligence represents the assembly of the activities of researching, collecting, treating and transmitting useful information to the economic agents, with a view to get competitive advantages, by its exploitation in a defensive or/ and offensive way (Biere, 2003). The BI applications of assisted decisions facilitate a great number of activities, including the multidimensional analysis, data mining, the predictable capacity, the business analysis, the inquiry, reporting and graphics designing facilities, the geo-space analysis, the knowledge management etc. (Turban, Aronson, Liang, & Sharda, 2007).

Business intelligence (BI) is a powerful instrument that the companies can use to improve the organizational performance offering valuable information for all the parties involved in the business. BI has become such a comprising concept that we must take a few minutes to revise it. Firstly, BI includes disciplines that are connected to each other, yet divided. Thus BI can be divided into four basic zones (Moss & Atre, 2003):

1 Data integration refers to the modality that allows data from different business processes, programs, platforms and systems to be assimilated so as to create consistent information that can be trusted an easily used.

2. Data management means creating a central deposit to stock data in a form and location that makes them more accessible to the analysis engine.

3. Analysis is a term used for mining, modeling and optimizing data to estimate the tendencies that will be communicated to the decision makers.

4. Reporting allows final users to see and show the results in a personalized form.

BI comes with a tempting offer under the form of a platform meant to bring together and to interrogate information in due time helping users to anticipate changes and to act accordingly.

The BI concept represents an architecture and a collection of applications and integrated operative databases, as well as of systems based on decision assistance, that provide to the business community easy access to the data on the respective business (Kimball, Reeves, Ross, & Thornthwaite, 1998). The BI concept represents a series of marketing techniques and analyses which can be fulfilled with the help of a special software. By means of this system, the experts analyse the internal data of a company. The BI concept focuses on the interdepartmental activities of a company, the analysis of material and informational flows as well as the improvement strategies of the activities inside of the company (Brannback, 1997.).

Because of the large amount of data and of huge processing needs, both the dynamic reporting solutions and the data mining require a powerful informational infrastructure designed to enable storage, interconnected, processing and huge correlation capacities (we can talk here not only about the hardware but also about the software capacities, including here the specific parameters for every organization).

The central warehouse that shelters the totality of the collected data from the computer systems represents the central part of the system. It is best known under the name of Data Warehouse (Adelman & Moss, 2000). In order to collect data in the data warehouse from more computer structures, that can be later correlated, even if they come from other systems, it is usually necessary a computer layer to collect, clean, filter and transform the ultimate data of the operational systems (Zillman, 2010). Usually, this task is fulfilled by the ETL services (Extract, Transformation, Load) of BI systems.

BI integrated systems offer data extraction, data analysis removes irrelevant information, the risk management and offers support for managing decisions at high speed and with almost perfect relevance (Rasmussen, Goldy, & Solli, 2002). Business is run through IT systems within BI and do not depend on the computer department.

BI Tools

The need of Business Intelligence solutions is obvious, especially in those companies where the top-management realizes they cannot make tactic decisions in due time based on the existent information under certain forms inside the company, they cannot harmonize the strategies in order to reach the aims and the are dangerously heading towards a competitively risky situation on the market. Taking the current dynamics into account, the data a company holds must be used 100%. They must be translated into information which can answer the critical questions of the management. In the cases where the reports still represent the main support for decision making, presenting all the necessary data but not an analysis or interpretation of these, the need for a Business Intelligence software will, sooner or later, impose itself in a clear way (Loshin, 2003). That is because the current business environment does not accept anything else but well-founded, fast and based on

reliable information decisions which, once taken, gain credibility and extra value for the company.

The Organizational Management considers Business Intelligence to be a vital means of activity improvement, gaining of competitive advantage and meeting the strategic goals (Vitt, Luckevich, & Stacia, 2002).

In Romania, the market of Business Intelligence solutions, together with that of ERP solutions (Enterprise Resource Planning), experienced an impressive evolution due both to the national economical development and to meet the need of companies to remain competitive on the market.

The work instruments which Business Intelligence applications offer give the managerial department of the company the possibility to get involved and to begin analyzing data, without having to wait for the IT departments to hand in complex reports (Bălăceanu, 2007).

The use of a Business Intelligence solution should not be limited to a single department or group within a company. Each department may use specific capacities of such solution (Dresner, 2010):

- The IT department provides the necessary operational systems for the other departments. Report generation has been the IT departments' traditional responsibility, but they should be released from this burden and provide, in exchange - with minimum time, information resources or outfit – an analysis and reporting solution for all the other departments, so that they get quickly the necessary information.
- The financial department uses the Business Intelligence capacities to analyze data, generate reports and financial statistics, and make financial decisions with them.
- The logistics department may anticipate demands and estimate inventories.
- The marketing and sale departments may estimate sales, profitability and analyze the market behaviour on brands (groups

of products) and distribution channels (groups of customers).

To stay competitive, businesses need tools to take advantage of opportunities and avoid risk, in real-time. As a result, business-intelligence and related business-reporting tools are going through a transformation, driven by business leaders and their need for visibility into day-to-day operations (Raisinghani, 2004).

Business intelligence tools, when combined with your operational data, enable you to:

Increase sales using fact-based selling tools.

Several age-old issues encumber the sales process:

- Sales reps traditionally don't know what's selling in a particular account or what should be selling based on a comparison with similar accounts.
- When making appointments, sales reps frequently don't have a substantial "business reason" to see the customer.
- Although building a customized, timely message for each account is a powerful sales tool, traditional marketing methods make this difficult. Consequently, many face-to-face meetings are bland and non-productive. Casual chatter about your products or your company is not a sufficient competitive differentiator - not enough to engage the customer's attention or complete a sale. Fact-based selling is all about delivering a crisp, customized, fact-based message that compels a face-to-face meeting with an attentive prospect or customer. A fact-based message contains key information your customers can use to increase their efficiency and profitability.

How can you overcome these obstacles? With business intelligence tools, you can analyze why a product sells in one account and not well in a similar account (Hoberman, 2001). You can spot inventory problems in a particular store and suggest moving its overstock between stores, or show how changing the product's in-store placement might stimulate sales. In addition, BI data allows you to identify cross-selling opportunities.

What's more, sales reps with laptop access to facts are equipped to make compelling sales propositions in real time. Often, this means helping customers make product or quantity decisions based upon on-the-spot analysis of similar accounts(Howard-Jones, 2000).

Finally, great companies are building loyalty by providing Internet access to information (White, 2000). Your customer also needs fast access to solid information, a factor that can become an incremental advantage for your organization.

Build profits by targeting profitable activities.

Here are some common sales and marketing issues which often act as barriers to higher profitability (Krizan, 1999):

- While profit is the ultimate goal in most organizations, understanding the impact on profitability of an individual product, customer, channel, or sales representative is beyond the reach of most organizations.
- If we don't understand what's driving our profit, how do we focus our efforts and resources? The answer is that we often guess, or adopt a "flavor of the day." In extreme(but not uncommon) cases, there's no focus and we simply react to the next phone call.
- Because credible profitability information may not exist, most sales organizations are driven by revenue. The push is to increase sales, with the hope that profit will follow. However, revenue-driven models treat each dollar of revenue equally, whether it

comes from a high-profit or a low-profit sale.

To break down these barriers, you require information that allows you to direct your team toward profitable targets (Anandarajan & Srinivasan, 2004). This same information enables you to steer your product mix toward increased profitability.

Increase customer loyalty and retain customers for life.

Increasing your customer base and retaining those customers involves several issues:

- Customer retention is problematic. A key to maintaining your customers for life is to make certain they're satisfied. The ideal, albeit difficult, solution is to spot problems early and correct them.
- Losing a high-value customer is a huge setback because these customers often purchase products with a high profit margin. These high-end customers also require less "maintenance" and don't require the high costs associated with customer acquisition and start-up.
- When customers are unhappy, word gets around. Studies show that, on average, each unhappy customer relates his or her experience to nine other customers. On the other hand, many customers never openly complain to the vendor. They just suddenly go elsewhere.

Obviously, customer loyalty is built on customer satisfaction. The strategy that is needed, but rarely in place, includes developing processes that monitor leading satisfaction indicators and feeding that information back to you in time for action (Lowenthal, 2003).

What should you measure? First, late and incomplete shipments are generally regarded as the primary cause of customer dissatisfaction.

Despite the importance of timely and accurate delivery, few firms have a clue about their record in this area, either overall or with respect to any specific customer. You'll likely want to start here, by measuring days between promised and actual delivery dates, for example. Similarly, you'll likely want to monitor customer claims, disputes, complaints, and returns. Be aware that you also have data enabling you to monitor any changes in order frequency.

Once you've identified problems in any of these areas, you'll be able to prioritize your process improvement initiatives according to the areas of greatest customer concern.

The Implementation of BI Solutions with the Qlikview Application

In order to design the reports on analysis we used the QlikView application, which is an excellent tool in analyzing the critical information on a business. QlikView is a complex and powerful BI software package and data analysis which offers a better way to work with the data of a business. The graphic interface offers an increasing interaction to the users. With a few clicks on the mouse, they have immediate access to information that goes from the general level to the level of the slightest details. The organizations, thus, succeed in discovering still unsuspected information, in understanding better what is going on in their current activity and, as such, in making the best decisions for their development.

The extensive facilities on personalization and visualization of information, combined with advanced capabilities in collaboration and implementation work, make the QlikView application easily adaptable inside the organizations (companies or public institutions) that intensively use electronic stored data. The QlikView applications are developed rapidly, they are easily administered by the IT department within a company, and they offer to the final users an unlimited freedom of

queries, at any level of database (QlikTech International, 2008).

From the point of view of the final user, the application ensures two important functions: free surfing through the database in search of relevant information and varied possibilities of displaying data. These functions are closely linked and it is difficult to distinguish between the two.

Searching through the database is performed by specifying the selection criteria. The user can express simple criteria or criteria combining logical operators in search for information. The application allows access, at the same time and on the same screen, to all information in the database, the selection being done with a simple "qlik" and the search by writing the corresponding criteria.

Specification of the display mode must allow the analyst to find optimal modalities to turn to a god account the extracted data. Beside the typical graphical possibilities of presentation, it is important for the user to visualize multidimensional data in a tabular form. Thus complex table can be used to group columns and lines expressing different dimensions and different aggregation levels.

The strong engine Business Intelligence of QlikView analysis uses the revolutionary technology AQL (Associative Query Logic), which accesses structured information from various sources in an interactive and dynamical way, propelling the selections of analysis throughout the entire available data basis in order to build an associative, non-relational and extremely efficient data basis (QlikTech International, 2008).

AQL offers QlikView the possibility to work with millions of data cells and yet to answer the questions within less than a second. By replacing the classic relational technology with AQL, QlikView replaces the need of pre-aggregation of data.

Furthermore it gives the possibility of connecting to any source of data (ERP, CRM, Microsoft Excel, logs, Access data bases), thus achieving the gathering of the pieces of information generated by the multitude of independent applications used within a company.

Any objective in QlikView – from lists to graphics and tables – is accessible through a "click". QlikView enables the users to find their own way towards the analysis and understanding of things.

Qlik View is the business intelligence solution that extends the concept of simplifying the analysis for everybody, further than ever (Swoyer, 2008). The extended facilities for personalizing and visualizing information, combined with advanced co-operative work abilities make QlikView easily adapted within organizations (companies and public institutions) that use intensively electronic data stocks.

Qlik View offers (Manohar, 2008):

- Personalized dashboards;
- A powerful reporting engine – fast and easily combines and distributes data from multiple sources;
- Flexible solutions - Qlik View users can connect to the internet;
- Personalized applications – the possibility to develop very fast 100% personalized solutions.

Case of Study A: Example of Sales Management

To give an example we considered a company that deals with product distribution. The company has got several warehouses situated at different addresses and furnishes products to several clients from all over the country. The used information refers to:

- *Articles* characterized through: Product Code, Product Name, Weight, Product Group, Group Type;
- *Customers* defined through: Customer Code, Customer Name, Location Code, Customer Location Name, Customer

Group, Customer Group Type, Department, Town, Invoicing Code;
- *Invoice heading* which comprises: ID, Invoicing Code, Date, Warehouse Location, Warehouse and Bill
- *Invoice lines* consisting of: ID, Product Code, Quantity and Price.

The most important operation that can be done very easily with QlikView is the "*Filter*" spreadsheet. This allows visualizing several pieces of information at the same time. The operations that can be made on this page are:

- The simple or multiple selection: for example if we select a certain product we can visualize information about the name, the customer's type and location to whom the product was distributed, about the group of product to which the particular product belongs, the warehouse, the delivered quantity and the price of the product, about the bills released for the sell of the product.

- The search: for example, if we want to find a bill number in order to see the information comprised in this particular bill (sold product, date of release, quantity, price), we have to select the thing corresponding to the bill and introduce the number of the bill. As the numbers are being introduced, all the bills that have the specified values comprised in their number are selected (see Figure 1).

A very important thing for the drawing of all the spreadsheets is the dimension established as representative for them. Thus we used as dimensions: time, location of warehouses, customers, products, etc. These can be selected and altered on each sheet and we can use combinations of these dimensions in order to define groups.

Using the information taken from the database described above we made the following spreadsheets:

A.1. Sales map: where the sales in each warehouse are graphically represented for the selected

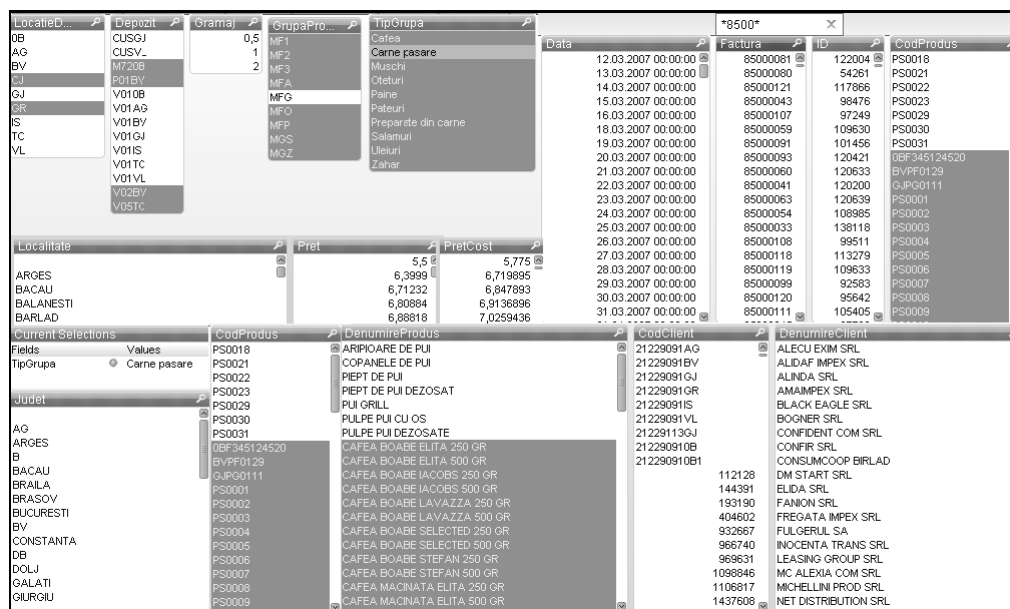
Figure 1. Filter page


Figure 2. The sales map
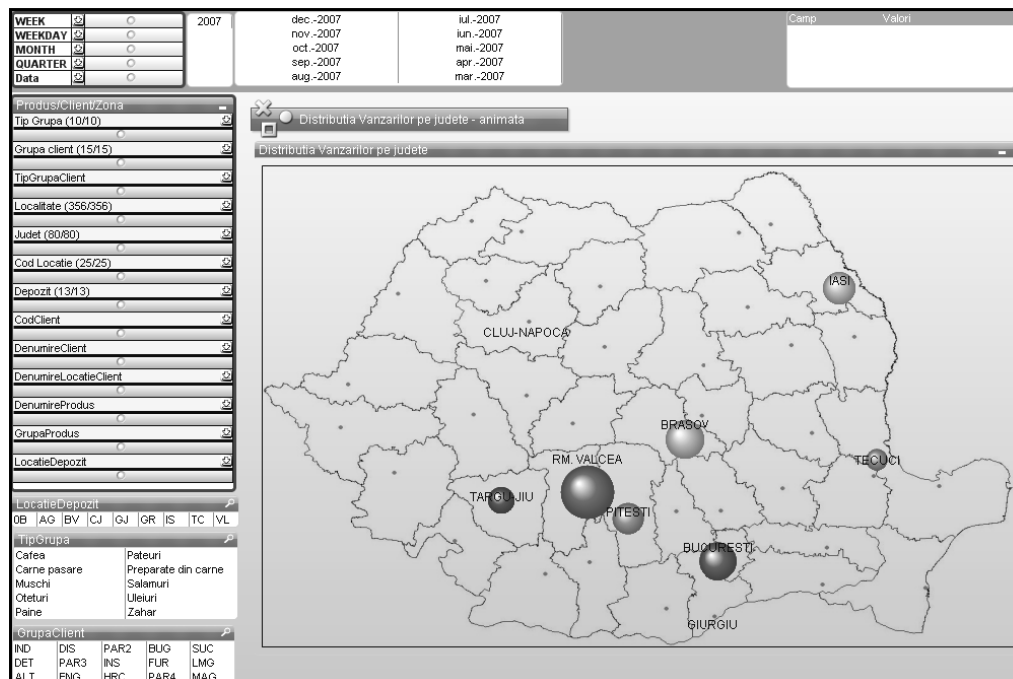

period. We can get a clear picture of the sales from each day, week or month, for a certain group of products, or for a certain group of customers. (see Figure 2)

A.2. ***The periodical evolution of the sold quantity.*** In this chart, it is presented a detailed analysis on sales by determining the evolution of the sold quantity from a group of products every month of the year. The dimensions of this chart can be changed so that the sold quantities can be displayed on another period of time (on weekends, weekly, daily, yearly, etc.). At the same time, the evolution of sold quantities can also be displayed, from different groups of products or, simultaneously, from two or more groups (Figure 3).

A.3. ***Customers' Evolution.*** In this chart, for every type of customers, there are presented the groups of products and the values corresponding to them, for quantity and value, as well as the evolution of prices (how many times the price has been modified), the low, average and high price for sale of the products from the respective group and the standard deviation. (see Figure 4). All these information can be displayed for every customer partly, for every product or warehouse, or by means of selection, for different values.

A.4. ***The report with reference to the evolution of the number of clients, of the number of distributed products and sales turnover.*** From the report an analysis of the monthly evolution of the sales can be done. Figure 5 shows the evolution of the sales turnover, but by choosing from a menu there can be drawn diagrams for the number of customers or for products.

From the table adjoining the diagram other selections can be done, for instance we can choose to draw the diagram for a certain product group, for a certain customer, for a certain geographical

Figure 5. Monthly evolution of the sales turnover
area, for a certain group of customers, etc. In fact these selections can be done within any spreadsheet built with the aid of QlikView application.

A.5. Variations on sales. In this chart, there are determined the differences between two days in different months. Thus, to exemplify, I considered a day in August and at 20days' distance, a day in July (see Figure 6). There can be noticed the differences between the sold quantities, the products value, and the price for every product which is found in the existing group of products.

This chart can be modified easily by changing the dimensions, in this way, visualizing the same information grouped differently. For instance, we can find differences in the quantities, values and prices for a group of products, or for other customers or types of customers (partners or non-partners), or from certain warehouses, or from a locality, etc. Selections can also be made, for example, we can choose to draw a statistics only for a certain group of products, for a certain customer, a certain geographic area or for a certain group of customers etc. In fact, these selections

can be made in all accounting papers built by means of this QlikView application (Figure 7).

A.6. Comparative evolution where we make a detailed analysis of the sales following several dimensions graphically represented on one axis or two. Here we can establish if there is or not logical correlation between the chosen dimensions, on certain periods of time, for example between the average price and quantity (we can study what happens to the quantity if the average price rises, or the other way) (see Figure 8)

A.7. Comparisons on certain periods such as:
- *Comparisons between the days of the week.* We build the evolution on a certain day of the week of the value, average price and sold quantity. For example, establishing the date of 01.08.2007 we get specific data for the three dimensions only for the day of Wednesday from the current or previous month (we take in account the last 4 weeks) and we compare these days to one another in order to

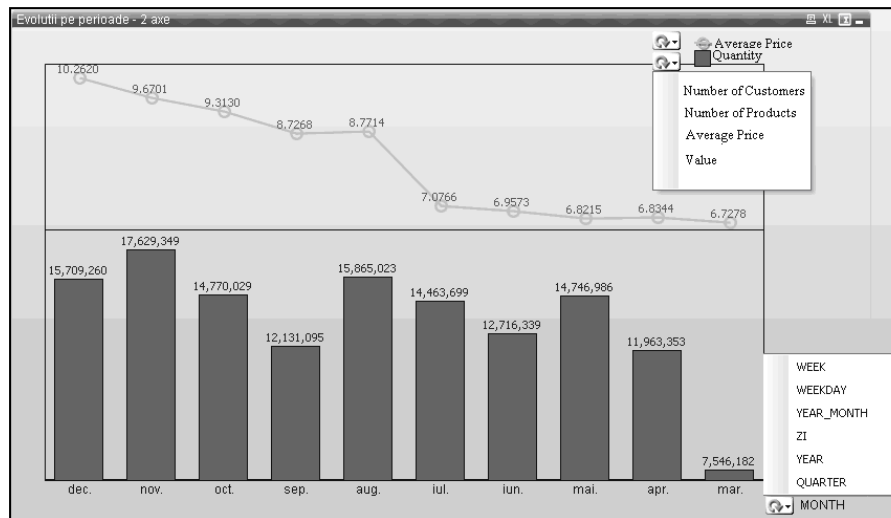
Figure 7. Variations on sales for the groups of products

Figure 8. Comparative evolution


establish if there was or not an evolution of the sales (Figure 9).

◦ *Period comparisons* era done using the same dimensions, but we establish a certain period for which we want to visualize sales evolution. For example, if we use a 7 days period, this does not mean that we built the evolution for that week, but for a 7 days period previous to the analysis date.

◦ *Monthly comparisons* – we draw the sales evolution following the three dimensions for each of the 12 months previous to the analysis date.

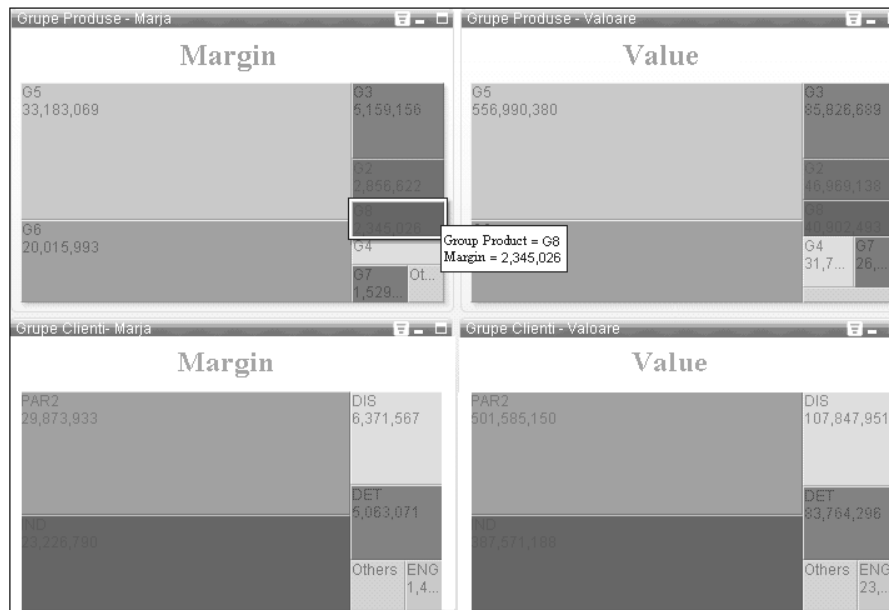
A.8. The margin analysis on product and customer. The in-depth analysis of the company's total margin means to study the main product margins and to establish the influence of direct and indirect factors on them. Figure 10 may provide the margin analysis on customers for a certain period of time (year, month, day) and also the product margin by selecting the attached menu.

Comparisons between the margin and value for both products and customers may be achieved, too (Figure 11).

A.9. "What-If" evaluation. This report shows how the margin value changes if the product price and/ or quantity change (increase or decrease).

The managerial decisions on sale prices should consider the two components of the sale price:

Figure 9. Days of the week comparisons

Figure 10. The margin on customers for a single month
Figure 11. Margin-Value comparisons


- The purchase price of the goods;
- The commercial margin.

The commercial margin, also known as the commercial addition, should be settled as to allow cost recover with good circulation, including the taxes regarding the good circulation (the value of product shipment, depositing and valuation, the market taxes, etc.) and gaining a certain profit.

The manager of a company has to make simulations to change the prices, the quantity to sell or the purchase costs.

For example:

- If the purchase cost increases with a number or percents higher than the increase percent of the product price, the margin will increase; otherwise, the margin will decrease;
- If the quantity and price increase, the margin will also increase;
- If the purchase cost increases more than the price value, the product quantity has to increase considerably so that the margin increases (Figure 12).

A.10. The Key Performance Indicators (KPI).
The key performance indicators are important for the teams, managers, or businesses in order to evaluate rapidly the progress to measurable objectives.

Every business area can choose to follow other types of KPIs, according to the objectives which are to be fulfilled. For instance, in order to increase the customers' satisfaction, a calling centre can have as its goal to settle to answer to a specific number of telephone calls in a shorter period of time (Figure 13).

Another possibility is for the sales department to use KPIs in order to settle performance objectives, such as the number of the new products sold every month. Other example of such indicators could be defined:

- The average income on customer;
- Sales versus target for every employee of the sales department;
- The success rate (the number of contracts signed of the total).

Figure 12. What If" evaluations

Figure 13. KPI

In the present case, I considered as performance indicators: the products value, the sold quantity, and the average price and I took into account the days of the current month and the days of the last month till the same day.

Case of Study B: Example of Human Resources Analysis

For exemplifying, I consider a firm which deals with the human resources analysis within a company. Data referring to human resources is processed in due time and analyses such as: the analysis of labour force, absenteeism, productive hours, personnel expenses, training days etc can obtained. The simple and comparative analyses, the examples and statistics shown in a corresponding chart are important means to support decision, the solution meeting the needs of the company in the short, medium and long term.

Apart of the designed reports for accomplishing an analysis on human resources within a company are presented in the following:

B.1. ***Salary evolution per month*** for each employee of the companie. This report shows the standard wage, the gross salary, the incentive category received over a period of three months (as selected) by each employee. For each employee, the differences in the standard wage, in the gross salary per month as well as the periods of time when s/he was given incentives can be easily noticed (see Figure 14). The information in this table can be rearranged. By targeting the month this will become column heading and we can see the value of the three components (standard wage, gross salary, incentive category) for each month. At the same time we can make selections such as: to visualize information on a certain department, on a certain position, etc.

B.2. ***Standard wage analysis***: the departments within a company and the positions within the departments are shown in the form of a table (see Figure 15). The following information is calculated for each position, for a three month period: the number of employees with the same position, the total sum and the average of the monthly standard wage, as well as the minimum and the maximum standard wage given in a month. This table can be modified, just with a few "clicks", to obtain the same statement for each employee, examining the differences in the salary for the same employee but also the differences in the salary for two employees with the same position. The monthly evolution of these parameters is easy to follow, and comparisons can be made between nonconsecutive months.

B.3. ***Evolution of costs*** contains the graphic with monthly values on net salary, gross salary, standard salary and on the total cost for a three-month period of time. This graphic enables the manager to notice the monthly differences between the expenses with the employees and it offers computer support for controlling the salary increases within a firm with a decentralized decision and with

Figure 15. Standard wage analysis

many employees. The total cost and the wages display the same trend, because they are in a direct connected. Anyway, the share of wages in the total cost is more than 55%. If the manager makes a connection between this trend of the wages and of the total cost with sales development, he will have a full image of the firm profitability and its development. So, his decisions can be supported with concrete data and can aim each worker or each department (Figure 16).

B.4. ***Evolution of pay rise*** contains for each employee the minimum standard wage and the maximum standard age the difference between maximum and minimum, the percentage of the difference and the average standard salary over a three month period of time (see Figure 17). The last column shows the number of months with pay rise.

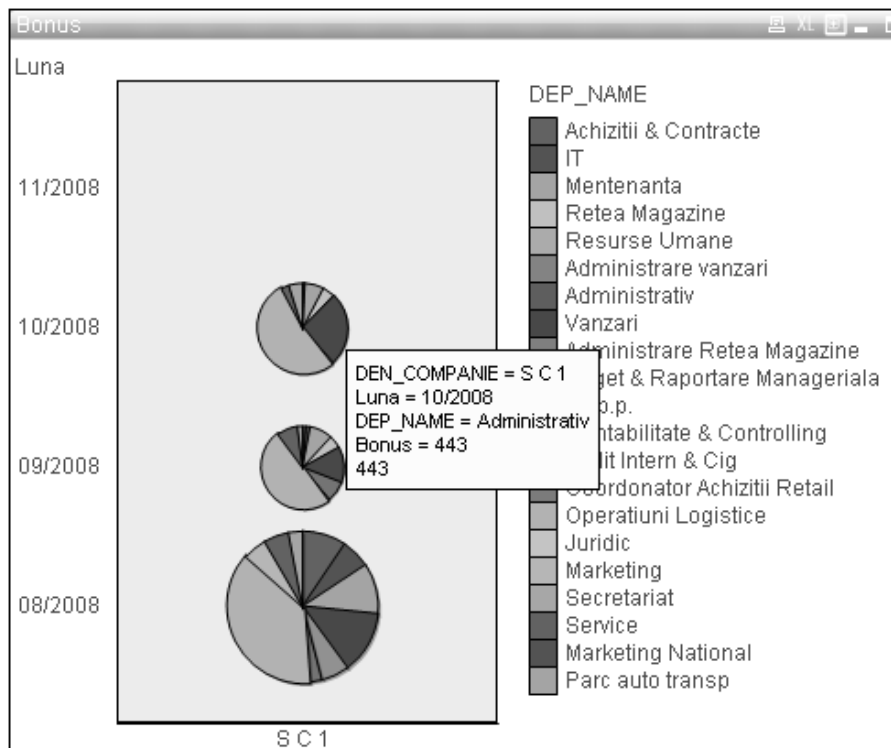
The actual analysis of the salaries can be done when it is needed, for the whole company or only for a small group of employees.

This report offers the informational support to control pay rises in a company with decentralized decision, with many employees (the increase percentage of over 20% are automatically signaled – colored in red). In the present example the increases are due to the change of position as well as the pay rise decided directly by the employer.

B.5. Bonus analysis contains for each department of the company the sums in the incentive category (bonus) given to the employees every month (see Figure 18). The chart can be used for statistics on the bonuses given by a company to its employees in a month or over a certain period of time. At the same time, the sums in the incentive category given by the company to its employees can be compared, for the whole company or for each department. By placing the mouse on

a certain department in the chart (a certain color) detailed information on department, month and the incentives given to employees are shown. We can notice that in August, which is a holiday month, all departaments and workers got primes, while in the rest of the months, only some departaments got primes, namely, again, the logistic operations department and the sales department were in top.

B.6. The analysis of extra work hours done by the company per month (see Figure 19). The average of total expenses, the average number of extra hours, and the value of the extra hours per employee are calculated for the company. The last column shows the ratio of the value of the extra work hours to the total expenses of the department. The supplementary working hours are noticed here at the logistics operations department and that explains the larger wages and primes given by the company to these departaments that contribute to the increase of the firm performances. If the firm manager will correlate

Figure 18. Bonus analysis


the increase of the total cost due to the supplementary working hours with the sales increase due to these working hours, he can decide if it is efficient or not to ask for such enlarged working program and pay for it.

The features of this report can be modified and thus the total expenses per department, per salary earner or per budget group can be carried out.

Figure 20. Leave records

B.7. **Leave records** contains information regarding the average number of vacation days taken by the employees of each company over a three month period. A simple click can change the chart to visualize information on sick leaves and the number of meal tickets per employee or change the period of time (one month on nonconsecutive months). The same information on leaves can be displayed in a chart but grouped on a department, on positions or on budget groups (Figure 20).

B.8. **The supervision of employee activity.** Is done by recording the days with sick leave and holidays, the number of training days, extra hours, the hours with normal work regime, the hours worked in the night shift or on holidays, for each month(see Figure 21).

A simple click can change the chart to visualize information on sick leaves and holidays, the number of extra hours, the number of hours worked in the night shift or normal work regim per employee or change the period of time(one month or nonconsecutive months).

The same information on leaves can be displayed in a chart but grouped on a department, on positions or on budget groups. The charts show the monthly evolution in the number of working hours, the absenteeism or personnel refresher courses.

B.9. **Instrument panel:** contains three types of charts that show, with a view to carrying out comparison and analysis, situations referring to (see Figure 22):

∘ The employee fluctuation for company over a five month period. This report also shows, if the features are changed, the number of sick leave days taken, the number of training days, the number of extra work hours and the bonus give to the employees;

∘ The total cost spent by company on human resources as well as the gross cost for taxation;

∘ The observation on the salary earners' activity taking into account the number of sick leave days taken, the number of training days, the number of extra work hours and the total number of employees, per month.

Figure 21. The supervision of employee activity

CONCLUSION

We must admit that these technologies are at the beginning of a long journey, in a world where the key to success lies on the ability to make better decisions and in a much shorter period of time than the competition. However, the life of a company depends more and more on such decisions, fact that makes impossible to deny the benefit that the BI can bring.

The cost of implementing the BI systems is rendered by a visible save of time that is accomplished by the company's management for the period when it gets the information and by the earnings of money that come from the quality of decisions.

This information system is a Business Intelligence product offers informational support to those with analysis and decision powers in the „HR" and „Sales" departments. Implementing a business intelligence solution has the following benefits (Thompson, 2004):

- It places at the users' disposal all relevant information about the business they need in due time.
- Simplifies the search for complex data and automatizes business processes
- The solution is adapted to the specific requirements of the organization, unlike a prefabricated and difficult to adjust one
- It makes use of the existing technologies: Excel and requires little training as it is based on the present knowledge of the users.
- It reduces the period of time for decision making, allowing rapid reaction to changes and generating a competitive advantage.

We believe that, in the future, Business Intelligence solutions will become indispensable tools in the management of any company since quick and good decisions will become critical for survival and evolution on the European market. Romania shows a great potential to assimilate IT solutions, the receptivity for Business Intelligence solutions becoming more and more obvious both as mentality and practical application within the Romanian business environment. There are still problems, as there are Romanian managers that still need to be convinced to adopt global Business Intelligence solutions.

The reason why Business Intelligence is needed in the activity of a company or of an institution in Romania is connected to the need to cope with the competitiveness imposed by the European market, by the standards and the legislation that must be observed, as well as by the acute need for a time and profit and performance economy. The problems faced by most of the organization, especially by the public ones, is the lack of fast, centralized and relevant information, the huge amount of information only partially used and the impossibility to turn the data into benefits, as a result of users' superficial and sporadic access to it.

The set of the BI reporting devices offers the access to the information that we need, when we need, in order to make the right decisions in the shortest period of time. Today, all the companies know the fact that their pieces of information are valuable/reliable. The most intelligent of them already invest in BI instruments and they offer the necessary visibility in the decision making process at all the levels of the organization.

Just because of the world crisis, the companies should become more efficient to survive. And it should be taken action right now. A BI system is included at the defensive investments and its role became very important under the circumstances.

Chapter 17

Recruitment and Retention of Healthcare Professionals for the Changing Demographics, Culture, and Access in Canada

Stefane M. Kabene
University of Western Ontario, Canada

Melody Wolfe
University of Western Ontario, Canada

Raymond Leduc
University of Western Ontario, Canada

ABSTRACT

The Canadian healthcare system strives to serve a population altered by ever-changing demographics, cultural shifts, and diverse societal populations, and to serve those in rural communities with remote access to health care. The following chapter examines Canada's current healthcare system and the effects on demand for services and the supply of healthcare providers created by the need to service rural populations, by limited access to medical schools, and by the introduction of foreign medical/ health professionals. More specifically, the chapter reviews the symptoms of a strained medical system plagued by "brain waste" due to the non-use of qualified immigrant healthcare professionals, long wait times as a result of inadequate staffing and resources, and a school system that hinders the development of aspiring medical care professionals from rural and international areas. If Canada is to face these challenges with efficacy and vigour, effective human resources management techniques and competent human resources professionals are a necessary prologue. Medical knowledge and skill must be valued; healthcare professionals should be utilized more efficiently to improve healthcare access and minimize brain waste.

INTRODUCTION

In response to the changing demographics of the Canadian population, various broad macro-policies have been implemented, changed, and subsequently remodelled in an effort to recruit and retain medical professionals to improve healthcare access (Kirby, 2002; Mazankowski, 2003; Romanow, 2002). On a micro level, the needs of the Canadian population are far from static. Ideally, macro-level healthcare policies should answer the healthcare issues affecting Canadians today, that is, the provision of adequate, quality healthcare for those who need it. However, it is important that the changing needs of Canadians are identified in order to provide an effective healthcare system adapted to the realities of Canadian society. Identifying the health needs of Canadians and the inefficiencies and inadequacies of a healthcare system that fails to meet them will provide a specific area of focus in which to remedy Canadian healthcare.

Effective human resources (HR) management—in order to provide adequate healthcare services—must anticipate the potential pressures that will be faced by staff and medical and health facilities. Currently, a major factor for future medical strain is the aging population. The percentage of Canadians over 65 has increased to 13.7, meaning that nearly one in seven Canadians are senior citizens (Martel & Malefane, 2007). The elderly are living longer, in many cases with one or more chronic medical conditions, and consequently, are requiring increasingly more medical attention. Epidemiological research has demonstrated that as the average life expectancy rises, so does the average number of years that a person lives in a disability-dependent state. As pointed out by Beaujot and Kerr (2004) "at age 45, men can expect to live 10.7 years, or 32.5 per cent of their remaining lives, with some disability, and the same would apply to women for 15.1 years, or 40.1 per cent of their remaining lives after age 45" (p. 49). The baby boomer cohort of the 1950s—a large proportion of the Canadian population—is aging

and without a corresponding increase in fertility or migration levels, is resulting in an increasingly older population. The median age of Canadians in 2001 was 37.6 years, and is projected to be 45 years by 2036; the proportion of those over 65 is predicted to increase from 13% in 2001 to 25% by 2036 (Beaujot & Kerr, 2004).

Healthcare professionals have seen an increase in degenerative diseases within the older cohort; consequently, the strain on the medical system is exacerbated by the increased need for medical attention required for longer periods of time and often in individuals with more complex conditions and co-morbidities. Improvements in medicine and technology may have prolonged the lives of the elderly, but in doing so, have increased the demand for physicians, nurses, and other healthcare professionals, and increased pressure and workload on existing healthcare providers. Such pressures can act as a disincentive to practice medicine in Canada

The sustainability of the current Canadian healthcare system is also an issue of concern. The costs of health care in Canada are increasing substantially each year. From 2006 to 2007, private and public sector spending on healthcare had risen 3.2%, even taking into consideration inflation and population growth (CIHI, 2008a; 2008b). Additionally health expenditure had risen from 9.1% of Canada's gross domestic product (GDP) in 2000 to 10.7% of 2007's GDP; this accounts for approximately 39.2% of provincial and territorial government expenditures. Health expenditure is increasing at a higher rate than health revenues. From 1993 to 2007, health revenues increased by 49%, while health expenditures increased by 60%. Unless drastic changes are made, it seems impossible that the Canadian and provincial/territorial governments can maintain a similar level of care, while controlling costs.

Changing Canadian demographics and cultural diversity also present potential challenges to healthcare workers; an increasingly broad cultural diversity requires the healthcare system

to be tolerant and accommodating to the changing population. Rural healthcare access is an additional area requiring improvement. Approximately 20% of Canada's population is currently living in rural areas, yet these areas are serviced by less than 10% of the physician population (CIHI, 2008a). Changes to international recruitment and redistribution of medical professionals may serve as important retention strategies to lessen the impact of the demands of an aging population and access to care in the rural population.

Challenges such as cultural diversity, an aging population, lack of healthcare providers in rural areas, and attempts to recruit internationally have produced issues in Canadian health care for which the medical system was not prepared. These issues manifested themselves in the form of "brain drain" (i.e., the loss of qualified health professionals to other countries), "brain waste" (i.e., the underutilization of international medical graduates), and as a by-product, have added to the increased waiting times for some health services and to ongoing debates about the ethical issues regarding international recruitment (i.e. our gain is another country's loss of a qualified health professional in a global environment where there is a worldwide scarcity of health human resources). In order to accommodate our changing society, these issues must be resolved. Particularly, the accommodation of more medical professionals is imperative in order to support increasing demands for medical care.

In an attempt to resolve the inadequacies of the Canadian healthcare system, government programs have attempted to increase the immigration levels of foreign-trained medical professionals and increase opportunities for residency training in Canada. Additionally, for individuals who fit the profile of future doctors who will practice in rural Canada, flexibility in medical school and residency training program admissions requirements has been granted (Goertzen, 2005) However, many questions remain. How are these programs expected to increase immigration lev-els of foreign-trained medical professionals *and* ensure more flexible admissions requirements in order to include more rural students? Is there any evidence that these programs have had success in recruiting and retaining medical professionals in Canada or in improving access to healthcare professionals in underserviced areas, such as rural communities? The answers to these questions are still being pursued. For example, technology has also been utilized in providing healthcare access to rural Canadian populations. The goals of such initiatives are to increase access to medical professionals, while simultaneously increasing the distribution of healthcare information and care to remote and underserviced areas.

Former senator Michael Kirby, in his national healthcare report (2002), examined some of the problems plaguing the Canadian healthcare system, and made several recommendations to address these issues. A general theme in his recommendations is an improvement in the coordination of health services between provincial, territorial, and federal governments. Since Confederation the delivery of health services and education, licensing and regulation of healthcare professionals has been a provincial responsibility with shared ideals and financing across the various levels of government. Kirby suggested the establishment of a national council to coordinate certain aspects of the healthcare system, such as recruitment and licensing regulations. In subsequent reports on the state of Canadian health care, Romanow (2002) and Mazankowski (2003) developed similar recommendations. Both agreed with Kirby in that the healthcare system must be reconfigured to establish well-defined roles and responsibilities for regional healthcare authorities and for the federal and provincial/territorial governments. Romanow also suggested the creation of a Health Council of Canada, similar to Kirby's national council, to facilitate cooperation between federal and provincial/territorial governments. These suggestions present the idea that a solution to the health

human resources problems of Canada must involve some integration of federal and provincial policy.

The above discussion illustrates the role of, and demand for, human resources policies and practices in the healthcare system. Is Canada effective at recruiting and retaining medical professionals? Currently each province and territory is suffering from similar problems regarding adequate provision of healthcare. It seems Canada requires drastic changes to address the shortage of healthcare practitioners and to provide prompt access for the population. Canada needs to develop an integrated approach to addressing this nationwide problem. By developing a strong understanding of the possible symptomatic causes and the current issues Canada is facing, adequate solutions for health human resources may be found.

HUMAN RESOURCE MANAGEMENT ISSUES

Despite the growing concern over Canadian medical practitioner shortages, several positive trends have been observed. For example, 2004 was the first time in over 35 years in which more doctors returned to Canada from abroad than those who left to practice elsewhere in the world (CIHI, 2006). According to the Canadian Institute for Health Information (CIHI) the same pattern has occurred in the last three years, and the number of physicians who moved abroad decreased by 57% over the past five years (CIHI, 2006). The number of practicing physicians in Canada has increased by 4.9% over the previous five years, while the increase in the population at large in the same period was only 4.0% (CIHI, 2006). Additionally, the CIHI data demonstrated that:

- The overall increase in physicians was attributed to an increase in Canadian-trained physicians.
- The number of doctors trained in Canada grew by 5.2% between 2002 and 2006,

compared to an increase of less than 1% (0.7%) in the number of foreign-trained physicians.
- Doctors trained abroad came primarily from the United Kingdom and Ireland, South Africa, India, Egypt, and the United States.

Based on these trends, it appears that medical provision in Canada may be sound, or at the very least, on a progressive track. However, there is still an imperative need for strategic development in improving the distribution of medical personnel within Canada. Many more physicians move between provinces and territories within Canada than immigrate or emigrate. This internal migration has a very clear overall trend, with Western provinces receiving most of the physicians. Between 2002 and 2006, Alberta and British Columbia were the only two jurisdictions that continuously experienced net gains in physicians from interprovincial migration (CIHI, 2006). Both of the these provinces have experienced significant economic and population growth in the last decade, and it is very likely that doctors have migrated to these areas on the basis of greater job prospects and hopes of higher wages. The same pattern of internal migration can be seen in almost every industry where distinct regions experience a surge of economic growth. The shortage of physicians may be a problem that varies in severity from region to region, but there are still some steps that can be taken to improve the coordination of efforts across the provinces and territories at a national level.

ISSUES WITH THE CURRENT CANADIAN MEDICAL SYSTEM

The Commonwealth Fund International Health Policy (CFIHP) survey, conducted by the Commonwealth Fund and the Harvard School of Public Health (Schoen, Blendon, DesRoches, &

Osborn, 2002), found that the vast majority of Canadian physicians stated that there were serious community shortages of nurses and specialized medical care professionals. These shortages have contributed to increased wait times in hospitals, as well as access to a physician, and have reduced the amount of time that physicians are able to spend with individual patients. This has resulted in a drastic reduction in the quality of care (Esmail, 2006). The CFIHP survey (Schoen et al., 2002) also found that two-thirds of Canadian physicians believed that the quality of patient care will decline in the future. Additionally, there was a significant decline in physician satisfaction with the Canadian healthcare system since the previous investigation conducted in 1991, when nearly 33 per cent of physicians were satisfied compared to only 24 per cent in 2000 (Blendon et.al, 2001). For example, a practitioner from the Université de Montreal Hospital Centre even recalls having to handle her own administration, such as scheduling patients. Although recent increases in medical school enrolment have sparked hope for an increasing population of medical practitioners, it does nothing to help alleviate the immediate demand. The small increase in medical school graduates will not be enough to replace the large number of aging doctors ready to retire nor address the increasing demands for medical practitioners. Solutions to these shortages include increasing opportunities for international graduates, adopting new practice models to enhance patient flow, further embracing technology, and encouraging healthcare workers to work more closely together (Collier, 2008).

Patients are experiencing the same frustration that healthcare professionals are. The lack of administration, available medical technicians and health professionals, and key resources increases wait times for access to beds in healthcare facilities and for access to practitioners and diagnostic tests, and curbs healthcare efficiency (Prentice, 2007). According to the Wait Time Alliance, a coalition working under the Canadian Medical Association (CMA), creating a workforce that meets current Canadian demands is a first step in resolving the consequences of an inadequate system (Howell, 2008). Howell (2008) also touches on the impending issue of current practitioners who are approaching the age of retirement; one in five physicians are nearing retirement. The Canada Healthcare Providers Study (CIHI, 2006) determined that Canada had the highest percentage of individuals that needed to wait six days or more to see a physician out of the six countries surveyed. Canada also had the lowest percentage of individuals able to see a doctor within one day (CIHI, 2007). Delays will only increase as more specialists retire in the near future. Over one-third of Canadian medical specialists are over 55 and over 4,000 are already planning to retire (National Physician Survey, 2007). The Canadian Cardiovascular Society expects to see a decline in the number of its specialists within the next two decades (CIHI, 2006).

In 2005, physicians made up only 9% of Canada's workforce. Of this 9%, there was a roughly even split between specialists (4%) and family doctors and general practitioners (5%) (CIHI, 2008a). This suggests that the number of family doctors is also an issue. Both the number of specialists and the number of general practitioners are expected to decline over the next few years. Over 5 million Canadians went without a family doctor in 2004. The area of internal medicine alone will require 60 to 100 new recruits each year just to maintain the level of the current workforce, which presents an issue for Canadians as, on average, only 20 graduate each year (Howell, 2008).

A central issue regarding human resources management of medical care professionals is that there is no central agency responsible for setting policy and strategy for health human resources management in Canada. There is little data regarding the total number of specialists, and no comprehensive tracking system to alert Canadians when there are shortages (Howell, 2008). Romanow (2002) also described this shortage of information and recommended that

there be a national committee in Canada to gather information about recruitment, distribution, and remuneration of healthcare professionals. Kirby (2002) also suggested that more studies should be conducted on how to improve the productivity of healthcare professionals. This lack of knowledge leaves the Canadian government questioning the number of medical school openings and residency positions to fund. Howell (2008) also notes that no one organization has sole responsibility for providing up-to-date information for specialists. One suggestion is that the Canadian Medical Association or the Royal College of Physicians and Surgeons of Canada should undertake responsibility to provide up-to-date information, since manpower forecasts from specialist organizations are extremely vague, and do not reflect the true need for all specialists in Canada (Howell, 2008). As well, specialist associations themselves are encountering difficulties in producing forecasts for their own focus because of staff shortages, out-of-date materials, and poor funding.

ISSUES WITH KNOWLEDGE TRANSFER ACROSS BORDERS: FOREIGN-TRAINED MEDICAL PRACTITIONERS

Canada desperately needs new doctors to replace the large number of those in the baby boomer cohort that are beginning to retire; an unfortunate issue compounded by a medical system already strained by an aging population requiring increased medical attention, a lack of students graduating to practice, unequal distribution of doctors in remote areas, and doctors that choose to stop practicing. Canada needs a large number of new doctors, right now, just to meet the OECD average of 3.1 physicians per 1,000 population from its current 2.1 per 1,000 (OECD, 2009). Part of the problem with producing this many new professionals is that the Canadian medical education system "offers just over 2,400 first-year medical school slots annually,

slightly more than seven per 100,000 people; by comparison, the U.K. has 13 openings per 100,000 people" (Kingston, 2008, p. 1). Recently, Ontario medical schools have adopted a policy that aims to assist foreign graduates who require language improvement and cultural integration before they can apply for Canadian residency training.

The issue of knowledge transfer is highlighted for Canadians studying abroad in Ireland. In 2004, there were approximately 400 Canadians enrolled in Irish medical schools where the language and cultural differences are small (Pole, 2004). If these Canadian-born students were to return to practice in Canada, they would be required to pass the same Medical Council of Canada examinations as graduates of Canadian schools, take in-training evaluations, and compete for residency training slots along with Canadian graduates. According to Dr. Jack McDonald (former president of the RCPSC) "virtually all still would like to return to Canada but there aren't residency training positions for them, so most end up in the United States" (as quoted in Pole, 2004, p.12). Unfortunately some deans of medicine feel that students with foreign undergraduate degrees (whether they are Canadian or not) should have access only to the "leftover" positions in the residency matching competition, lessening the chances that we will recapture these bright Canadian students (Pole, 2004). Thus, Canadian medical students who choose to study abroad (approximately 1,500 per year), must compete with foreign trained doctors for residency positions. This results in lower percentages of Canadian-born doctors (Maudsley, 1997).

The integration of foreign trained medical graduates into Canadian medicine can be improved by accrediting foreign schools that have similar and overlapping curriculums. The issue of integration is currently a provincial responsibility; however, it should be a target for national policy making. Chan (2002, p. 1102) noted that:

"We need a comprehensive, coordinated frame-work for health human resource planning. We must monitor trends every year, set plans more frequently, and continually fine-tune our policies on admissions, postgraduate training and foreign graduate intake. We must do a better job of antici-pating future demand, identifying more efficient models of care and reducing inappropriate care."

In order to improve the supply of doctors, the federal government must assist the provincial governments with this responsibility.

One final criticism of the medical school sys-tem is its removal of rotating internship programs common to all medical students. The initial aim of rotating internships was to give students the necessary experience needed in order to make an informed decision about whether to specialize or become a general practitioner. Instead, in their third year of school, students must decide on a clinical specialty or career focus, in many cases without any experience in that particular medical field. It is difficult to make the transition from one specialty to another, and this contributes to the intense pressure and feelings of dissatisfac-tion that many young medical students report (Marshall, 1997).

INTERNAL ISSUES: SHORTAGES OF EQUIPMENT, FACILITIES, AND FUNDING

The Canadian healthcare professional shortage is further exacerbated by several other factors. For example, the CFIHP found that 63 per cent of Ca-nadian physicians reported shortages of the latest medical and diagnostic equipment in their com-munities, and more than 70 per cent of Canadian physicians reported a shortage of hospital beds (Blendon et al., 2001). Half of Canadian physi-cians reported a shortage of home care, and more than 70 per cent reported shortages of long-term care and rehabilitation facilities. It appears that

there is a general lack of funding for health care in Canada. Inadequate resources make it difficult for the already limited number of physicians to efficiently treat patients. Furthermore, the lack of facilities and funding may discourage new foreign and domestic medical graduates from practicing in Canada (Blendon et al., 2001).

A common arrangement regarding payment for healthcare services is the fee-for-services model in which healthcare providers receive a fee for each service they provide. However, an emerging method is the pay-for-performance system. In this model, healthcare providers and/or institutions are rewarded for meeting preset quality and efficiency standards. Currently, the concept of pay-for-performance in the healthcare system is relatively vague. Monetary incentive systems alone are not sufficient to retain even the most valuable physicians. This may be partially due to ethical values aside from the lure of monetary incentives. Physicians also value professional relationships, *esprit de corps*, camaraderie with coworkers, and recognition for their work (Laza-rus, 2007).

Concerns about the work-life balance of health-care staff will increase the difficulty of retention. Due to the nature of their jobs, overtime, and ir-regular shift work are often unavoidable. When preparing schedules, management should always take into consideration the healthcare profession-als' physical and psychological well-being, and try to accommodate their personal needs. Lazarus (2007) suggests that management should con-stantly ensure that the healthcare staff's expecta-tions are met. When asked about the solution for retaining healthcare staff, the president of Doctors Nova Scotia, Dr. Rhonda Church, concluded that "money is only part of the equation. Being part of a dynamic and positive environment is equally important" (quoted in Cardwell, 2007, p. 1).

Physicians themselves have also proposed several solutions for improving the quality of medical care in Canada. For example, improved use of new information technologies, such as

electronic medical records (EMRs) and electronic prescribing systems, would increase the number of patients physicians could assist by decreasing the amount of time spent looking for information or writing prescriptions. In 2001, only 17 to 24% of physicians said that they used these systems (CIHI, 2007). A study conducted in Alberta suggested that a major barrier to the implementation of EMRs is the physician's reluctance to take time away from their work to gain the appropriate training and technical support (Ludwick & Doucette, 2009). However, Ludwick and Doucette (2009) found that those who did invest the time to learn the system reported significant benefits to using EMRs. Additionally, a considerable number of Canadian physicians stated that the implementation of treatment guidelines or protocols would also be very useful (Blendon et al., 2001). Having the latest medical and technological equipment accessible is only half of the problem — the other half is using it effectively.

Additional internal pressures also affect healthcare providers' retention rates. Murrow, Nowak, and Hurst (2007) found that effective administration and presence of a positive culture are essential in motivating physicians to stay at their jobs. Sufficient support and infrastructure will help retain physicians, while inadequate facilities, out-dated technology, and inept personnel, both administrative and clinical, are influencing factors that contribute to leaving one's job (Lazarus, 2007). Healthcare institutions should construct valuable internal marketing programs that create positive environments in order to lower turnover rates. Similar to other organizations, management must continuously and actively listen to healthcare staff while conducting ongoing surveys, 360-degree assessments, and setting reliable goals. Providing healthcare staff with continued training, as well as the opportunity to further develop in their areas of interest, can be further motivation to stay in their job. Job descriptions and work environments must be stimulating and provide variety (Lazarus, 2007). The work of healthcare professionals must be challenging and inspiring.

TAKEN FOR GRANTED: WASTED HUMAN CAPITAL-THE IMPORTANCE OF FOREIGN-TRAINED PROFESSIONALS AND IMPLICATIONS OF BRAIN WASTE

Sheldon et al. (2008) illustrated that health care employees are leaving developing countries for greater economic opportunities offered by developed nations (for instance in the U.S., U.K., Canada, and Australia). The World Health Organization (WHO) recognizes that there are a limited number of educated healthcare professionals worldwide, and that competition for their knowledge and services is a global fight (WHO, 2008).

In recent years, a voluntary freeze in medical school funding and decreases in class sizes were based on the belief that the United States was facing a physician surplus in the coming years. Consequently, only one new medical school was founded between 1990 and 2003. In an attempt to gain control of ever-increasing medical costs, the Balanced Budget Act of 1997 froze the number of medical school graduates. This decision was particularly important because, at the time, population growth was accelerating (Sheldon et al., 2008). Even with fewer graduates and an increasing population, the supply of healthcare professionals was expected to be in line with demand. The 1975 Study of Surgical Services in the United States (SOSSUS) indicated that the existing surgeons would be sufficient to perform surgeries needed within the country. In 1989, the United States encountered an unexpected change; the committee for long-term planning uncovered a forecasted shortage of surgeons due to the aging population by the year 2000.

Barer and Stoddart (1991) caused a similar stir in the Canadian healthcare system. Their report examined the common deficiencies of the Canadian healthcare system and made suggestions for improvement. One influential recommendation was their proposal for the reduction of medical school enrolment by ten per cent in

order to keep the quantity of physicians in line with Canada's population. Additionally, Barer and Stoddart suggested decreasing both the number of provincially-funded post-graduate programs and Canada's reliance on foreign graduates. In 1992, these recommendations were accepted by the government (Esmail, 2006). Due to the application of these recommendations, Canada's physician per 1,000 population ratio reached a high of 2.2 in 1993 and has now flat-lined at 2.1, well below the international OECD average of 3.2 (OECD, 2009). Canada now faces the possibility of a prolonged physician shortage.

Changes to health care have relieved some of these issues and shortages as the scope of practice of non-physician clinicians has increased. Nurses can now write prescriptions in the United States, and many nurse practitioners assist in anaesthetics and midwifery, establishing careers in these field. However, non-physician healthcare workers cannot provide the critical services that, for instance, surgeons can. Additionally, there are other non-technical skills that require cultural specialization in order to meet the needs of a growing population of immigrants in North America, and particularly in Canada.

Choosing a healthcare professional with a similar cultural background can have profound impacts on one's treatment and satisfaction. Wang, Rosenberg and Lo (2008), in their study of immigrant mainland Chinese, illustrate the importance of the family physician who speaks the patients' first language. It should also be noted that since 1998 China is Canada's largest source of immigrants (Wang, Rosenberg & Lo, 2008). Since Canada currently employs public health care, payment is not an issue when choosing a family physician; patients instead seek a physician who both speaks their native language and is of the same ethnicity. An issue facing Toronto-area immigrants—resulting from their inability to speak one of the nation's first languages—is their subsequent inability to understand the Canadian healthcare system (Wang et al., 2008). Approximately 32%

of new immigrants do not speak English. While Canadian hospitals do offer translation services, they do not provide primary health care, i.e. the general healthcare services and consultations that address the large majority of common illnesses or diseases. Canadian hospitals offer instead tertiary hospital services, the specialized care for a limited number of conditions. In contrast, hospitals in China do provide primary health care that eliminates the need for patients to seek out the services of a primary care physician.

Language and cultural barriers may also have a strong influence on the number of immigrants utilizing healthcare services, and the extent to which they seek them out. Difficulties understanding medical terminology along with different ways of interpreting symptoms influence their utilization of Canadian healthcare. A focus group of 15 mainland Chinese immigrants (Wang et al., 2008) indicated that of all factors, language was the most important for choosing a Chinese-speaking physician. The participants indicated that Canadian medical terminology was difficult to comprehend, and that they could communicate more effectively with a Chinese-speaking physician. Even among those who did not experience problems with differing dialects, none expressed interest in using an English-speaking physician. Participants indicated that they believed Taoism, the fundamental aspect of Chinese culture and medicine is better understood by a medical doctor from a similar culture. Concepts such as Yin/Yang and Chi influence the way symptoms are interpreted, and patients with backgrounds similar to their primary care physicians are better able to communicate their feelings. Chinese physicians also have a connection to traditional Chinese medicine in Toronto, and were able to refer their patients to traditional Chinese healers in herbal medicine and acupuncture that is more fitting in the Chinese culture. Traditional Chinese healers can also prescribe medicinal food, a mandate that Western practitioners do not have. Taking these factors into consideration, in 2005, Ontario man-

dated that Chinese medicinal healers were to be recognized as professionals and to be regulated by the *Regulated Health Professionals Act* (MPP Consultation Group on Traditional Chinese Medicine and Acupuncture, 2005). However, despite the evidence of a growing demand for diverse medical professionals, as well as an increased attempt to recruit and train them in Canada, there has been little progress towards actually increasing their prevalence.

This is not to say that Canada has not employed various strategies to recruit foreign medical experts into the country. Canadian provinces often rely on head-hunters to put together incentive packages to lure foreign medical experts to Canada, and also advertise in medical journals which foreign practitioners may read and consider. Such practices have been scrutinized as being ethically misguided, as many of the foreign medical professionals that Canada is able to recruit are from developing countries, that have an insufficient supply of doctors of their own (Cardwell, 2007). During the 1980s and 1990s, Canadian recruiters targeted doctors in South Africa, and by the year 2000, there were approximately 1,545 physicians located predominantly in rural locations in British Columbia, Alberta, and Saskatchewan.

However, a majority of foreign trained physicians are never able to practice in Canada, a phenomenon referred to as "brain waste". University of Toronto sociologist Monica Boyd found in a study based on a 2001 census that of 5,400 foreign-trained physicians between the ages of 32 and 54 years, only 55% of them had occupations in Canada as physicians. She believed this was due to the exclusion of groups who traditionally have a more difficult time adapting to the high Canadian standards. For example, Eastern Europeans have a less than 66% chance of ever practicing (Boyd & Schellenberg, 2008).

Unfortunately, because these foreign candidates are profiled and stereotyped, some provinces have also been accused of systematically and indirectly discriminating in admittance practices for residency training. The ethical implications of such evidence have caused grassroots organizations to construct opposition forums that educate foreign-trained medical professionals about the difficulties that they will face due to Canada's archaic training system. Consequently, such forums encourage individuals not to emigrate to Canada. One such forum is www.NotCanada.com, which allows contributors to discuss personal stories, such as doctors who end up working in low-skilled jobs, wasting their talents, while developing negative perceptions of the Canadian government and society. Attracting foreign medical professionals to fill underserviced positions in Canada has a contradictory effect, since the recruitment does not actually materialize in an increase in practicing personnel. Instead, it may deter future medical professionals from migrating to Canada to practice.

Differences in language, communication, understanding of cultural norms, and culture shock, are often the most difficult barriers to overcome when an individual from a foreign culture is submerged into the host country. Although most countries educate their professionals in English comprehension, there is still a large culture gap, and often extensive training is needed to adapt to new surroundings (Andrew & Bates, 2000).

Many people perceive monetary benefits to be among the most influential for a Canadian-born medical professional in his/her decision of whether to practice in their home country. This is certainly true in some situations, but not all doctors and nurses feel this to be the case. There are many intrinsic rewards gained from community relationships that matter more to healthcare professionals than economic pay-offs. It is often the case that practicing in small towns fosters personal and community relationships, an intrinsic value cherished more than monetary influences. It is commonly observed that medical graduates from small towns are more likely to practice in rural areas (Goertzen, 2005). Unfortunately, it is also less likely that they will graduate, as underprepared

students from rural areas often face unrealistic expectations when medical schools compare them to different standards, resulting in lower completion rates within these groups. Consequently, the health field suffers a double loss: fewer positions are available for competent students capable of handling the challenging medical school environment, and the rural localities that desperately need medical professionals cannot recruit the graduates who are most likely to practice there (Goertzen, 2005). In light of practicing rural-physician scarcities, the medical school system has traditionally been inefficient in producing a sufficient number of rural health practitioners.

One initiative proposed to deal with these inefficiencies is the opening of medical schools that strictly target students who are more likely to practice in rural or underserviced areas after graduation. Human resources research should aim to detect individual differences in physician characteristics that draw them to different practicing areas, such as prior places of residence, age, marital status, and gender. Such findings would give the health field a better understanding of which types of tools to use for recruitment and retention of different medical graduates, as well as experienced doctors.

By opening schools that target rural candidates, shortages may be reduced as individuals from a rural background are more likely to practice in rural areas following graduation. One study focusing on rural family physicians practicing in Ontario, found that many factors influence a physician's decision about where to practice (Rourke, Incitti, Rourke, Leslie & Kennard, 2005). In particular, those who grow up in communities with a population of less than 10, 000 were significantly more likely to practice in rural communities (Rourke et al., 2005). Physicians with undergraduate clinical training in a rural area and those who take their residency training in a small community are also 2.46 times more likely to continue practicing in a rural area. Those who have post-graduate training of at least eight weeks in a rural area are

more likely than others (about 2.17 times more) to continue their practice in a rural area (Rourke et.al., 2005).

LOCATION OF PRACTICE: URBAN OR RURAL?

Approximately 90% of Canada's population lives within several hundred kilometres of the American border; the remaining population is widely dispersed amongst rural areas. As previously noted, these rural communities suffer from a chronic shortage of family physicians. Medical staffing in these areas has generally been based on the idea that when a sufficient number of physicians are trained, and urban centers are adequately serviced, remaining physicians will trickle into less urban areas (Goertzen, 2005).

There are four fundamental factors that increase the likelihood that graduates will practice in rural areas (Goertzen, 2005). First, physicians with a rural background have a higher probability of serving in a rural area following graduation. The background and interests of his/her spouse can also affect the decision. The second factor encompasses appropriate undergraduate and postgraduate training for rural practice, especially practical training in a rural setting. The third dynamic is a personal attraction to the recreational, cultural, educational, and social opportunities available to the physician, spouse, and their children in a rural setting. For example, a physician may prefer opportunities to ski, swim, and hike within a few kilometres of home and work. Finally, the working conditions and remuneration for rural physicians must be adjusted accordingly. Rural settings require family physicians with a range of skills to handle patients in multiple locations, including offices, emergency departments, hospital wards, operating rooms, delivery rooms, and chronic care facilities. Dr. Eliseo Orrantia (2005), a family physician in the rural town of Marathon, Ontario, affirms that a supportive team of physicians, ongoing communication between

them, personal control over work schedules, and an internal governance agreement on an alternative payment plan, can reduce burnout or departure.

There is a fairly wide gap between available training positions in family medicine and the number of students who are willing to pursue family medicine. According to one study conducted by Wright, Scott, Woloschuk and Brennies (2004) only one-fifth of new medical students stated that family medicine was their first career choice. Although most students do not consider family medicine to be their first career choice, they agreed that there was a possibility for them to work in family medicine in the future. Additionally, older students educated in smaller communities were more concerned with maintaining a lifestyle outside of medical practice, were more likely to choose a career in family medicine, and were less likely to take a job in a hospital (Wright et al., 2004).

RESOLVING THE INTERNAL PROBLEM: UNEVEN DISTRIBUTION OF DOCTORS IN RURAL VERSUS URBAN AREAS

In response to the consistent shortage of Canadian-trained physicians and the discrimination faced by foreign-born medical graduates, Ontario, Quebec, and Manitoba have set up postgraduate training programs for international medical graduates. In 1992, British Columbia funded a program to license international medical graduates. Unfortunately, this program only provides two entry positions every year, and only 25 to 35 candidates are even eligible for this program. Additionally, most of these programs are only available to landed immigrant or foreign-born individuals possessing Canadian citizenship status.

Telehealth

Telehealth is the distribution of health-related information and services over short or long distances transmitted via telecommunications technology. It can be used for transferring patient information, such as diagnostic medical images and previous medical histories. It can also be used for diagnostic and treatment aspects of health, including video conferencing, that can transmit real-time images and information between medical specialists to analyze the condition of a patient, or provide consultation between rural and non-rural medical professionals or a physician and patient.

It has been one option that provincial governments have utilized in order to create a sense of collegiality and professional proximity between rural and non-rural medical professionals. The Quebec Ministry of Health and Social Services concluded in a Delphi study of nine expert physicians that telehealth is an effective method to improve the accessibility of health services in remote areas of Canada, as well as the recruitment and retention of practitioners (Duplantie, Gagnon, Fortin, & Landry, 2007). Distance barriers may otherwise limit communication between rural doctors and their medical peers, resulting in diminished collaboration with other medical professionals, their removal from mainstream academia, and consequently a lack of opportunities for professional development.

Telehealth was shown to have a positive effect on the recruitment and retention of remote/rural physicians, as it helps address the potentially deterring issues of limited communication and isolation, which contribute to rural doctor shortages (Duplantie et al., 2007). However, it should be noted that telehealth is not a substitution for access to medical specialists, and can make retention less likely and recruitment very difficult. Rural physicians must have stand-ins to relieve them from practice, while they are educated on new procedures and innovations in medicine. Additionally, technology is not a substitute for physical contact with other medical professionals, that, in and of itself, can lead rural health workers to feel isolated reducing the likelihood of retaining them (Duplantie, et al, 2007).

Recommendations

One possible recommendation is that medical schools should plan for future medical professional supply by taking into consideration the generalizations one can make about the current age cohort and its demographics, such as increased life expectancy and increased cultural diversity. Equality and diversity in the school system is greater than ever before; such inclusiveness must consider group differences in work values. Whereas the hardest working doctors have been said to be the oldest, these professionals come from a generation where people worked to live. Although a healthy challenge is important for personal development, today's generation tends to puts more importance on leisure time and time spent with their families. The highest concern for this new group is burnout and stress (Lazarus, 2007).

Gender is also an important consideration when planning for sufficient numbers of future doctors. The number of women in the medical profession, including historically male-dominated positions such as surgeons and specialists, is increasing in relative proportion to men. Some studies have concluded that females work on average less than male counterparts in terms of weekly hours and years (CIHI, 2007). The reasons for this can be inferred: women often still carry the burden of their household with them, and are still the predominant caregivers for their children, making the work-life balance a challenge.

As the Canadian government plans to upgrade immigration to help increase Canada's decreasing labour force, diversity will continue to increase. If foreign citizens are comforted by having the option to see a doctor of their own ethnicity, but cannot find one, or are sceptical of seeing a doctor who is not of their ethnicity, they may avoid visits altogether. Such an occurrence can lead to prolonged sickness, taxing their place of employment with unnecessarily lengthy sick pay, absenteeism, and lost productivity.

Lastly, medical school acceptance needs to be inclusive of rural-residing Canadians, increasing the likelihood that they will return to rural areas and creating a more equal physician distribution throughout Canada. With greater access to doctors, the strain on urban areas will be less, increasing the effectiveness and efficiency of the Canadian healthcare system.

CONCLUSION

Overall, the number of healthcare professionals is not sufficient to sustain an acceptable level of care for Canada's changing demographics. Cultural diversity, an aging population, and the distribution of medical access throughout Canada are issues that can be resolved with the assistance of effective human resources management. Wait-times, preferences for a physician with the same ethnic or cultural background, and the strains on urban doctors are issues to be addressed in the coming years. It is recommended to introduce a more culturally-sensitive medical admissions program that is inclusive of aspiring physicians from different countries, backgrounds, and cultures. Also, recruitment from rural areas can help solve inequality in the distribution and access to medical care. Finally, investments in developing new secondary resources, such as administrative and technical staff and knowledge-sharing activities using computer technology can assist in retention of doctors where they are most needed.

Chapter 18
Integration of Predated Notifications of Personal Actions for HR–Planning in ERP–Systems

Peter Cissek
University of Magdeburg, Germany

Jorge Marx Gomez
University of Oldenburg, Germany

ABSTRACT

This chapter intends to reveal the benefit of predated notifications of personal actions for HR-planning and discusses the interrelated demands on ERP-systems. If e-government is implemented, one has to think of rearranging the government's HR-structure in order to adapt to the new circumstances, too. This means to take advantage of modern HR-methodology in order to become more efficient in HR-administration. One possible way in improving human resource management (HRM) is using predated notifications of personal actions for HR-planning. Human resource planning (HR-planning) is a component of strategic enterprise planning. It is fully integrated into the enterprise-wide planning process, because HR-planning is not only determined by other planning areas, but it also determines them vice versa. So the more precisely and comprehensively HR-planning is done, the more accurate derived key figures, which are used in other planning areas, can be. Governments usually deal with a huge amount of personnel, so HR is one of the main tasks in administration. Predated notifications of personal actions usually are known in present, but will be started in the future. In contrast to planning a personnel action the predated one will take place with the highest possible probability. An example for making the difference more clear may be an employee's retirement. It does not stringently depend on the employee's age, but rather on the person's individual decision to retire. As a general rule, an employee's intention to retire is already known about half a year before it takes place. If this information is used in the planning process, the company will have enough time to estimate the loss of knowledge or the cost-savings that will be caused by the employee's withdrawal. In huge companies, HRM typically is supported by ERP-

systems. The functionality offered by the software depends on the company's needs and may range from a simple keeping of personnel data to a complex module called human capital management, which is used for payroll accounting, talent management, employee self services, and many more. If the decision-making body considers the company's personnel as business critical, a lot of employee-related data is collected and analyzed, ranging from master data to planning key figures. This chapter will emphasize the importance of efficient HR-planning for governments in order to improve their business processes. It can be seen as one of the goals of e-government. It will be pointed out how HR-planning can be improved by using predated notifications of personal actions, so that HR-divisions in governments can use advanced HR-planning right on from the beginning when preparing themselves for e-government.

INTRODUCTION

E-Government has been invented in order to improve governmental business processes with the help of information and communication technology (ICT). The main objectives are cost-reduction, increase of process-quality and lowering lead-time. But improvements do not have to focus on governmental business processes only. Governments will work more efficiently, if all administration tasks are optimized, too. And one of the main tasks in administration is HR-management. The optimization potential in the HR-sector can be imagined if one takes a look at how many full-time employees are deployed in the German Federal Land Nordrhein-Westfalen and its communes. The population living in Nordrhein-Westfalen in 2007 was about 18 millions of people (NRW, 2007). In 2007 there have been 188.425 employees with a full-time contract for administration tasks (NRW, 2008). For comparison, the Daimler AG in Germany producing Mercedes-Benz cars among others had 272.382 employees all over the world in 2007 (Daimler, 2008). An efficient human resource management is vital for companies as well as for governments, which act with view to offer a high-performance and high-quality governmental service at optimal cost. A more precise HR-planning will definitively lead to a more efficient use of personnel, no matter if governments or companies are concerned, as both have to face the same challenges in HRM.

With the need for a more precise enterprise-wide planning the HR-planning must be optimized, too. The improvement can be achieved by collecting and analyzing systematically pre-dated notifications of personal actions and using this data to enhance HR-planning. ERP-systems are applied to collect the actions that will take place in the future, so the data is fully integrated and can easily be used in the planning process. In the following the importance of pre-dated notifications of personal actions will be highlighted and it will be shown how the data can be used for an ERP-system-based HR-planning. The findings will lead to a better use of HR-resources, in governments and companies.

Thus, governments have the opportunity to make one more steps towards a higher sophisticated e-government through improvements in HR-management. Governments can have an effect on the efficiency of their HR-planning with the choice for an enhanced ERP-system and take advantage of a more efficient HR-planning-module and -process. When dealing with e-governmental readiness, it is necessary to emphasize that the customer-view (or citizen-view) is not the only perspective that has to be considered. This research indicates that the optimization of general administrative tasks in governmental business processes is one of the tasks governments must work at in order to become ready for e-government or to use e-government more intensively. And HR is one of these administrative tasks every government is

faced with. What is more, now and in future HR will become a vital division of governments, like IT and Financials. This research uses the awareness that HR has to be taken into consideration if a government or a company wants to improve it's HR-management and concentrates on a specific part of HR-planning and HR-controlling, the predated notifications of personal actions.

HUMAN RESOURCES PLANNING

Human resource management is defined by Scholz (Scholz, 2000) as "the systematical analysis, evaluation and organization of all personnel aspects in a company". The main task of HRM is deriving HR-goals from the company's strategic objectives and also assuring the achievement of these objectives (Drumm, 2006). HRM is more than just collecting personnel data. It must not be isolated from other business data used in the company, although personnel data often is considered as severely critical as far as privacy is concerned.

Looking at a company's manner when dealing with its employees one can suggest what kind of HR-philosophy is dominating. Saying it backwards, it means that HRM guidance is determined by HR-philosophy, which makes a statement about the importance of HR in the company (Müller-Christ, 2005). HRM may have different guidelines. It depends on the decision, whether the employees must be just administrated, or they are joint venturers, who expect a wide supply of services (Müller-Christ, 2005). As an example two different enterprise concepts will be presented. On the one hand a bakery with a lot of chain stores. This type of company needs to administrate a lot of homogenous, lowly trained employees. On the other hand a law firm with highly trained experts, who demand a service from the personnel office.

Human resources have to subordinate to strategic objectives in the same way as other divisions of the company (Schanz, 2000). The main objectives for HRM can be harmonized with HR-philosophy and derived from economic and social aims (Olfert, 2006). Although companies may differ from each other, they have to solve the same primary problems in HRM. Kossbiel specifies them as availability and effectivity of human resources (Kossbiel, 1994). A definition strongly influenced by functional economic thoughts says that the main objective of HRM is offering the required personnel in all sectors of the company, in the exact number, with best skills, at the right time and with regard to long-term profitability and objectives of both, the company and the employee (Freund 2003). Finally all this points to the conclusion, that HRM is an interdepartmental function, which affects all other sectors of the company. Simultaneously HRM aims for decentralized tendencies. Therefore coordination, communication and harmonization of strategic HR-objectives are vital to a sustainable success of the company (Reichard, 2001).

An important part of HRM is HR-planning. It includes all activities that are used for planning the quantity and quality as well as the personal actions, which have an impact on the HR-structure (Müller-Christ, 2005). Kolb says, HR-planning "is the systematic anticipation of future actions concerning a company's personnel" (Kolb 1998). The main objective is to assign strategic enterprise aims to HR and to prepare the personnel systematically for future requirements with the use of personal actions, so that the target achievement will be maximized (Schanz, 2000). Important constraints are given by the law, so that not all action alternatives may be permitted (Olfert, 2006). Finally the effectiveness and availability of human resources has to be maximized (Kossbiel, 1999).

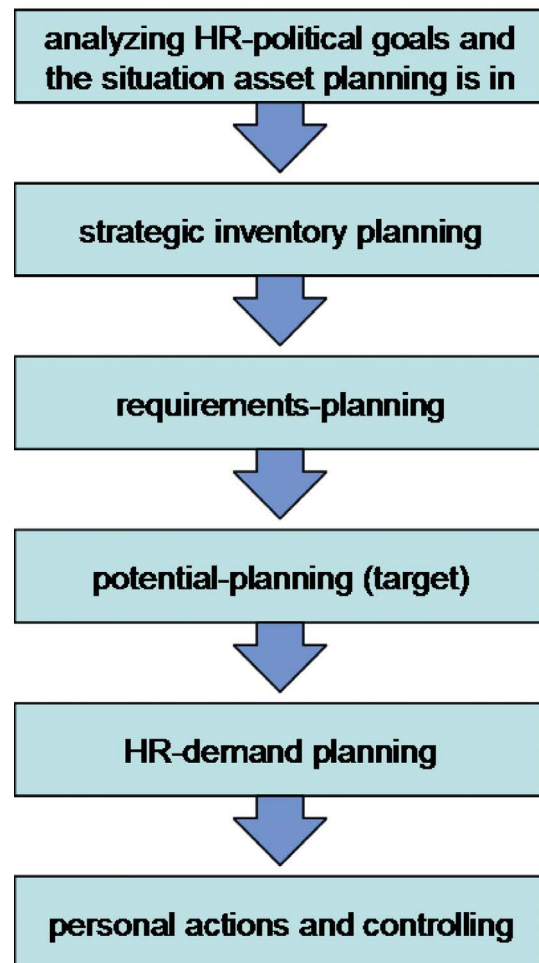
HR-planning can be divided into quantitative and qualitative HR-planning, followed by the planning of personal actions. The whole process is known as the planning part of human resource management (HRM). Quantitative HR-planning deals with the number of employees or headcount (HDCNT) and the full time equivalent (FTE) in relation to time and space. Qualitative HR-

planning is about the employees' occupational aptitude, depending on time and space as well. Planning of personal actions means describing the process of turning the actual performance into the target performance as far as the personnel sector is concerned.

HR-planning is not just one activity; it is just an aggregation of many tasks. These tasks are planning the demand, the acquisition, application, development, leadership, disposal and the costs of HR, for example (Reichard, 2001). The different tasks are highly interlocked between each other, what leads to the conclusion that only an integrated and comprehensive view of the HR-sector can lead to the point (Albert, 2002). External and internal factors must be considered in the planning model in order to adapt objectives and actions to real world conditions (Drumm, 2006). A roadmap for HR-planning (see Figure 1) has been proposed by Müller-Christ (Müller-Christ, 2005).

With subject to HR-political guidelines the personnel inventory planning is prepared. Changes in the production-planning or recurrent events like the close of the second quarter are often the inducement for the HR-planning process. Besides pointing out the reason for starting to plan again, the identification of determining rules of the objects to be planned and constitution of planning parameters like planning horizon, factors, allocation base and the planning and estimation methods take place (Springer 2006).

When all basic conditions for the planning process are set, current and future HR-requirements can be listed and arranged into homogeneous task-groups (Springer 2006). Ideally each task in the company can be represented by a job by connecting the specification of service to a position in the organizational hierarchy (Jetter, 2003). Generally speaking the specification of service is dynamical and must be connected to a timeline, because it changes very often. Therefore it is suggestive to aggregate the specifications into time slots, in which they are unaltered (Edinger, 2008).

Figure 1. Roadmap for HR-planning


From the prepared data the qualitative and quantitative target-values can be derived. A statistical analysis of job descriptions provides an indication of how many employees have to work at what kind of job in the company. The number of employees usually is described in headcount (HDCNT) or full-time-equivalent (FTE), the quality of performance in the job is given by the required qualifications (Drumm, 2006). In HR-structures with homogenous descriptions of job performances the number of work places is estimated by statistical methods. Modelled on job descriptions the target value for the headcount is calculated for one or more points in time. For the

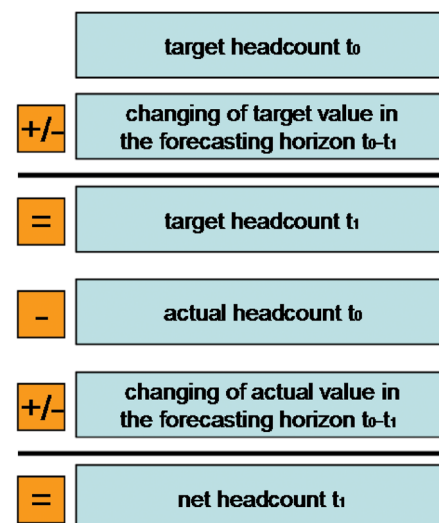
computation data from many sources, internal and external, is used, like work plans, job descriptions, absenteeism analysis and employment law (Scholz, 2000).

The way of how the target value for the headcount is computed is decisive to how the actual headcount has to be calculated. This is made for assuring the comparability of actual and target values and to develop and monitor personal actions, which have a stake in the actual headcount. The actual headcount represents the current HR-structure and is updated as well as the target headcount, because it is influenced not only by planned personal actions, but also by several factors (Olfert, 2006). Factors in detail are demographical changes, job training, changes in the work schedule, absenteeism and retirements (Schanz, 2000). In general these factors are known before they happen, so updating the actual headcount in advance is possible. Therefore in addition to the estimation of the actual HR-structure a prediction of how it will look like in the future and what kind of measures are needed to work against factors must take place (Reichard, 2001).

When the actual and target values for HR are computed, a comparison of the headcounts reveals how much employees are needed to achieve the company's objectives. Planning the demand determines how the actual HR-structure has to be changed in order to fulfil the company's requirements, in other words: how many employees with what kind of qualification are when and where needed to meet the production and performance plans (Schanz, 2000). Planning the demand is also called the pivotal unit of HRM (Müller-Christ, 2005). It is the fundament for the whole HR-planning and determines all other HR-sectors (Springer, 2006). Demand planning is connecting production and sales planning with HR-planning. It determines, if the number of employees has to be increased, decreased or unchanged in every division of the company, so that the personnel capacity is used with a maximum benefit in the short, middle and long term. Demand planning

means not only to estimate the headcount that will be used productively, but also the amount of employees that serve as a buffer to compensate absenteeism (see Figure 2). What is more, the demand for replacement of existing jobs and filling new ones (or dismissing employees) has to be planned, too (Drumm, 2006).

In order to ensure the required headcount for the creation of value in the company measures have to be implemented to match actual and target values. Neither actual nor target headcount are constants, both can be changed using personal actions (Drumm, 2006). For example, the target headcount can be reduced by implementing more efficient production techniques. What personal action is applied to change the headcount depends on the objective and the action's characteristics. Characteristics are the type and intensity of the action, the costs and the period of time it affects the headcount. Secondary effects like influencing the employees' motivation must be evaluated, too, even if they are not intended. Not taking into consideration secondary effects can even lead into a devaluation of intangible assets

Figure 2. Computing the net demand (Adopted from Müller-Christ 2005)


(Jochmann, 2007). Hence a simulation of a personal action's effects is vital.

The results from demand planning are handed over to personnel acquisition (Springer 2006). All agreed personal actions must be monitored with the aid of key figures in order to make a prompt reaction to irregularities possible. Unexpected changes are most likely as all planning data is future dated and most of it has been only estimated. Thus expressive, subject-oriented key figures must be defined in advance. They replenish HRM through making a comprehensive view over HR-development in the whole company possible (Hentze, 1993).

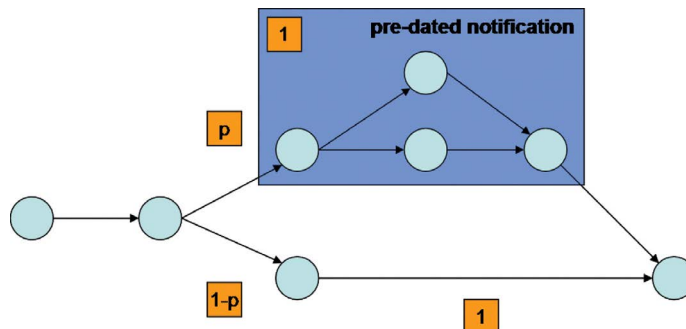
PRE-DATED NOTIFICATIONS OF PERSONAL ACTIONS

From the actual point of view future events can only be anticipated. If the level of abstraction is low enough, all statements about future evens are uncertain. The more precisely a future event is predicted; the more difficult it is to reach the objectives. Uncertainty for future events can be distinguished between two kinds: uncertainty if an event will occur and uncertainty what it will be like. In the quantity of all possible predictions about future events and their effects on HR pre-dated notifications of personal actions are those with the highest probability and very precise description of

the effects that will take place when the action is executed. There is a clear cause-and-effect-chain when we talk about pre-dated notifications with a probability of occurrence of 1 (unity). Pre-dated notifications are no plan-values, but they affect them and thus are highly valuable for the HR-planning process.

A pre-dated notification is a future event with a maximum probability of occurrence, which is started with input-data and whose action has a deterministic effect on the environment. Actions can be executed simultaneously or sequentially, but they all have the probability of occurrence of 1 (unity). The cause-and-effect-chain and the probability can be modelled as a deterministic process, which can be implemented in any other decision process. Figure 3 illustrates a pre-dated personal action implementation in a decision tree. Furthermore, as many events can take place inside the process-chain of a pre-dated notification, it is not a Bernoulli experiment.

As pre-dated notifications are no planning values, they must be handled differently in creating scenarios, too. The accrual from planning happens through versioning: a plan can have many versions; pre-dated notifications have only one valid version. The action is started always under the same conditions and causes every time the same effects. Therefore, pre-dated actions are constant events in a planning process. Input-parameters and output-data make pre-dated per-

Figure 3. Pre-dated personal action implemented in a decision tree


sonal actions flexible, so that an implementation into different processes or even into dynamic scenarios is quite easy. The deterministic workflow guarantees a comparability of all planning versions with the same pre-dated notification of a personal action.

A pre-dated notification of personal actions is distinguished by a functional description of the starting events and the following effects on personal data. By this means a catalogue of personal actions can be created in order to define pre-dated notifications of personal actions correctly. Listing the complete input-data is vital, so that all uncertain values of parameters are excluded right from the beginning. The creation of a catalogue means also, that personal actions which are not mentioned inside this catalogue must not become a pre-dated notification of personal actions and must be regarded separately.

An employee's decision to change its full-time job into a part-time one will serve as an example for a pre-dated notification of a personal action. A correct pre-dated notification defines the employee, the beginning-date of the action and the new FTE. A false pre-dated notification of a personal action is entering a probable FTE and not the constant target value (see Table 1). This may happen if one wishes to emphasize that the employee still does not know, how much part-time he wants to do in the future.

Pre-dated notifications of personal actions are derived from personal actions, because in fact they are an anticipation of changes made to the HR-structure and have identical work flows. Therefore pre-dated notifications can be turned into a personal action without making any severe change to the process or the existing data. The main characteristic is the fact that pre-dated notifications are not approved yet and will not be turned into a productive event until the decision-maker decides it to become a regular personal action. This is the main difference: a personal action is turned into reality at once, a pre-dated one changes its status from pre-dated into productive or is copied and set productive. In terms of EPR-systems this means, that the date difference between entry-date and beginning date indicates, if the personal action was pre-dated or not. None or a small difference indicates that there is no pre-dated notification of personal actions. But regular personal actions cannot be analyzed later easily, because one has to inspect the beginning-date and the entry-date to identify a pre-dated notification, what will become very complex in modern ERP-systems, as the entry-date is not a common data field for functional (i.e. HR) analytics. And if the entry-date is higher than the beginning date, we talk about personal actions that were started retroactively, because one has forgotten to execute them in the right time, for instance. These actions may not be considered as pre-dated as well. What is more, not all personal actions are in the catalogue of pre-dated notifications. Finally, using only the entry-date and the beginning-date is not suitable to identify pre-dated notifications.

Like personal actions pre-dated notifications are approved by the HR-division in advance. The decision making process with the HR-division, the managers and the affected employees as key players usually has successfully ended before. Although the process takes more time when

Table 1. Correct and false pre-dated personal action

	employee	personal action	Beginning	new FTE
correct pre-dated personal action	10000001	work-time reduction	01.01.2008	=0,5
false pre-dated personal action	10000001	work-time reduction	01.01.2008	=(0,5*0,8)+(0,62*(1-0,8))

Table 2. Pre-dated personal actions

personal action	description
Employment	A person becomes an employee. Usually the decision has been made months before the action takes place.
Dismissal	An employee leaves the company at a point in time in the future. More often than not this is known a few months before the employee is dismissed.
Retirement	An employee leaves the company at a point in time in future and will get a retirement pay from that date on. Usually a retirement is known about one year before.
training course	An employee will take part in a professional training. Although this is not mandatory a personal action, it may be worth analyzing it together with personal actions.
organizational change	An employee is being relocated in future. This action has to be prepared carefully, so it is known a few months before.
take-over of trainees	A trainee has been doing well during his apprenticeship and will be taken over. Often one can make this decision before the trainee has written his final exam.
partial retirement	An employee wishes to take part in a partial retirement program. The beginning date is know years before, as the contract has to be changed completely for that purpose. The working-phase and the retirement-phase typically take five and more years.
maternity leave	The employee will become inactive for a period of time, or he will be active again. The time period is known before about half a year.
Salary change	An employee's salary has to be changed, because he will take part in a project team, what for he will earn more money.

all affected actors are involved, this procedure assures that the pre-dated notification will take place with a maximum probability and does not has to be reversed. An exemplary set of personal actions shows (see Table 2) what kind of actions can suite as pre-dated notifications.

How much value is added by the successful implementation of pre-dated notifications depends on how many personal actions are started in the company on average. If there are only a few employees, the number of personal actions will be low and no methodical collection of this data is needed. Objectives provided by the top-management of a small company are very detailed and the data the management uses is almost completely operative. Most personal actions are decided directly by the CEO and included into the plans, whereby an analysis of pre-dated notifications of personal actions is not of interest. But if a company has so many employees, that it applies decentralized management techniques, the organizational distance between the decision-makers and the basic staff is big enough to turn pre-dated notifications into useful information.

The benefit for HR-planning is the opportunity to improve the updated actual values and to analyze pre-dated notifications of personal actions in order to make predictions about the number of pre-dated personal actions in the future. Clear-cut information about changes in headcount and the employees' master data are highly planning relevant, because they are as precise as the existing personal master data. Thus they can be analyzed in the same way and the same level of detail as existing data collected in the past and can be used for HR-planning without any constraint. The integration factor is most important: using pre-dated notifications of personal actions one can exactly predict how an employee's master data will be affected. This information can be used for example to forecast the loss of know-how through the dismissal of an employee before he really leaves the company. Thereby the HR-division is able to start counter measures, so that the loss of knowledge will be compensated in the organizational unit. In a more complex scenario all effects of the dismissal can be simulated like cost-changes, different span of control, organi-

zational effects, qualification profiles, changes in absenteeism or even the contribution to profit. If pre-dated notifications are analyzed through a longer period, trends can be educed from the collected data, which can be used to make even the target values more accurate and an evaluation of how many pre-dated notifications really became personal actions.

Using pre-dated notifications of personal actions for operative analysis is possible, too. Career planning, for example, can be monitored with the use of data gained from pre-dated notifications. The according personal actions are organizational changes, changes in contract or professional training. If these pre-dated notifications are considered, an employee will be asked to join conferences which will be useful for his career. The other way around one could monitor whether an employee is still developing his skills and moving forward his career by analyzing his pre-dated notifications of personal actions. This offers the opportunity for the HR-division to act before too much time has passed and it will be too late for any action.

INTEGRATION OF PRE-DATED NOTIFICATIONS OF PERSONAL ACTIONS INTO ERP-SYSTEMS

Today's companies use ERP-systems in order to support the main divisions like financials, material management or HR. The more sophisticated the software is, the more functions it offers. In the majority of cases an ERP-system's HR-component offers master data collection, payroll accounting and computation of personal actions. Superior software offers even routines for HR-planning and employee self-services (Haßmann, 2003).

A HR-module's level of complexity depends on a company's demands. The more challenging the demands are, the more complex the software is. ERP-systems like the SAP ECC 6.0 HCM-module offer the function to enter personal actions and to execute them, what finally gives way to make

the system change an employee's master data (Edinger, 2008).

Changes in data mostly result from so-called personal actions, which are implemented in programming routines. These routines use input-data, compute the data according to the selected personal action and generate output-data. So it is a complex program that causes changes of the data in the data base. Although most of the personal actions needed by HR-administrators are already available in the software in terms of ready-to-use routines and functions, they are rarely used to record pre-dated notifications of personal actions. More often than not the only data that implicates a future action is the valid-from-date of the personal action. What is more, employee-self-services (ESS) have to be used more intensively in order to reduce administration tasks as far as pre-dated notifications are concerned.

The capture of pre-dated notifications of personal actions must be identical with the collection of personal actions in order to use the data comprehensively for HR-planning. The only difference in the records is a label that identifies them as pre-dated notifications of personal actions. But data that belongs to pre-dated notifications must not have any impact on productive processes, the payroll accounting for instance. Although pre-dated notifications are events that will happen almost for sure, the data must be stored separately and the actions must not be applied to productive data until the process has been approved by the management.

Pre-dated notifications can be collected manually or generated automatically by the system. The advantage of manual input of data is the precision and the complete supervision over the process and the data. Disadvantages are not only the manual effort, but the more complex workflow and the appointment of the dates. If the process is not reliable enough, events may not be recorded correctly and thus personal actions will be incorrect. Automatic collection of data and pre-dated notifications on the other hand is suitable only

if the events require almost the same data and have an identical process every time. Thus flexibility is low or will cause a much more complex process, if it has to be guaranteed. But in some cases like taking over trainees or the retirement of an employee automatic generation of pre-dated notifications may be easy to implement.

Pre-dated notifications of personal actions must be converted into real personal actions without any barriers, so that the manual effort gets as low as possible. Ideally a reminder exists, which provides information to a clerk in the HR-division about pre-dated notifications, which will be actual soon. The system can also generate suggestions for personal actions to be started like the replacement of a job position. A workflow-integration could suite perfectly here. When applying a pre-dated notification the data record should be copied, and not changed. This procedure ensures that pre-dated notifications can be differed from regular personal actions and analyzed later on.

If a pre-dated notification is not to be activated, the data should not be deleted from the system. The records can be used to evaluate how many pre-dated notifications were turned into productive personal actions in the past. This monitoring will provide information about how reliable pre-dated notifications really are.

Today large-scale enterprises use a data warehouse for enterprise-wide reporting. The newest trend is to integrate planning functions into the data warehouse. Even existing planning routines are transferred from the ERP-system to the data warehouse in order to generate scenarios and to make plans on a higher scale. In this case redundancy may be eliminated through service-oriented-application-programming. The programming routines needed for planning functions are offered by a service, which runs on the ERP-system and computes values for the data warehouse, which calls it, for instance. However it should be examined if all functions are needed to be transferred to a data warehouse.

FUTURE TRENDS

Today personal actions usually are collected and maintained by the HR-division. It is a service the HR-division offers to the company's employees. This will certainly change soon. With employee self-services and delegated HR-planning a new approach has been started, which will lead into a decrease of personnel maintaining personal actions and master data. These administrative tasks will be taken over by the employees themselves or the mid-level management. Like employee self-services, which made HRM more efficient and cost-optimized, personal actions will be the next outsourced task. In future the HR-division will only authorize personal actions; the employees will deal with the maintenance themselves.

Many surveys described how positive the impact by ESS on HRM is. Costs for Standard HR-processes will decrease by up to 50%, personnel needed for administration tasks will be reduced by up to 40% (CEDAR, 2002) and lead time will be reduced by up to 50% (Hunter Group, 2000). With these KPI-values it is only a matter of time until personal actions will be delegated, too.

The HR-module is an essential component of an ERP- and also of a governance system. It is not only an operational system, but also a data source for reporting systems like data warehouses. Future trends in e-government analytics indicate the necessity of a data warehouse-based reporting for statistical analysis and data mining (Nandan and Gopi Chand, 2007; Sharma, 2008). This kind of reporting will use HR-data, too. As reporting becomes more and more transparent, especially in e-governance, data quality is most important. It is obvious, that the higher the data quality is, the more precise reports and analyses will be. In case of e-governance many of the reports concerning the government are public, so especially in this case reports must be reliable, transparent and updated. And public interests focus on how efficient the work is done, too. An enhanced HR-planning will contribute to this very well.

CONCLUSION

There cannot be a single answer for challenges of today's governmental processes. E-Government is just one measure of many. What is more, the implementation of e-Government forces to adapt all other structures in the government to the new strategy, ICT and HR for example. As far as HR is concerned it is necessary to analyse the HR-structure in governmental departments and anticipate changes that will take place because of e-Government.

The implementation of e-Government will lead to different requirements: on the one hand many jobs will become dispensable, because the work can be done more efficiently with less effort; on the other hand the employees will be faced with a broader field of activity, i.e. dealing with an enterprise portal and workflows.

The government's HR-system must meet all the requirements which result from the suddenly dynamic structure in business processes and job descriptions. If a new HR-system will be introduced in HR-division of a government, it will be one of the few leading vendors. This assumption results from the fact, that the headcount in a government will be more than 100.000 employees (see 188.425 employees with a full-time contract for administration tasks in the German Federal Land Nordrhein-Westfalen (NRW, 2008). This amount of people necessitates a powerful HR-system.

When evaluating the different systems available on the market, one should also take the ability to deal with pre-dated notification of personal actions into consideration. The significance of pre-dated notifications of personal actions for HR-planning is high enough to be considered seriously. In the planning process they improve the target values because the data added to the process is comprehensive and precise. Thereby the operative processes are supported very well and tendencies can be recognized early.

Pre-dated notifications are usually known some time before they shall take place, but they are rarely used for the planning process. Standard ERP-systems do not offer the function to work with pre-dated notifications of personal actions. The planning process, which is supported by ERP-systems, thus is not enhanced by the data from pre-dated notifications. But the data would be very useful, as it can be fully integrated into the data model without great efforts, because pre-dated notifications of personal actions are quite similar to existing personal actions. On the contrary the information about pre-dated notifications is used in reports and planning processes. But the source for the data is not the integrated ERP-system, but a bunch of Excel-sheets. The process is not integrated as well and becomes very error-prone. The effort to consolidate the data is enormous in this case, even if the planning is done only once a year. Finally this will lead to not regarding the data from pre-dated notifications as important anymore.

Thereby the benefit of integrated pre-dated notifications is often higher than assumed by the IT-director. Even if the planning values for headcount gets about 30 FTE more precise, with an average earning of 50.000€ (employer's share for social insurance included) the saved costs are 1.500.000€ high. If we take a look at more expensive job titles on the executive levels the cost savings will be much higher, projects will run better and will not be delayed because of the leak of information about personal actions.

ERP-systems as the central software product in a corporate information systems landscape must offer the option to use pre-dated notifications of personal actions. The benefit for the customer is much higher than the costs to implement the functionality. Governments wanting to become ready for e-government should also take a close look at the ERP-system they want to introduce and find out if it supports pre-dated notifications of personal actions when building up or improving their HR-management system. What is more, the organizational structures have to be prepared for an enhanced HR-controlling and HR-planning,

because an ERP-system is not a final solution, but only a tool which makes efficient HR-management possible. Not until the business processes are redesigned and set up-to-date, governments will be completely ready for e-government.

KEY TERMS AND DEFINITIONS

Employee Self-Services (ESS): Employee self-services have been invented in order to make HR-administration more efficient by transferring administrative workload to the employees. Commonly an enterprise portal is used as user interface, which is directly connected to the database. Employees are allowed to maintain certain master data themselves, like address or vacancy-dates. ESS made administrative HR-processes faster up to 50% (Hunter Group, 2000).

Human Resource Management (HRM): Human resource management is defined by Scholz (Scholz, 2000) as "the systematical analysis, evaluation and organization of all personnel aspects in a company". The main task of HRM is deriving HR-goals from the company's strategic objectives and also assuring the achievement of these objectives (Drumm, 2006).

Human Resource Planning (HR-planning): HR-planning is an important part of HRM. It includes all activities that are used for planning the quantity and quality as well as the personal actions, which have an impact on the HR-structure (Müller-Christ, 2005). Kolb says, HR-planning "is the systematic anticipation of future actions concerning a company's personnel" (Kolb, 1998:pp#). The main objective is to assign strategic enterprise aims to HR and to prepare the personnel systematically for future requirements with the use of personal actions, so that the target achievement will be maximized (Schanz, 2000). Important constraints are given by the law, so that not all action alternatives may be permitted (Olfert, 2006). Finally the effectivity and availability of human resources has to be maximized (Kossbiel, 1999).

Personal Actions: Personal actions are a bunch of functions to change data in a database consistently. They are implemented in programming routines. These routines use input-data, compute the data according to the selected personal action and generate output-data.

Pre-Dated Notification: A pre-dated notification is a future event with a maximum probability of occurrence, which is started with input-data and whose action has a deterministic effect on the environment. Actions can be executed simultaneously or sequentially, but they all have the probability of occurrence of 1 (unity).

Time Slot for Master Data: An employee's master data often changes in a period of time. This can be his address or bank account number, but also his assignment to an organisational unit or his status. For time-dependency each dataset has a valid-from and a valid-to date. Time slots define the temporal validity of master data restricted by the valid-from and valid-to date of each dataset.

ABSTRACT

This paper explores the impacts associated with different software process models on the staff. The main research question addressed is whether any process model leads to a higher satisfaction of staff, and less human resource related problems, including staff turnover or increased stress levels. This issue is empirically investigated using a set of projects from 15 different software developing companies. Agile-oriented models are not necessarily limited to small projects, but both groups showed nearly identical distributions for team size and duration. Interestingly, rigid-type models tend to exhibit higher effort estimations, and lower correctness in these estimations. Also customer satisfaction is slightly lower. With regard to human resource issues, the differences are not major overall, but there are some noticeable exceptions. In general, satisfaction and acceptance are higher at lower stress and overtime levels for agile-type project participants, but, interestingly and contrary to theory, people wish for more responsibility. Agile-type projects also enjoy some advantages in information sharing and communication, and in some quality aspects. Rigid-type projects show considerable higher abilities to cope with absence of personnel.

INTRODUCTION

Software development is, above all, a task performed by human beings. Nevertheless, human factors and human resource management have not been a major issue in the context of software engineering and software development, with some notable exceptions (Brooks, 1999; DeMarco & Lister, 1999; DeMarco, 2002; Cherry & Robillard, 2008; Good & Romero, 2008; Tenenberg, 2008). In this paper, we will explore the impacts associated with different software process models on the staff. With this term, we subsume all people directly involved in the respective projects, and therefore include analysts, programmers, management and others.

The main research question addressed is whether any process model leads to a higher satisfaction of staff, and less human resource related problems, including staff turnover or increased stress levels. Naturally, impacts of staff satisfaction on the quality of the final product, and on efficiency and effectiveness of work should not be underestimated. For example, eXtreme Programing (XP) explicitly has a "no overtime" rule designed to maintain spirit and motivation (Beck, 1999). We addressed this question with a literature review on human resource related topics in software development, and an empirical study. The empirical study included interviews with a number of project participants, mostly project managers from different software developing companies.

The outline of the paper is as follows: We will start with a literature review which covers the types of software process models included in our study, as well as possible human resource related problems and prior research on the intersection of both issues. Then we will detail the empirical study undertaken, starting with a description of the methodology, followed by the results themselves. The paper closes with discussion and directions for future research.

LITERATURE REVIEW

Process Models in Software Development

The concept of a process model in software development is still not uniformly defined, and some of the approaches to be found in the literature are not detailed enough to be called a full-blown process model. The basic idea we will use is that a process model contains a list of time-successive steps in a problem-solving process, thus constituting a guideline for developing software, structuring the overall project, helping in achieving goals including quality levels, and aiding in planning, controlling and monitoring (Liu et al., 2008). Also a process model helps in giving a common understanding to all involved parties, and defining clear interfaces between different tasks. Process models also gain special importance in multi-project management (Demirkan & Nichols, 2008).

In the literature, a plethora of approaches can be found including the V-model, SA/SD, XP, Scrum and many more. Although they are difficult to group, for this paper we will adopt a widespread differentiation between those models which are of a more consecutive, waterfall-based nature (Royce, 1970) like V-model or SA/SD, for which Syed-Abdullah et al. (2006) also use the term designed-based approaches, and those which show more prototyping, spiral-oriented features (Boehm, 1988). This last group is currently primarily embodied by agile approaches like Scrum or XP, which are based on the Agile Manifesto. This holds as central tenant that both the business and technology environment continue to change at an increasing pace. Therefore the main question to be addressed is how to better handle these changes, not stop them early in the life cycle by anticipating them all, while still aiming at achieving high quality and timeliness. A focal point therefore is the flexibility that is to be ensured (Ollson, 2008). This leads to a set of principles, which value individuals and interactions over processes and tools, work-

ing software over comprehensive documentation, customer collaboration over contract negotiation, and responding to change over following a plan, while explicitly acknowledging the value of the items on the right. While all the instruments of more process- and planning-oriented methods are recognized as useful, they are the ones seen as needing to give in problematic situations.

Quite often, the right choice of model is a huge challenge. Lots of research has focused on comparing different models, and trying to determine in which contexts different approaches have merit or not (Boehm & Turner, 2003; Reifer, 2002; Stephens & Rosenberg, 2003). For example, agile approaches have faced a lot of criticism, one of them being that planning, processes and documentation are essential, and agile development is nothing more than an excuse for hackers to do as they like, coding away without planning or design (Rakitin, 2001). Another point of criticism is the reliance of agile methods on individual competency and craftsmanship, with participants working together in self-organizing teams even including members of other organizations, e.g. customers (Cockburn & Highsmith, 2001; Lindvall et al., 2002). It is argued that the number of developers possessing excellent technical knowledge paired with the necessary social skills is naturally limited. Also the possible size of agile development teams is discussed. While Cockburn and Highsmith (2001) cite successful projects with up to 250 people, other authors see a size limit in the area of 15 to 20 people. For any analysis, it is important to note that in many cases, a model is not used according to a certain book or source, but is tailored to fit a certain project (Garcia-Crespo et al., in press). Also the distinction between the types of process models as described above is not as distinct in practice many times. For our empirical study, we have therefore not used a binary variable, but a 6-grade Likert scale to rate between full agility and full rigidity. This is somewhat akin to what Boehm (2002) and Boehm and Turner (2003) have proposed and used in form of a continuum.

Human Resource Problems in Software Development

In all team-based settings, a series of problems can arise during work. The first determining factor in this is the selection of team members which can work together without major frictions (Reel, 1999), and to optimize cost, duration and risk (Tsai et al., 2003). Especially in the initial phases of a project, distribution of work packages is often the most pressing task, during which necessary communication phases are neglected. Main sources for team problems are in most cases deadlines, differing opinions on a factual level, personal difficulties among staff, opaque process steps and a lack of well-defined interfaces. Naturally, the end of a project puts the members of a team in most cases under the highest time pressure, and therefore results in mental phenomena such as mild irritability. For international projects also the mentality of different nationalities can play a major role in stressful situations, or even cause them. It is not always possible to keep every employee in the team, so some team members might need to get dismissed, which for projects is also often difficult due to accumulated experience and increased overall pressure. Sengupta et al. (1999) found that staffing and assimilation delays cause considerable problems for managers. Regarding time problems, two different aspects need to be considered: On the one hand, scheduled deadlines must be respected and, on the other hand, managers often have little time for the employees' needs. Managers are responsible for ensuring that milestones are met. If they also have very little time for the staff, and thus are not in good and permanent contact with the employees, they might become aware of any problems too late. In this research, we will focus on any such problems related to the staff. This includes the number of people reporting illnesses, especially before major milestones, the number of absences without valid excuse, any contract terminations by employees, employee satisfaction and complaints, cases of fake work

or refusal to work, interpersonal problems like boycotts of certain co-workers, using work assets for personal tasks or faking time sheets, errors, delays and quality problems, as well as employee motivation and stress level in general.

Process Models and Human Resource Related Effects

To date, there is not much research linking human resource related problems and the process models used in software development projects. The process model followed structures both the flow of work and also the different interactions, and thus can be hypothesized to have an impact on employees, their satisfaction and stress levels. For example, Cherry and Robillard (2008) empirically study ad-hoc collaborations which are spontaneous and mostly based on face-to-face communication. In agile approaches, these collaborations are much more pronounced than in traditional approaches, which mostly rely on documentation (Cherry & Robillard, 2008). It was found that these collaborations take significant time, but are rarely taken into consideration during task assignment. Nevertheless they are important for knowledge sharing. The increased presence of those interrupting collaborations in one type of process model could therefore increase satisfaction with knowledge transfer and social effects, but might increase stress levels due to neglect in task assignment and frequent interruptions. Jiang et al. (2003) also identify the organizational environment, like centralization and especially formalization, which can directly be linked to process models, as an important factor for team effectiveness. Tenenberg (2008) argues for institutional analysis of software development teams in the lens of collective action problems to uncover policies that enhance cooperative and restrict self-serving behaviour, the latter of which can lead to human resource related problems. In the conclusions, he directly links to agile processes.

In the most similar research to the one presented here linking human resource related problems to process model adopted, Syed-Abdullah et al. (2006) empirically analyzed the effects of agile methods, namely XP, on the well-being of a set of 17 development teams composed of undergraduate students. The main effects on well-being in general are job design, performance monitoring, human resource practices and team leader's support. They employed participative observation, as well as focus group interviews and questionnaires. Initial results show that XP has a positive effect on the level of enthusiasm (as opposed to depression) in the most dynamic project, but no statistical effects on anxiety – contentment. In another empirical paper, Pikkarainen et al. (2008) show that agile practices improve both informal and formal communication. While the use of SCRUM and some XP practices was found to facilitate team and organizational communication of the dependencies between product features and working tasks, the use of agile practices requires that the team and organization use also additional plan-driven practices to ensure the efficiency of external communication between all the actors of software development. Cohn and Ford (2003) detail their experiences in introducing an agile methodology (SCRUM) to organizations. They explain that in such cases, some developers actually resist, because they might enjoy creating non-code artifacts, or that they dislike the more frequent interactions with management. They also report cases where developers became overwhelmed by the freedom of not having a detailed plan governing their actions. In one case, a group of overly enthusiastic people adopting agile practices too quickly caused problems and frictions within the team. In some cases, the dissatisfaction even turned into complaints at the HR department with regard to how the project was managed. All of those effects either directly constitute human resource related problems, or might be the cause of stress or dissatisfaction.

Table 1. Demographic data on participating organizations

	N	Min.	Max.	Mean	Median
Age (years)	13	5	50	19.2	15
Number of employees	9	20	92000	21564.4	110
Number of countries active in	13	1	80	13.9	2
Turnover in 2008 (Mio. EUR)	4	3	11764	5298.9	4714

Additional empirical data on agile methodologies were reported by Sfetsos et al. (2006), based on interviews with 30 managers and developers from 15 Greek firms applying XP. Among other factors, they found communication and synergy between skilled personnel to be a significant success factor.

METHOD AND DATA SET

Methodology

For this empirical research, we used a set of 15 randomly selected companies in Austria. In this set, both smaller companies, but also large and multinational organizations are represented (see Table 1 for data on the organizations).

Within each company, an interview with one person, quite often a project manager, was performed. In all cases, the most recent project was used as reference. For this the project had to be completed or at least very near to its end. All data was anonymized before any analysis, no personal data about the interview partners were collected. The majority of the interviews was conducted live, one of them was done by telephone due to scheduling problems. The interview was a semi-structured one, using a guideline containing a set of closed questions and also several open questions to catch any comments not covered by the pre-conceived list. This mix was chosen so as to be able to have some quantitative analysis for common problems and attributes, while being able to capture more rich data in an interview

setting, or to probe deeper in some cases. Therefore, we chose not to use a questionnaire and mail or e-mail it to possible respondents. The interview guidelines and scales were pre-tested once with an IT project manager, which resulted in small changes to the wording of some questions.

Most of the questions had to be rated on a 7-point Likert scale, using +3 to -3, with the endpoints question-specific. This form was mostly used for the questions pertaining to human resource related problems or motivational aspects, but also, e.g., for resulting customer satisfaction ratings. Of considerable importance was also the question for rating the process model itself, here a 6-point scale between very agile (1) and very rigid (6) was employed. As has been discussed above, process models are almost never used according to book, and are difficult to put in one simple category. This is somewhat similar to the continuum that Boehm (2002) and Boehm and Turner (2003) have used. For our data set, the majority of respondents classified their own process model as rather an agile one. That ratio is exactly 2:1. That means there were ten project managers that modeled their actions as rather agile and five classified the process model to be of a rather rigid nature. Only two project managers indicated that they have used a comprehensive process model as described in the literature, and in only two cases the extreme positions in the spectrum were selected. This underlines the importance of not sticking to binary categories, and published process models, but allowing for company and project specific variations. In an additional part of the interview, quantitative data

on the project, like size or duration, and also on results were collected.

For analysing the data, we try to establish in most cases a relationship between the process model adopted and the dependent variable, mostly ratings for human resource related issues. Descriptively, we report mean and median ratings for both groups. To test these for differences, we use the exact Wilcoxon rank sum test, which can deal with small sample sizes, and also with ties that are relatively frequent in this data set. In this approach, we use the classification into two groups (as can also be seen in Table 2). In a separate approach, we employ a series of univariate OLS regression analyses to establish in each case a simple linear model between the dependent variable considered, e.g. stress level, and the independent variable process model, and in that case use the full scale of six different levels

which was employed to capture this data (see also Table 2). For these cases, we also check the non-parametric Spearman correlation coefficient.

Data Set

Table 2 gives a first overview of the data set and some project characteristics collected[1]. We will now continue to give some results on differences between the groups according to process models in general, while in the next section will be focusing on the human resource related problems.

The two groups did not show any major differences with regard to team size or duration (Wilcoxon rank sum test, $p > 0.1$), although the estimated effort was significantly higher for the rigid-type projects (Wilcoxon rank sum test, $p < 0.1$). While this is in accordance with the literature, which sees this type of process models in

Table 2. Data set of projects with characteristics

Group	Project	Process model	Team size	Duration (months)	Estimated effort (person-months)	Deviation in effort from estimate (percent)	Deviation in duration from plan (percent)	Customer satisfaction (7 point scale from +3 very high to -3 very low)
Agile	1	2	15	14	24.0	100	8	2
	2	1	12	12	23.5	0	0	3
	3	2	8	8	6.0	12	0	3
	4	3	4	3	5.0	10	5	2
	5	3	6	11	27.5	20	0	2
	6	3	6	10	18.0	-10	-10	1
	7	1	5	9	12.5	0	0	3
	8	2	8	5	4.8	0	20	2
	9	3	7	12	10.0	24	34	2
	10	3	10	7	22.5	10	14	2
	Mean	**2.4**	**8.2**	**9.1**	**15.4**	**16.6**	**7.1**	**2.2**
Rigid	11	5	10	6	40.0	0	0	3
	12	6	9	8	15.0	15	0	0
	13	4	5	5	25.0	12	20	2
	14	5	6	15	30.0	30	0	1
	15	5	8	8	15.0	100	30	2
	Mean	**5.0**	**7.6**	**8.4**	**25.0**	**31.4**	**12.5**	**1.6**

use for larger projects, and also needing higher effort due to their nature, the results for team size are more surprising. Theory would prescribe agile process models to be more suitable for smaller groups, which is still true in this dataset with a mean of about 8 persons, while more rigid models are employed in larger projects. This size is about equal to what Reifer (2002) found. This difference is not to be seen here. Regarding correctly estimating the effort, the result that agile projects seem to fare better is also surprising, as effort estimation in general will be more easy to perform in a rigid environment of fixed requirements, although the difference is statistically not significant (Wilcoxon rank sum test, $p > 0.1$). It is interesting, that those projects of rigid type which were finished on time seem to have been doing so at the expense of customer satisfaction: Exactly the two projects with this type of process model which finished on time scored lowest in this regard. The average customer satisfaction resulting from the agile models was at 2.2 (median 2) and the rigid models at 1.6 (median 2), which overall did not constitute a significant difference when comparing these two groups (Wilcoxon rank sum test, $p > 0.1$). Using the full scale of process models, the model adopted actually becomes a significant factor in a linear model using customer satisfaction as dependent variable ($p < 0.05$), with the model achieving an adjusted R^2 of 0.31. The factor stays in the model if other control variables like team size or total effort are added. Agile process models place a high value on customer satisfaction as well as early and continous inclusion of user representatives, which seems to affect the outcome as underlined by this empirical result. It was striking that with regard to the hierarchical structure of the project team all persons indicated a flat hierarchy, although according to theory, rigid models in general favor a hierarchical structure. Outside the team, very hierarchical forms were present in the organizations.

Regarding the age of team members in the projects of the two groups, again there is a small,

but statistically not significant difference. In general, both types of projects have young and old employees working on them, which leads to results around the mean of 0 with the endpoint of the scales 3 very old, which was anchored at 50 years due to the industry conditions, and -3 very young at about 20-25 years of age. For rigid-type models, the mean value was 0.2 (median 0) and for agile-type models -0.8 (median -0.5), showing a small but insignificant difference (Wilcoxon rank sum test, $p > 0.1$). There could be several reasons for that, for example training received during education might give younger people more awareness and insight about agile methodologies, which leads to both them choosing such projects, and also being chosen for them. As an additional factor, agility and flexibility are more often associated with younger people, so this again might lead to both a selection and self-selection bias in project placement.

ANALYSIS

The main point of investigation for differences between the two groups of projects are diverse human resource related issues.

Acceptance and Responsibilities

As a major influence on this, and also in a way an outcome of exposure to the model in practice, is the acceptability of the model to the involved persons. In general, both types of model, agile and rigid, have a quite high acceptance rate, although agile models score somewhat higher: For rigid models, the acceptance rate was consistently 2 (on the -3 to +3 scale), for agile models straight 3 70% of the time, 20% scored 2, and one outlier of -1 existed (mean 2.4, median 3). Therefore, overall, agile-type process models seem to be more acceptable for team members (Wilcoxon rank sum test, $p < 0.05$), which would be in line with theory, as these models put more emphasis on team members, their

responsibilities, and several other aspects which should help to increase the morale. Responsibilities and wishes for changes in this area (i.e. mostly the wish for increased responsibility) were also inquired as separate topics. In theory, agile models propose concepts like shared responsibilities, collective code ownership and other related ideas, while rigid models advocate a more well-defined, small set of responsibilities for each team member. Interestingly, the results, although showing only a minor and not significant difference between both groups (Wilcoxon rank sum test, p > 0.1), display the opposite trend: In the mean, for the agile projects, -0.2 resulted (with -3 denoting no wishes for increased responsibilities, median 0.5), with -1 (median -2) for rigid models. Overall, as the numbers in absolute terms indicate, this is not a major problem in all projects, but the direction still seems interesting. One explanation could be that collective code ownership and similar concepts in agile development are either not fully implemented, or are too abstract for some people, who would prefer more clearly defined responsibilities. There is one additional explanation for this, which is derived from the personality of people chosen for agile projects. Possibly, developers with a higher propensity towards taking on responsibilities are selected, or self-select, to participate in this type of projects, but are still not satisfied with the level found there. In rigid-type projects, they would be even more displeased.

Sharing and Caring

Disclosure and transfer of information between different project participants seems to be working more efficiently in agile-type models. Although the values with -0.9 (median -1.5) and -1.6 (median -2) are not very far apart (Wilcoxon rank sum test, p > 0.1), the trend might indicate that agile models have a small advantages in achieving communication and cooperation within the project team. Also Pikkarainen et al. (2008) have shown that agile practices improve both informal

and formal communication. Knowledge sharing within a project organisation is one of the most influential factor on success, and was found to be correlated to organisational culture (Ajmal, in press). While we did not directly take organisational culture into consideration, the development model and underlying values followed can be said to form an important part of this, and thus the results underline this. In a connected topic, it was also explored whether people cared about their colleagues beyond a work context, but no difference between the two groups were to be found regarding this (Wilcoxon rank sum test, p > 0.1), although theory again sometimes cites this as an advantage resulting from agile process models.

Human Resource Related Problems

The main block in our empirical research dealt with a long list of human resource related problems which can occur in software development projects, or mostly, in all projects. We will now take a look at whether some or all of these problems tend to turn up in one of the groups of projects according to adopted type of process model, and how well and easily they can be dealt it in that case. The first problem concerns team members' illnesses. In only one case, a major disorder turned up during the course of the project, all other illnesses were rather short-term. Neither in numbers nor in the counter-strategies a major difference between both groups of projects showed in the data (Wilcoxon rank sum test, p > 0.1). Strategies employed included redistribution of work, postponement of milestones or a reduced number of iterations (only for agile-oriented projects). While there was no major difference in these points, the impacts on the projects actually differed: For agile models, the impact on duration of the project was more severe (-1.1, median -2) than for rigid models (-2.4, median -3), where almost no delay resulted. Despite the difference, it is not statistically significant (Wilcoxon rank sum test, p > 0.1). While in theory this could be blamed on larger number of

manpower in rigid-type projects, this cannot be accepted as a reason in this dataset, as the mean size of the projects is quite similar between both groups. It seems as if rigid-type projects might be better able to deal with (temporary) loss of team members than agile models, although due to concepts like pair programming or collective code ownership, this should actually be the other way. The issue of absenteeism is negligible in general, because in the projects there were only sporadic absenteeisms and no striking differences between the two models. The same is true for all instances of refusal of work, like leaving work undone uncommented, fake work, threats of illness or similar: Those occurred in a small number of projects only, and there is no difference between the groups of projects considered (Wilcoxon rank sum test, $p > 0.1$). Also inter-personal problems within the team, like boycott of cooperation with certain colleagues, occurred only seldomly and without difference in both types of projects (Wilcoxon rank sum test, $p > 0.1$). No major problems with management or colleagues turned up in any project. Also other effects like deliberate damaging of resources, the wasteful use of company resources, the use of equipment for personal use and cheating in various events such as payroll or hours statements, were seldomly reported, and incidents do not show any connection to the process model (Wilcoxon rank sum test, $p > 0.1$). It can be noted at this point that using company equipment for personal tasks is not seen as a major problem by management. It is widely accepted that this happens to some degree, and is not judged to be problematic. Of course, it needs to be noted that some of these effects are quite severe, and there might be some inhibition to report those within a questionnaire or interview.

Quality and Errors

We also checked for differences in several quality-related aspects due to human resource problems. For instance, the quantity of errors as made by the team members is reported as not very low for both models. This is not seen as something very negative, with some interviewees mentioning that errors are a natural consequence of getting work done. Also, some errors are quite easily fixed in software development. Between the two types of process models, a small difference showed up, with advantages for agile methods: While the value for rigid models is slightly above 0 with 0.6 (median 1), thus leaning towards more errors, the value for the agile group is slightly negative with -0.5 (median 0), indicating a smaller probability of errors. In the OLS regression model, the adopted process model turns out to be a significant factor ($p < 0.05$, even if controlled for team size or total effort) as does the correlation coefficient (non-parametric Spearman, $p < 0.1$), underlining this relationship. Jiang et al. (2003) also have identified the organizational environment as a major factor in effectiveness. Of course this could also be caused by team member selection, as agile approaches are often deemed to need better people, which are therefore selected and thus have a smaller rate of errors. For the question of how often the results of the work do not meet quality requirements, there is no significant difference between the models, as is for forgetting important dates (Wilcoxon rank sum test, in both cases $p > 0.1$). A difference is found when the relationship between quality and quantity is investigated. The average value in relation to this issue has shown that rigid models have a worse outcome than agile models (mean of -0.2 with median 0 versus -1.2 and -1, respectively). A similar situation can be seen with regard to delivery on time, again showing advantages for the group of agile approaches, although the differences in both cases are not significant (Wilcoxon rank sum test, $p > 0.1$).

Stress and Satisfaction

A major factor for satisfaction within a project or work environment in general is the workload. Both too high a workload, which results in overtime

and stress situations, and too low a workload have been found to have detrimental effects. Complaints about both were relatively seldom in the projects in our sample, within both groups, the mean was -1.4 (median -1 respectively -2). With regard to stress and occurrences of overtime (as opposed to complaints), there is actually a difference between projects employing different process models: Stress is actually quite common, and more so in rigid-type projects. They have a mean of 1.6 (median 2), while agile projects only reach 0.8 (median 1). For overtime, the difference is even more pronounced, with mean and median 2.0 (rigid-type projects) against 0.5 with median 1 (agile-type projects). The second difference is statistically significant (Spearman correlation, p < 0.1, OLS regression, p < 0.05, even if controlled for team size). This underlines that some of the main ideas in agile models, including reasonable workload and "no overtime" rules are actually implemented, and counters the notion of Cherry and Robillard (2008) that more frequent informal collaborations might increase stress levels. Possibly resulting from this, both in motivation and performance, agile-type projects score slightly better than the other group of projects, but in both cases the differences are not statistically significant (Wilcoxon rank sum test, p > 0.1). An unusually sharp decrease in performance was, on the other hand, only found in agile-type projects on two counts. For one of those, a reason was given, which was frustration of an employee when he/she could not enforce his will. A more or less final stage for dissatisfied employees is the possibility to terminate the contract. This should therefore be taken as a serious sign of discomfort with the current work situation. In our dataset, such a threat nearly never was made by an employee, with the exception of one project from each of the two groups. These two projects were also the only ones where actual layoffs took place during the lifetime of the project. Therefore, no significant difference between the two types of process

models can be seen in this regard (Wilcoxon rank sum test, p > 0.1).

Lastly, we used the answers to all human resource problem related question for arriving at an overall staff satisfaction measure. Due to lack of any weighting scheme to differentiate between questions (or any reliable way to arrive at such), all answers receive equal weight in the summation, using the mean result for each question. On this level, the results are actually quite good for both models, hinting at high overall satisfaction levels. For the complete list of 29 questions included, rigid-type projects had a sum of means of -43, agile-type of -44.3 (out of a possible maximum of -87). Again, a difference between both groups of projects can be seen, with an advantage for agile process models, but it is quite small.

CONCLUSION AND FUTURE RESEARCH

Results and Discussion

In this paper we have dealt with human resource related problems and issues in software development projects, and their relation to the adapted process model. We have used a classification to distinguish between two broad groups of models: More modern, agile approaches, and more traditional, rigid-oriented types. The empirical study has shown that indeed companies do not adopt models directly as proposed in the literature, but adapt and change for each project. Therefore, we are facing a continuum of process models according to this dimension of agility and rigidity, which makes it more difficult to arrive at statistically significant results. Using interviews with members of 15 different software developing companies in Austria, we have arrived at a data set of recent projects. Regarding project characteristics, it was interesting to see that agile-oriented models are not necessarily limited to small projects, but that both groups showed nearly identical distributions

for team size and duration, contrary to current mainstream assumptions (Boehm, 2002). Interestingly, rigid-type models tend to exhibit higher effort estimations, and lower correctness in these estimations. Also customer satisfaction is slightly lower, which would coincide with the literature which highlights the importance placed by agile models on customer satisfaction and inclusion, and the age of project participants is slightly higher. This last finding can be explained by different educational backgrounds, or psychological traits together with self-selection.

With regard to human resource issues, the differences are not major overall, but there are some noticeable exceptions: In general, satisfaction and acceptance are higher, confirming the findings of Syed-Abdullah et al. (2006), at lower stress and overtime levels for agile-type project participants. Agile models mostly have a no overtime rule, so this might seem intuitive, but Cherry and Robillard (2008) have hypothesized that the more frequent informal interactions could increase stress levels. Their notion was not supported by our findings.

On the other hand, interestingly and contrary to theory, people wish for more responsibility. There are some explanations for this last finding, one being that collective code ownership and similar concepts are either not fully implemented or too abstract for some people, and another being derived from the personality of people with a higher propensity towards taking on responsibilities being selected or self-selected for this type of projects, who are still not satisfied with the level found there. This might be likened to what Cohn and Ford (2003) experienced as over-enthusiasm. Agile-type projects also seem to enjoy some advantages in information sharing and communication, and in some quality aspects. Both of these ideas have already been proposed in literature (Jiang et al., 2003; Cherry & Robillard, 2008; Pikkarainen et al., 2008). Reifer (2002), for example, found similar quality levels, but not superior ones. On the other hand, rigid-type projects show considerable higher abilities to cope with absence of personnel.

Overall, therefore, both types of models have been found to be adopted in practice, but not to their full extent, but in slightly adapted, changed, and mostly moderated form. Companies seem to shy away from extremes in both cases, which seems to be a sensible choice given the results presented here. Both models have advantages and disadvantages, but neither are very pronounced. As expected, agile-oriented approaches achieve good results for some dimensions like stress or overtime, but show problems in other areas like responsibility or coping with employee absence. A good fit for a company and team would therefore enable to reap benefits from both ideas, and to withhold any major problems on the other hand. The managerial applicability of this research lies exactly in this trade-off which is a conscious decision of team leadership. Any decision on which process model to adopt needs to take these human resource related effects into consideration, in addition to other factors like cost or schedule.

Limitations and Further Research

Naturally, any empirical study always has some limitations, which also give impetus for further research. Of course, a larger data set, including a diverse population of projects would be interesting to explore. Still, we have tried to ensure the external validity by gathering data from a widely diverse set of small and large, old and young companies. Pre-testing of the questions and scales was employed to counter any problems with construct validity. As many questions pertain to problems easily measured in other ways, it is not assumed to be a major concern. For the overall satisfaction measure as a construct, validity would need to be ensured by a large-scale investigation of team members. Sadly, this was not possible. One main threat is internal validity, as it is possible that some of the results are influenced by a selection bias in staffing projects: Theory holds that agile approaches need more capable and highly motivated team members, so exactly those might possibly be

selected. This would lead to some of the results seen here, like better quality or less satisfaction with responsibilities, which in this case would not be due to process model, but personnel attributes and selection. The same effect could result out of self-selection, i.e. a certain type of person selecting projects or companies with a more agile-oriented approach. It would therefore certainly be worthwhile to include employee qualifications and abilities, or, even better, to study the same people in differently organized environments or projects. Naturally, this is a long term task, which nevertheless might yield very interesting and relevant results. It has also been found to be difficult to assess some human resource related problems like theft or cheating in time reporting, because these severe violations might carry penalties even much later on. Achieving a high level of trust would be paramount in getting truthful results for these areas. With regard to quality and customer satisfaction, it would also be interesting to include interviews with those different stakeholders and gather more, and more objective, information on this. With this paper, we hope to have given a first glimpse at the topic of human resource related topics in connection with process models employed, and we hope research on this is going to continue. After all, software development constitutes a major human effort, and addressing the participants' needs, concerns and problems would greatly enhance our knowledge about and ability to manage these efforts successfully.

Chapter 20
Personnel Performance Appraisal Coverage in ITIL, COBIT and CMMi:
A Study from the Perspective of People-CMM

ABSTRACT

Human capital is of paramount importance in the ICT industry. This paper analyses one of the elements which underlies effective management of human assets: performance assessment. This analysis uses the development of a common standard based on the tasks and processes outlined in People CMM, the standard in human resource management designed by the Software Engineering Institute. This framework is evaluated in different models related to IT Governance, such as COBIT and ITIL, as well as other related IT practices like CMMI for Development, CMMI for Acquisition, and CMMi-SVC. The results indicate that COBIT is the only framework that presents reliable coverage in relation to personnel performance assessment.

1. INTRODUCTION

Human capital is key for the knowledge society. The advancement in techniques for personnel development has enabled the application of practices and processes which foster training and learning, improving the performance of individuals and groups. Studies of human capital (Schultz, 1959; Becker, 1964; Mincer, 1974) indicate that this asset is sustained in knowledge, and that this element provides individuals with increases in their cognitive abilities, leading to more productive and efficient potential activity. Drucker (1998) stated that knowledge is the most significant economic resource of a post-capitalist society. Thus, according to Bakry and Alfantookh (2010), building the knowledge culture is of increasing importance, not only because of its role in providing sound knowledge management and effective knowledge-based economic development, but also because of its support to environment protection, intercultural harmony and human well-being.

In this scenario, Knowledge Intensive Organizations (KOI) are, according to Starbuck (1992), those organizations in which "knowledge plays a more important role than any other of the inputs to an organization". In this environment, KOI, in which IT-related organizations are included, according to Hurley and Green (2005) require effective measurement techniques for the development of their employees, both from the perspective of knowledge as well as competency elements (aptitudes, attitudes, etc.). Human capital is particularly critical for competitiveness in high-tech sectors (Bartelsman et al., 2004). According to López-Fernández, Martín-Alcázar, and Romero-Fernández (2010), IT human resources are gaining importance in an environment more and more competitive and changeable. This circumstance has obliged an increase in the importance of human capital in general and its evaluation, in particular in different environments focused on the governing and management of ICT. In order to accurately analyze such elements, the current paper proposes a structured reflection of this research field, comparing the practices proposed in the state of the art with those models implemented in the ICT field. To include a more refined analysis, this paper outlines some recommendations for the inclusion of such practices in different models. Given that, according to Ruiz-Larrocha et al. (2011), IT standards (like ISO 27001, ITIL and COBIT) are available to assist organizations implement the appropriate programmes and controls to mitigate risks, knowing to what extent these standards covers performance appraisal could be helpful for managers and practitioners alike.

The remainder of the paper is organized as follows. The next section defines the state of the art about people assessment methods, as well as its components and principal implications. This is followed by the description evaluation framework. Subsequently, several ICT related initiatives are analyzed using the evaluation framework. Lastly, the paper presents the principal conclusions and future work of the study.

2. STATE OF THE ART

IT workers professional practice must be continually revised and improved in order to adapt workers' competences to technical innovations and soft skills to evolving markets (Casado-Lumbreras et al., 2009). Thus, in all industries, but more in particular in IT, one of the leading activities for managers is to discover to what degree workers are competent. In this scenario, the performance appraisal of human resources has been explored both from a theoretical and applied viewpoint.

The use of rating scales in performance evaluations is deeply rooted in the history of personnel psychology (Landy & Farr, 1980). However, performance appraisal is a delicate issue (Myloni, Harzing, & Mirza, 2004). Cole (2001, p. 798) defines performance appraisal as a formalized, systematic assessment and discussion of an employee's performance and his/her potential and

desire for development and training. In plain words, according to Chilton and Hardgrave (2004) performance is a term that is often used to refer to the degree to which an employee has executed his or her assigned duties. Appraisal practices often include formal review and feedback sessions, and may include procedures for establishing work objectives, conducting self-appraisals, and setting performance goals (Thurston & McNall, 2010). There are three approaches a manager can take in evaluating an individual employee: (1) effectiveness and productivity; (2) evaluation of traits; and (3) evaluation of behaviors (Latham & Wexley, 1977).

According to Curtis, Hefley, and Miller (2009), the role of performance appraisal as a part of performance management is primarily to record the results of performance for use as input to decisions about adjustments to compensation, personal development planning, staffing, promotion, and other workforce activities. In this way, performance appraisal is the central point for the collection of data which underlie decisions regarding the competency of human assets in their activities, requiring, on the one hand, the definition of the elements for comparison with established performance standards, and on the other hand, mechanisms put into place for the storage and exploitation of performance information.

On the other hand, poor management of human factors can hinder the use and effectiveness of technology and Information Systems (Ives & Olsen, 1984; Willcocks & Mason, 1988). Examining this aspect even further, performance management has been cited as a common cause of IS failure (Eastman, 1991; Legge, 1989; Seilheimer, 1987). According to Ball and Harris (1982) Information Systems personnel evaluation is the second most critical issue of IS management. Perhaps for this reason, the literature has discussed the difficulty of developing software systems and evaluating IT personnel in the organization for more than 40 years (Boyd et al., 2007). The different goals of the stakeholders lead to different courses of

action and conflicting perspectives of this personnel performance (Linberg, 1999), the differences between the perception of the success of IT staff and the success of the standard user being one of the principal sources of disagreement, as exhibited by the evaluation (Jiang et al., 2001).

In this study domain, in one of the earliest studies of IT personnel performance, Arvey and Hoyle (1974) developed a behavioral expectation scale to measure the performance of systems analysts and programmers. Subsequent to this work, contributions by many other authors were made for the construction of a method of performance management (Igbaria & Wormley, 1992; Jiang, Sobo,l & Klein 2000; Chilton & Hardgrave, 2004). The applications of the performance measures proposed are focused on distinct objectives, such as the comparison of performance between contract versus permanent workers (Ang & Slauter, 2001), fit between individual characteristics and job characteristics (Ketler & Smith, 1993), assignment of personnel in software projects (Acuña & Juristo, 2004; Acuña et al., 2006), to cite some of the most significant cases. Concerning the elements which have been examined in order to achieve an effective evaluation, intensive debates have also emerged among the scientific community regarding the elements for performance evaluation. In a recent significant contribution, based upon a literature review, Boyd et al. (2007) found seven important performance dimensions for IT Professionals: (1) work quality, (2) project work, (3) general tasks, (4) interpersonal quality, (5) dependability, (6) teamwork and leadership, and (7) career related training.

Independently of the evaluation method and the items evaluated, due to the importance of performance appraisal, the authors considered it interesting to determine the level of support which is given to this management tool in the various ICT maturity and governance initiatives. The sections which follow provide a response to this research question.

3. ELEMENTS FOR THE ANALYSIS

Prior to realizing the analysis of the evaluation of performance of different frameworks, a reference standard for the management of human capital and a diagnostic element which permits the analysis of the distinct models from a common perspective should be established.

The reference standard in the management of human capital selected was the People Capability Maturity Model (P-CMM). P-CMM is a model of maturity and capacities based on 17 key process areas for the management of human capital in software development organizations, however, it can also be applied to organizations in other industry sectors (Curtis et al., 2009).The model is divided into 5 maturity levels (from level 1 to level 5, which represents a rather restricted view of the management of human capital), each of which represents a change in the culture of the organization. Traversing the levels, each level improves the attraction, deployment, organization, motivation and retention of human capital. Each of the 17 process areas corresponds to one of the four operating levels of the model, and is divided into the following sections: purpose, description, objectives, compromises, skills, practices, measures, verifications. From the perspective of performance management, P-CMM offers an

evolution according to level with four phases; at level 2, performance is measured at individual level and is reported to the managers; at level 3, performance is measured at team level, and is reported to the management, together with performance at individual level. At level 4, performance is measured quantitatively; and at level 5, performance is aligned between the teams of the organization. Taking into account the characteristics of this model, for the present research, the model has been analyzed selecting exclusively the process areas which focus on performance management: Performance Management (level 2), Quantitative Performance Management (level 4), Organizational Performance Alignment (level 5); together with the objectives and practices of other process areas linked to this management. As a diagnostic, a checklist for the evaluation of the performance of human capital has been created. For the preparation of this checklist, the P-CMM model has been analyzed examining process areas, activities, and objectives, which cover the elements necessary to evaluate human capital performance. The evaluation, viewed as a process, has been divided into three sub-processes; establishment of measures, measurement, and evaluation of performance. Within each sub-process, generalized practices which are based on at least one P-CMM practice have been included. Each

Table 1. Checklist extracted from People-CMM

Process	Subprocess	ID	Activity	Mode
Human Capital Performance Assessment	Establishment of measures (EST)	EST1	Individual. (PM: P4, P5) (QPM: P3) (C-BP: P7)	I
		EST2	Unit (PM: P1, P2) (QPM: P2) (C-BP: P6) (WP: P6)	G
		EST3	Group (QPM: P3) (WD: P3)	G
	Performance measurement (MED)	MED1	Individual Level (PM: P7) (QPM: P5, P6) (CCI: P2)	G
		MED2	Unit Level (PM: P3) (WP: P11)	I
		MED3	Group Level (QPM: P5, P6) (WD: P13)	G
		MED4	Almacenamiento de las mediciones de rendimiento (QPM: P8)	A
	Evaluation of performance (EVA)	EVA1	Individual Level (PM: P9) (C-BP: P8, P9) (CCI: P3)	I
		EVA2	Group Level (EW: P11) (CCI: P6)	G

I= Individual; G= Group; B= Both

sub-process contains a series of activities with an identifier, a level (individual or group or both), a short description together with the P-CMM practices to which it is related. These practices are defined using the initials of the process area which they pertain to, and the practice number. Table 1 demonstrates the checklist.

The section which follows presents the analysis of the evaluation of performance using various ICT models, employing as analysis tool the checklist just described. The use of the checklist may be split into three levels. At the activity level, an activity is considered covered when at least one element of the model under analysis has the same objective as the activity in the P-CMM model. At the sub-process level, three categories have been considered: performance appraisal at individual level, when the model covers individual employee activities (I); covered at group level, when the model applies measurement and evaluation at group level (G); and covered at both levels, when the model covers all activities of the P-CMM model together with those which pertain to both categories, individual and group (A), or "joint".

4. ANALYSIS OF THE MODELS IN RELATION TO HUMAN CAPITAL EVALUATION PRACTICES

The models selected for the analysis are focused on the following principal areas: ICT management, project development, and outsourcing. For the selection of the models, their relevance and level of use has been taken into account, both in academic and organizational environments. Employing the diagnostic element formulated in the previous section, the results of the analysis for the following models will be presented and discussed: ITIL, COBIT, CMMi-DEV, CMMi-ACQ y CMMi-SVC. For each model, the following aspects are included: a brief description of the model, the checklist as applied to the model, and a summary of the analysis together with the

considerations taken into account for performing the analysis. Upon completion of the analysis of the models, the section includes a diagram which summarizes the conclusions of the findings.

4.1. Information Technology Infrastructure Library (ITIL)

Information Technology Infrastructure Library (ITIL) is a standard of best practices whose objective is to manage ICT infrastructure efficiently, with the objective of guaranteeing the levels of service agreed upon by the ICT organization and its clients (OGC, 2009). ITIL in version 3 consists of a set of five books published by the Office of Government Commerce (OGC), which empowers an ICT organization to improve the service it offers to its clients. Each of the books covers a specific area: Service Strategy, Service Design, Service Transition, Service Operation, Continual Service Improvement; this set has been entitled ITIL Core. For each area, ITIL defines objectives, activities, and the inputs and outputs of the processes of the ICT organization. Using these elements as a basis, it is possible to realize an analysis of the evaluation of the performance of human capital from the ITIL perspective.

The elements of ITIL utilized for the analysis of this model are processes, together with sub-processes, and their associated activities. Based on these elements, and using the checklist, the following results are obtained (Table 2):

Taking into account the results displayed in the previous table, it can be deduced that ITIL does not cover the entire process of human capital performance evaluation, the model lacks elements for measuring and evaluating at individual level (MED1, EVA1), however, it defines roles and responsibilities for the entire service provision life cycle (EST1). At joint level, ITIL does not cover performance measurement (MED2). To carry out the current analysis, ITIL has been considered in the context of services; with the outcome that the practices for human capital

Table 2. ITIL personnel assessment coverage

Activity (ID)	Related Elements	Covered (Yes/No)

performance evaluation for groups are considered uniquely for services in the context of this framework or model.

4.2. Control Objectives for Information and Related Technology (COBIT)

COBIT is a set of recommended practices for the governance of Technologies and Information Systems (TIS), created by the Information Systems Audit and Control Association (ISACA), and IT Governance Institute (ITGI) (ISACA, 1996). COBIT 4.1 is organized into 34 high level control objectives for TIS processes, which are grouped into 4 activity domains for the governance of TIS: Plan and Organize (PO), Acquire and Implement (AI), Deliver and Support (DS), Monitor and Evaluate (ME).For each of the 34 objectives, COBIT provides detailed control objectives, 215 objectives in total. All of the objectives, both those at high level (34), as well as the detailed objectives (215), are correctly structured and contain explanations of their purposes and reach (ITGI, 2007). COBIT defines the relation between an ICT organization and its goals, as a set of clearly defined processes which use the skills of the employees, and the infrastructure, to use automatic business applications, adding value to the information of the organization.

The elements of COBIT used for the analysis are the detailed objectives, based on which, and using the checklist, the following results are obtained (Table 3):

Taking into account the results of the previous table, it can be said that COBIT covers the entire performance evaluation process of human capital, which includes its sub-processes and activities. In order to realize the analysis, the researchers considered the characterization of COBIT focusing on services and projects; this has been subsequently formulated as the conclusion that the performance appraisal of human capital practices for individual employees are considered in this model for projects only, and group evaluation for services.

Table 3. COBIT personnel assessment coverage

Activity (ID)	Related Elements	Covered (Yes/No)
EST1	PO4.12, PO7.3, PO10.8	Y
EST2	PO10.7 (at project level)	Y
EST3	DS1.3, DS1.4 (at service level)	Y
MED1	PO7.3, DS3.5	Y

MED3	DS1.5 (at service level), DS3.5	Y
MED4	ME 1.2	Y
EVA1	PO7.7, DS3.2	Y
EVA2	DS3.2 (at service level)	Y

4.3. Capability Maturity Model Integration for Development (CMMi-DEV)

CMMi-DEV (CMMI, 2006) provides a comprehensive integrated solution for development and maintenance activities applied to products and services. This model forms part of a set of models whose objective is to cover the necessities of specific areas. CMMi-DEV follows the structure CMMi Model Foundation, which defines, among others, the following elements: objectives, roles, measurements, and verifications. Taking into account these elements, it is possible to analyze human capital performance evaluation from the perspective of this model.

The elements of CMMi-DEV used for the analysis are the practices, both generic and specific, based on which and using the checklist, the following results are obtained (Table 4):

Examining the results obtained, it can be concluded that CMMi-DEV covers the entire performance appraisal process. It should be mentioned that the coverage of the practices at individual and joint level is low, given that CMMi-DEV does not include practices exclusively dedicated to evaluate performance at these two levels. To realize the analysis, the researchers considered the characterization of CMMi-DEV as focused on the development of projects; this has led to the conclusion that evaluation performance practices for groups are considered for projects in this model, and individual employees for suppliers.

4.4. Capability Maturity Model Integration for Acquisition (CMMi-ACQ)

CMMi-ACQ (CMMI, 2007) is a maturity model evolution of CMMi-DEV model focused on the acquisition process of acquirer organizations. This model follows the structure of the CMMi Model Foundation, making it possible to utilize

Table 4. CMMi-DEV personnel assessment coverage

its elements to analyze the evaluation of the performance of human capital from the perspective of this model.

The elements of CMMi-ACQ used for the analysis are the practices, both generic and specific, based on which, and using the checklist, the following results are obtained (Table 5):

Examining the results obtained, it can be concluded that CMMi-ACQ does not completely cover the human capital evaluation process. The model does not cover the evaluation of performance at joint level, and its coverage at individual level is scarce. The conclusion in this case is that this model exclusively covers evaluation of performance for the group framework; teams, projects, services. To realize the analysis, the characterization of CMMi-ACQ has been considered focused on the acquisition of projects; this has been translated into the conclusion that only performance evaluation practices for groups are considered in this model, as well as for work teams, projects and services.

4.5. Capability Maturity Model Integration for Services (CMMi-SVC)

CMMi-SVC is a maturity model which covers the activities necessary to manage, establish and deliver services (CMMI, 2009). Similarly to CMMi-ACQ, it is a model based on CMMi to adapt itself to the requirements of organizations which provide services. Given that its structure is based on the CMMi Model Foundation, it is possible to analyze performance evaluation of human assets in this model in the same way as in the two previous models. CMMi-ACQ contains elements in common with CMMi-DEV and CMMi-ACQ, and adds objectives and practices specific to the provision of services.

The elements of CMMi-SVC used for the analysis are practices, both generic and specific, based on which and using the checklist, the following results are obtained (Table 6):

Taking into account the results obtained, it can be concluded that the CMMi-SVC model covers the entire human capital performance evaluation process. The model lightly covers the evaluation of performance at joint and individual level. Therefore, the conclusion is that the model covers performance evaluation for the group model; teams, projects, and services. To realize this analysis, the characterization of CMMi-SVC has been as being centered on service provision projects; thus performance evaluation from a group perspective is considered for this model, as well as work teams, projects and services, and units for suppliers. To finalize, Figure 1 includes a graphical vision of the coverage of the elements of Personnel performance assessment in the models analyzed.

Table 6. CMMi-SVC personnel assessment coverage

Activity (ID)	Related Elements	Covered (Yes/No)
EST1	GP 2.3, 2.4, 4.1;	Y (Low coverage)
EST2	MA: SP 1.1, 1.2;	Y (Low coverage)
EST3	SSD: SP 2.2	Y
MED1	SAM: SP 1.3 (Supplier)	Y (Low coverage)
MED2	IPM: SP 1.4; QPM: SP 1.1, 2.1 (Project);	Y (Low coverage)
MED3	IPM: SP1.6 (Team);	Y
MED4	CAM: SP 1.2; SD: SP 1.2 (Service)	Y
EVA1	GP 2.8, 4.2;	Y (Low coverage)
EVA2	MA: SP 2.1;	Y

Figure 1. Results of the analysis
5. CONCLUSION AND FUTURE WORK

This paper presents a study carried out with the aim of finding out the coverage of diverse models related to IT management with respect of personnel performance. Results show dissimilarities with regard to coverage of the global process. COBIT is the only model that covers the entire evaluation process exhaustively, while the CMMi-ACQ and CMMi-DEV models cover personnel performance, but presents weaknesses with regard to individual and joint levels, and lastly, ITIL does not cover the process satisfactorily. However, results, in spite of the overall differences, present certain similarities. Thus, all models cover the establishment of measures for individuals (EST1), the storage of the performance measures (MED4) and the evaluation of performance at group level (EVA2). Regarding the differences, not all of the models cover the establishment of measures for units (EST2) and groups (EST3), some lack elements for the measurement of performance in the three categories (MED1, MED2, MED3) and only COBIT covers the evaluation of performance at individual level (EVA1).

As future research lines, three different study areas are proposed. In the first place, it is proposed to extend the work to other models which are considered of relevant application in the

ICT field, and in particular, applicable to Chief Information Officer, such as COSO, for the case of risk management, PMBoK and PRINCE2 in project management and ISO 20000, eTOM and BPM for IT services, operations and infrastructure. In the second place, a study is proposed which covers the personnel competencies cycle in the context of evaluation, focusing on fields such as compensation and the management of competencies for the alignment of the performance and job position. Lastly, and as principal future research line, the development of a standard which includes recommendations for the integrated inclusion of management measures in the context of management tools for ICT is proposed.

Chapter 21
Investigating Temporal Structure Usage in Individual Time Management Practices:
Two In-Depth Field Interviews

Dezhi Wu
Southern Utah University, USA

INTRODUCTION

Researchers in management and organizational behavior have shown that temporal rhythms and norms exist and that they collectively impact multiple aspects of an organization. They have also shown that individual productivity is hampered if temporal cycles clash. This suggests that individual time management is related to the temporal structures that govern and constrain an individual's life. At its simplest form, individuals use external records to capture explicit temporal structures that allow them to view this constraint. This external record then allows individuals to view the relationships between the temporal structures affecting their lives and the relation-

ships between the different temporal structures. Thus, knowing these relationships can help an individual build a personal schedule in a calendar tool that optimizes his or her use of time while still abiding by the temporal structures that cannot be controlled. It is expected that people who are very busy or very interested in personal advancement want to optimize their time usage and, therefore, spend time learning about the myriad of temporal structures that affect their lives so that they can best control them. It follows that people who are effective time managers are likely to use and understand temporal structures in a more sophisticated fashion than people who are not. This research investigates this possibility through two sets of intensive field interviews with a group of academic professionals at a U.S. public research university. The focus of this work is on investigating types

of temporal structures being used in individual time management with calendar tools.

The chapter has this focus because its underlying motivation is that of developing new information technology to support better personal time management. In particular, this research is designed to provide evidence that offering the support of additional temporal structure features in electronic time management or calendar tools will help users be better time managers. It recognizes that being an effective time manager also involves personal commitment. This research seeks to find evidence that additional temporal structure management tools will help such a person better achieve this goal. Therefore, it mainly focuses on collecting temporal structure requirements at the task analysis stage in the systems analysis and design process through intensive user studies.

This research examines (1) how the temporal structures discussed in the literature review are used in personal time management, (2) what types of temporal structures are being used in individual time management practices, (3) what kind of support the current time management tools provide for capturing and managing the temporal structures, and (4) what design implications can be drawn from human studies for the inclusion of multiple types of temporal structures in electronic time management or calendar tools. In the field study, twenty busy professionals from a U.S. public research university were interviewed about their time management strategies and time management tool usage.

LITERATURE REVIEW

Temporal structure has long been regarded as a complicated instrument of activating and structuring asynchronous differentiation to achieve organizational goals. Temporal structure is defined as patterned organization of time used by humans to help them manage, comprehend or coordinate their use of time (Wu et al., 2005). It is a primary

concept in organization behavior and organization change (Bluedorn & Danhardt, 1988; Clark, 1985; Orlikowski and Yates, 2002). In particular, considerable management interest has been observed in today's organizations, which are facing globalization, technological innovation challenges and uncertainty pressures. As Jones et al. (2008) mentioned, "*Specifically, attention has focused on accelerations in the pace of organizational activity (e.g., speeding up of information transfer and processing); reductions in cycle times (e.g., decreasing 'wait times' in business processes); shifts in when and where work is performed (e.g., distributing working geographically); changes in significance of deadlines (e.g., generating expectations of immediate response); and intensification of work experience (e.g., increasing the availability and accessibility of people, products, and services) (e.g., Cusumano and Yoffe, 1998; Fine, 1998; Gleick, 1999; Green, 2002; Hongladarom, 2002; Whipp, Adam, and Sabelis, 2002; Yeh et al., 2000)*" (p. 2). These changes have altered a number of aspects and dimensions of temporality in organizations. For example, more tensions are created with established work processes (Sawyer and Southwick, 2002; Scott and Wagner, 2003). As the main actors in organizations, individual professionals, who are responsible for responding to and implementing these temporality changes, constantly face more time pressures to meet their hectic and ever-changing deadlines. In other words, people are restricted by their external temporal structures. Orlikowski and Yates (2002, p. 686) proposed that "*people in organizations experience time through the shared temporal structures they enact recurrently in their everyday practices*." In theory, the temporal structures provide a foundation that human beings use to construct the regularity of their society and reduce the uncertainty of human perception of time. In practice, "*a challenge individuals and organizations face is reconciling these different temporal structures to make it possible to work and take part in non-work activities*" (Saunders and Kim,

2007, p. iv). In their personal time management practices, professionals need to understand and manage their various temporal structures to maintain and enhance the competitive advantages of their organizations.

Two key temporal structure categorizations in prior research provide a theoretical foundation for us to further investigate how users capture and utilize their internal and external temporal information and construct their own time management practices, which inherently involve many temporal structure management activities. One such categorization proposes that temporal structures are composed of three components: (1) *explicit* schedules, sequencing patterns, and deadlines, which are typically encoded in personal calendars; (2) *implicit* rhythms and cycles of behavior, which are understood time patterns that are never explicitly stated or written but which are learned and understood by a population of individuals; and (3) *socio-temporal,* which include organizational cultural norms about time (Blount and Janicik, 2001). Orlikowski and Yates (2002) categorize temporal structures into *clock-based*, *event-based* and *practice-based* time. *Clock-based* temporal structures are geared to calendars and clocks, such as schedules for meetings and classes. *Event-based* temporal structures are events that have a specific time and place associated with them but also have an overall structure of time usage around the event. For example, a couple planning a wedding may set a wedding date, but then have to schedule multiple activities preceding this date. The date can be moved around in time, thereby moving all of the other associated activities in time. *Practice-based* temporal structures are a combination of clock- and event-based temporal structures (e.g., scheduling summer vacations when children are free of school obligations). This research utilizes these two studies as a base to analyze the qualitative data in later data analysis section.

Other researchers have provided insight on temporal dimensions of different activities in organizations. Zerubavel (1981) differentiated temporal activities based upon their sequential structure, duration, temporal location and the rate of recurrence. Bluedorn (2002) characterized activities to be either monochronic or polychronic, meaning that multiple activities are carried out one at a time or undertaken simultaneously. Schriber and Gutek (1987) utilized deadlines, punctuality, autonomy, reutilization, and future orientation to characterize temporal norms in organizations. Jones et al. (2008) recently reported significant temporal structure changes in the traditional newspaper industry because of the use of ICT technologies. The work shift for the newspaper professionals has been changed from a once-a-day collective deadline to continuous deadlines, regular updating and almost instant publication. Online news is regarded as a consequence acceleration in the pace and immediacy of temporal structuring. This change reflects what Castell (1996) called "*timeless time,*" which is now changing people's expectations on work pace, duration, timetable, deadline and sequence. The immediacy, intensity, and impermanence of "*timeless time*" in contemporary forms of work activities challenges the established expectations, meanings, and norms of the temporal organization of work.

For individuals in a workplace, work time is created by the organization members who establish and regulate the temporal structures. Individuals experience different regular deadlines, engage in routine activities, and take seasonal vacations. However, it seems still a mystery that how individual professionals respond to these temporal demands and constraints set up by their organizations. This research takes the definitions of temporal structures and relates them to individual time management practices. This research is to ascertain the evidence for what types of temporal structures are being captured and utilized to guide individual time managers, and determine what design implications can be made to provide more intensive features of temporal structure management for enhancing current electronic time management tools, such as electronic calendars.

RESEARCH APPROACH

This section presents the main research approach—two sets of in-depth semi-structured interviews conducted with twenty professionals in a U.S. public research university. Data was collected on each individual's time management strategies and the types of temporal structures they experienced and used.

Participants

It is argued that a university is an appropriate source of information for this research because a university has a collection of conflicting temporal patterns. It is a complex environment with multiple departments setting their own temporal structures (e.g., department meetings and seminars take place in addition to a seasonal cyclic structure that is imposed on the university by term start and end times and U.S. designated holidays). Compared to other types of organizations, an academic environment is supposed to provide a more structured setting because of class schedules, graduation ceremonies, research paper deadlines, etc. This research population choice should provide a rich and detailed collection of temporal management requirements.

Twenty professionals were recruited via email and/or personal contact. All were considered active and extremely busy employees (See their weekly work hours' distribution in Table 1 below). Their roles ranged from receptionist to organization president and spanned a diverse set of occupations. The interview focused on individual time management strategies (those involving weekly, monthly and yearly scheduling).

Procedure

Interviews lasted from twenty minutes to two hours. The major focus was on general time management strategies and types of time management tools people used. In particular, we investigated

Table 1. Interviewees' weekly working hours

Percentage of the Interviewees	Number of Working Hours/Week
5%	40
15%	40-50
25%	50-60
20%	60-70
35%	>70

all types of temporal structures that people are experiencing and using. We also investigated utilization, perceived effectiveness and satisfaction with various time management tools. During the interviews, individuals' daily and weekly schedules were also examined through a retrospective procedure.

With the consent of each participant, all interviews were audio recorded. All individual information was kept confidential. Each participant was assigned a subject code and names were removed from interview transcripts.

The first set of interviews focused on short-term time management strategies (those involving the current day's scheduling and temporal coordination activities). The second set of interviews focused on long-term time management strategies (those involving weekly, monthly and yearly scheduling and long-term time management plans). At no time in the interviews were temporal structures or norms mentioned. When the short-term time management interviews were conducted, each interviewee showed the interviewer the schedules recorded in their electronic calendar tools (e.g. Outlook, PDA etc.). Using the interviewee's personal schedules, they were asked to explain how and why they scheduled and allocated time on specific meetings, events or other items found in their calendars or scheduled in their life for the coming week. Each interviewee was interviewed somewhat differently because of their different personal daily schedules (Note: a

complete interview guide is attached in Appendix B in this book).

Because individual interviewees worked on various schedules for their daily work, the following interview questions were used as a guide to gather their short-term time management strategies:

1. What are the most time wasters in your daily work?
2. Does this daily work mirror most of your ordinary life?
3. Can you please tell me how you get rid of these time wastes?
4. When do you feel losing control for your time management? If yes, please indicate some situation.
5. After viewing your time management planned and completed tasks, are you going to change your time management strategies? How?

Individuals were asked about long-term time management strategies in the second set of interviews which took place a month later. The interview questions used to gather information on long-term time management strategies are as follows:

1. When you have too many things to do, what kind of time management strategies do you use to get your work done on time?
2. When you have important deadlines, how do you usually handle your family demands?
3. When you have many unproductive meetings, how do you deal with more important work?
4. Do you feel you lose control of your time management? If yes, why? If no, why not?
5. Do you usually participate in social events when you are too busy? If yes, why? If no, why not?

FINDINGS FROM THE INTERVIEWS

The purpose of the interviews was to determine the types of temporal structures (explicit vs. implicit) used by organizations and individuals. *Explicit* temporal structures were further broken down to *clock-based* and *event-based* temporal structures. *Implicit* temporal structures were subcategorized to *practice-based* temporal structures and *social temporal norms*. This information was then used to develop an instrument for measuring the temporal structures in use in the organization studied, how the temporal structures are being used and what effect their use has on time management.

Types of Calendar Tools Being Used

Among the twenty professionals interviewed, five people still kept traditional paper-based calendars for managing their time, but they planned to switch to electronic calendars. The majority of the interviewees were using some form of electronic calendars or a combination of desktop and mobile time management tools to organize their time (see Table 2). In terms of their perception of satisfaction with and effectiveness of their time management tool, the electronic forms obtained a much higher rate (approximately 4.5 on a 1 to 5 scale with 5 being the best), than the traditional paper-based tools (about 3 on the same scale), simply because of the lack of ability to further edit, visualize, duplicate and share features available in the paper-based tools.

In addition, about half of the interviewees were using a mix of different time management tools. Many users complained about inadequate integration between the tools; the current electronic calendar tools only met part of their time management needs, and no proper integration was available for them to customize their time tasks using a single electronic tool. For example, a key advantage for having a mobile tool was the ability to access calendar information anytime and anywhere. In the meantime, desktop time management

Table 2. Calendar tool distribution

Type of Time Management Tools	Number of Users

PDA + White Board	1
Total	20

tools were also used because the larger screen allowed users to see more of their schedule and make strategic decisions that involved multiple weeks or months of time scheduling. The interviewees mentioned that they can synchronize their mobile devices with their desktop calendar tools. Upper administrators often have secretaries or office managers to support their scheduling. They complained that inadequate synchronization and calendar updates done by other people often messed up their scheduling.

Almost all interviewees commented that their time management tools lacked support for developing time management strategies and for assessing their time management efficiency. At the current stage, people often used their own mental notes to help them to assess their time management quality, as most of their tools only serve as a recording device to remind them of meetings, appointments, project tasks and so on. Another example of a mixed tool used by a senior administrator was the Yahoo! online calendar, which she intentionally set as public in order to manage her department. Her online public calendar served as a major communication tool to show her availability if somebody planned to make an appointment with her. This publicly shared calendar saved her a lot of time when negotiating meeting time slots with others. She also used her PDA very often, especially during her commuting time, which normally was at least 3 hours on the train. Her PDA kept her informed and sent her reminders while she was on the train. Because of her extensive use of her PDA and her online calendar, she was very satisfied with her calendar tools for managing her time.

Overall, four basic needs of time management tools were uncovered. They are: (1) portability; (2) ability to gain an overview; (3) ability to better coordinate between multiple tools; and (4) collaborative scheduling. More detailed calendar tool findings were reported in Wu and Tremaine (2004)'s AMCIS paper.

Types of Temporal Structures Uncovered

Our interviews found that all of our time management respondents were using multiple temporal structures. Some of them used more than one calendar for managing their different temporal structures, such as one interviewee who kept her husband's schedule (which was private information) on her PDA. Because of this, she was unable to synchronize her PDA schedule with her publicly displayed calendar. Other respondents re-typed university schedule times in their personal calendars. Still others annotated (but did not indicate time usage) their calendar with key temporal events generated by external entities (e.g., parking restrictions for parents' day). All respondents reported difficulty in maintaining multiple temporal structures. Some, especially new employees, reported difficulties with knowing the university's temporal rhythms.

In order to further analyze our interview data, a coding scheme (see Table 3) was designed according to the literature. The temporal structures are first classified based on whether they are

explicit (published and made known by some administrative aspect of the university) or *implicit* (understood as a norm that was followed by a university but not published or officially stated anywhere). They are then further broken down to *clock-based*, *event-based*, *practice-based* temporal structures or *a socio-temporal norm* (culturally understood time usage). Table 4 indicates some examples for each temporal structure category, and Table 5 shows the frequency analysis for different types of temporal structures among the total 475 temporal structure coding units uncovered from both long-term and short-term time management interview transcripts.

The completed interview transcripts for both long-term and short-term time management interviews contain over 250,000 words. These transcripts were reviewed and broken down to many small coding units, among which 475 temporal structure-related coding units were uncovered. Furthermore, these 475 temporal structure units were reorganized to a spreadsheet for further frequency analyses. We found that the majority of temporal structures were coded as "*explicit clock-based*" (total 272 units), the second largest temporal structure coding units belonged to the "*implicit practice-based*" category (total 141 units), and the two categories were "*explicit event-*

based" temporal structures (total 40 units) and "*socio-temporal norms*" (total 22 units). Figure 1 above shows the percentage distribution for the temporal structure categories. The *explicit clock-based* temporal structure usage is almost 60% among the temporal structures being used in personal time management practices. About 30% belong to *implicit practice-based* temporal structures.

FINDINGS FROM THE USER STUDIES

The large majority of the temporal structures that we found in use were *explicit clock-based*. Most of our respondents were using some form of electronic calendar system to maintain their schedules. Explicit clock-based and explicit event-based structures were often listed in the calendars while implicit structures and practices were used to guide the allocation of time in the schedule but were maintained in the time manager's head. Complaints about schedule juggling arose when cyclic university events were not synchronized with external cyclic events (e.g., due dates for grades conflicting with grant and conference paper

Table 3. Personal use of temporal structures coding scheme

Type of Temporal Structure	Coding Instructions
Explicit	The temporal structure is externally coded, and rules can be precisely written to describe its behavior in an external time structure.
Clock-based	The temporal structure uses the framework of minutes, hours, days, weeks and months for representing its structure (e.g., staff meetings are every Monday at 9 a.m.)
Event-based	The temporal structure is organized around an event using sub-events that take place in a time structure governed by the main event (e.g., a bridal shower happens a month before the wedding).
Implicit	The temporal structure is internally known by one or more people. It may be involved with cultural behavior (e.g., how much time is allowed before someone is considered seriously late).
Practice-based	The temporal structure is a result of an established practice that people implicitly know (e.g., parents coordinate kids' activities).
Socio-temporal Norm	The temporal structure is a result of a socially established and expressed rule for using time. It often involves cultural practices or social behaviors (e.g. the acceptable amount of time one can be late for an event).

Table 4. Temporal structure examples captured from the interview data

Type of Temporal Structure	Examples from the Interview
Explicit	
Clock-based	***Example 1:*** *If I have meetings, at one o'clock … if I have a meeting at two o'clock, and I just allocate time based on the schedule.* ***Example 2:*** *But usually I meet my doctoral students once every week or once every other week.* ***Example 3:*** *I won't get an article published if I missed my editor's deadlines.*
Event-based	***Example 1:*** *There's no time for social event, but secondly, there is no compatibility.* ***Example 2:*** *On the weekends, if I have a family related event, such as birthday, or some other celebration, that takes priority.* ***Example 3:*** *There is a graduate student seminar day. We have that and that's a major activity.*
Implicit	
Practice-based	***Example 1:*** *(If I have important deadlines) I work more hours, so family demands are pushed aside for a while.* ***Example 2:*** *I try to move through my mundane or repetitive tasks quickly. I try to delegate some of that to help, and that frees up some time to do some of the research. Other times I am working…* ***Example 3:*** *Everyday, my responsibilities are to get them (my daughters) both out of bed, get them dressed, get them breakfast, get their teeth brushed, and get them ready for school…That is my responsibility.*
Socio-temporal Norm	***Example 1:*** *Now I know people are higher than me and lower than me. They expect me to be always connected, at all times.* ***Example 2:*** *I hope I can get through my Ph. D in four years. I have about half the courses, and so it's the rest of the courses and the dissertation and the research that goes with it. I think it will take about four years.* ***Example 3:*** *My boss could call me, and I need to respond to him, which will set you back in your schedule.*

Table 5. Frequency analysis of different temporal structures uncovered in the interview transcripts

Type of Temporal Structure	No. of Total Coding Units	Percentage
Explicit		
Clock-based	272	57.26%
Event-based	40	8.43%
Total Explicit TS coding units	312	65.69%
Implicit		
Practice-based	141	29.68%
Socio-Temporal Norm	22	4.63%
Total Implicit TS coding Units	163	34.31%
Total Explicit and Implicit TS Coding Units	475	100%

deadlines) and when superiors imposed unplanned deadlines and meetings.

Within the set of respondents were individuals who complained less about the difficulty of managing their time and who also had more time for personal activities and additional achievements. Many of these individuals were in senior administrative roles, but some were graduate students and faculty. A number of features characterized their time management behavior. First, they were either better able to estimate the amount of time a task required, or to control the amount of time required for a task (that is, they did not work to perfection but to some level of acceptable standards on a product). Second, they created their own temporal structures to manage their life, that is, they allocated units of time for specific types of repeating activities. These better

Figure 1. Percentages of different types of temporal structure being used in personal time management practices

Distribution of Four Different Temporal Structures

Implicit Practice-based	29.68
Explicit Event-based	8.43
Socio-Temporal Norm	4.63
time managers also recorded more of the external temporal structures affecting their time usage in their electronic calendars.

In contrast, another subset of respondents, who complained about a lack of time for accomplishing anything significant, were much less likely to record and manage their time in a calendar system. Some of these individuals worked longer hours than the better time managers and were constantly scurrying to meet deadlines. They indicated that much of their work was overdue. These individuals were much less likely to create temporal structures of their own, much less likely to be aware of the external temporal structures that impacted their lives (e.g., one faculty member was always surprised by conference paper due dates.) Another set of respondents managed their time by simplifying the temporal demands on their life. They limited the number of external activities they engaged in (conferences, university committees and non-work activities) and (if work permitted) spent large units of time away from the work environment that they found to be interruptive. However, unless these individuals then created temporal structures of their own for managing this less demanding time schedule, they were relatively unproductive in contrast to the better time managers, that is, they produced less work product.

The interviews indicated that knowledge and use of existing temporal structures plus the creation of additional personal temporal structures aided personal time management. The interviews also indicated that electronic calendar tools could be given features to help users maintain multiple temporal structures and visualize their impact on time usage (thus, the proposed development of a temporal structure prototype described in the last chapter in this book as part of future research.)

Calendar Tool Design Implications

From the user studies reported in this chapter, it is evident that only limited temporal structures are supported by the current electronic calendar tools, in particular, *explicit clock-based* temporal structures, which are easily recorded and edited with clear time requirements. The explicit clock-based temporal structures could be either personal or public once these structures have clear and explicit time boundaries. For instance, when scheduling a meeting or a doctor appointment, users clearly know when, where and what are needed for scheduling such a time task with their calendar tools. These explicit temporal structures also could be public: for instance, many calendar tools now can directly incorporate holidays from

different cultures, and users can select their preferred holiday settings.

For those users who adopt multiple tools to manage their time, the main complaints are noncompatibility available among their different calendar tools or devices, as they serve different purposes, and each device has its own limitations. For instance, professionals who often manage several projects often need to rely on additional project management tools to support their daily tasks, but their calendar usage is limited to meetings, appointments or reminders. For managing different time tasks, it would be ideal to integrate the different time management tools seamlessly. Although there is no easy solution for this type of integration, it is needed to provide the flexibility to manage a variety of different temporal structures with the calendar tools. A possible design solution could be to give users options to define their explicit clock-based temporal structures based upon meeting, appointment, project or any needed category, and allow users to customize their temporal structures for managing their different time tasks. For example, the project management features could be incorporated into the current calendar tools to benefit users who constantly need to use additional tools to support their projects, which are often time critical and need to be managed carefully. Another way to integrate different types of temporal structures with calendar tools is to make all possible temporal-related resources available in the calendar tools. When managers try to schedule a group meeting, they often need to find additional meeting resources, such as available meeting rooms, meeting equipment, etc., but information about these is usually not available in their electronic calendar tools. Instead, they often have to call for help from people who are in charge of these resources. These additional meeting resources also have their own temporal structure features, which may cause the managers to postpone their meetings (e.g., the resources had been booked out in advance). Since these temporal structures are not explicit and reflect

socio-temporal norms in such a setting, it will be very valuable if these resources can be available electronically and be integrated with the organizational calendar systems where people can check the availability of different resources and make more efficient decisions how they are going to schedule and manage their meetings.

Professionals are constrained by their organizational temporal structures or norms. New employees often complain of no simple way to access all temporal resources and requirements that they need to follow at work. Sometimes even seasoned employees perceive difficulties as well. A possible design implication to resolve users' complaints is to make seamless temporal structure integration between personal and organization-wide calendar tools. Most of organization-wide temporal structures are explicit and public, such as university graduation ceremonies, public facility opening and closing times, new semester schedules, etc. This integration is somewhat doable, as most organizations require their employees to use their organizational calendar tools, which can be shared with the public or internal units or just a group of people who have collaborative projects together. In this case, the organizational calendar tools could be customized for announcing public temporal structures which apply to every employee, and the employees could also customize their temporal structures for eliminating some irrelevant temporal structures in their personal calendar interfaces. A possible design implication is that the organization-wide new temporal structures could be designed as an icon, which users could easily download from the public website and directly incorporate into their personal calendars. Customization could be an option for easy integration.

Implicit practice-based temporal structure, as the second large group of temporal structures being used, can vary dramatically based on each individual's task priorities, life styles and work environments. Often, individuals use their mental notes and try to make their implicit temporal

structures explicit to schedule them into their personal calendars. In other words, using time management tools to support this practice, implicit temporal structures have to be converted to explicit ones first. Otherwise, people would not be able to schedule something implicit. How individuals bridge this gap relies on their ways to manage their time, but what calendar tools can support translates these implicit temporal structures to explicit ones. The only difference is perhaps the transparency level for sharing this more personalized time information. In general, this type of implicit temporal structure is being used within a very small group or just for personal practices which are normally not shared with others. When designing this type of temporal structures in calendar tools, it is important to consider privacy and security issues.

Regarding the last two categories – *explicit event-based temporal structures* and *implicit socio-temporal norms* in the calendar tool design, what we could consider is making a series of events somewhat easier to control. Since the current tools do not support automatic event changes or transformations with the tools, people need to manually type in and modify the existing series of event schedules one by one, which often causes errors. It is very easy to forget to update sub-events, and each event has different temporal structures, which could be drop-down, sequential or another type. For a better event-based temporal structure design, users could possibly select the event structures first, and then have predefined event structures available to support this task. In addition, users should still have the ability to customize the event structures to fit their personal needs. When doing event updates, the calendar tools should be able to automatically update a number of event components based on the appropriate temporal structures and the nature of the scheduled event. The key of this design is to identify proper rules for each type of temporal events. This design could possibly avoid cumbersome data entry issues.

Lastly, regarding socio-temporal norms design in the calendar tool, difficulty is expected, as people first need to decode these norms and figure out how to make the implicit socio-temporal norms explicit. Social environments are hard to capture and decode, as they involve cultures, political beliefs, management styles and so on, which are very dynamic and implicit. Only seasoned personnel could possibly have some idea of how these norms work, such as one department in the researched university, where all meetings are generally scheduled on Mondays and Wednesdays. The department research seminar is scheduled on Monday, when most people are available on campus. On Wednesday, most university-wide meetings are held and the department administrators and senior faculty members are also available. It is therefore viable to meet people, get advice or do collaborative work together in these two dates. Once the norm is recognized with this group of people, it is more practical to put this norm into the calendar tools.

In summary, this chapter reported two sets of in-depth field interviews with twenty professionals. These user study results demonstrate that it is necessary to incorporate more extensive types of temporal structure features into the current electronic calendar tools, which only support very limited temporal structures, such as *explicit clock-based*. However, these user studies only identified the need to extend temporal structure features with possible design implications. It is a challenge to decode various temporal structures of which most are *implicit* and require time and effort to convert to explicit ones. Also, understanding the underlying temporal structure rules involve in-depth understanding of local cultures, which are not easily captured and decoded. It is challenging to have a holistic view of the dynamic organizational and personal temporal structures: nevertheless, there is a need indeed.

The next chapter will present a number of individual time management profiles, which indicate how users choose their electronic calendar tools, how they use them and what issues they experience.

Section 3
Tools and Technologies

This section presents an extensive coverage of various tools and technologies available in the field of Human Resources Management that practitioners and academicians alike can utilize to develop different techniques. These chapters enlighten readers about fundamental research on the many tools facilitating the burgeoning field of Human Resources Management. It is through these rigorously researched chapters that the reader is provided with countless examples of the up-and-coming tools and technologies emerging from the field of Human Resources Management. With 11 chapters, this section offers a broad treatment of some of the many tools and technologies within the Human Resources Management field.

Chapter 22

Team Dynamics in Virtual Spaces:
Challenges for Workforce Training, Human Resource Development, and Adult Development

Martha C. Yopp
University of Idaho, USA

Allen Kitchel
University of Idaho, USA

ABSTRACT

Collaboration within virtual environments is an increasingly important aspect of organizational and workplace activities. "Virtual teams" are intentional groups of highly qualified people brought together in a virtual environment in order to capitalize upon each member's unique attributes. In many instances these people represent different organizations, or branches of an organization, who work together virtually to tackle a specific problem or project. This paper examines issues that "virtual teams" encounter and identifies best practices that can positively contribute to effective and efficient teamwork within the virtual environment. The ideas and practices presented may be of value to organizational leaders, planners, human resource professionals, adult educators, and others involved in workforce training.

INTRODUCTION

The purpose of this chapter is to examine team dynamics in a virtual environment and identify ways to make them successful. Collaboration within virtual environments is an increasingly important aspect of workplace activities. It is up to organizational leaders, planners, human resource professionals, adult educators, and others involved in organizational development to identify and establish best practices that make virtual team work positive and productive.

BACKGROUND

In the best of circumstances, teambuilding occurs naturally as people work together, form alliances and establish collegial relationships. However, in reality this is often not the case and a more attentive approach is needed. Team members are prone to experience anxiety in the team forming process. They wonder how the team will work together, whether they will be liked and whether they will like the people they are working with. Teambuilding activities can help alleviate some of these feelings by consciously providing shared experience and goals (Brown, Huettner, & James-Tanny, 2007).

When building a team it is important that everyone feels included and welcome. Team members should be involved in initial planning and goal setting. Facilitators should watch for signs of social isolation, encourage participation from everyone and create an environment that promotes active engagement. Early in the process, there should be an open discussion about team expectations, policies, and practices. Both team and individual efforts should be recognized. Some best practices suggested by Brown, Huettner & James-Tanny (2007) include:

- Negotiate goals together
- Document expectations, goals, position descriptions and contact information
- Hold regular team meetings and allow time to check in with each member at the beginning of the meeting
- Provide frequent and timely feedback
- Maintain a positive, constructive attitude even when things go wrong
- Focus on strengths (Brown, et al., 2007). Group success requires members to be willing to share their efforts and accomplishments, and work to meet clearly defined goals (Odgers, 2005). It is important that team members have incentives to participate. Some benefits of being on a team

are experience, recognition, and visibility. The high-energy and motivation created through effective teamwork is contagious and leads to a special synergy whereby employees and administrators attain extraordinary results. Characteristics of effective teams include:

- The members are loyal and committed to one another and the leader.
- The members and leaders have a high degree of confidence and trust in each other.
- The group is eager to help each other develop to reach their full potential.
- The members communicate fully and frankly about everything relative to the team.
- The members feel secure and empowered to make decisions.
- The atmosphere and climate is supportive and risk free, and members put the organization first (Odgers, 2005).

Virtual teams are an important component of many corporate and educational organizations, and have evolved largely because of globalization, technology, and changing demographics (Merriam, Caffarella, & Baumgartner, 2007). Virtual teams are composed of members who are physically located in different places. They conduct most of their work through electronic technology. Team members rarely meet face-to-face and rely primarily on digital forms of communication. Effective communication that leads to a shared understanding of the teams' purpose, goals and objectives is vital for success.

For purposes of this discussion, virtual teams are defined as more than typical groups of people who work together in a virtual environment. Instead, "virtual teams" are defined as intentional groups composed of identified individuals who have special talents/skills/knowledge related to the goals of the team. Teams are brought together for a specific reason and purpose. In many instances these will be groups of people who represent dif-

ferent organizations, or branches of an organization, who work together primarily in a virtual environment to solve a common problem.

Virtual teams are intentional groups of highly qualified people who are brought together in a virtual environment in order to capitalize upon each member's unique attributes. It is rare to find teams where individuals know each other, occupy the same space, work the same hours, belong to and are paid by the same organization, have a common business culture and enjoy a history of working together. Today's teams are an alliance of talented individuals from different organizations, departments, professions, and locations. Teams are made up of people with different backgrounds, languages, cultures and education who are involved in collaborative activities in varying degrees (Thompson & Good, 2005). Shachaf and Hara (2005) write that virtual teams are groups of people who work interdependently with a shared purpose across space, time and organizational boundaries using technology. Davis and Scaffidi (2007) define a virtual team as a collection of individuals who are geographically and/or organizationally dispersed who collaborate via communication and information technologies in order to accomplish a specific goal. Nunamaker, Reinig, and Briggs describe a virtual team as consisting of "a well-defined group of individuals brought together to produce a specific deliverable…" (2009, p. 1).

The virtual aspect of teaming presents a variety of challenges that coalesce on communication and trust. Three of these addressed by Roebuck, Brock, and Moodie (2004) are:

- Lack of face-to-face interaction
- Relationship building
- Accessing and leveraging the unique knowledge and expertise of each member to achieve team goals.

Effective team building must concentrate on how team members relate to each other and how work is implemented and completed. Unfortu-

nately, but not surprising, although virtual teams are popular and widely accepted, communication researchers contend there is no substitute for face-to-face interaction (Pillis & Furumo, 2007). The lack of, or diminished aspect of non-verbal cues, facial expression, and voice inflections can decrease trust and commitment of team members who become reluctant to share ideas and concerns. This can cause mixed or misinterpreted messages which lead to conflict, splintering of unity, and less trust. Loss of trust is fatal to the effectiveness of a virtual team (Pillis & Furumo, 2007). The literature provides us with many definitions and descriptions of virtual teams, and most of them identify trust as one of the essential ingredients for success.

Parker (2007) recognized the need for virtual teams to be made up of adaptive team players who are able to communicate with different types of people, who "subordinate their functional goals to the goals of the team" (p. 3), and who are able to quickly develop trust. Building trust quickly is a challenge for which a solution may be found within the adult and human resource development and training literature.

FACILITATORS OR TEAM LEADERS

Team leaders in a virtual environment can benefit from examining the history of andragogy and guidelines for working well with adults in their quest for success in team development and effectiveness. The work of Malcolm Knowles is well known and provides insights into team development and implementation. Knowles, writing from years of experience, advocates that administrators or facilitators of adults should exhibit some of the following characteristics:

- Have a genuine respect for the capacity of adults to be self-directing
- Derive satisfaction from the accomplishments of others

- Value the experience of others as a resource for accomplishing both work and learning
- Are able and willing to take risks involved in experimenting with new ideas and new approaches
- View failures or set-backs as opportunities to be learned from
- Have a deep commitment to and skill in the involvement of people in organizations and learning processes
- Have faith in the value of education and learning for contributing to the solution of organizational and societal problems
- Are able to establish warm, empathic relationships with people
- Engage as a good listener (Knowles, 1980).

Thompson and Good (2005) address the fact that virtual teams are not always successful in using technology to engage in effective collaboration. The teams frequently get bogged down by technology issues, communication breakdowns, reliance on out-dated work methods, and the absence of strong team motivation. Thompson and Good contend that the adoption of new technology tools without the parallel development of a new culture that supports its use is unrealistic. In effect, successful virtual teams require more than internet technology to be successful. What is needed is a culture of collaboration and cooperative learning capable of developing strategies and techniques which encourage team unity and interaction. Unless members think and act with solidarity, no amount of technology will transform inefficient teams into highly effective and productive units.

In spite of expensive technology, and sometimes because of it, virtual teams are not always successful. In fact, some of the statistics used to measure success are not positive (Thompson & Good, 2005). One problem is that leaders do not readily recognize the evolving and living nature of successful teams. Many leaders treat their teams more like machines than dynamic individuals. They are inclined to control the team and its mem-

bers rather than looking at them as an evolving entity, capable of creative and innovative thinking.

Rethinking how teams should be nurtured, organized and supported is a first step toward finding effective and suitable ways of improving the productivity of virtual teams. It is important to develop team intelligence, although, superior team intelligence does not necessarily predict how successful a team will be. A distributed intelligence model uses intellectual capabilities in a collective, collaborative and cooperative fashion to support the development of team intelligence. Eventual success requires that team intelligence be supported by team members who are motivated, optimistic, share a set of beliefs and commitment, and who treat each team member as a leader (Thompson & Good, 2005).

Davis and Scaffidi (2007) discuss challenges that virtual teams must overcome. Just as with traditional teams, leaders must build group cohesion, facilitate communication and establish realistic team objectives. Davis and Scaffidi focus on member selection whereby some of the most talented employees, who have the ability, knowledge, and tenacity to enhance team performance, are recruited. They must also be experts in their field. A benefit of virtual teams is that location does not drive member selection. Team leaders choose members based on expertise not geographic proximity. In addition to expertise, interaction style is also important. Personality type impacts group productivity. Research indicated that extroverted personalities are a great addition to virtual teams but that too many extroverted individuals negatively impact productivity. Each team needs balance (David & Scaffidi, 2007).

While team members must possess superior knowledge in their field, they must also be comfortable in a virtual environment. Communication skills are a necessity, as are self-confidence, self-motivation, and self-esteem. Virtual team members must manage their schedules efficiently. They must complete tasks on time and take initiative to communicate with team members when they

are having difficulties. This communication will lead to quicker and more effective problem solving and avoid problems that are likely to affect the entire group (Davis & Scaffidi, 2007).

Creating a sense of community within a team helps to strengthen relationships and positively reinforce group performance. Research indicates that face-to-face interaction used strategically at the beginning of a relationship, as well as during key times to establish a shared vision, to overcome anxiety, and build trust is optimal in creating a sense of community. This, however, is not feasible for all virtual teams. Other practices and strategies must be explored and refined so that people may get to know each other and establish commonalities. Personalized electronic interactions are one possibility. Virtual team leaders and members must be encouraged and provided incentives to take advantage of every opportunity to build personal relationships with virtual team members (Davis & Scaffidi, 2007; Odgers, 2005; Parker, 2007).

Stronger personal relationships facilitate more productive work relationships. In order to develop a feeling of community in virtual teams, members must feel motivated and supported by their team, their leader, and the organization. Motivation is positively associated with the perception of the significance of a team member's task. Periodically and over time steps should be taken to recognize each member's contribution. If team members feel they are a vital part of the team and the organization they are more apt to stay focused and engaged. Processes must be developed to create a sense of team spirit within the group and the organization as a whole. Camaraderie within virtual teams leads to motivation, commitment, and increased productivity, and promotes a shared vision of purpose.

Shachaf and Hara (2005) present an ecological approach to team effectiveness in virtual environments. The authors state that prior studies on virtual teams use a model of input-output process based on traditional, and possibly dated, team effectiveness known as the Systems Approach (Gal-braith, 1997). Shachaf and Hara seek to capture the complexity of work groups and information technology through a framework that examines environmental aspects of teamwork (social, cultural, organizational and technological) and then they propose an ecological approach relevant to teaching and learning with virtual teams.

Shachaf & Hara (2005) contend that in traditional teams trust is important, but in virtual teams it is even more important. Team members in virtual teams have to rely on other people, share a purpose and rewards, and trust their information channels. The members in a virtual team have only their shared reliance on each other to guarantee the success of their joint work. Shachaf & Hara also highlight leadership as an important factor for team effectiveness. They report that the leadership role becomes more ambiguous in the virtual team because the leader is not the gatekeeper but rather a negotiator and facilitator. In addition, in virtual teams the leadership/facilitator role may be rotated and shared.

The ecological framework consists of three components: the external environment, the internal environment, and boundaries. In on-line collaborative settings internal environments are particularly important. Team leaders should emphasize building learning communities that foster a sense of belonging through peer-to-peer interaction.

VIRTUAL TEAMS

Parker (2007) writes that in the last decade the world in which virtual teams and team players are asked to perform has changed. Team members are located in multiple locations, and cultural differences are evident. He acknowledges that the bar has been raised for team success. Organizations now expect that teams will function at a high level. There is a greater impatience among management when they observe a breakdown in team progress.

There is recognition that team success requires a support system that draws from a variety of sources. Simply creating teams will not ensure success. There is a need for a total system that includes a supportive management style, performance management processes, reward systems, and a team-based culture. The search is on for new and creative ways of selecting leaders, and appraising and rewarding team members. It follows that the organization must adopt new methods that incentivize teams, recognize outstanding team players, and incorporate performance of a team into the overall employee appraisal process (Parker, 2007).

STRATEGIES AND TECHNIQUES

When team members are identified and asked to serve, the leader or facilitator must make them feel welcome and important. The atmosphere from the beginning should be inclusive, comfortable, safe, inviting, and empowering. Each member must feel that they have been selected to participate in this very important assignment because they have abilities and strengths that will add value to the team.

Nunamaker, Reinig, and Briggs (2009) synthesize their decade long experience with virtual teams into nine principles intended to "help designers, managers, and virtual team members … improve their effectiveness" (p. 116). The nine principles are:

- **Principle 1**: Realign reward structures for virtual teams.
- **Principle 2**: Find new ways to focus attention on task.
- **Principle 3**: Design activities that cause people to get to know each other.
- **Principle 4**: Build a virtual presence.
- **Principle 5**: Agree on standards and terminology.

- **Principle 6**: Leverage anonymity when appropriate.
- **Principle 7**: Be more explicit.
- **Principle 8**: Train teams to self-facilitate.
- **Principle 9**: Embed collaboration into everyday work (Nunamaker, Reinig, & Briggs, 2009).

Nunamaker, Reinig, and Briggs' principles provide a framework that promotes productivity and trust among team members. In global virtual teams, trust is associated with the perception of team members' "integrity, ability, and benevolence" (David & Scaffidi, 2007, p. 9). Building trust is important and incorporating trust building exercises needs to be an integral part of the initial team building process. One way or another trust must be earned through optimism and respect. Helping to build trust may transpire through the effective use of virtual introductions, photographs, autobiographical sketches, and icebreakers. To help develop unity and team spirit the teams might be given names, a logo, and a mission.

If there are three or more members of a team at a common site, one person should be identified as the facilitator and be responsible for making certain the site is set up to maximize team effectiveness. Facilitation responsibilities can be rotated so that each team member serves as the facilitator over a period of time.

The meeting area should be inviting and well suited to the technology being used. Water and possibly light snacks should be available. Every member of the team should be able to hear and be heard. If video is used, every member should be situated so they can see and be seen. The room should be comfortable with respect to heat, air conditioning, lighting, glare, noise reduction, and wiring for laptops or other equipment. A white board, projector, and host computer should be available. The internet in most cases is essential. All too often, when virtual teams come together nobody is in charge and people come and go and sit wherever they want. This is a mistake. Planners

and facilitators should take as much time and care setting up a virtual meeting as they would a face-to-face meeting. Agenda and handouts should be available, attendance should be recorded, someone should serve as recorder at each meeting, and a summary should be prepared, circulated, and discussed with the local team prior to the next virtual team meeting.

If there are only one or two members at each site, the lone member, or pair, should be provided incentives for creating a comfortable and hospitable environment. They should have adequate technology support and be encouraged to bring a beverage or light snack. Again, they should take notes which are then typed and maintained as a journal or record at least until the team project is completed and the team is disbanded. This record may be very valuable for the preparation of a final written report.

Team members at different locations are frequently in different time zones. These differences must be recognized and appreciated. If people are being asked to participate during a time that is not part of their normal workday, they should be compensated by receiving extra pay, perks, or compensatory time. If the team meeting is during the normal lunch or dinner hour, some type of catering should be provided or members should be encouraged to bring in food and beverages. Many significant returns can be achieved by paying attention to realistic creature comforts.

Team members must develop a feeling that they are connected with all of the team members – near and far. At each site, members should meet between meetings and have small group discussions about the project and their role in it. They should be a team within a larger team. They should have lunch together periodically and be encouraged to get to know each other at a personal level. They should know each other's names, job description, and a little about their career. They should also be encouraged to share something interesting or unusual about themselves that most people don't know. Members might be divided into pairs or sub-groups to investigate certain aspects of the project and bring that information back prior to the next large meeting.

In the virtual environment, every member of the total team should have a recent headshot photo. These photos, along with a brief autobiographical sketch should be shared and all members should be encouraged to use them in an effort to be able to communicate more effectively with each and every member. At every meeting, members should be asked their thoughts or opinion about something, particularly if they are not a regular contributor to the conversation. Ask them what they think -- get everyone involved. Every member should have one or more assigned responsibilities so that they share ownership in at least part of the larger endeavor. Depending upon how frequently the teams meet, they should be asked to provide an update since the last meeting. This can be personal, professional, cultural, or environmental. This type of informal sharing can build familiarity and foster trust, respect, dedication, and synergism.

Dani, Vurns, Blackhouse, & Kochhar (2006) write extensively about the implications of organizational culture and trust in the working of virtual teams. They emphasize that the working practices in industry are changing, with organizations becoming more knowledge based and focused on core competence, and that they are willing to share their unique competencies in alliances with partner organizations. These alliances are facilitated through the use of virtual networks and the use of globally based teams (Dani, et al., 2006). Team members may or may not know each other so it is important that trusting relationships develop quickly.

Virtual teams represent a new form of organization that offers unprecedented levels of flexibility and responsiveness that has the potential to revolutionize the workplace. Virtual teams cannot be implemented on faith and they do not represent a perfect solution. Peter Druker, as referenced by Dani, et al. (2005), has identified changes in organizations and potential changes likely to

emerge over the next few years. The market place is complex and uncertain, and becoming more so. Traditional organization structures and management concepts of the past are no longer viable. Organizations are placing more emphasis upon trust between collaborating individuals, groups and companies. The ability to respond to change requires high levels of agility. Organizations are utilizing improved communication technology to support the increased need for agility (Dani, et al., 2005).

APPRECIATIVE INQUIRY

Periodically, members should be asked what is working well for them. Only after being asked about what is going right, should they be asked what they would like to see improved and what are their recommendations for improvement. This line of reasoning comes from the literature on Appreciative Inquiry (AI), which focuses on what is going right and what is working well (Cooperrider, et al., 2001).

Appreciative Inquiry (AI) is about the search for the best in people, their organizations, and the world around them. It involves the discovery of what gives "life" to a living system when it is most alive, most effective, and most constructively capable in economic, ecological, and human terms (Cooperrider, et al., 2001, p. 7). AI involves asking questions that help heighten positive potential and involves the mobilization of inquiry through crafting "unconditional positive" questions. The task of intervention gives way to imagination and innovation. There is discovery, dream, and design. AI seeks to build a "constructive union among people and what they talk about as past and present achievements, assets, unexplored potentials, innovations, strengths, elevated thoughts, opportunities, high point moments, lived values, traditions, strategic competencies, stories, wisdom, insights into the organizational spirit and visions of valued and possible futures" (Cooperrider, et al., 2001,

p. 7). The positive core of organizational life is one of the greatest and largely unrecognized resources in the field of change management. The single most prolific thing a team can do if its aims are to construct a better future is to embrace the positive by appreciating the best of what is and dream what might be (Cooperrider, et al., 2001).

CULTURE

Additional challenges occur with virtual teams whose members reside in different countries, speak different languages, and are of different ages, ethnicity, and religions. Culture and language determines how an individual processes and interprets the environment around them. Cultural differences may also account for misinterpretations during communications. Distance and a lack of nonverbal cues intensify this situation. Cultural differences and cultural values can lead to cultural miscommunication (Davis & Scaffidi, 2007). This chapter does not address cultural miscommunications directly but it recognizes the potential for serious challenges and problems. It is essential that those involved in team building and team effectiveness and trust understand these differences exist and that they seek expert guidance on how to best overcome them.

BIOTEAMING

Virtual teams are a reality in the modern workplace and their success relies in part on ways to ensure that trust, unity, cohesion, and performance are cultivated and rewarded. Thompson and Good (2005) discussed a new paradigm for conceptualizing virtual, networked business teams called *The Bioteaming Manifesto*. They believe that in order to produce cooperative and highly motivated teams, adoption of new technology must be accompanied with the development of a new

culture that supports the delivery and interaction methods required by virtual teams.

A Virtual Networked Team should be recognized as a separate entity from its members. It is in itself a super-organism that needs to be nurtured in ways that enhance and support its complex and interconnected nature. The team is a whole that is more than the aggregation of the individual parts (Thompson & Good, 2005).

Bioteaming is a dynamic concept used to enhance team effectiveness. Bioteaming is about building organizational teams that operate on the basis of the natural principles which underpin nature's most successful teams. One key mission of Bioteaming is a review and analysis of scientific literature in search of the common traits of Mother Nature's most effective biological teams. Bioteaming is based on a distributed intelligence model whereby members are able to self-select when to use personal intelligence and critical thinking and when to rely on team intelligence. Team member motivation and optimism are important aspects of, and required for effective Bioteaming. These high performance teams are more successful when they share beliefs by which their behavior and attitude is determined:

- **Belief 1**: Clear and Public Accountability
- **Belief 2**: Trusted Competency
- **Belief 3**: Give and Take
- **Belief 4**: Total Transparency
- **Belief 5**: Shared Glory
- **Belief 6**: Meaningful Mission Value
- **Belief 7**: Outcome Optimism (Thompson & Good, 2005).

High performance team members come to believe that the other team members trust them to do their job without being supervised. This translates into, "I know what you have to do and am confident you can do it – how you do it is your business" (Thompson & Good, 2005, p. 15). High performance team members believe they can ask for help and that, with moderation, asking for help increases their standing within the team. Members expect to be kept informed in an honest and timely manner of any important issues in the project. Team members believe they should be free to express opinions about situations they are not directly responsible for and that these opinions should be highly respected and listened to.

Team members believe they are all in it together and that glory and pain will be shared. They do not believe that the leader will take an unfair portion of the credit for a success or all the blame for a failure. Each team member is equally accountable to the leader and fellow team members. The team members believe that the group's mission is significant, important and meaningful. They believe that if they are successful they will have made a fundamental contribution to their organization. This is not just about business as usual. The task must not seem trivial or unnecessary (Thompson & Good, 2005).

Team members also feel that they are the best people in the organization to succeed in accomplishing the identified task. The members are confident they will succeed in delivering a positive outcome for the project. The teams work better if they develop a deeply shared set of beliefs and a commitment by members to put in the necessary amount of work for the project to succeed. If the team feels trusted, it acquires self-confidence and adopts a meaningful, positive and responsible attitude toward successful completion of the mission (Thompson & Good, 2005).

Bioteaming works as the implementation process for leaders who want to make their virtual business teams more productive. Four action zones have been identified which generate repeating patterns common to all living things. These include:

- Leadership zone
- Connectivity zone
- Execution zone
- Organization zone

In the Leadership Zone every team member is treated as a leader. The rule is to stop controlling and to communicate information not orders. Team members are trained to judge for themselves what they should do in the best interest of the team. Team members achieve accountability through transparency not control.

In the Connectivity Zone team member are synergistically connected with other team members, partners, and networks. Information flows freely. Team members are selected carefully but once they have committed to them they treat them with full transparency and trust. Symbiosis is achieved. Team members cluster and pay attention to the collective networks and relationships of each team member. They are truly a team and not just a group of individuals.

In the Execution Zone team members experiment, cooperate and learn. For a team to be effective it is critical to count on the ability of the team to guarantee a pre-defined set of key tasks in a reliable and systematic fashion. Members take a proactive and responsible interest in anything which might affect the ultimate success of their project whether it is within their defined role or not. Win-win is an outcome not a strategy. Traditional teams believe that analysis is the best way to get things right. These bioteams believe that live controlled experimentation is the best way to get things right. In this environment teams quickly experiment with multiple alternative courses of action to find out what works best. After they have collected sufficient data they build on and methodically apply the most promising results.

In the Organization Zone teams define their goals and roles in terms of the transformations they intend to make in the people and partners they engage with. In a bioteam environment members select the other members and recognize that the team will change and emerge over time. They keep looking for new and useful team members through the team life span. They tend to seek out part-time members as advisors, experts and allies who can help them just in time as necessary.

Members are aware that growth cannot always be managed or controlled. The leaders and members treat their own team like a living thing and watch for and facilitate natural opportunities for growth (Thompson & Good, 2005).

TECHNOLOGY

Many technological tools and resources exist to support the interaction of virtual team members. The chosen applications and technology hardware should depend upon what works best to achieve the team goals and objectives. Uniformly, a digital network is required with appropriate bandwidth and security features. Newer forms of communication tools rely upon computer networks and digital tools, and provide virtual teams powerful forms of interaction. These include innovative technologies such as those used to facilitate interaction between individuals in 3-D virtual worlds, to more common but important means of communication such as the use of email. Within this spectrum lie a plethora of other tools, examples include instant messaging, webinars, shared whiteboards, chat rooms, asynchronous discussion boards, wikis, meeting software, video streaming and web pages. Not mentioning other forms of communication tools available to virtual teams would be remiss. Some of these non-computer based media include interactive video or video conferencing and the use of the telephone bridges. Variety helps keep people interested and engaged, thus consideration should be given to using more than a single communication tool.

Effective engagement in 3-D virtual worlds requires computers with good graphics ability and high-speed internet access. It also requires participants to learn how to navigate and interact within the virtual world which may require more training than other forms of communication. Although, because virtual teams meet regularly and intensively, the benefits of engaging in a virtual world may far exceed the additional investment

needed in training. At the other end of the technological sophistication spectrum are telephone bridges, which are relatively inexpensive but do not work well with more than seven or eight people. A webinar combines attributes of a telephone conference call with online digital content and is effective in certain situations. Meeting software, instant messaging and chat rooms allow people using individual video cameras and microphones to see and talk with each other one-on-one or in small groups. Organizations are using Blackboard, social networking sites, and internal blogs to share information. Video can be produced at one or more locations and distributed on demand through collaborative websites or email.

While email may not be the most effective way to facilitate virtual team relationships, it remains a useful tool. Daily or weekly updates sent regularly to all virtual team members contain pertinent business information to keep them updated and connected to each other and the project. To promote personal relationship building, at the end of the update the facilitator and the team members are encouraged to write something that happened to them personally during the week. These personal stories help to develop collegiality and trust within the team (Davis & Scaffidi, 2007).

When working with video conferencing technologies from multiple locations, teams must plan ahead and work smarter rather than harder. At each location there needs to be a facilitator, or at least facilitator guidelines. People should position themselves around the room in such a manner that ensures the greatest likelihood that they can be seen and heard at the remote sites. In many cases one microphone may not be sufficient for the audio needs of the meeting, work with the IT people to obtain sufficient types and quantities of microphones. Have a podium or location, where the camera and the microphone are well situated to capture the speaker. When people are giving a report or discussing important issues they should move to that location so that team members everywhere can see and hear them

clearly. It is important that people are able to be seen, distinguished from each other, and heard at remote sites. In video conferences, every member should be expected to be an active participant. This participation requires that they come to the meeting prepared to engage and contribute in some way. The meeting facilitator, as well as team members, should engage with other members and ask for their opinion frequently if they do not volunteer information.

VIRTUAL WORLDS

Virtual worlds are difficult to define in narrow terms (Wilson, 2009). A range of names have been used for them that include virtual social worlds, massively multiplayer online role-playing games, multiplayer online games and 3-D Internet (Krell, 2007). The variance in names indicates the wide array of applications that virtual worlds offer. Virtual worlds are three-dimensional spaces in which users interact with each other through an avatar. Avatars in these spaces are three-dimensional (3-D) representations of the user. They are user created and may appear in any variety of forms, including a realistic human representation, a fanciful embellishment of the human form, or a completely imaginary creation. The three-dimensional environment in which they interact may be fixed, or be open-ended and generated and manipulated by the user.

There are key words that are associated with virtual worlds. They include Business ready, On the radar, and Upcoming. Wilson (2009) identified a number of virtual worlds that are business ready, meaning they are established and organizations are using their services. These business ready virtual worlds include: Active Worlds, OLIVE, Protosphere, Qwaq Forums, Second Life, Web Alive and others (Wilson, 2009). Substantial investment into companies involved with providing virtual world platforms and services is occurring, for example, in the fourth quarter of 2007 more

than $425 million was invested into virtual world companies in the United States alone (Tampone, 2008).

Corporations around the world recognize the value of teams working within virtual worlds to hold meetings, conduct training, or build prototypes or simulations in a safe learning environment. Although a variety of virtual world platforms exist, for purposes of this discussion we are going to concentrate on one, that being Second Life. Second Life is not without its critics, but "for inexpensive, non-critical applications Second Life is far ahead of the pack" (Wilson, 2009, p. 13). Despite any flaws, both business and educational organizations use Second Life for meetings, trainings, simulations, conferences and exhibitions. Recommendations from Wilson (2009) are that businesses and educators use second life to get a feel for virtual worlds. He recommends using the platform quietly and privately at first and to be aware of text-chat logging and other security concerns.

SECOND LIFE

Second Life is a virtual world developed by Linden Lab in 2003 that is accessible via the Internet. A free program called the Second Life Viewer enables users, called Residents, to interact with each other through avatars. Residents can explore, meet other residents, socialize, participate in individual and group activities, and create and trade virtual property and services with one another, or travel throughout the world, which residents call a grid. Second Life provides an open-ended environment that can be manipulated and customized and is available for users over age 18. A three dimensional modeling tool is built into the software which allows residents to build virtual objects (Wikipedia, 2009).

In 1999 Linden Lab's founder, Philip Rosedale, developed software that enabled computer users to be fully immersed in a 360-degree virtual world experience. By September, 2008 more than 15 million users had established accounts and Second Life was honored at the 59th Annual Technology & Engineering Emmy Awards for advancing the development of online sites with user-generated content. Second life can take you to a place and event you would otherwise not be able to attend, and put you in contact with people you otherwise would not have any contact with.

There is no charge to create a Second Life account or for making use of the world for any period of time. A premium membership of about $10 per month facilitates access to an increased level of technical support. Avatars may take any form including being made to resemble the person they represent. A single Resident account may have only one avatar at a time, although the appearance of the avatar can change. Avatars can communicate via local chat or global instant messaging. Second Life has an internal currency, the Linden dollar, which can be used to buy, sell, rent or trade land or goods and services with other users. Because of Second Life's rapid growth rate, it has suffered from difficulties related to system instability. Second Life is used as a platform for education by many institutions such as colleges, universities, libraries, and government agencies.

Second Life encourages engagement between users and provides exciting new means for conducting meetings and conferences, conducting focus groups, executing customer research and recruiting, as well as fostering interactive engagement among colleagues and target audiences in an immersive 3-D environment that includes voice, text, video, and other collaborative tools (Second Life Grid, 2009).

With Second Life individuals can publicly communicate with each other in text or 3-D spatial voice chat while private conversations can be held among designated groups or with one-on-one texts and voice channels. It allows keynote speakers to address an entire group while subgroups can maintain communication and share thoughts, ideas and reactions. The platform supports multiple

languages and real-time translators are available. Second Life provides a safe and powerful platform for interactive learning experiences whether in a classroom setting or in a dangerous or expensive environment for experimentation. It enables people to learn new languages, rehearse presentations, try out new ideas, practice new skills and functions, and learn without risk of damage or injury.

Second Life brings a new dimension to training events, research, professional certification, and compliance. Trainees can participate in team building activities and training from locations anywhere in the world. Learning and interacting together in 3-D space creates the sense of immersion. This shared experience may improve motivation, training retention and teamwork as a result of heightened sensory engagement and the opportunity for collective activity and communication. Unlike other e-learning technologies, Second Life can bring trainees and their instructors into the same "physical" space where they feel as if they inhabit the same world at the same time. Using Second Life simulations and models avoids the expense of real world training sites.

Corporations and educational institutions of all types choose the secure Second Life Grid software platform to build online 3-D virtual worlds. Business, education, government, and nonprofits create both public and private spaces using the tools and technologies powering Second Life, the largest virtual world community. Many report better collaboration, high productivity, reduced costs, and greater innovation. The advantages include:

- Hold meetings without leaving the office using real-time 3-D collaboration
- Construct product and process simulations so participants from all over the world can test new designs and concepts
- Conduct employee training
- Offer seminars and symposia that include distant participants

- Meet with global partners at your virtual headquarters
- Receive product feedback from clients
- Engage different constituencies and raise funds
- Build community (Second Life Grid, 2009).

Although the advantages of using Second Life or other virtual world platforms are intriguing and may far outweigh any disadvantages, those venturing into this arena should be aware of the potential challenges. Some of these include the need for adequate technological equipment and support, a shift in organizational culture, a relatively steep learning curve for users, and the need for designated time to allow users to create their account and the virtual world environment in which the team will meet. One specific example of how the use of virtual worlds can consume a considerable amount of time is seen in the process of creating a user's avatar. A visit into Second Life quickly reveals people's need to represent themselves through their avatar in an attractive manner. Although visual representation is important, the "good looking" avatars typically require a fair amount of time to develop. It is true that user can simply use the default avatar, however, it should be expected that the majority of individuals will want to customize theirs in some kind of appealing manor, and that this customization is likely to consume a considerable amount of time. In some ways this is no different than dressing appropriately for a professional work environment; however, adopters should expect a larger investment of time for this endeavor than required to simply put on a business suite. If an organization adopts the use of virtual world technology, and employs systematic and efficient processes for helping its users overcome these challenges, then they may in fact turn out to be minor in comparison to the rewards.

Planning and building a virtual world can be complicated but Second Life makes the process relatively straightforward. Here is how to do it.

- Plan Well. It is important to clearly identify project objectives and goals. Understand what you want to achieve, who you want involved, and the Return on Investment you expect. You need executive support with Virtual World activities if you are to have successful in-world experiences.
- Understand the Technical Requirements. Some organizations have strict firewall policies that prevent Second Life from running on business or government computers. It may be necessary to work with the IT department to authorize Second Life into the network. As with all three-dimensional type applications, Second Life runs best on newer computers with advanced graphics cards.
- Join Second Life. Go to the join page and register. You need to choose a standard avatar, an in-world name, and provide basic contact information before you can download the Second Life viewer. The Second Life viewer is your Second Life browser.
- Learn to Work in a Virtual Space. Once you download the Second Life Viewer, you enter the Second Life environment on Orientation Island. It may look and feel unfamiliar to you. The best resource for beginners is in the Support section.
- Design Your Avatar. An avatar is a virtual representation of you. Using your basic avatar you can then change nearly every element from body size to hair color to clothing, and more.
- Find a Solution Provider. Second Life has a community of over 300 Solution Providers to help you plan, design, and build a custom environment in Second Life to suit your purposes. To find a Solution Provider search the Solution Provider Directory.

- Purchase Land. Purchase land or space where you can build your work or learning space. You buy land from the Land Store.
- Help. If you hit a snag the Second Life Knowledgebase and Second Life Wiki have a wealth of information about how to create and run a business in Second Life.

CASE STUDY

Many organizations are using virtual world technology to engage in significant interaction with others and IBM is one of the most prominent. IBM's investment in virtual worlds is significant. They have thousands of employees using several virtual world technologies on a regular basis. IBM is building green virtual data centers as well as running large internal conferences. IBM's Academy of Technology has 300 members within the organization who define the technical agenda for the company.

An example that highlights some of the benefits of the use of virtual worlds is IBM's use of Second Life to conduct a virtual conference. The challenge was to determine how to hold two, multi-day meetings, each for 150-300 IBM employees from dozens of countries, without the need for anyone to travel. The solution was to run a version of Second Life behind IBM's corporate firewall and host the events entirely virtually. Employees participated in conference activities such as keynotes, breakout sessions, poster sessions and networking opportunities.

IBM estimates they saved approximately $250,000 by holding the Virtual Worlds for Business conference virtually. Karen Keeter, a spokesperson for IBM's Digital Convergence group, reports that all the event cost participants was time and much less of it than had they traveled to a physical conference. The Annual General Meeting (AGM) ran for 3 days with 120 poster sessions, social events and over 300 registered attendees for dozens of different countries. It is

reported that engagement was high with the conference running 4 hours in the morning and 4 hours in the evening each day. The virtual conference saw over a 100% increase in attendance from prior years. People hung out in the virtual plaza and other social areas where video conference calls and networking took place.

IBM surveyed participants of the conference and asked them how the virtual conference compared to face-to-face conferences on the following four levels: content, presentation style, learning, and networking. The results were surprising and very positive towards the use of virtual worlds. The participants responded as follows: 96% said content was the same or better; 85% said presentation style was the same or better; 78% said learning was the same or better; and 62% said networking was the same or better. These results are impressive.

An Executive Summary of the IBM experience is entitled *A Fifth of the Cost, and No Jet Lag*. The report states that in late 2008 IBM held a Virtual World Conference and an Annual Meeting hosted in a secure Second Life environment with a conference space specially designed by IBM for keynotes, breakout sessions, a simulated Green Data Center, a library, and various areas for community gathering. The participants were offered pre-conference training on the basics of Second Life to make them comfortable communicating and navigating within the environment. IBM estimates the ROI for the Virtual World Conference was roughly $320,000 and the Annual Meeting cost one-fifth the cost of a real world event. Many IBM staff are reported to have been converted into virtual world advocates. They realized that virtual environments are much more than an interesting gaming environment or social networking tool. Virtual environments have the potential to change the way business is done globally and are worthy of in-depth exploration (Second Life Grid Case Studies, 2009).

CONCLUSION

New and emerging forms of technologies influence the way people interact and work within organizations. Virtual teams are enabled by technologies that allow for the sharing of text, audio, video, and workspaces within a virtual environment. It is important to choose appropriate technologies to support collaborate efforts. In some cases, the use of virtual worlds (e.g., Second Life) may be an appropriate and effective median. In other situations, it may be best to use alternative technologies that have less of a learning curve than those required in virtual worlds, or less of an organizational investment. Virtual team effectiveness and success however, rely on more than just technological tools. The achievement of these teams is dependent upon the types of processes, practices, and incentives that guide their work, that promote a sense of common goals and community, and that nourish individual and group motivation.

KEY TERMS AND DEFINITIONS

Appreciative Inquiry: Appreciative Inquiry (AI) is about the search for the best in people, organizations, and the world around us. It involves the discovery of what is taking place when an organization and its people are most alive, most effective, and the most positive about the future. AI seeks to build a constructive union among people and what they view as past and present achievements, assets, unexplored potentials, innovations,

strengths, elevated thoughts, opportunities, high point moments, and lived visions of the future.

Avatars: Avatars are three-dimensional (3-D) virtual representations of the user. They are user created and may appear in a variety of forms including a realistic human representation, a fanciful embellishment of the human form, or an imaginary creation.

Bioteaming: Bioteaming is a dynamic concept used to enhance team effectiveness. Bioteaming is about building organizational teams that operate on the basis of the natural principles which underpin nature's most successful teams.

Second Life: Second Life is a virtual world developed by Linden Lab in 2003 that is accessible via the Internet. Second Life is a free or inexpensive way for people, called residents, to interact with each other through avatars. Residents can explore, meet other residents, socialize, participate in individual and group activities, and create and trade virtual property and services with one another, or travel throughout the world, which is called a grid. Second Life provides an open-ended environment that can be manipulated and customized. Second Life encourages engagement between users and can be adapted for use with a wide variety of audiences.

Team Dynamics: The interaction among and between team members as they engage and work together toward a common objective.

Virtual Environment: A non-physical setting within which individuals interact and work. Virtual environments are typically computer based and rely upon the Internet for functionality.

Virtual Teams: Intentional groups composed of identified individuals who have special talents/skills/knowledge related to the goals of the team. Virtual teams are groups of highly qualified people brought together in a virtual environment in order to capitalize upon each member's unique attributes. Virtual teams are an important component of many corporate and educational organizations and have evolved largely because of globalization, technology, and changing demographics.

Virtual Worlds: Virtual Worlds are three-dimensional online spaces in which users interact with each other through an Avatar. Corporations around the world recognize the value of teams working within Virtual Worlds to hold meetings, conduct training, or build prototypes or simulations in a safe learning environment. A variety of virtual world platforms exist and more are being developed or improved at a rapid rate.

Chapter 23
Evaluation of Corporate Structure Based on Social Network Analysis

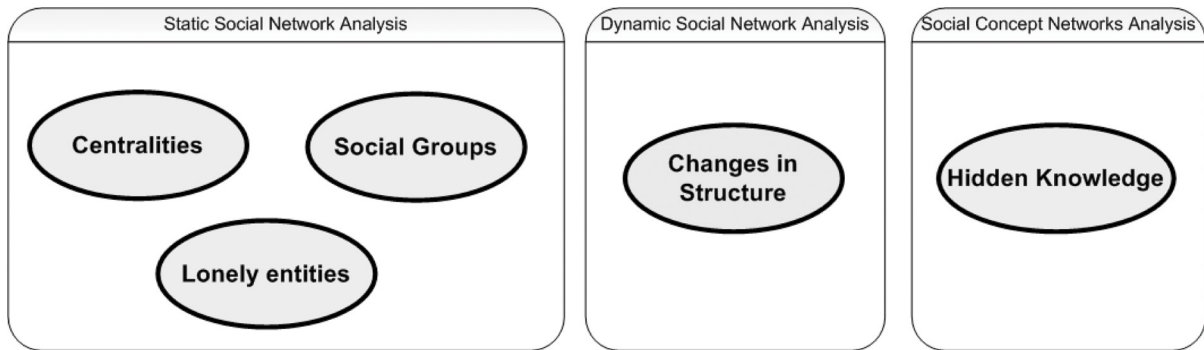
ABSTRACT

Social network analysis provides helpful reports and comparisons, which may support the corporate human resources management. Several ideas, measurements, interpretations and evaluation methods are presented and discussed in the chapter, in particular group detection, centrality degree, location analysis, process management support, dynamic analysis, and social concept networks.

INTRODUCTION

Over the past few years, corporations have evolved from sets of individual units to collaborating social beings. Recent companies are implementing various ideas to help their employees to get known and co-operate with each other and therefore improve performance of their work. Some of them are company integration events, trips and more fresh as well as less expensive intranet social websites.

Hence, people get into various relationships due to their different job activities. Based on these relationships, a typical social network describing organizational connections can be created. These social connections between employees can be extracted from the data about pure communication like email exchange, phone calls, instant messengers or teleconferences. This paper describes a general social network approach to help analyzing the knowledge flow in the organization (Musiał, 2008) and therefore supporting corporate management.

Figure 1. Social network analysis in organization


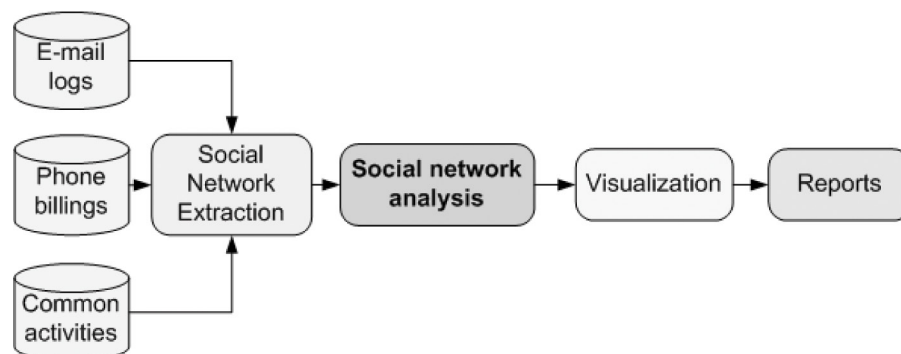
Each company or organization can be compared to a living organism (Gloor, 2004). Like in the nature, each unit is dependent on others and only altogether they really form a complete system. Nevertheless, the essential part of a human body is the nervous system which steers and supervises all other processes. The similar role plays the knowledge flow for the corporate lifecycle. Thus, analysis and optimization of communication efficiency within organization is very important. Such analysis can detect invisible anomalies and suggest some improvements in managing corporate policies, hierarchy structure and social approach to employees, which may result e.g. in achieving competitive edge, making the organization more flexible. or friendlier to its employees.

SOCIAL NETWORK APPROACH TO CORPORATE ASSESSMENT

Social Network Extraction

A corporate social network can be extracted from various IT systems utilized in the organization, in particular from internal communication like email logs, phone billings and from common activities, e.g. events, meetings, projects, etc. Some other sources for the social network extraction may be intranet community forums and physical location of workplaces, i.e. fact of sitting in the same office room.

A process of generating social network requires to determine the objects connecting people – concentrating humans activities. These can be an email message, for which two roles of users can

Figure 2. System architecture overview


be distinguished: email sender and email recipient. Some additional recipients extracted from fields 'To', 'Cc', 'Bcc' can, in turn, effect relationship strengths. A phone call object can be treated similarly with roles of caller and receiver. These two object types (email and calls) are an example of direct relationships where actors through their mutual communication directly know about their connections.

In specific cases, there may be a need to perform additional preliminary processing on social network members. For example, if most of CEO's correspondence is sent by the secretary using secretary's own email address, both the secretary and CEO may be treated as a single social entity – one network node depending on general analysis requirements. Another example is the automatic correspondence sent by different kinds of applications, which has no important meaning in social network – those entities (nodes) may be removed from further analysis, because they even do not exist in the corporate hierarchy as well.

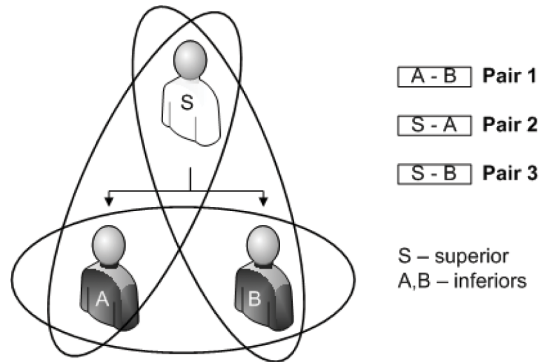
Some other objects are container type. People are connected indirectly through them by being a part of an activity and it is not certain that they communicated directly at all. These objects are common events/meetings/projects in which some employees can participate in. For example, if two employees are both the team members in the same project, they are thought to be in common social relationship. The same approach can

apply to Active Directory or ERP system group memberships, forum discussions and even office room co-workers.

Comparison with Corporate Hierarchy

In most corporate information system structures, directory services are used to reflect internal hierarchy (Carter, 2003). These directory services allow the administrator to build a hierarchy tree of organization units, departments, teams and individuals; leafs in this tree are single employees. The most common implementation of LDAP/X.500 directory services is Microsoft Active Directory (Iseminger, 2000). Assuming that information contained within directory structure is correct and up-to-date, the organizational hierarchy derived from Microsoft Active Directory can be directly used in structural comparisons, Figure 3. This comparison confronts the known and visible organizational structure (extracted e.g. from Microsoft Active Directory) against the real but invisible social relationships computed from communication and common activities (structure of the social network).

If the organization maintains no directory service (or it is outdated), there are also other options available: extracting this structure from HR system or even manual import of the corporate hierarchy from organizational documents.

Figure 3. Social network vs. corporate hierarchy
Figure 4. Extracting of pairs from the organizational hierarchy for comparison


Having both the formal structure of the organization and the structure of the social network we can estimate their equivalence. To be more accurate, we would like to know whether the positions and roles of actors in the network structure correspond to their official roles and positions. Summing up, all needed data can be divided into two groups: a) the data necessary to build the social network, b) the additional data for comparative analyses. Note that both source types can be automatically processed using data available in appropriate IT systems.

Equivalence Measurement Methods

Two main approaches to measurements of equivalence between corporate structure (hierarchy) and social network (graph): comparison by pairs or by ranks of employees.

Instead of considering the whole network, the first method focuses on comparing employees pairwise. People in a pair must be very close in the organizational hierarchy and are either in the direct relation superior-inferior (Pair 2 and 3 in Figure 4) or are at the same level and have the same direct supervisor (Pair 1 in Figure 4). Then, for both pair members, we analyze the difference between their social measures, e.g. centrality degree, clustering coefficient, etc. These measures can be compared separately or weighted and combined as proposed in (Rowe, 2007) (Figure 5). Pairs where social metrics differ more than a given threshold are supposed to be at different levels of the hierarchy. Otherwise, if the social score is similar, it means they are even in the terms of organizational structure. Comparing these to the real hierarchy will point out anomalies e.g. when a superior is at the level of his/her inferior or even below.

Second proposal compares two ranks, e.g. using well-established comparison methods (Fagin, 2003): Kendall's coefficient of concordance (Kendall, 1948) or Spearman's rank correlation (Spearman, 1904/1987). These rank correlation measures answer the question how similar the corporate hierarchy (the first rank) and the social network (the second rank) are in the organization. The first rank is derived directly from the corporate hierarchy – each level of the hierarchy should have weights assigned, starting from the top level (tree root) to the lowest one (leaves). Later, these weights are assigned to all employees work-

Figure 5. Difference between social measures: centrality degree (1), clustering coefficient (2) and combined (3)

(1) $Diff_{Cen\,A\text{-}B} = Cen_A - Cen_B$
(2) $Diff_{Clu\,A\text{-}B} = Clu_A - Clu_B$
(3) $Diff_{Comb\,A\text{-}B} = Cen_A \cdot w_{Cen} + Clu_A \cdot w_{Clu} - Cen_B \cdot w_{Cen} + Clu_B \cdot w_{Clu}$

Cen_X – centrality degree for node X;

Clu_X – clustering coefficient for node X;

w_y – weight for measure y.

ing on the particular levels. So, probably, on the top of the first rank will be CEO, then directors, managers and regular employees at the bottom. The second rank is built by using social network analysis (SNA) and one or more structural metrics regarding the node importance. An exemplary combined and normalized metric (Social Score) is proposed in (Rowe, 2007), and can be used to build social network rank. If the rank comparison result (Kendall's or Spearman's coefficient) is close to1, both ranks appears to be very similar. It means that the corporate structure and social network well correspond with each other. If the result is near 0, there is almost no similarity between both structures.

However, as noted in the Conclusions section, the decision about changes in the corporate structure should not be automatically made based only on the proposed equivalence metric results.

STATIC ANALYSIS OF SOCIAL NETWORKS

Centralities

There are several structural measures which can be applied to static social network analysis (SNA). Primary benefit from applying graph theory analysis to social networks is the identification of most important actors (Kazienko, 2009; Musiał, 2009; Wasserman, 1994). In one measure, a central node of the graph is the one with the greatest number of connections to other nodes. Therefore, a central person in the social network is the most popular person in the certain community (local centrality) or in the whole network (global centrality) (Klein, 2004; Scott, 2000). However, the main goal of the concept presented in this paper is not to detect such actors, but to point out differences between the invisible social position (extracted from the social network in the analytical way) and the official, visible position in the organizational structure. It is suspected that the most important people in the

corporation should probably be the department directors or team leaders. What happens if there are some other people with the higher centrality degree than them? Conclusions can be ambiguous. It could mean that there are some "hidden natural leaders" who may not fulfill their potential and their role in the official hierarchy may be too low (Balkundi, 2005). However, it may also mean the opposite; the real leader position is too high for his abilities. It depends on the scale of difference between centrality degree of the real leader and the potential one. If this difference is small, there is probably no reason to apply any changes into organizational structure. For example, there can be a secretary who manages most of the business cases for the leader. Nevertheless, if the difference is high, it is highly probable that some serious changes in the hierarchy structure need to be performed to optimize team's performance. (Figure 6)

Social Groups

A social network can be divided into smaller groups (subgraphs, communities). The equivalent structures in the corporate hierarchy are subtrees of teams and departments. As a result, corporate analysis of groups includes comparison of social network groups and hierarchy subtrees to detect differences. One of the possible scenario in such case is when a person is more connected to the other team members in the social network than it comes from the organizational hierarchy. As in the example in previous section, the possible set of actions for the management depends on the difference between link strengths to the own group in opposite to strengths of the links to other groups. If this difference is significant, then the system may suggest to move this employee to another department/team in order to improve his or her efficiency. (Figure 7)

Other scenario is linked to the idea of developing swarm intelligence in the form of Collaborative Innovation Networks (Gloor, 2004; Gloor, 2006). The groups, which are not present in the

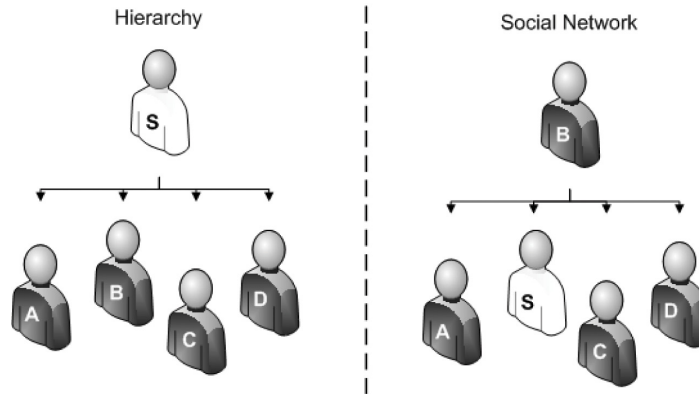
Figure 6. Comparison between two structures: an organizational hierarchy and a social network graph (employee B has higher centrality measure than his superior S)


Figure 7. An illustration of group comparison shows anomalies (B4 has stronger relationship with Department A)
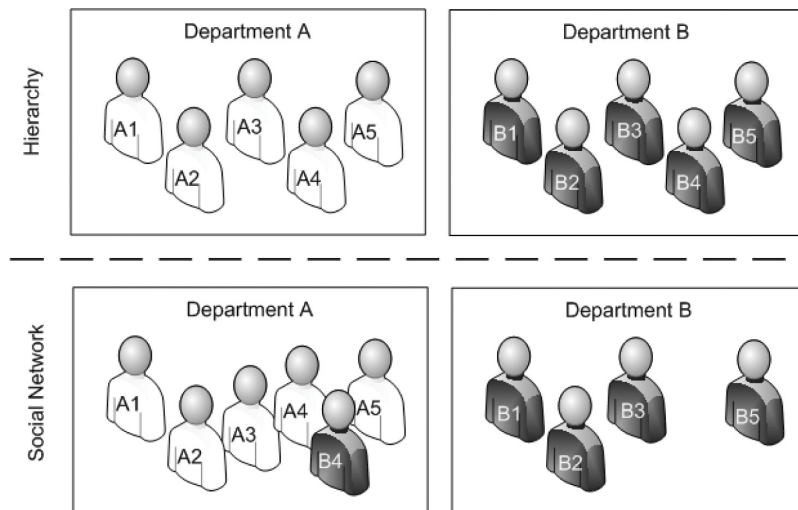
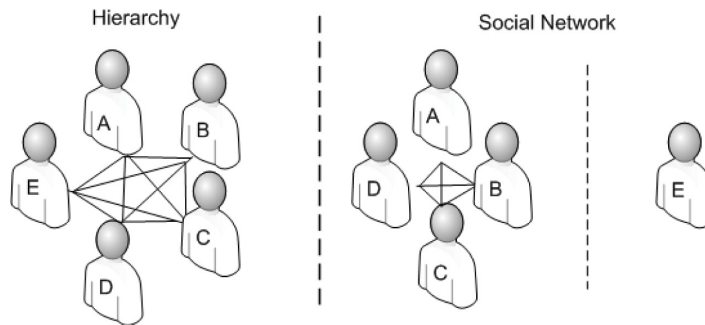


corporate hierarchy can be recognized as independent collaborative initiatives and, if given a free hand and the friendly environment, may lead to creation of new, fresh ideas. A perfect example of such structure is the Linux kernel developers community, where members of different corporations in the whole world are working together on new ideas and taking knowledge development to the higher level based on their interests (Lee, 2000).

Lonely Entities

In each society, there are "outliers" - people who are not fitting well into their group. Such actors can be easily detected in the social network. Because of their weak ties to other people, they usually far from the centres of the network (Musiał, 2009). According to psychological studies, it is obvious that teamwork is not performing well because of them. Unless they are real geniuses, it is required to find out reasons of this behavior by doing internal

Figure 8. A lonely entity E in the social network


investigation and take steps to deal with it, e.g. move them to another team or dismiss. (Figure 8)

Process Management Support

These days, more and more companies are transforming their own management style in order to be more process-oriented. To achieve it, the knowledge gained through the static analysis of social networks may be very helpful for the management staff. If a company does already have its own processes defined in some formal way and these processes may correspond to different layers of social network, an analysis may show whether they are really used. For example, if a process should be carried out in the group of three employees on some chosen layer, the existence of the ordered path between these employees may confirm (but not definitely) that this process does work. However, if there is no such path, the company management needs to perform some steps to find out why the process fails and to fix this problem: to redesign the process or to enforce employees to follow the procedures.

Location Analysis

Apart from the hierarchy structure management and proper employees' selection, companies have to deal with yet another problem. If we would consider the organizations bigger than small family businesses, where employees are counted in hun-

dreds or thousands, the optimal office allocation arises as a significant issue. It is very important to establish effective communication between two closely collaborating departments as easy as possible by placing their offices next to each other. While the close relationships between e.g. sales and finance departments are fairly obvious, some other inter-department links may not be so clear. This is where the analysis of the social network can be very helpful. A frequent communication between two social groups indicates that they have got many things in common. They may work on the same project, discuss some financial issues or plan ahead future marketing moves. However, the distant collaboration can be less effective if their offices are far away from each other, even in different buildings. The detailed SNA report may point out the strength of relationships between entire departments and, after confronting it with the physical locations, may facilitate some adjustments. Department A can be moved closer to department B to improve their communication. Department C, in turn, whose link to A is much weaker, can be placed in the location where its members can easily discuss project details with departments D and E using a new conference room in another part of the building. Possibilities are only limited by the infrastructure.

DYNAMIC SOCIAL NETWORK ANALYSIS

Studying dynamics of changes in social networks over time is currently one of the most interesting research topics (Wasserman, 1994). Even in stable environments, social networks evolve. People establish new friendships as well as break others. Anyway, this paper focuses on changes caused by HR management. Moving employees to other teams/departments, hiring new workers, dismissing others, promoting, relegating – all of these actions have a huge direct impact on social network structure. It usually requires some time to gather the appropriate data but after it happens, managers have a very powerful knowledge of rules linking HR management with corporate social structure. The analysis of dynamics in the social network, which is extracted from the long term data about user activities and communication, provides the answers to some tough questions. Which employees should be promoted? Which ones should be relegated? Which people should be fired to strengthen the others and their social ties? Which workers should be assigned to a new project? The more and diverse data is available for analysis the better prediction accuracy.

However, the length of analyzed period is crucial for final results due to internal or external factors. It should be noted that there may be some departments not so active within specific periods, increasing their interactions in some other time. For example, controlling department might be in intensive contact with almost all departments while creating the next year budget whereas for the rest of the year, it might communicate only with a few key company persons. The same situation can be observed in the quality department, that maintains connections periodically in order to perform internal or external audits. Thus, the window of analysis in that case should be big enough to gather such activity irregularities or to find out if long-lasting processes are carried out properly. On the other hand, such big window may discard dynamic recent changes, which are not desired either. One of the proposed approaches is weighting of social connection with time factor so that the recent activities are weighted higher than the older ones (Kazienko, 2009).

SOCIAL CONCEPT NETWORKS (SCN)

Concept maps are structures showing which terms are connected with each other by co-occurrence in the same object such as email message (Cañas, 2005; Novak, 2008). Social concept networks is an idea of joining concept maps with social networks where the relationship between actors is based on email messages and common activities. Relationship strength is computed from the usage frequency of given terms/phrases in the linking objects. Actually, all SN-specific analysis can be applied to social concept networks. Interpretation of them is slightly different, though. For example, in this kind of social network, centrality degree identifies actors with the highest knowledge on given topic, experts.

Once keywords specific for a given project are declared, the social concept network immediately shows people with the expertise relevant to it. After comparing them to the group of people officially assigned to the project, it is possible to reveal actors with a "hidden knowledge", i.e. people who are not formally part of the project but are socially considered to be helpful. It can be a sign for the management to add these experts to this project and the future ones. Same analysis will also expose project members who are, in fact, not involved in discussions on project-specific topics.

EXPERIMENTAL STUDIES

Introduction

To test the idea of matching corporate structure and social network presented in this chapter, two

networks have been build and analyzed (Michalski, 2011). One is based on mid-size manufacturing company located in Poland source data and the other one uses data gathered from Enron corporation.

The process of building social network consists of choosing the graph type (directed or undirected) and weight calculation method between nodes. The authors decided to build directed graph with the weight of an edge between node *i* and *j* is as follows:

$$w_{ij} = \frac{\sum e_{ij}}{\sum e_i} \; w_{ij} = \frac{\sum e_{ij}}{\sum w_{ij} = \frac{\sum e_{ij}}{\sum e_i} e_i} \qquad (1)$$

where $\sum e_{ij}$ is the number of e-mails sent by node *i* to node *j* and $\sum e_i$ is a total number of e-mails sent by member *i*. It means that weight w_{ij} focuses on local neighborhood of an employee rather than on global network characteristic.

The next step is to calculate social network metrics used in comparison. It has been shown that some metrics are more suitable in matching social network to corporate hierarchy.

Final step of the process consists of comparison of social network and corporate hierarchy. It is accomplished by answering the question how many employees in social network rank are a good fit for certain level in corporate hierarchy. The basic result is made up of percentage coverage of each management level by correspondent social network rank employees. If a significant differences are found, more detailed analysis may be performed, even focusing on each employee when needed.

Companies Description

The first analyzed company is a manufacturing company located in Poland. The company employs 300 persons, whereas 1/3 are clerical workers, the

rest - laborers. The period analyzed was half a year. The type of organizational structure is functional (Daft, 2009). However, due to organization operating model and its consequences to organizational structure clarity as well as logs interpretation possibility, only a subset of organization have been chosen for current analysis: 49 clerical employees not directly related to manufacturing process. Three-level management structure exists in the selected company part: management board (2 persons), managers (11 persons) and regular employees (36 persons) and they work in twelve different departments. There were no organizational changes during the analyzed period.

Enron, the another analyzed company, was one of the largest energy corporation around the world. It become especially famous worldwide in 2001 due to financial manipulation scandal. The Enron email dataset was made public by the Federal Energy Regulatory Commission during its investigation. The email dataset had a number of integrity problems which were corrected by researchers at MIT and SRI International (Cohen, 2009). The Enron hierarchy structure is still not publicly available. However, there are sources which can provide information concerning plenty of job positions of given employees and their department or division (Rowe, 2007). Because only some of employees existed in email corpus, authors have decided to analyze social network building only within limited set of managers and employees which positions - with high probability – were known.

Results

As stated before, the graphs built were directed with weight defined in Equation 1. The authors have decided to calculate most popular metrics used in social network analysis within each network their built: in-degree centrality, out-degree centrality, centrality beetweenness, centrality closeness, clustering coefficient Watts-Strogatz and centrality eigenvector (Musiał, 2009). Ranks

of social network position using above metrics have been compared to organization structure to gain information how well the organization levels had been matched. Because it has been found that none of the used metric and tested metric combinations were able to make the clear distinction between the first (management board) and the second management level (managers and directors), further analysis has focused on distinction management as a whole from regular employees. The results are presented in Table 1.

The results show that only some metrics are capable to make good distinction between management and employees. The best of them are: in-degree centrality and centrality eigenvector. It proves that the basic distinction between managers and others is based not on outgoing relations rather than on incoming relations (in-degree centrality) and the importance of employees contacting with us (eigenvector centrality).

DISCUSSION

Profile of Relationships

Throughout the process of building and analyzing the social network only the existence of mutual communication of common activities has been considered so far. However, the fact that email

message sent from person *A* to person *B* does not determine itself the nature of the relationship between *A* and *B*, e.g. whether it is rather positive or negative. The emotional character of the single message should also effect relationship strength. Nevertheless, sophisticated and powerful text recognition tools would be required to examine the profile of the messages, not mentioning the advanced forms of expression like irony, sarcasm or even the meaning of the attached images or videos. There are no effective methods for these purposes yet (Krippendorff, 2004; Wiebe, 2005). This is just to point out that even a strong relationship between two people not necessarily means that they like each other. We should always be aware that connections in the artificially extracted social network do not completely reflect the complex nature of human relationships.

Decision Making

All presented analysis methods should focus on two general evaluation rates: similarity of the structural position and the role both in the social network and in the official organizational hierarchy.

Having the differences between the social network and hierarchy recognized, the management of the organization can undertake appropriate decisions to decrease these differences. For example,

Table 1. Accuracy of management level matching while using various social network metrics

	Percentage of the first and the second management level matched		Percentage of regular employees matched	
	Manuf. comp.	**Enron**	**Manuf. comp.**	**Enron**
In-degree centrality	85	67	94	85
Out-degree centrality	62	50	86	77
Centrality beetweenness	38	33	78	69
Centrality closeness	46	33	81	69
Clustering coefficient	15	17	69	62
Centrality eigenvector	77	67	92	85

the position in the structure can be affected by moving employees to other teams/departments. Changes of roles in the hierarchy are achieved by promoting/relegating.

Moreover, new positions and roles can be discovered in the social network which do not exist in the corporate hierarchy structure. As a result, the managers can create new positions in the organization.

CONCLUSION

Social network approach to manage problems is capable to significantly improve the Human Resources efficiency by either detection of hidden anomalies in the corporate hierarchy or making communication between employees more effective and easier. By analyzing semantics of email messages exchanged within the corporate network we are able to identify individuals with "the hidden knowledge".

Overall, social network approach to the problem of corporate management appears to be very helpful, however, all analysis need to be well interpreted to improve performance and social health of the company. This is only a tool. Still, human resources have to be managed by humans.

Chapter 24
Social Media:
Opportunities and Challenges for Human Resource Management

ABSTRACT

Social Media is primarily internet and mobile tools allowing people to share, collaborate and publish information. Over the last couple of years, the availability and usage of such tools has emerged substantially and led to a cultural shift, connecting people and allowing them to collaborate in ways that were not possible otherwise. To embrace social media tools seamlessly in the organizations can be a real challenge for human resource management professionals. The specific contribution of this paper is to take a relook at the opportunities which social media tools are able to create for the organizations in terms of learning and collaboration. Living and smooth working in a non-hierarchical network is still a big hurdle for organizations and can be a challenging task faced by human resource departments. This paper presents the foundational components of social media linked with human resource processes and lays the groundwork required for companies to harness the potential of social media in the long run. The ultimate objective of human resource departments is to be ready with a shift in their competency and skill sets by embracing a high degree of "technological readiness", adaptability and positive attitude towards these new social media tools. An exhaustive literature survey presents the analysis of the paper.

INTRODUCTION

We are living in an era of unprecedented change and rapid growth. The challenges of this growth are not unique to the Web 2.0 and social media (SM). Tim O'Reilley, a media guru, in 2004, had popularized the term Web 2.0, which covers a wide range of technologies such as, wikis, blogs, pod casts, linked in, Facebook and Twitter. From the perspectives of the Human Resource (HR) professionals, these tools have immense potential to transform the way business is being conducted, leading towards greater credibility. SM is a subset of Web2.0, which falls under the broader Web 2.0 landscape of tools. One of the interesting paradoxes of social media is that its biggest impact is human rather than technological. As people adopt and leverage social media, their personal, consumer, and professional lives are changed in significant ways. The human impact of SM is not limited to individuals, however. The human capital that drives organizations will also be transformed significantly as organizations continue to incorporate new digital technologies into their operations (Hunt, 2010). It is also important to remember that the lines between work and non-work have become increasingly blurred as technology continues to advance. Many organizations have capitalized on this by enabling and expecting employees to work beyond the confines of traditional work spaces and work hours. And though employees are generally willing to accommodate those expectations, they expect some reciprocity in terms of being able to meet some of their personal, non-work needs during the traditional work day. They rightfully fail to see the logic or the fairness in limiting access to their social networks while they're at work – and as they increasingly feel empowered, they're increasingly likely to assert their rights, either directly or indirectly (Hunt, 2010).

Human resource professionals are increasingly becoming aware of the rapid changes which SM is bringing into the workplace, which is not only affecting the communication patterns of the working professionals but also affecting the rigid structures of the workplace. Changing communication patterns at the work place are diminishing the rigid boundaries between the various levels of the hierarchies at the workplace. To drive organizational success HR in its strategic leadership role need to understand the implications of the SM trends. Use of SM has created highly effective communication platforms where any user virtually anywhere in the world, can freely create content and disseminate this information in real time to a global audience ranging in size from a handful to literally millions —in less time than it takes to read this document (ISACA, 2010). SM is creating both new challenge and opportunities for HR, by helping to build in a culture of collaboration, transparency and engagement. In order to succeed in today's hyper connected environment, organizations will need to adapt to and implement SM tools not only around their business strategy, but also around their marketing and public relation efforts and information technology which can ultimately create an internal culture of collaboration and engagement. SM offers a whole new paradigm within which HR can work to engage organizations' members, investors and internal and external employees. Social media has become a powerful tool for enterprises across the globe.

In this paper an attempt has been made to highlight the changing role of HR professionals and the need of the time is to evolve to become a strategic partner within the organization. The role of the HR department must parallel the needs of the changing times and to become more adaptable, resilient and employee focused. It is important to engage the employee's interest in SM by empowering them with SM tools to exploit and explore its benefits further. In order to succeed HR must be a business driven function with a thorough understanding of the potential of SM tools for the benefit of the organization. In the present paper an attempt has been made to involve the support of SM tools to create an effective management of mainstream functions of HR department like recruitment

and selection, job descriptions and its changing nature, training and development, performance management and compensation, organization and development, culture and engagement, talent management and retention, new employee orientation, career mapping and knowledge management and maintaining relationships with alumni's. With the support of the SM tools, HR is also able to keep its employee policies and their welfare related information at a central repository from where the latest information can be retrieved by the employees at their convenience. At the same time the need of the hour is to have a clear social media policy adopted by the organizations. This paper strives to fill the gap in organizations between the HR policies, functions and SM tools which can help the organizations in not only creating a greater degree of alignment between the line and staff personnel but also across and between the departments. A strive to understand the companies' policies to measure returns on investment in social media (ROI), is quiet crucial and imperative to understand the returns of the SM gains. Hence it is crucial to understand the support of SM, which is not only revolutionizing the collaboration and communication patterns of professionals at a personal and professional front but also at the same time trying to resolve the often conflicting professional expectations of HR professionals and perceptions of utility of SM tools for employees. The flow of the paper will be as follows-First we will try to understand the impact of the social media and its linkage with the hr role and will try to share the best practices of hr functions with the support of social media tools. The next step will be to understand the return on investment as well, which is a crucial factor for the businesses to understand in order to implement the SM tools. Encouraging and supporting the implementation of SM in organizations policy can be reflective of an organization's culture –which can ultimately go a long way in building up a culture of sharing and collaboration.

SOCIAL MEDIA AND ITS STRATEGIC IMPACT

Kaplan and Haenlein (2010) define social media as "a group of Internet-based applications that build on the ideological and technological foundations of Web 2.0 and that allow the creation and exchange of user-generated content. In the words of Hart (2010), "Social media are a new breed of technologies that provide a range of services and applications that let individuals (co-)create content in a variety of formats, share information and knowledge with others in networks and communities, and support a new collaborative approach to working". Social media can take many different forms, including internet forums, web logs, social blogs, micro blogging, wikis, pod casts, pictures, video, rating and social book marking. These media are becoming more widely used by organizations to increase knowledge sharing, improve collaboration and employee voice, and connect with new generations of employees (Martin et al., 2009). According to José Carlos Eiras, former CIO of General Motors Europe, "In today's hyper-competitive markets, speed is absolutely essential. The best method for ensuring rapid and effective transmission of critical information is via social media because everyone on the network can immediately see what everyone else is doing. So if there's a problem somewhere, you will find out about it fast" (Polansky et al., 2010). The outcome of a benchmarking study conducted by Barnes (2010), on Fortune 500 lists of companies to quantify their adoption of social media tools and technologies shares a less then promising outcome. Here is the excerpt of the study:

- 23% (116) of the primary Fortune 500 corporations have an external corporate blog. This represents only a 1% increase over the 2009 study.
- Fortune 500 companies are blogging at a lower rate than other business groups, spe-

cifically the Inc. 500.While social media adoption data is not yet available for the 2010 Inc. 500, in 2009 45% of Inc. 500 companies had externally-facing corporate blogs.

- 60% (298) of Fortune 500 primary companies have corporate Twitter accounts. This is a dramatic increase from 35% of companies in 2009.
- 56% (280) of the 2010 Fortune 500 have a Facebook presence. This is the first year Facebook was included in this study, and the first time any systematic review of the entire Fortune 500 has been conducted on this issue.
- Insurance companies are most likely to be on Facebook, followed by specialty retail, food, drug and consumer products companies.
- 29% (147) do not have a Twitter account or a Facebook presence.

Hence we can see that the companies have started realizing the importance and impact of SM tools and gradually the acceptance has started taking place in many organizations. But change is never an easy journey. HR departments are facing business and technological challenges while implementing SM tools in the organizations. Business challenges can be led by uncertainty of transforming of existing organizational culture to one which embraces a culture of transparency, empowerment, openness and engagement with immediate results. Challenge also lies in immediate implementation-of the effective change processes in the organization. Selecting right kind of SM tools based on the strategic needs of the organization can be a challenge for the organizations. Lack of proper training and need of a proper social media policy for the effective implementation of SM policies by HR departments can be a real challenge. Executives all over the world are not only avid users of SM tools like Facebook, Twitter and YouTube video channels to mention a few, but also tends to be active bloggers. Effective employee communication is a leading indicator of employee engagement. In today's turbulent time effective communicators use SM tools to engage an increasingly diverse and dispersed workforce with the support of wikis and podcasts, thus enabling the companies with the potential to tackle traditional challenges associated with the culture of knowledge hoarding. In organizations there is a growing emphasis on the combined formal and informal learning with a special emphasis on collaboration, knowledge sharing, coaching and mentoring which ultimately involves a process of unlearning old attitudes, beliefs and values and relearning of new attitudes, values and beliefs. Social media platforms are ideal change management tools which are able to initiate and take the lead in listening, sharing, generating information, strengthening and engaging the workforce. With the wise usage and implementation of SM tools companies are able to gain a competitive advantage because of the privileged access to the information located on the social networks and encouraging a culture of more participation and deeper collaboration. The next step will be to start discussing the association of SM tools and its linkage with the various traditional and new HR functions combined together, like recruitment and selection, training and development, performance management and compensation, organizational development, culture and engagement and employees handbook, talent management and retention, new employee orientation, knowledge management and career mapping and wellness awareness to name a few with an innovative approach and outlook.

ORGANIZATIONAL HUMAN RESOURCE APPLICATIONS AND SOCIAL MEDIA TOOLS

As SM technologies will get integrated in to the organizational system in depth, it will become

essential for the strategic partners of the organizations to design and plan for its impact on human resources functions along with the HR professionals to include the routine HR functions like, administration policies, health and wellbeing, recruitment, job descriptions, organization development, culture and engagement, employment branding, retention, engagement, training and development, performance management and compensation At the same time new employee orientation, knowledge management and career mapping, maintaining relationship with alumni can be few innovative HR practices which are evolving with the implementation of SM tools. It becomes crucial to remember the importance of empowering of employees by SM tools. If empowered, employees can be the important advocates for their employers. We will be discussing the association of SM tools implications in HR functions one by one starting with the recruitment and selection-

RECRUITMENT AND SELECTION

"In today's rapidly changing economy, people tend to move from one job to another and from one industry to another – much more often than in the past" (Polansky et al., 2010). Integrated social media technologies (e.g., Facebook, Blogs, Twitter, LinkedIn, etc.) have made the recruiting process easier and more engaging than ever before (Dunn, 2009). Social media now allows human resource departments to aggressively seek out potential applicants. This is particularly true on linked in, which is a site that revolves around one's profession and professional training. Sites such as linked in permit human resources departments to instantly determine if there is anyone they should extend a job offer to immediately, without the need to resort to expensive head hunting services. "IBM has always been one of the first companies to experiment with new social technologies. Its recruiters use Twitter to broadcast job openings, and the company organizes its own talent com-

munities… Cost saving is a major motivation for companies looking to bypass big headhunting firms" (Hempel, 2010, p. 2). Deloitte is taking a multifaceted digital approach to recruiting by using a blend of social networking resources and multimedia elements. A versatile introduction to their company is available at the click of a button. The program integrates several interactive social media outlets including a micro-site, a Twitter feed, a Facebook page and Linked In group, and a You Tube channel (T+D Blog, 2010). Recruiters and hiring managers are turning to Twitter to seek referrals and applicants for open positions. Twitter and social networks can spark a social effect that galvanizes community support and action. Not only can companies save a significant amount of money on listing and referral fees using traditional outlets and resources, they essentially create a presence through the practice of "unmarketing" itself through the process of seeking qualified candidates (Solis, 2010). In the words of Sharlyn Lauby (2010), "As social media becomes more defined in the business world, human resources professionals will have a significant opportunity to leverage this powerful medium in many aspects of the business". The use of social media also allows human resources to eliminate employees with a history of lies or malfeasance, since it is often harder to hide statements online. By being picky, HR departments can get the best possible candidates, as well as eliminate liars and cheats (Clyne, 2010).

New Job Descriptions

Some companies are going beyond posting tweets about new positions to using the wisdom of the crowd to actually write a new job description. At Best Buy, when they posted a job description for a position as senior manager of emerging media marketing, the qualifications included were: one year of active blogging experience, a preferred graduate degree, and 250+ followers on Twitter. The number of followers one has on Twitter is

now finding its way into a job description. At Best Buy the job description was crowd sourced, and anyone with an interest was invited to post qualifications to the job role on Idea X, a forum for Best Buy customers and employees. The final job description spoke about the traits of the social media revolution we all are experiencing: humor, collaboration and authenticity. For instance, the revamped job description included a requirement that the Senior Manager "understands the following acronyms: RSS, SEM, SEO, PPC, CPM, CPC, LOL, IMHO, WTF, API, B2C, B2B, CTR, IM, PV, RON, WWW, TTYL, LMAO, ROTFLMAO, WYSIWYG and, most importantly, RTFM." It's unlikely that Best Buy would have come up with them on its own (Meister & Willyerd, 2009).

Organizational Development, Culture and Engagement

Strong cultures bind people together through shared norms, values, understandings and discourse, thus acting as important, informal social integrating mechanisms in organizations which complement the more formal design features discussed in the previous paragraphs. In doing so, however, they also act as a form of psychic prison, often producing collective blind spots to new information and ways of doing things (Morgan, 1997; Weick, 2001). The new social media tools extend opportunities to employees, to cross the rigidities of the organizational hierarchies and thus releasing them from there self imposed mental prisons. These tools make employees voice/innovative ideas heard across up and down the various levels in the organizations, ultimately leading to higher levels of employee engagement. According to Suss (2008), social media can increase engagement in the areas of credibility, respect, pride and camaraderie. In the area of change management, the new communication channels provided by social media can help to keep organizations up to date about (or even better: to involve them in) organizational change situations. Pfizer was

able to set an example in this regard. Pfizerpedia was developed few years ago by the scientists of Pfizer to develop an internal knowledge sharing repository, on the merits of wiki technology, to help them work more effectively on their projects. Retaining and tapping the potential of multigenerational workforce has never been an easy process. It will be a compelling vision of HR professionals to tap the SM tools for engaging its employees.

Talent Management and Retention

Talent management is increasingly becoming one of the most important aspects of the HR functions in organizations. In today's challenging times, SM tools can be deployed in the workplace to reach out to the people in a very short span of time. Among a number of SM tools, blogs can be a good place of showcasing a company's mission, vision, values, culture and accomplishments. To match with the real- time and transparent communication expectations of the Gen Y executives, blogs and interactive channels are being created. These channels are used by the senior leaders of the firm to reach out at the people with many formal and informal learning situations. Talent pipeline can be created in the organization through wikis, blogs and many other platforms where introverts and extroverts, both are equally comfortable in conveying their messages to the concerned person(s), through a medium of their choice. Companies like Deloitte, IBM and Ernst and Young are taking advantage of these tools to reach out and engaged the workforce. Deloitte (Brandel, 2008) is using the internal social networking by the name of D- Street, which is similar to Facebook. Employees of Deloitte are encouraged to join this internal social networking site and get connected with the other employees of Deloitte. It also keeps the employees engaged, by letting them to participate in the Deloitte film festival, to make short videos that answer the question," what is your Deloitte? Beehive at IBM is intended as a collaborative platform that emulates the physi-

cal work environment, where employees display personal items like photographs and trophies and chat about last night's game. The idea is to have a water cooler effect –which help people build stronger relationships and thus create an effective organization. Ernst and Young created their Facebook page in 2006, and currently they have more than 30,000 fans. Through their Facebook page, E&Y are trying to take care of the aspirations of the young graduates, who want to be a part of this organization.

New Employee Orientation/On Boarding/Virtual Mentoring

The new employee orientation and mainstreaming process is known as "employee on boarding". On the company's intranet, virtual new hire groups can be created and new employees can have an access on the new employee orientation schedules, materials, benefits forms, and an extensive FAQ. On the company's Intranet information can be made accessible to the new hires through chat or discussion forums. By providing relevant information in advance, organizations are able to eliminate a common source of new hire angst and give them a better chance to start off on the right foot. Virtual" Mentoring" can also be encouraged which will be able to facilitate quick and better adjustment not only to understand the work culture of the organization, but also at the same time lend a helping hand in providing useful information for shifting overseas if need be. Interactions with the senior members and peers of the clan, give the employee a chance to participate in various discussions, and also to get acquainted with various colleagues. For new employees, a focused new group, by the name of "A social group-for new hire" can be formed on Twitter or on Facebook, which will enable new employees to share their initial experiences through chat / discussion forums. Creation of wikis can also help the new joiners to get the support in getting the answers for the most frequently asked questions

regarding dress code, vacation time, housing links and information about the hospitals and the good schools in the town. The overall understanding of the work system and familiarization helps in building up the confidence, comfort and trust in the organization's work processes for a new employee, even before they join the organization.

Knowledge Management and Career Mapping

In today's knowledge based economy people and organizations are leveraging social media for informal learning. Supported by organizational culture, social media tools can allow employees to contribute ideas, and help organizations to capture the various threads of knowledge being created by its employees. According to Leistner, Chief Knowledge officer at SAS,"The CKO, in his role as internal consultant, can help to build a social media strategy that is targeted towards value creation and knowledge sharing with a business focus". And to continue it further in the words of Leistner," Since social media is essentially driven by people-to-people relationships, it can be a natural platform for knowledge management programs. An experienced, insightful chief knowledge officer can maximize the benefits of a corporate social media strategy" (Polansky, 2010). Employees can use social media tools to make connections between the tasks, responsibilities and roles they want, and the skills, experience and contacts that lead to future career opportunities (Tulgan, 2007). HR department can bring a dynamic outlook to the world of training and development with the help of SM.

Training and Development

An understanding of the implementation of the SM tools in the organizations by its employees has become an absolute necessity in the organizations today. It has become imperative for today's entire workforce to have an understanding of the

usage of SM tools. A continuous and ongoing training of various uses of SM tools provided to the employees has become an absolute necessity of the day. In today's dynamic, cost-competitive business climate the value of learning is embedded in corporate environment, where leaders understand the value of a trained workforce. Providing training programs to executives all over the world has earned a place as one of the most critical issues in the training and development field which is largely driven by the needs of the clients and their initiatives and solutions. Through wikis, discussion forums and chat rooms –subject matter experts can be identified and leveraged for the new learning either from the peer group within the organization or from the outside. Telstra, an Australian Telecom giant of 40,000+ personnel has made social media training compulsory for its employees. They are able to publish their entire social media training guide online, which is an interactive tool, so that anyone can read, learn and able to make suggestions for improvement. Till now more then 12,000 people were able to complete this course (Ostrow, 2009). Providing on line training inputs to the small focused targeted group at the companies are able to have a paradigm shift in the performance based learning in the organization. Along with the e-learning training an ongoing continuous training module should be provided to the employees with a special emphasis on the rights and responsibilities. Implementation and usage of SM tools in organizations are changing the landscape of training programs in organizations which includes leadership development opportunities.

Leaders need to become the role models to lead through the informal channels of various social media. Leadership blogs, for example, can help junior leaders to learn from the philosophies, styles and experiences of senior leaders. Leaders at all levels can form virtual support groups with their peers to discuss specific challenges and opportunities in more efficient and effective ways. Leaders can be role models in understanding the

changes in the balance of power created by the open and free access of SM tools. Leaders can also form groups to share best practices. Junior leaders can access leader's wikis, blogs and other tools to develop the knowledge; skills and abilities they need, to increase their efficiency and effectiveness.

Extending learning opportunities through on line games can be a novel opportunity for the trainers. According to Reeves, Malone, and O'Driscoll (2008), "Put simply, online games can be informal but realistic simulators for contemporary leadership training. In fact, companies could explicitly integrate these games into their leadership development programs in order to teach the "soft" aspects of leadership, complementing simulation tools that emphasize hard, analytic skills. The benefits would extend not only to individuals but also to business teams, which might use the games to try out various leadership structures for the group." Wikis have lots of potential for providing a base for on going training programs in organizations. It allows individuals to participate, collaborate and share ideas. Providing cross cultural training programs can be one of the biggest challenges faced and overcome by the organizations today is to reach out at the diverse and dispersed work force around the globe. According to Jestice (2009), "Cross-cultural training is one promising area for using virtual worlds to deliver efficient training as well as to cut costs and resource commitments from organizations. We may see over time that some of the features available in virtual worlds may actually increase the effectiveness of training over traditional seminars". Pod casts can be one of the social media, tools which can help in recording the training program or some missed lectures. These recordings can be heard online or can be recorded at MP3 players and heard at one's convenience later. This is a very useful medium for providing sales and marketing tips, new product development or management lectures which employees may want to hear multiple times. During a training session, it is useful to create

Twitter hash tag # and encourage participants to tweet during the session.

Performance Management and Compensation

A well-designed and disciplined approach to performance management can play a positive and constructive role in delivering sustained high performance. The culture of an enterprise is an all-important aspect of why and how performance management is used. The standard by which employees' performance is measured and compensated keeps on changing with changing job requirements and responsibilities. In the words of Hunt (2010), "Performance management systems will have to be updated to better accommodate new knowledge, skills and behavior, and managers will need to learn how to evaluate the success of their staff in achieving social media objectives. Changes in job responsibilities and performance expectations also may require associations to revisit their pay structures". According to Nesbitt and Krainin (2008), "A well-considered approach to implementing social media performance management can yield significant benefits including a more focused ream that sets goals and manages for results."

Relationship with Aluminis

SM allows each and every employee in the organization to expand their network. Setting up an alumni group on the linked in or at the Facebook gives employees a chance to be connected and gets updated on the various new facets of the company. At H&M (a Swedish clothing company), a Linked in alumni group has been created for the former employees. This group not only helps in leveraging the brand recognition with the former employees but also acts as rehiring tool. Companies like Yahoo and HP are using Facebook alumni page to stay connected. And it is also a platform to think of joining back one's company.

THE EMPLOYEE HANDBOOK

A central repository of information can be created at the organization's intranet, consisting of employee handbook of policies, procedures, benefit plans and performance appraisal forms, which are current, regularly updated and easily accessible. Linking of SM tools with intranet can enable employees to get important reminders on regular basis about the upcoming deadlines. Organizations can show their concerns about their employees' health by sharing health related updates and information through the wellness awareness portals.

Wellness Awareness

Brian Baker of "Engagement 2.0: Beyond the fire wall" (2009), has spoken about the meaningfulness of wellness awareness program in the organizations. According to this report, "Social media has created a whole new conversation on wellness that is based on two-way dialogue. According to Brian, organizations can successfully implement the following strategies in the workplace with the help of the following social media tools:

- Upload and share pod casts on healthy living, common risks and conditions, and general wellness advice.
- Survey Linked In users to compare wellness program ideas, create cross-company teams, or involve other professional groups or consortiums.
- Get daily health tips by email or text message (SMS).
- Track daily, personal progress on an iPhone or Black Berry.
- Blog about typical health and wellness challenges or post questions on the company's
- Check the company's website for who is teaching today's yoga class and connect with other colleagues who are participating.

- Allow spouses/partners and dependents to receive and send communications, take part in contests, or contribute to other dialogues traditionally only available to internal employees.

In India big IT names like HCL, Infosys, Wipro, Tech Mahindra and TCS are online and engaging with customers either with leaders sharing information via Twitter or a group of bloggers connecting with audiences. Bharti (Airtel), a leading telecom organization with over 20,000 employees switched to an SMS based intranet on an IBM tool called me-tize. The move did away with e-mail; got employees connected, increased productivity, added convenience and also contributed in a 'green' way (Verghese, 2010).

RETURN ON INVESTMENT AND SOCIAL MEDIA

The ROI is a business formula that calculates the ratio between an investment and the return. To quantify the social media ROI, we need to determine both the return and the investment in dollars, and we need to ensure that the return has a direct correlation to the investment. When an organization is able to determine and quantify the correlation between the return and the investment, one is able to quantify the ROI of SM. Companies such as Dell are not only tracking the impact of Social Media on revenue, but expanding lessons learned across the entire organization. Measurement and ROI can be one of the biggest challenges in successful implementation of the SM. A 2009 study by ENGAGEMENTdb report (2009), found that the most valuable brands in the world are experiencing a direct correlation between top financial performance and deep social media engagement. Findings of the study show that enterprises that aggressively embrace social media as part of their strategy are more financially successful. Enterprises are using social

media in many functional areas of business and are enjoying numerous tangible benefits such as increasing brand recognition, sales, search engine optimization (SEO), web traffic, customer satisfaction, and revenue. According to Margaritis and Rockland (2010) while most monitor for online mentions and activity, participants generally agreed that there is no consistent, reliable approach to measuring ROI and that looking at metrics like "followers," "friends," or "views" is not sufficient. In today's fast changing world human beings need to be motivated, encouraged and rewarded by being empowered. Need of the time is to let them discover their own pace of learning with a defined strategy of policies and goals. McKinsey's new survey research (Bughin & Chui, 2010) finds that companies using the Web intensively gain greater market share and higher margins. To explain further-the benefits from the use of collaborative technologies at fully networked organizations appear to be multiplicative in nature: these enterprises seem to be "learning organizations" in which lessons from interacting with one set of stakeholders in turn improve the ability to realize value in interactions with others.

Participatory technologies have a high rate of involvement when employees from various streams of organization tend to get a chance to circulate their ideas in the organization through informal channels of social media like blogs and wikis. At AT&T, it was frontline staffers who found the best use for a participatory technology—in this case, using web 2.0 for collaborative project management. Rather than dictating the use, management broadened participation by supporting an awareness campaign to seed further experimentation. Over a 12-month period, the use of the technology rose to 95% of employees, from 65%. (Chui, Miller, & Roberts, 2009). Best Buy's example can be one of the most notable in not only empowering its employees, but also taking care of the external's customer's need with an amazing speed." A good example is Twelp force. More than 2,500 Best Buy employees have signed up

for this system, which enables them to see Best Buy–related problems that customers have aired on Twitter and respond to them. Twelpforce includes customer service staff, in-store sales associates (called Blue Shirts), and Geek Squad, the service reps who make house calls for technical assistance. Twelp force exists because Best Buy empowers its employees to come up with technological solutions. Best Buy's leaders support technological innovation regardless of where in the organization it comes from" (Bernoff & Schadler, 2010). The traditional HR employee handbook is one of the useful and handy repository tools which provide the mandatory and standardized information to all employees of the organization.

CHALLENGES AND STRATEGIES TO IMPROVE ADOPTION

Social media helps in transforming the way people tends to be connected with each other and share information with trust and openness. There are few steps which can be taken by the organizations to consider, in advance before implementing these social media tools successfully. One of the basic threats in implementing the social media at the workplace lies in employees sharing/shifting in power. A word of caution is absolutely essential here-for the smart use of SM tools. With a large number of companies using SM to interact with customers, it is important to get it right. A good and recent example is of Nestlé's fan page-where an exchange of rude and impolite remarks, landed Nestle into a public relations nightmare, thanks to SM in a matter of minutes. Any company that maintains social media tools to engage with the customers should learn from Nestlé's mistakes and try to remember that the power of balance is shifting from the hands of big brands in to the hands of consumers. The smooth implementation of SM tools in the organizations will only be possible by developing a progressive social media policy. It is necessary to have a social media

policy booklet with clear directions of its usage. It is very important for employers to educate and train their employees regarding the professional and responsible use of the SM tools. In the USA an employee (Greenhouse, 2010), was fired because of something she posted on her Facebook page. In the same post of New York Times of 8th Nov 2010 another case has been mentioned of an emergency medical technician at an American Medical Response of Connecticut who was informed of violating the company policy that prevents employees from depicting the company on social media sites. Additionally, it was conveyed in the media that this was one reason for her termination and alluded that there were other reasons as well. According to the post, this is "the first case in which the labor board has stepped in to argue that worker' criticisms of their bosses or companies on a social networking site are generally a protected activity and that employers would be violating the law by punishing workers for such statements" (Greenhouse, 2010).

Thirdly, it is important to understand and respect today's workforce. There are differences between the attitudes, values and work ethic of the different generations that will now find themselves working side by side in the workplace. A critical difference lies in the way in which they communicate. It is necessary for the organizations to understand the preferences of various generations in communicating and remaining engaged. It is a two way dialogue, which helps in building up a new attitude and understanding of social media. According to Brian, (2009), "In today's 24/7 culture, there's no longer a clear line between using the web for work and non-work. People are working—whether it looks like it or not—24/7. If we let them work how they want, and if we value their work based on results, we are more likely to engage them. In other words, if employees are using social media at work and for business purposes anyway, we should capitalize on that to expand their network, build and improve our firm's reputation, and enhance our business".

The need of the hour is to build a culture of trust in the organization. The culture of trust cannot be created in a day. Gradually and seamlessly the organizational culture need to break the barriers of change. Here the senior leaders of the organizations need to be role models-who gradually tend to build and increase the level of trust. Also HR can help in intensifying the effort of building a culture of trust in organizations, by empowering its employees with these collaborative tools.

Fourth, it is important to understand the cultural nuances of a work place. Before implementing these SM tools HR departments can design and implement a pilot training program based on future culture changes in the organization. The wisdom of channelizing people's energy in to direct and honest engagement is the ultimate sum of getting everyone's volunteer participation. Changing the "culture" of an organization requires that people know what is expected of them, what they are supposed to do, and how they do it. It is essential that the expertise for these kinds of training programs, to establish the need in the first place, to be identified by the HR department, which is essential for implementation.

It will be wise for the HR dept to identify the early enthusiastic adopters, from the line as well as the staff functions. From the informal channels the supporters for these kinds of tools can be identified, who can ultimately become the role models, for applying these tools in their day to day roles. Sixth, it is important to employ "socially skilled" change agents, identified by the human resources department for implementing social media tools effectively. In the words of Verghese (2010), "To groom a pool of social media champions, find employees who are interested in contributing to the social media space either as a content provider, moderator or a guide." It will be advisable to have a trainer, who understands the business processes, is able to use social media effectively and is good in social skills. Companies--especially large ones--are slow to adopt social media to exchange experiences. It's

the whole "we-want-to-control-the-conversation" thing. But, in reality, no company can "control" it's message any more: you either let people talk and exchange ideas where you have the benefit of moderating, or people will exchange ideas on their own through a social media platform.

CONCLUSION AND DISCUSSION

The role of the human resource manager is evolving with the changing times and it becomes imperative that human resource management must play a strategic role in the success of an organization. SM is changing our world and they are here to stay. Web 2.0 and SM are becoming more widely used by organizations to increase knowledge sharing, improve collaboration and employee voice, and connect with new generations of employees (Martin et al., 2009). Successful Web 2.0 initiatives in organizations are fundamentally about shifting attitudes and behaviors. Collaboration increasingly drives value creation in organizations, but for that technology is only an enabler. As such, HR will ideally play a central role in Web 2.0 initiatives. And this is a good initiative for HR for making changes in their operational and strategic goals (Dawson, 2008). Incorporating social media into HR is important in today's globalize world, especially for international companies, where social media can play a part in centralizing data/information sharing and wisely able to use the collective wisdom of employees, customers and partners to name a few.. These are engaging powerful tools that enable employees from different regions to share information at an instant. For example, managing a regional payroll faces the challenges of meeting local legislative and cultural differences. With the use of social media, it may helps to centralize the system across the different regions by leveraging on the benefits of the interconnectedness of information technology.

The previously discussed strategies are not difficult to implement. But it is essential that someone

has been assigned the responsibility of observing the interaction that occurs on social media. Rather than seeing it as another marketing platform that can achieve a certain ROI, social media should be viewed as a valuable opportunity to directly connect and engage with an organization's potential and current customers. By keeping the fundamentals of social media in front one can be in the right place to develop a well-planned and well managed social media presence that stakeholders will appreciate, recognize, and want to be a part of. The opportunity for HR professionals is to leverage new communication media and technology platforms to further organizational objectives, is almost limitless. In the hands of HR professionals, SM can be an important tool for crafting the future of one's organization. Human resources professionals must educate themselves and their management teams, acting now to set policies, develop training and benefit from this revolutionary new communications channel (Dunn, 2009). To conclude, it will be important to remember that technology does not replace people, it enhances the ability of people to do better, smarter work that leverages more of their skills. The same holds true for SM and the HR world that collectively learn to understand the complex dynamics Of the new world of power, control and discipline.

RECOMMENDATIONS

It is crucial to understand the impact and influence which social media will have continuously in the organizations at all levels, irrespective of the hierarchies Now the time has come for the organizations to take advantage of SM services in the day to day working of the workplace, instead of putting a blanket ban in the organization. Working and interacting in a non-hierarchical workplace is the need of the time. Change agents are required to facilitate the process of desired cultural change by bringing in the paradigm shift for a new realization. Today, the need of the day

for HR professionals is to act as change agents. It is critical to remember that it needs a cultural change in the organization. The need of the hour is to have implementation of "values in use" in the organizations designed through participative decision making involving strategic partners from the employees and employers groups. It will be crucial for the organizations to remember that in today to be productive people will have to keep on learning through and with others. The productivity in the organizations will be measured by how effectively and efficiently the employees are able to finish the task in hand. The world has gone in to a new direction and it is of strategic importance to optimize it by joining hands with it to make the maximum leverage of the situation.

Chapter 25

Sources of Legitimacy for the M-Government Initiatives in Turkey:
Human vs. Technical Resource Management Concerns

N. Meltem Cakici
Gediz University, Turkey

Ronan de Kervenoael
Sabanci University & Aston University, Turkey

ABSTRACT

Emerging markets have recently been experiencing a dramatic increased in the number of mobile phone per capita. M-government has, hence, been heralded as an opportunity to leap-frog the technology cycle and provide cheaper and more inclusive and services to all. This chapter explores, within an emerging market context, the legitimacy and resistance facing civil servants' at the engagement stage with m-government activities and the direct implication for resource management. Thirty in depth interview, in Turkey, are drawn-upon with key ICT civil servant in local organizations. The findings show that three types of resources are perceived as central namely: (i) diffusion of information management, (ii) operating system resource management and (iii) human resource management. The main evidence suggests that legitimacy for each resource management, at local level, is an ongoing struggle where all groups deploy multiples forms of resistance. Overall, greater attention in the resource management strategy for m-government application needs to be devoted to enablers such as civil servants rather than the final consumers or citizens.

INTRODUCTION

Mobile government (m-government hereafter) has been heralded as an imperative for administrative processes' modernization in emerging countries (Kushchu, 2007). Although several m-government services are already available in emerging markets, provided by both private and public organizations, little is known about the formative stages and the legitimacy/ resistance (positive and negative) civil servants are encountering in their everyday activities, from a resource management perspective, in order to implement m-government applications and strategies (Abanumy & Mayhew, 2005; Ghyasi & Kushchu, 2004; Sundar & Garg, 2005; Tozsa & Budai, 2005; Prins, 2001). In this chapter, m-government is defined as the development of new technologies, applications and services in order to create an "able society" (Kushchu, 2007). Digital technologies as resource management tools used in public administration have contributed to an improved understanding of many aspects of everyday practices, especially at local level, including digital strategies (Kahraman et al., 2007; Ferguson, 2001), impact of e-culture on e-governments (Hazlett & Hill, 2003), m-government policy issues (Yildiz, 2007; Lam, 2005), service architecture (Sharma & Gupta, 2004; Abramowicz et al., 2006), e-governance (Saxena, 2005; Stahl, 2005; Holliday & Kwok, 2004) and e-government models (Heeks, 2002).

In turn, legitimacy of ICT and mobility within public administrations at local level, in an emerging market context, point to multiple possible sources (m-GovLab, MGCI, www.mgovernment.org). The literature highlights two important aspects: (i) the difference between the meanings of mobility: mobility which is driven by personal motivation/resistance and by social factors; and (ii) the difference between mobile technological innovation and the legitimacy of institutional changes.

Consecutively, mobile technologies have attracted interdisciplinary interest centered around three main areas: domestication (Goggin, 2008; Weilenmann, 2001); mobile technology and user practices (Fortunati et al., 2003; Katz, 2003); and, at a societal level, adoption with engagement in wider spheres including politics and social policies (Brown et al., 2002; Rheingold, 2002). Further related aspects include status symbols (Dedeoglu, 2004; Ozcan & Kocak, 2003), MMS/SMS social and pragmatic aspects (Chapman & Schofield, 1998; Lin & Tong, 2008; Rettie, 2007; Sharma & Sturges, 2007), networked society (Ling, 2004, Goggin, 2008), mobile devices as fashion items (Katz & Sugiyama, 2006; Hulme & Peters, 2003) and m-entertainment (Ha et al., 2007; Harmer, 2003; Pagani, 2004).

The negative aspects of mobile technologies have also been studied including issues relating to health (Foster & Moulder, 2000), addiction (Bianchi & Phillips, 2005), lack of concentration while driving or multitasking (Esbjornsson et al., 2007), increased reaction time, psychological impact of mobile consumption on children and adolescents (Döring & Gundolf, 2005) and miss-appreciation of cognitive and/or physical demand while multitasking (Goodman et al., 1999; McEvoy et al., 2005).

Based on the above characteristics, three partial gaps have been identified from the literature. First, few, if any, studies have been conducted in the context of the public services and the role of m-services. Second, most studies examining digital resource management strategies have usually been conducted at macro level rather than at local level. Third, published work on digital resource management strategy has almost exclusively focused on the so-called 'first tier' countries, with concentration on the central North American and European perspectives. Examples of the 'second tier' or peripheral regions of Europe such as Turkey are limited.

This book chapter presents the findings of a total of 30 phone interviews which were conducted with the key civil servants working within local government organizations in Turkey during the

introduction of the first concrete m-government strategy in 2008-2009. This key period coincides with the recent transition and creation of the central e-government platform, which was launched only few months before in December 2008, in order to centralize the digital government strategy.

While the e-government activities have yet to be fully understood and implemented by all local organizations, deeper technological transitions are already requiring further evaluation, attention and changes. In this context, this chapter draws on a number of concepts such as organizational development, innovation management, strategic management, and evolutionary theory of the firm and development studies (Marcelle, 2004).

This chapter is organized as follows: Section II provides a summary about digital and m-government resource management in general and regarding Turkey in particular. Section III presents the literature review on legitimacy and the impact of the forming stage framework in shaping legitimacy and resistance to new strategies. Methodology and findings are explained in Section IV and Section V, respectively. Finally, Section VI presents the conclusion.

M-GOVERNMENT BACKGROUND

Digital government is defined as the provision of traditional government services to citizens through electronic tools such as computers, telephone and other hand held devices. The Internet is increasingly becoming the channel for delivering government services to citizens and sharing information among various administrative layers and civil servants (Melitski et al., 2005). Digital databases have been created to support back-end operations that are able to provide instant and up-to-date services which are accessible anywhere and at anytime. Recent developments in mobile technologies, especially the introduction of internet enabled mobile phones (3G), PDAs, Wi Fi and wireless networks, are creating a sustainable

alternative model for managing, updating and retrieving government information and knowledge towards creating the civil administrations and administrators of tomorrow. These developments are opening a new era in public service delivery practices which is often called as New Public Management (NPM) (McIvor et al., 2002).

M-government is further defined as a strategy and its implementation, which involve the utilization of all kinds of wireless and mobile technology, services, applications and devices for improving services to the parties involved in digital government, including citizens, businesses, NGOs and all government units. In particular, mobile government gives extra added value when compared to previous methods of public service delivery, in terms of (i) lowering costs (Holden et al., 2003), (ii) increasing the efficiency of work practices, and providing the transformation/modernization of public sector organizations (Larsen & Rainie, 2002), (iii) increasing convenience and flexibility (Klein, 1999), and (iv) increasing range and types of applications (Kushchu & Kuscu, 2003). In emerging markets, active initiatives and engagements can be found in countries such as Hungary Latvia Estonia, Bulgaria, and Croatia with local referendum, road planning debate, infrastructure building competition, procurement and public health information, public administration and job advertisements as examples (http://www.epractice.eu/en/factsheets/).

More than four billion mobile subscriptions worldwide signal a great opportunity to reach and interact with broader audiences both for final user service delivery and more importantly for day-to-day resource management within public administration. For example, in Turkey, the total number of wireless subscribers is estimated to increase from 66.4 million in 2008 to 76 million in 2013 (Research and Markets, 2009). In effect, many citizens will own more than one handset.

Concurrently, examples of governance and policy delivery related activities, through which mobile phones have been used (Briseno, 2009),

include: i) SMS communication to empower people in places where censorship and violence are present; ii) social participation and advocacy purposes (the protest against former president Estrada in the Philippines, women in Kuwait advocating for the right to vote -which they ultimately won - and pro-democracy demonstrations in Ukraine and Burma are examples that have been replicated in the rest of the world); iii) voting and participatory decision making (e.g. civil society organizations have been using mobile phones for monitoring electoral processes in several countries; m-voting will soon be possible in Estonia where the Parliament approved the use of mobile technology for the 2011 elections); iv) m-government for public service delivery, which is making its case as a complementary way to reach people that remain unconnected, leads to new applications such as information consultations and requests, parking payment mechanisms and payment for local services in Malaysia and the Philippines; v) m-government is also used in data monitoring and collection in remote rural areas; vi) mobile technology has made it easier to increase civil participation and enforcement of laws; the reporting of crime in Ireland and Peru by providing real-time exchange of information between citizens and law enforcement units: In Ireland, MMS (multimedia SMS) has been used to send the photos of suspects to law enforcement agencies. In Peru, crime reporting systems have helped in the reduction of drug related crime; vii) finally, mobile technologies are also now widely used as enabling tools to save time and to be closer to citizens; benefit check, neighborhood task forces, services for the disabled and the old, as examples.

Our attention is now turned specifically to m-government in Turkey which will provide a more specific background to the analysis. The main initiatives center in the newly implemented E-government gateway (www.turkiye.gov.tr) which is a single and centrally managed website with a standard format and set of services. This platform provides detailed information about government services electronically to citizens (Table 1) and is divided into two main sections; (i) the e-government portal itself and (ii) the array of interactive e-services available.

At local level, further efforts have been made in creating and developing initiatives that provide day-to-day applications such as SMS for public announcements (e.g. regarding school activities, weather warnings, roadwork, and utilities cut) which also give information about the status of the services (Ghyasi & Kushchu, 2004). These interactive types of services allow citizens to directly receive information, updates and feedbacks.

At institutional level, rather than providing services directly to citizens, a series of initiatives and strategies such as infrastructure enabling tools (Ghyasi & Kushchu, 2004), Mobile Electronic System Integration, Traffic Information System, Mobile information Project (Ministry of education), G2G applications (mobile intranet for ministry personnel), and modernization of the National Judicial Network have been implemented (Court system integration) (Cilingir & Kushchu, 2004). After setting the scene in Turkey and demonstrating similar examples of services in other emerging countries, we now focus on the theoretical basis of this study which is formed by the concepts of legitimacy and front-loading.

LITERATURE REVIEW

Our work takes into account theories and models such as: (i) Rogers' (1995) adoption of innovation framework which identifies desirable factors for the success of a new product or innovation including relative advantage, compatibility, complexity, communicability observability and triability; (ii) theories such as the Theory of Reasoned Action (TRA) and the Theory of Planned Behaviour (TPB) (Ajzen, 1985, 1991; Ajzen & Fishbein, 1980) which provide a theoretical framework for

Table 1. E-Government gateway services in Turkey

	Service	Subjects
1	Birth	Notification of birth, registration, maternity leave
2	Education	Preschool education, primary, secondary and higher education
3	Military service	Enrollment of soldiers, military man and reserve officer operations, operations abroad
4	Job and career	Job search, employment, legal provisions, unemployment insurance
5	Social security	
6	Family	Marriage, health, register of births operations, children and young, children's rights
7	Individual and society	Women's rights, housing, traffic, civil defense activities
8	Health	Family and society health, nutrition
9	The disabled	Health, education, employment, employee benefits and services
10	Social relief and public spirit	Welfare subjects, project support programs, welfare services, the old
11	Travel and tourism	General information about Turkey, railway and highway transport
12	Environment	Forestry, nature protection and national parks, forestation, erosion check, fight against desertification
13	Culture, arts and sports	Cultural heritage, cultural activities, theaters, festivals, fairs, sports activities
14	Legal issues and rights	Legal affairs, being elector, protection of consumer rights, address registration, public notary
15	Turkish citizens abroad	e-consulate, diploma equivalence, military service, marriage
16	Foreigners	Visa and passport, travel, habitation, birth, marriage

understanding individuals' behavioral patterns; (iii) Studies by Davis et al. (1989) that consider users' acceptance of technology (Holak & Lehmann, 1990; Pagani, 2004; Venkatesh et al., 2003).

Following on from these theories and models, we now present the theoretical constructs of legitimacy and frontloading framework and link them to ICT resource management in public administration. We take a first step towards understanding: (i) how legitimacy is derived from m-resources; (ii) why civil servants decide to use or resist to certain m-resources?; (iii) how m-ICT is shaping the relationship between civil servants and formal government structures.

Legitimacy

Legitimacy, within the context of this chapter, is defined as "a generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within a socially constructed system of norms, values, beliefs and definitions"

(Suchman, 1995, p.574). Legitimacy is a multifaceted construct; both positive and negative, short term and long term. Its meaning, opportunities and limits are located both within technological development, resource management strategy and human technology relationship (Prins, 2001). These are often depicted as contentious issues whereby a polarization occurs where winners or losers have to be defined. Technology is seen, not simply as a body of practice, but as a body of understanding. As a consequence, the nature of the evaluation (deterministic modus operandi) and selection choice become more dynamic and recurrent (multi-period) and increase in scale and scope as the initial investment grows (Ziman, 2000). Furthermore, civil servants and all other types of stakeholders in the power structure, who support the acquisition or reject certain forms of technology, ought to be explicitly perceived as part of the legitimacy rationalization. They are, in effect, legitimating the intangible investment and are the guardians of the technical knowledge

and cultural learning that form the ethos of the organization (Marcelle, 2004).

Shaping new forms of governance in the mobile information age requires knowledge of dynamics of hardware (back-end) processes and structures in the public sector as well as sufficient information about the capabilities associated with information and communication technologies in order to respond to everyday needs. At this point, the degree of relative advantages, benefits and consequences of the new innovation need to be addressed. These advantages range from increase in profits to gain in social status. As an extreme position, over-adoption, which is defined as "adoption of an innovation by an individual (or organization) that experts feel he/she should reject" (Rogers, 1995, p. 215) is also found to be relevant. From a different perspective, ethical and practical obstacles, which are related pragmatically to security, fraud, liability, free access, equality and privacy, should not be underestimated (Prins, 2001, p.3).

Following Dacin et al.'s (2007) study, five dimensions of legitimacy are presented: market, relational, social, investment and alliance legitimacy. The first type of legitimacy, "market legitimacy", refers to an organization's expanding or maintaining its place in a market. When an organization enters a new market or aims to enhance its place in a new environment, strategic alliances with already successful, experienced partners approved by the local market increase the company's legitimacy in a geographical area, technology or product market. The second aspect, "relational legitimacy", is perceived as the worthiness of an organization to attract alliance partners. Once an organization is high in relational legitimacy, it is able to attract high-quality partners whose market share and experience can be shared. "Social legitimacy" as the third type leads to getting approval from others for using resources. By engaging in strategic relationships with favorable partners, one increases in social legitimacy. Social legitimacy is more important for the organizations practices of which are questioned or are undergoing radical change. These organizations contribute to further services within given communities in order to reduce opposition and boycotts. "Investment legitimacy" means that an organization is more likely to be supported by external parties by demonstrating an increased level of investment in the particular objectives sought (i.e. hardware, software and skills provision), which in turn makes the future goals more feasible to accomplish. Finally, "alliance legitimacy" is especially crucial for the markets where a history of competition and rivalry is prominent. The use of strategic alliances for increasing legitimacy in particular technologies enables organizations to reduce risk. The legitimacy interactions of an organization or an individual determine how well the resources are: (i) deployed, (ii) integrated with other activities, (iii) reducing the risk of pervasive acts, and (iv) allowing the creation of competitive advantages (Dacin et al., 2007). Legitimacy becomes central to the engagement process. Our attention now turns to the notion of front-loading.

Front-Loading

Front-loading activities are defined as being part of a strategy that seeks to improve pre-service activity performance by identifying and solving current and potential problems in the early phases of the transition process. Front loading, as a philosophy, has been applied successfully in the automotive industry and has been particularly associated with lean production methods championed by Toyota (Thomke & Fujimoto, 2000). In other areas such as team management, front-loading activities are linked to the forming stage which includes the engagement of agents or teams in specific activities (Tuckman, 1965). Other examples, where preparatory stages have been recognized as crucial, are: (i) technology acceptance, (ii) attitude towards smoking, alcohol and drugs, (iii) encouragement towards greener disposition of garbage, (iv) systematic wearing of seat belts and bicycle helmet, and (v) fishing quotas.

Front-loading strategies concentrate on 'preliminary/preparation needs' which are crucially important to legitimize engagement and logic in future cooperation and to lower potential resistance. Themes such as project scope, investment expectations, management roles, time frame, benefits, external and internal supports as examples are assessed. Reflecting this, micro-strategies are deployed to encourage civil servants' engagement in new technologies at early stages that ought to increase the likelihood of the overall outcome success (de Kervenoael et al., 2010). Significantly, individuals want to minimize unpleasant changes during the transition process towards new ICT usage and reproduce traditional processes that allow them to retain control over their everyday work routines. In turn, hierarchical setting and historical relationships between technological services and individuals have a memory effect on learning opportunities and communication style directly shaping the transition and acquisition of novel communication know-how (Gudykunst, 1993).

In most of the organizations, the conceptualization of innovation as a learning process is rather loosely applied. The precise nature of the learning that takes place, as well as how it occurs and who learns, are matters that often remain largely unexamined (Ziman, 2000, p.119). According to Holm et al. (2002), the role of ICT for the national economies is constantly increasing and careful selection of human resource management (HRM hereafter) practices has become crucial in managing the growing population of information professionals. Studies show that there have been several alternative approaches to consider depending on how the effectiveness of HRM is defined and what the expected outcomes of the best HRM bundle are.

It is further underlined that how people identify and commit to their groups and organizations should be understood from an individual point of view. Higher management strategy, on the other hand, traditionally only tackles technological transition and change issue from a deterministic functional process. A miss-match is often found between HRM strategy at individual and organizational levels shaping illegitimacy and causing resistance to engage in m-ICT before it is deployed. How individuals' future expectations are aligned with the business strategy and how they support each other are often overlooked (Holm et al., 2002).

Rousseau's (1995) model of psychological contracts provides an interesting unifying framework for simultaneous analysis of both managerial and individual views. Two fundamental terms of psychological contracts are developed namely transactional and relational. Transactional contract is based on close-ended time frame and mutual profitability. Relational contract on the contrary is based on confidence, stability and commitment. Organizational commitment is one key element which makes the difference between transactional and relational contracts. Subsequently, commitment is defined as; i) acceptance of an organization's goals and values; ii) willingness to exert considerable effort on behalf of an organization; iii) desire to maintain organizational membership (Porter et al., 1974). Furthermore, this framework contains an additional performance requirement dimension in addition to the time frame that relates to the duration of the employment relationship (Holm et al., 2002).

Front loading activities are traditionally broken up in a series of iterative steps ranging from; (i) the learning and understanding of the current standing and relationships during change; (ii) the critical evaluation and re-evaluation of current processes benchmarked against industry leaders; (iii) the design of novel structure to allow collaborative problem solving and quicker identification of emerging problems often involving feedback loops; (iv) the evaluation of expectations regarding possible outcomes; (v) the proactive recognition that individuals are fundamentally different and that more than one outcome or solution ought to be considered before finding a solution to complex dynamic issues; and (vi) setting achievable goals for the coming periods. The concept of legitimacy

and front loading will now be discussed together within the specific context of m-government.

ICT Resource Management Considering Digital Government Services

As the availability and the accessibility of information improve and cost declines, many governments are considering the Internet as the efficient way to reach to a large group of citizens. Indeed recent reforms have lead to the introduction of approaches putting greater emphasis on ICT 'as a transition from passive to an active welfare state'. Significantly, despite the importance of technologies, it is estimated that governments' ICT spending for the 2000-2010 period stands at over $3 trillion but that between 60 to 85 percent of e-government projects will fail to deliver their expected outcomes (Gubbins, 2004). On the other hand, how this dynamic setting affects the way through which government services are accessed and offered remain unanswered. What cultural and organizational changes are needed in order to manage the transition are also important issues to be addressed which remain controversial especially in emerging market conditions.

Several key characteristics are shaping the debate including: (i) civil servants' control over the interface choice in their daily administrative work at local level; (ii) human machine synergies and the re-organization of activities and tasks; (iii) cooperation, negotiation and deliberations between administrative layers, arm length public private partnerships, NGOs and the business world; (iv) regulation and standards regarding information depository, storage and access; (v) rights that protect civil servants' privacy, promote ethical and transparent practices, and create a learning organization which maximizes the common use of ICT services across all government layers. Guarantee of an acceptable level of service quality, both by individual civil servants and new hardware and software providers, has become paramount. The

integration of pre-ICT era information, the translation of administrative jargon and processes, and the match of jurisdictional structure with the new emerging ICT back end infrastructure, along with possibilities for tracking, correcting and upgrading services, are required to take full advantages of the new digital opportunities. m-ICT ought to allow, following the French example, the true creation of "the Administration á accés pluriel" (plural access to administrative services) with a greater "service de proximité" (local services or where citizens are "in the field").

In particular, m-government has been described as limiting: (i) demand to interpretation, (ii) hidden discretion, and (iii) political influence (Lenk, 1997). Such m-opportunities in turn allow a better decision making process which includes: (i) substantiation of facts by data, (ii) decision as a result of information processing, (iii) clear execution of strategy and corrective mechanisms. Significantly, m-government allows administrative cooperation: (i) over distances, (ii) across organization boundaries, and (iii) across hierarchical echelon. Technology should not be seen as the reason for resistance but only the tool which allows organizational changes (Gerst & Bunduchi, 2005).

From these perspectives, the idea of hegemony and control of power remain important. Technologies often bring radical change within organizations and power and politics are issues that cannot be neglected in the domain of m-services for municipalities (Emerson, 1962). The multiple types of shareholders ought to develop a strategic framework regarding m-governance. From this point of view, legitimacy can be re-defined as positive resistance. Resistance is, in this context, the sum of "those behaviors and cultural practices by subordinate groups within the context of hegemonic social formation that threaten to unravel the strategies of domination" (Haynes & Prakash, 1991, p.3). Legitimacy, as an m-governance issue, needs to be analyzed along a continuum including public administration history, culture and power (Hall, 1990, p 225). As a result, a novel definition

of power is emerging that is transitory, flexible and ambivalent abolishing previous boundaries and creating new territories (Law, 1997, Sack, 1986). These schematics are also utilized in Actor Network Theory giving a greater role on non-human agency and contingency (Heeks & Stanforth, 2007). Contingency represents the language, connections, flows, speed and lines of contestations. At this point, the significance of apparently apolitical standpoints cannot be overstressed. In other words, following Canel (1992), the traditional state centered locations of politics and new emerging civil society voices should not be seen as separated.

Lastly, new technical infrastructures have to be created that often involve third parties from private sector. The services and processes which are required include: (i) payment procedures, (ii) certifying agencies, (iii) protocol and interface control systems, (iv) m-signature and (v) m-legislation regarding complaints and errors. In addition, m-applications include resource management such as voice over IP, moving images, file transfer, web browsing, collaborative working, electronic agents, job dispatch, information services and still images which are all requiring 3G or GPRS technologies. Other examples of SMS/GPRS applications are email, chat, remote monitoring, instant messaging, electronic commerce, customer service and vehicle positioning.

From this perspective, the m-platform function appears more complex than originally perceived by civil servants. Simultaneously, clearer divergences from other forms of digital government such as e-government become more prominent. Indeed, many of these requirements will only become apparent during the trial period of these applications which escalate the financial risk faced by local authorities. As stated by Phipps, (2000) p 41: "A risk is acknowledged that ICT developments may reinforce polarisation and create additional division through people and communities who are 'information rich' or 'information poor', whereby the failure to get plugged-ins leads to a downwards

spiral of economic activity with associated fall outs. ICT can be seen as neutral in themselves, as an enabler. Positive and beneficial applications, enhancing democracy and accountability, are an active choice and responsibility for our society". Furthermore, increase in information intensity, access reliability, urgency of information and data interactivity need to be considered within this context.

METHODOLOGY

This research is based on a series of semi-structured interviews which were conducted in 2008-2009 as being part of a wider project. This period coincides with the initiation of the first Turkish e-Government gateway portal. Phone interviews, using the notable people methodology (Kempster, 2007), were conducted with a total of 30 ICT officers within local government organizations (municipalities) in Turkey. Each respondent was interviewed in four waves. This methodology enabled us to talk to the civil servants sufficiently despite their work load. Respondents did not receive any feedback on previous surveys' results or other respondents' comments. Each interview lasted in total between 40 and 90 minutes and was audio taped.

For each respondent, a separate within case analysis was conducted (Each author's own observation). This follows Yin's (1989) ideas of pattern matching. Second, cross case comparisons to offer consistency on the issues, themes and a holistic appreciation of the data were made (Miles & Huberman, 1994). In order to operationalize the coding based on the original broad constructs identified in the literature, the authors developed and reinterpreted their coding to reach a consensus, via a series of iterative discussions with a focus on flexibility and contextual sensitivity (Merriam, 1998).

Each wave of interviews builds on the findings of the previous interviews. Following Lee and

Cadogan (2009), "analysis proceeds concurrently with data collection and theorizing, with each having an impact on the procession of the others". Moreover, this methodology is used to determine the moment of "theoretical saturation" (Strauss & Corbin, 1998) where respondents do not add any further aspects or new themes.

Themes investigated included: (i) the current usage of ICT by the municipalities and the civil servants' awareness and perception of m-services, (ii) organizational process and day to day civil practices in terms of m-ICT, (iii) mobility and ICT capability building, and (iv) m-services resource management issues in local governments (see Appendix 1 for the survey).

FINDINGS

Three broad resource management dimensions, leading to legitimacy for adopting or rejecting to the new initiatives related to m-government, emerged as the most enduring aspects; i) *Awareness and diffusion of information management*, ii) *Operating system and resource management, and* iii) *Skill, strategy and human resource management.*

Awareness and Diffusion Of Information Management

The first group of findings was related to the concepts of awareness and information diffusion among civil servants about the current and future potential of m-municipality services (investment and market legitimacy). First, interoperability was described as key to any engagement likelihood. As compatibility, the degree at which the innovation was perceived as consistent with the existing value, past experiences and needs of potential adopters remained fundamental. Fragmentation was depicted as present both from a technical perspective (e.g. back-end architecture, middleware integration and individual applications level) and from a broader

cultural organizational perspective (e.g. process, practices, praxis). Indeed, technology was not viewed singular by civil servants. The adoption, resistance or legitimacy of a technological tool was an important precedent for current and future strategies. The boundaries around an initiative or an activity were often not clear cut which caused the perception of threats rather than benefits, at least in the short term.

"Transferability is an important issue to be solved. Coordination among the departments within the municipality is crucial"; "I think, m-municipality may benefit a certain group of citizens or civil servant, but I do not know what shall be done to widen the scope of the target audience".

Second, scalability to all services in all aspects of municipality life was not perceived as straight forward. Third, a re-engineering process towards a seamless m-municipality was required. To achieve the integration and automatic workflow services, IT offices and floor level civil servants needed greater and better communication channels. For m-government, the positioning of the innovation and the strategy at national level made an implementation difficult at local level. Not all stakeholders (e.g IT, financial, Technical providers) were indeed available in the local environment. While benefits were perceived for the civil servants acting in the field, it was recognized that few civil servants were leaving their offices. Traditional process required a citizen to come physically to the local office and not vice versa.

"Mobile government does not provide any advantage for municipalities compared to e-government. I still need to have the same technology, servers etc. But from a civil servant "in the field" perspective, it will provide a time saving practice".

Subsequently, it was felt by some of the respondents that indigenous local knowledge and specificity were forgotten. As described by Rogers

(1995) p. 240, "An innovation often commit the empty vessels fallacy by assuming the potential adopter are blank slates who lack relevant experiences with which to associate the new idea". Furthermore, cross national services provision through better content management is yet to be achieved in Turkey in other areas (e.g. school management). It was felt that the complexity of the changes was not appropriately understood as negatively related to potential legitimacy. This element was compounded by a lack of trialability and observability. These were highlighted by a number of respondents with issues such as:

"Cultural factors are important; all civil servants should adopt these mobile services, but what about local differences?"; "I think other civil servants know m-government services but I don't know whether they use them or not; does it fit what they need to work with?".

From the present perspective, further organizational integration was emerging as an underlying requirement. In parallel, a certain categorization of civil servants regarding to whom and when m-government would have impact on seemed to become a compelling necessity. The question of m-government initiatives' including all civil servants (exhaustive method) based on innovativeness degree to which a unit/jurisdiction has been subject in the past or using other methods such as starting in one service based on urgent needs and moving organically towards all services should be addressed.

"My colleagues are not knowledgeable about mobile services that much. As the IT office, we are more informed and knowledgeable now, my team (IT) knows but most of the people working in our municipality do not have detailed information about the mobile services"; "We are already using mobile devices and my colleagues know m-applications. I have information about the activities of other municipalities. My friends know

the applications which are developed by Istanbul Metropolitan Municipality. But in general I can say that there is a trust and security concern"; "Most of the civil servants are not aware of these mobile services since they are very old. Those who are aware of these services don't have detailed information about the services offered to citizens".

In particular, a strategy needed to be devised regarding private sector's roles in supporting m-municipality applications, the role of inter-personal (political) network and its influence on both individuals and organizations. Defining leaders and champions (opinion leadership) seemed particularly relevant for the informal integration of m-government and its automation components of resource management. Legitimacy was found to be important in driving m-government through clear policy statements, official documentation and political discourse.

Operating System and Resource Management

The second group of findings centered on operating system and resource management within the set of local level activities (technology robustness legitimacy). First, the cost of running back-end services for mobile applications was described as unknown. This feeling was reinforced by a lack of homogenous pricing structure for similar services by the three m-providers in Turkey. Second, supporting m-services through mobile phones was described as tricky due to the great variety of devices and operating systems. This lack of interoperability became a psychological barrier as well as a technical limit for the civil servants. Third, mobile government activities' value added was still not perceived as superior than other traditional delivery methods by most of the civil servants. This resulted in confusion over priority and usage of technological tools such as mobile phones and traditional computers.

These were described by our respondents with the concerns such as:

"There are technical issues such as the variety of mobile phones in terms of design, operating systems, technical limits and capabilities. Therefore, it is problematic to build a common m-application base structure"; "I don't think there is problem in terms of government, actually government supports m-applications. But institutions differ a lot in their policy and attitudes towards resource management. Public institutions except municipalities are dependent on national government funding waves and therefore their ability to generate m-applications is so limited"; "The problem here is that each mobile phone does not support m-services. There is a limitation, so it is not like a computer on internet. So, even if one person likes to use the m-service, he cannot do it because of his old generation mobile phone".

Another emerging issue was linked to the level of decentralization or centralization of m-government strategy. The experience of the e-Government gateway was a move towards a centralized application in Turkey. From this perspective, peer diffusion of innovation and experimentation couldn't be sufficient and the order of service priority didn't reflect local needs. Furthermore, user self reliance was encouraged in a decentralized process which is not the case currently. Yet, it was perceived that technical expertise or quality of m-service as a proxy could be easier to standardize at central level. Cost was also perceived as high; hence an impediment in a decentralized system.

"Emerging m-service quality is good but the price level limits its usage along with security issues. Mobile signature application should also be improved"; "In mobility, cost of using a service is important (3G phone acquisition and daily use). Besides, I do not prefer to use my mobile phone for a service if I can have access to the same service free of charge through a municipal (work phone) provided device. I think the main problem is the cost also for us civil servants". "Similar to e-government, m-government will also provide labor cost reductions. It provides a better allocation of government resources. Moreover, compared to e-government, m-government will enable us to deliver public services to everyone, even to those who cannot use computers".

While implementations at local level within day to day activities were emerging, stronger strategic perspectives were required to allow legitimacy of investment both in terms of ICT resources and service range and depth. Civil servant layers within any country should not been seen as homogenous. Civil servants at public administrations, rather than the ones at organizations, do not always work together to achieve common goals. The hierarchy of power is having a deep impact on the politics that shapes each layer. M-government is related not only to internal organizational structure, characteristics of organizations and public administrations' adoption of change but also to individuals' uniqueness. We now turn our attention to this.

Skill, Strategy and Human Resource Management

The third group of findings included concepts which were related to individuality, level of confidence with ICT and strategic tools that were used to persuade civil servants to engage in m-technologies' tools and services for their daily activities at the municipalities (social and relational legitimacy). Easy learning, convenience and accessibilities were important factors. Compared to usual computers, m-devices were described as: (i) accessed anytime and anywhere, (ii) always switched on and carried around, (iii) more precise at delivering instant up to date content to relevant individuals, and (iv) more confidential since a person does not usually share mobile phone. Implications were profound in terms of

responsibility and control mechanism. The older generation perceived risk as they traditionally did not engage in technological changes and had control over the tasks.

"I think Turkish civil servants will be able to adapt to any technological developments On the other hand, technology improves so fast that older colleagues do not follow. We are curious to learn about new technological tools but usually we do not have the education and technical background to learn quickly how to use these tools efficiently, immediately".

As a secondary perspective, the findings highlighted that civil servants could be convinced to invest in m-services if a series of themes were clarified at strategy level; (i) both the civil servant users and the technical service providers need to demonstrate readiness to implement m-applications; (ii) the timing or intensity of change needed to be made by consensus; (iii) the issues such as the ranking of m-services within the whole array of digital services and the people who will make the decision regarding adoption or rejection were perceived to be political rather than technical; (iv) the impact on municipalities' service delivery regarding efficiency and effectiveness remained too vague. Evaluation of the progress or the consequences of failure on the achievement of the targets were important. Typically respondents described issues related to skills and strategy making in the following ways:

"If a municipality has budget to train us and qualified employees are recognized, then it is easy to build the required infrastructure for m-municipality. In addition, young personnel can learn technological tools more easily than the old can do that should accelerate the change in culture towards ICT resource management"; *"How is all that going to be assessed? Against which criteria and by whom?"; How fast will decisions be taken?".*

Interestingly, these issues were echoed in other countries as a source of legitimization for engaging in m-government. In Turkey, the changing working patterns of civil servants regarding more 'in the field' and 'closer to the citizens' as opposed to the traditional 'behind desk' position need progress.

CONCLUSION

"One of the greatest pains to human nature is the pain of new ideas. It … makes you think that after all, your favorite notions may be wrong, your firmest beliefs ill founded … Naturally, therefore, common men hate a new idea, and are disposed more or less to ill treat the original man who brings it". (Bagehot, 1999 as cited in Rogers, 1995, p. 335)

This chapter proposed an approach that examined civil servants as resisting gate keepers of the new promising applications of m-government. Civil servants' perspectives on the concepts surrounding legitimacy and resistance in the early stages of an m-government strategy were presented including market investment, technological robustness, social and relational legitimacy. The findings of this exploratory study indicated that the legitimacy of m-government services -in Turkey- is multi-factorial. Thus, it should be better understood that m-government resource management ought to take into account the emotional management of civil servants at local level as well as the overall organizational change brought by the concept of mobility both at national and local level. Mobility is understood more as how local governments can provide a better social infrastructure through mobile applications and services than technological tools per se. While digital government has been an important step taken by most of the governments, provision of services through mobile technologies is now inevitable and needs to be managed not only from a citizen centric perspective but also taking into account civil servants' expectations.

Although previous research concentrated mainly on macro strategy level from a citizen perspective, we argue that more interest should be given on civil servants and ICT supply chain issues.

From these perspectives, it is pertinent to consider the global policy landscapes and the convergence between countries in the widening of ICT usage which makes the engagement in innovation more important for Turkey and other emerging countries. At this moment, it is obvious that mobile services are rapidly emerging as the new frontier of change in transforming government from within. As more advanced mobile devices are becoming common and faster rates of data transfer are possible, more useful and higher value-added mobile services will be expected from all levels of governments. For this reason, understanding civil servants' legitimacy and resistance to mobile technologies and applications has become more important. Furthermore, from a resource management perspective, an evolution needs to occur that takes into account both human and technical issues which are related to change in non-homogenous organizations.

In a nutshell, the objective of this chapter was to investigate the perception of the civil servants, who are working at local level, regarding the potential for m-government services. Our findings indicated that there are many issues that influence civil servants' legitimacy to engage in or resist to m-government services. Frontloading activities at local level and national level were found to be important steps towards making m-governments' resource management initiatives successful and beneficial for both the citizens and the civil servants. Legitimacy regarding the perception of m-municipality services, mobile tools and technologies, as prerequisites for further improvement and growth in information communication technologies, was emphasized. More action is needed in order to increase the awareness and knowledge of civil servants currently delivering m-municipality services. Thus, further research should look at various types of civil servants from a qualitative perspective in order to elicit detailed issues in practice which are related to the emerging mobility phenomenon.

APPENDIX : SUMMARY OF THE SURVEY INSTRUMENT

Wave one investigated the ICT adoption by the municipalities and civil servants' awareness and perception of m-services?

Q0 Can you provide us general information about your municipality's characteristics regarding ICT usage?

Q1 Can you summarize your municipality's ICT activities over the last 5 years?

Q2 How do you evaluate if there is a demand for mobile services?

Q3 How do you perceive the use of mobile phones for your daily tasks?

Q4 What is the most important benefit of being mobile as a civil servant?

Q5 What may be the key problems related to using mobile phones for public administration work, and from an individual user perspective?

Wave two explored organizational processes and possible causes of resistance to ICT.

Q0 What are the effects of the following barriers on your municipality's usage of ICT?
   ◦ Errors/defects in supplied equipment hardware and software
   ◦ Lack of flexibility considering ICT suppliers
   ◦ Lack of integration between applications
   ◦ Lack of qualified staff in the municipality
   ◦ Difficulties to recruit or retain ICT qualified staff
   ◦ Reluctance among staff to use ICT
   ◦ Municipality's lack of updated ICT strategy
   ◦ Lack of commitment by management
   ◦ Cost of adoption of ICT

Wave three investigated the concept of ICT capability building relating to m-services in particular.

Q0 What types of initiatives have been undertaken to introduce m-government to civil servants in your municipality?

Q1 At an individual municipality level, how are you preparing to explain the future development of m-government services? Why? Why not?

Q2 Can you describe the current ICT capabilities from a technical perspective and from a civil servant user perspective? How is technological change rationalized?

Q3 Set of questions on ICT expertise location*

Q4 Set of questions on trust in other knowledge regarding ICT*

Q5 Set of questions on coordination of ICT knowledge*

*Q3-5 adapted from Kanawattanachai, P. (2002). Formation and development of socially-shared cognition and its impact on performance of virtual teams over time. Doctoral Thesis, Department of Information Systems. Case Western Reserve University.

Wave four concentrated on the concept of m-services' resource management issues in local governments.

Q0   In your opinion, which factors influence the management and legitimacy of m-services resources, both considering technical and human factors?

Q1   How does civil servants' perception of mobility affect the resource management process?

Q3   How do you think the political pressures are shaping m-government adoption? Why? Why not? Benefits/problems?

Q4   Do you perceive any power-control issues arising from the new possibilities and opportunities offered by m-government?

Chapter 26
Promoting Digital Competences through Social Software:
A Case Study at the Rovira i Virgili University

Teresa Torres-Coronas
Universitat Rovira i Virgili, Spain

María Arántzazu Vidal-Blasco
Universitat Rovira i Virgili, Spain

ABSTRACT

In the present landscape of technological change there is increasing awareness of the need to support the acquisition of digital competences. In this chapter, we address how digital competences can be developed through formal learning. We show how to design a web 2.0 learning experience that was undertaken at Universitat Rovira i Virgili[1] and which developed both digital competences and management knowledge. In particular, the case presented focuses on the field of gender equality within the framework of labor relations in a non-real company created for this purpose, "Quadratonics SA". Through Quadratonics', web 2.0 tools and social software students improve their digital competences and, at the same time, are exposed to the most up-to-date innovations in ICT. Our final reflection is that higher education academics should continue to expand their awareness of web 2.0 applications and the role they can play in optimizing learning and knowledge creation among students, who will be the digital workers of the future.

INTRODUCTION

Information and communication technologies (ICT) are currently playing a key role in the education arena, from primary school to higher education and adult learning. Nowadays, campuses are networked, faculty post their notes on web pages, students access the library from their rooms, and entire classes can have discussions via chat software (Rice-Lively, 2000). This development was labelled under the now commonly accepted term

e-learning, which is evolving to new models such as mobile learning.

The European e-Learning Action Plan 2001 (European Commission, 2001) defines e-learning as the use of new multimedia technologies and the Internet to improve the quality of learning by facilitating access to resources and services as well as remote exchanges and collaboration. This requires new e-interaction and e-communication competences and a reorganization of e-learning structures. The components of these structures include content delivery in multiple formats, learning management, and a networked community of learners (Gunasekaran, McNeil, & Shaul, 2002). Internet/World Wide Web have meant that opportunities have been identified for developing distance learning activity into a more advanced online environment known as Virtual Learning Environment (VLE). Higher education institutions devote substantial resources to providing students with access to internet-based information, VLEs and other forms of e-learning. These efforts are predicated upon the assumption that "university students are inherently inclined towards using the internet as a source of information within their day-to-day lives and, it follows, disposed towards academic use of the internet" (Selwyn, 2008, p. 12).

In a fast moving technological environment, the traditional approach to e-learning is currently changing from the use of VLE to learning 2.0, an approach that combines complementary tools and web services—such as blogs, wikis, podcasting, videoblogs, and social networking tools—to support the creation of ad-hoc learning communities. In this context most of the current research tends to be concerned with the potential of the worldwide web and other internet applications to accelerate university students' learning and knowledge-building, and support interactivity, interaction and collaboration (Selwyn, 2008).

This chapter aims to provide an introduction to the application of web 2.0 tools and social software on the learning process. Social software

has emerged as a major component of the web 2.0 technology movement. But, how can social software play a role in higher education? To answer this question, this proposal focuses on the role of web 2.0 technologies in promoting learning and the development of digital competences among students. A pedagogical application at the Rovira i Virgili University (URV) which stems from the provision of collaborative knowledge discovery, is discussed in depth. At the same time, the chapter explores the concept of digital competence from the perspective of the competence needs of the labour market and, the role that social software plays in the learning process. Finally, some suggestions are made for future research in this field.

BACKGROUND

Social Software, ICT and Learning 2.0

The term social software includes a large number of web 2.0 tools used for online communication: for example, instant messaging, text chat, internet forum, weblogs (or blogs for short), wikis, social network services, social guides, social bookmarking, social citations, social libraries and virtual worlds. O'Reilly (2003) describes web 2.0 as an "architecture of participation" in which collective intelligence generates a "network effect" leading to websites that become more valuable as more people participate. For McGee and Begg (2008), web 2.0 "represents a group of web technologies with a user-centric focus that actively change and evolve with user participation." (p. 164). According to De Pablos (2007), social software refers to the "use of computer-mediated communication for forming communities: a web-based application is made available to a multitude of users contributing and sharing information." (p. 22). From these definitions, two basic characteristics of social software can be derived:

1. They provide support for communicative interaction, either in real time (e.g. chats) or delayed time (e.g. email).
2. They provide support for social networking, so that knowledge can be shared and constructed collectively.

The educational potential of these changes require a "thorough rethink of both the individual and collective dimension of the teaching-learning processes, rhythms of learning, new ways of structuring information for the construction of knowledge, and the tasks and competences of teachers and students " (De Pablos, 2007, p. 21), and the development of on-line learning activities based on collaborative work (Landeta, 2007). In higher education, social software is now seen as a tool that offers learners access to learning experiences which are based on active participation rather than passive reception and new forms of knowledge creation. The use of Web 2.0 tools and social software at the University is a strategy for a change towards the continuous improvement of education (Guzman, 2008) and a new culture sustained on the connectivism developed by Siemens (2004), in which knowledge is generated by means of a participatory culture or 2.0 learning.

2.0 learning involves using the web 2.0 and a variety of technological tools, mainly located on the web, for teaching and learning (Comba & Toledo, 2009). According to Cuesta Morales (2008) it is a type of learning that: (1) is not based on objects and content that is filed away; rather it is a stream that flows, which we can join whenever we want; (2) focuses on the user; (3) is carried out by immersion (learning by doing); and (4) is connected, based on conversations and interactions, that take place through social networks or virtual communities. For Haro (2009) the added value of such networks in the learning process resides in the effect of social attraction for the student—it brings informal learning closer to formal learning and private life closer to teaching life—and the simplicity of a communication model that allows

for "unlimited interaction and multidirectional communication processes" (Cabero & Llorente, 2007, p. 112).

2.0 learning takes place within a sociocultural system in which people use technology to interact and learn collectively bargaining, thus encouraging lifelong learning. Some examples of how social software can help to encourage learning are (McLoughlin & Lee, 2007):

- *Connectivity*: Social networks like MySpace, Facebook and Friendster facilitate the connection between people by creating spaces of affinity in which people can acquire social and communication skills. These networks are places of informal learning that contribute to digital literacy.
- *Finding and sharing information in a collaborative fashion.* There are a wide range of new possibilities for sharing information. Social bookmarking services such as del.icio.us or Digg make it possible to create, classify and organize collections of web resources. Thus, users with similar interests can learn from one other and contribute to the growth of web-based content and knowledge.
- *Creating content:* The Web 2.0 stresses creating content above and beyond mere consumption. Anyone can create, organize and share content. Wikis allow individuals to work together to generate new knowledge by openly publishing documents.
- *Aggregating information and knowledge, and changing content*. The *Really Simple Syndication* (RSS) systems and related technologies such as podcasting and vodcasting (which involve syndicating and aggregating audio and video content, respectively) are an indicator of how material can be collected from different sources and then put to personal use. The content can be easily reformulated (mashup).

In short, as Maenza and Ponce point out (2008, pp. 4-5) these new environments are contributing to an educational transformation which implements, with no major problems, Piaget's concepts of constructivism and Vigostsky's social interaction: permanent, collaborative and active learning, in which learners are responsible for their own learning. At the same time, however, information technologies are an instrument of support and reinforcement in teaching innovation (Salinas, 2004). The new technologies make a new university model possible which promotes 2.0 learning. According to Thompson (2007), students who have grown up with the Web 2.0 (the so-called digital natives or "Web Generation Students") will eventually reform the higher education institutions.

Esteve (2009) expressed himself in similar terms and pointed out that the Spanish university, in the middle of the process of adapting to the EHEA, should continue to renew its educational methodologies and, ultimately, continue the process of change of the educational paradigm. The driving force of the ICT and the revolution of the social tools are somehow reshaping the personal learning environments of the students and generating new horizons for the development of new competences of future graduates.

As is well known, the EHEA places the student at the centre of teaching-learning process. This shift in the educational paradigm is related to a methodological change that stresses the student's active role, initiative and critical thinking. In this new context, which focuses on the student and the attainment of competences, as we have already pointed out, the information technologies play a key role, providing new contexts and possibilities for the development of these skills. In this chapter we shall explain how to carry out these processes of educational innovation and develop digital competences.

Exploring the Concept of Digital Competence

All the changes involved in the information society make new demands of individuals, because they need to acquire competences that are qualitatively different from those required just one decade ago. The information society requires new knowledge, new skills and, above all, new attitudes, which can be grouped under the term digital competence, and it also requires individuals to be able to use technology interactively. As stated by the OECD's Definition and Selection of Competences (DeSeCo) Project (http://www.oecd.org/edu/statistics/deseco) the interactive use of technology requires an awareness of new ways in which individuals can use technologies in their daily lives. ICT can transform the way people work together (by reducing the importance of location), access information (by making vast amounts of information sources instantly available) and interact with others (by facilitating relationships and networks of people from around the world on a regular basis). To harness such potential, individuals will need to go beyond the basic technical skills needed to simply use the Internet, send e-mails and so on. The twenty-first century must prepare graduates for the technology-enabled communication that has transformed the world into a global community, with business colleagues and competitors as likely to live in India as Indianapolis (Partnership for 21st Century Skills, 2003).

The "*Key Competences for Lifelong Learning European Reference Framework*" (European Parliament and Council, 2005) defines a digital competence as the "the confident and critical use of Information Society Technology (IST) for work, leisure and communication. It is underpinned by basic skills in ICT: the use of computers to retrieve, assess, store, produce, present and exchange information, and to communicate and participate in collaborative networks via the Internet." (p. 7). Digital competence requires a critical and reflective attitude towards the information available

and responsible use of the interactive media. An interest in engaging in communities and networks for cultural, social and/or professional purposes also supports this competence. Higher education institutions and academics are responsible for fostering this interest among students.

This definition is important in that it lists five critical components of ICT literacy: access (knowing how to collect and/or retrieve information), Management (applying an existing organizational or classification scheme), integration (interpreting and representing information, including summarizing, comparing and contrasting), evaluation (making judgments about the quality, relevance, usefulness, or efficiency of information), and creation (generating information by adapting, applying, designing, inventing, or authoring information). However, apart from the ICT literacy needed to manage information, learners need additional competences to react to the challenges of a digital society. Siemens (2006, p. 113) lists the following:

- Anchoring: Staying focused on important tasks while undergoing a deluge of distractions;
- Filtering: Managing knowledge flow and extracting important elements;
- Connecting with each other: Building networks in order to continue to stay current and informed;
- Being human together: Interacting at a human, not only utilitarian, level to form social spaces.
- Creating and deriving meaning: Understanding implications, comprehending meaning and impact;
- Evaluation and authentication: Determining the value of knowledge and ensuring authenticity;
- Altered processes of validation: Validating people and ideas within an appropriate context;

- Critical and creative thinking: Questioning and dreaming;
- Pattern recognition: Recognizing patterns and trends;
- Navigation of the knowledge landscape: Navigating between repositories, people, technology, and ideas while achieving the intended purposes;
- Acceptance of uncertainty: Balancing what is known with the unknown to see how existing knowledge relates to what we do not know;
- Contextualizing: Understanding the prominence of context, seeing continuums, ensuring that key contextual issues are not overlooked in context-games.

All these digital skills go beyond obtaining, evaluating and using information. They are the basis for students to demonstrate creative thinking, construct knowledge and develop innovative products and processes. They are the competences that allow students to use digital media and environments to communicate, and work and learn collaboratively. They enable students to use the skills of critical thinking to plan and manage projects, solve problems and make informed decisions with the appropriate digital tools and resources. In short, digital competence is the ability to understand and express by making analytical, productive and creative use of the information technologies and social software to transform information into knowledge.

Working in the Digital Era: New Competence Requirements

In a society of increasing individualism, social networks are providing a communication fabric that allows people to interact with great intensity within their organizations. In a survey conducted by the Economist Intelligence Unit and sponsored by KPMG International, executives from different

sectors agreed that the adaptation of Web 2.0 tools could offer benefits in key areas (Matuazak, 2007):

- *Greater collaboration*. Most Web 2.0 technologies connect people and facilitate cooperative work, thus encouraging the exchange of knowledge and information. This sort of collaboration may help us to improve decision taking and solve problems more effectively.
- *Innovation*. The Web 2.0 tools can make it possible for a wider range of collaborators to take part in research and development (R+D) activities. Thanks to these tools, R+D may become more inclusive.
- *Improved productivity*. The Web 2.0 tools have the potential to create a network effect that will improve the quantity and the quality of work.

Undoubtedly, Web 2.0 tools and social software can increase the commitment of the members of an organization (Dawson, 2009). The improvement in internal communication systems helps information to be sent more efficiently and improves communicative skills. The main reasons are that the Web 2.0 tools encourage basic collaborative behaviour in knowledge-based work environments and that learning and development are more effective with 2.0 tools that provide easier access to new knowledge because they encourage learning processes based on connectivism as it is understood by Siemens (2006).

Working in the digital age means that, more than ever before, it is necessary to understand how organizations make use of 2.0 tools and social software in the various areas of their activity. In 2007, the survey *Enterprise 2.0* of KPMG International revealed that sales and marketing, information and research, information technology, customer service, and strategy and business development are the areas that make most use of Web 2.0 tools. Companies can go to a specific blog and see whether their products are being

questioned or praised. Present-day companies, then, cannot ask themselves if this is a fashion that will last or not: they simply have to be aware that the Internet can destroy a brand, so they have to be a part of it to defend their products. And they can be a part of it by participating in the Web 2.0.

There are more and more 2.0 companies every day. Procter & Gamble, for example, use RSS systems to give news and information about the company, they publish wikis to encourage cooperation and blogs to communicate and share. Procter & Gamble also created a social network that enables its staff to find experts in specific knowledge areas (Hoover, 2007a). For its part, Motorola uses more than 4000 blogs and wikis, and nearly 3000 people are actively involved in creating content by means of social bookmarking (Hoover, 2007b). The blog McDonald's "Open for Discussion" blog brings together all those interested in corporate social responsibility. Customers, suppliers and employees all make contributions (Scott, 2007).

All these initiatives depend on the professionals who work in companies and this is where the importance of being a 2.0 professional lies. Professionals in the age of knowledge and connectivity:

- Understand the dynamics of the Enterprise 2.0 model and of a network economy in which interactive dialogue with clients has become the key to keeping clients faithful.
- Have the skills to work in the knowledge economy, master the language of the information and communication technologies, and know how to use them to discover opportunities within their organizations.
- Can cope with the challenge of hyperconnectivity in network economy communications with the purpose of making collaboration an efficient work tool that enables the power of collective intelligence to be exploited.
- Are constantly aware that business decisions must take into account the needs

of society and sustainable economic development.

These new demands of the labour market mean that the processes for evaluating the competences of higher education institutions need to be adapted to include digital competences in a framework of general competences and independently of the particular qualification. It is on the basis of these ideas that the teaching innovation experience summarized below was planned.

A CASE STUDY AT THE ROVIRA I VIRGILI UNIVERSITY

Rovira i Virgili University Competence Framework

Organizations are using competence models to "clarify organization-specific competences to improve human performance and unify individual capabilities with organizational core competences" (Rothwell & Lindholm, 1999, p. 104). Competence models can be used as a recruitment and selection tool, as an assessment tool, as a tool to develop curricula and training material, as a coaching, counselling and mentoring tool, as a career development tool, and as a behavioural requirement benchmarking tool (Yeung, Woolcock & Sullivan, 1996). The European Higher Education Area is an education model with a competence-based approach, which aims to ensure that the competences taught are those that are required in the workplace. Thus, the goal of any competence-based education is to ensure that learning is transferred to the workplace. It involves an extensive process of identifying relevant competences, after which learning activities need to be developed. In this context, the ability to choose and use appropriate ICT and social media is becoming a necessary competence for academics.

A deep understanding of what is required by the labour market needs to be matched by a common understanding of the learning outcomes achieved in different courses and degrees. Synthesising the available literature, Andrews and Higson (2008) have identified the following key 'transferable' competences that are integral to graduate employability: professionalism; reliability; the ability to cope with uncertainty; the ability to work under pressure; the ability to plan and think strategically; the capability to communicate and interact with others, either in teams or through networking; good written and verbal communication skills; information and communication technology skills; creativity and self-confidence; good self-management and time-management skills; a willingness to learn and accept responsibility. In turn these are attested to by different qualifications. The URV competence framework is a key step towards increased transparency in the competence market. Competences, which enable student to succeed and to have a university degree, will also enable them to prosper throughout their professional careers. The development of competences must be maintained and reinforced by higher education institutions.

The Rovira i Virgili University competence framework was first implemented in the academic year 2003/04 to adapt its curricula to the European Higher Education Area. The proposed competence framework divides student's competences into three different types: specific (A), transverse (B) and nuclear (C) (see Table 1 for a definition). Within each competence, various levels of mastery can be formulated. These levels express the degree of achievement of a competence throughout a degree, a course or a planned activity.

The development of competences has a complex structure. As an initial working proposal, the URV has established the competences displayed in table 2 for a variety of disciplines, as is described in the document "Guías para trabajar y evaluar las competencias transversales/nucleares en las titulaciones de Grado" ("Guide for developing and evaluating the transferable/core competences

Table 1.Definition of competences

COMPETENCE	DEFINITION
Specific	Set of competences related to the knowledge (*knowing and understanding*) and skills (*knowing how to act*) of each degree. They are not transferable to other professional fields not connected to the knowledge area.
Transferable	Set of competences related to attitudes and values (*knowing how to be*) and, procedures (*know how*). They can be transferred from one specific professional field to another.
Core	Set of basic competences required by all URV students, which may be knowledge, attitudes and procedures

Table 2. Core and transferable competences at the Rovira i Virgili University

CORE COMPETENCES		TRANSFERABLE COMPETENCES	
C1	Intermediate knowledge of a foreign language, preferably English.	B1	Learning to learn
C2	Advanced user knowledge of the information and communication technologies.	B2	Ability to effectively solve complex problems.
C3	Ability to manage information and knowledge.	B3	Ability to apply critical, logical and creative thinking and to show innovative capacity.
C4	Ability to write and speak correctly one of the two official languages of the URV.	B4	Ability to work autonomously with responsibility and initiative.
C5	Ethical and socially responsible behaviour as a citizen and a professional.	B5	Ability to work cooperatively as part of a team and sharing the responsibility.
C6	Ability to define and undertake the academic and professional project proposed by the University.	B6	Ability to communicate information, ideas, problems and solutions clearly and effectively in public or in specific technical fields.
		B7	Sensitivity to environmental issues.
		B8	Ability to manage technical or professional projects.

in bachelor degree qualifications") (Rovira i Virgili University, 2009).

Once the competences to be developed in the academic curricula of the various degrees have been agreed on, learning outcomes must be determined as an explicit statement of what students must have achieved by the end of the teaching-learning process. Students will be evaluated on the basis of these competence-based learning outcomes. If the outcomes are well defined, students will be made aware of what they need to learn, and teachers will be able to reflect on which knowledge, procedures and attitudes need to be taught and assessed. These procedures, attitudes and knowledge are defined by the demands of the labour market and the new competences required of the workers of the digital age.

Adapting the URV Competence Framework for Digital Competence Assessment

The experience described here has focused on developing the digital competencies related to competences C2, C4 and B5 in Table 2. Tables 3 to 7 present the definition and the descriptors for the skills that we have evaluated, and which have been chosen because of their relation to the development of skills for the use of social software. In this regard, it is important for students to have an advanced user knowledge of ICT, to know how to adapt their communication style to the new technological environment and, at the same time, be able to work collaboratively in virtual teams. The EHEA prioritizes collaborative work as a transferable competence in order to promote

independent, committed learning that is in tune with the changing needs of businesses today.

The Added Value of "Quadratanics, SA" as a 2.0 Learning Experience

Using the competence framework described, we analyze how digital skills can be developed through formal learning. In particular, we present a Web 2.0 learning experience carried out at the Rovira i Virgili University. The course, entitled "The Development of Professional Competences for Professionals of the Digital Age: Use of Social Software and 2.0 Web Tools" was taught completely in digital format. The students who participated in the experiment had specific learning targets about the world of management and they

Table 3. C2 Competence: Definition and learning levels

C2. ADVANCED USER KNOWLEDGE OF THE INFORMATION AND COMMUNICATION TECHNOLOGIES			
The URV has divided this competence into three areas: computer hardware, the operating system and specific software, focusing on the use of the computer as a communication tool. This third area can also be divided into two: software for off-line communication and software for on-line communication.			
LEARNING OUTCOMES (2)	**DESCRIPTORS (1)**		
	1	**2**	**3**
Can use software for off-line communication.	Is aware of the existence of text editors, spreadsheets and digital presentations	Uses basic tools for editing texts, spreadsheets and digital presentations.	Adapts software to personal needs
Can use software for on-line communication: interactive tools (web, Moodle, blogs, etc.), e-mail, forums, chats, videoconferences, collaborative work tools, etc.	Is aware of the existence of Internet and the basic tools: web navigator and e-mail.	Uses ICT for work purposes.	Habitually uses ICT and adapts them to personal needs.

(1) Descriptors are used to assess student work which cannot be evaluated with complete objectivity. Scores are always given on a scale of 1 to 3.

(2) The learning level displayed in the table refers exclusively to the third area of the competence, which is the area that has been used to evaluate the development of digital competences. In our case the evaluation has focused exclusively on the use of software for on-line communication.

Table 4. C4 Competence: Definition and learning levels.

C4. ABILITY TO WRITE AND SPEAK CORRECTLY ONE OF THE TWO OFFICIAL LANGUAGES OF THE URV			
General URV definition: competence related to the ability to produce oral and written texts with the characteristics of grammatical accuracy, textual cohesion and communicative appropriateness			
LEARNING LEVEL	**DESCRIPTORS (1)**		
	1	**2**	**3**
Can produce a written text that is appropriate to the communicative situation (1)	The type of language used is deficient in regard to the degree of formality and the channel. The text does not respond to what was asked.	The type of language used has some deficiencies in regard to the degree of formality or the channel, some information may not be entirely relevant or some essential information may be missing.	The type of language used is appropriate to the degree of formality required by the channel and it is maintained throughout the text. The information is appropriate and relevant to what was asked.

(1) Because it is an on-line course, it was decided to choose a single learning level related to the need to adapt the written text to the communicative situation. In this case it is on-line communication using the web as a channel, which requires a different communicative written style.

Table 5. B5 Competence: Levels of Mastery

B.5. ABILITY TO WORK COOPERATIVELY AS PART OF A TEAM AND TO SHARE THE RESPONSIBILITY	
URV general definition: Ability to work as part of a (interdisciplinary) team, as a member or supervisor with the purpose of undertaking projects with pragmatism and responsibility, accepting commitments and respecting the resources available.	
LEVEL OF MASTERY	**DESCRIPTION**
First level	Ability to participate and collaborate actively in the tasks of the team and to promote confidence, cordiality and focus on the joint task.
Second level	Ability to contribute to the consolidation and development of the team, by encouraging communication, the balanced distribution of tasks, internal climate and cohesion.
Third level	Ability to direct work groups, ensuring that members integrate and perform to a high standard.

Table 6. B5 Competence: Levels of mastery and learning outcomes

LEVELS OF MASTERY	LEARNING OUTCOMES
First level	Students: Identify the collective objectives of the group with their own Collaborate in defining, organizing and distributing the tasks of the group Actively take part and share information, knowledge and experience Make their individual contribution before established deadlines and with the resources available. Bear in mind the points of view of others and give constructive feedback
Second level	Students: Accept and respect the rules of the group Contribute to establishing and applying the team's work processes Act constructively to solve conflicts Contribute to the cohesion of the group with their way of communicating with and relating to others Are interested in the importance of the group's activity
Third level	Students: Take an active part in planning teamwork, distributing tasks and setting deadlines Lead meetings efficiently Propose ambitious and clearly defined objectives Facilitate the positive management of the differences, disagreements and conflicts that emerge in the group Encourage all members to commit themselves to managing and running the team.

Table 7. B5 Competence: Definition and learning levels for the third level of mastery

B.5. ABILITY TO WORK COOPERATIVELY AS PART OF A TEAM AND TO SHARE THE RESPONSIBILITY (THIRD LEVEL OF MASTERY)			
LEARNING LEVEL (1)	**DESCRIPTORS**		
	1	**2**	**3**
Ability to take an active part in planning teamwork, distributing tasks and setting deadlines	Improvises the planning and the deadlines are not realistic	Correctly plans the distribution of tasks and sets reasonable deadlines	Encourages other members to participate by coordinating their contributions
Directs meetings effectively	Coordinates meetings inefficiently (time, commitments, results)	Coordinates meetings appropriately	Coordinates meetings effectively and achieves the objectives and the commitment of the group members
Facilitates the positive management of the differences, disagreements and conflicts that emerge in the group	Cannot redress the differences expressed	Copes with conflicts by dealing with the contributions of the various team members and the differences between them	Copes with conflicts by explaining that differences are enriching and gets all team members to reach agreements

(1) In the particular case of competence B5, the three learning levels in the table have been chosen. Working with 2.0 tools and social software requires developing digital competencies related too n-line teamwork, which affects everything from the way in which the work must be planned to conflict management.

used ICTs and social software as support tools to create knowledge.

This experiment in teaching innovation, aimed at exploring the power of 2.0 learning, arose out of the idea that this teaching methodology solves two basic problems: firstly, it helps students to learn about the world of management and, secondly, it enables them to develop the skills they need to work in the digital age. The result of this process is that students create social capital and become digitally literate in Web 2.0 tools and social software. The case that was studied in the summer course, from the point of view of management, was equal opportunities in labour relations at a fictitious company created for this purpose, Quadratonics SA.

Forty students were enrolled in the online course. They worked in virtual teams. The contexts for learning in this course were interactive, collaborative, multi-disciplinary and student-centred. Students were required to solve a multimedia case, entitled "Quadratonics SA" (available at http://quadratonics.awardspace.com/.). Quadratonics SA uses a connectivist learning approach, provides an interactive learning experience, supports the development of 2.0 competences, encourages student creativity, relates academic and workplace competences, promotes the use of ICT and social

software, encourages on-line collaboration and fosters changes in the learning process.

The course was held online in July 2009). Moodle[2] served as the online learning environment. The course was divided into three learning modules (Learning about web 2.0 and social software, Enterprise 2.0 and, Labour relations 2.0). All the theoretical and conceptual aspects presented and the instructions about the work that had to be done were posted on Moodle at the very beginning of the course.

The general purpose of the course was to provide students with an overview of the Web 2.0 world by working with technology 2.0 and social software. Because they worked with these tools, students were expected to develop competences 2.0 and understand how to apply this technology to solve business problems. Rubrics related to competence development were designed for student assignments (see Table 9), which made student grading fairer. The students worked in teams and had not met each other before the course. The members of the team of instructors all had different backgrounds to maximize the mutual learning experience. The final project report required teams to present their results using a blog.

The methodology used to achieve the overall aim of the project was based on social interaction,

Table 8. Pedagogical criteria for Quadratonics course design

CRITERIA	DESCRIPTION
Use of technology	Interactive content to increase student motivation and the development of digital competences.
Versatile use	The case of Quadratonics SA can be easily adapted to different degrees or curriculums.
Flexibility	Quadratonics SA is a general experience in which digital competences can be applied. It provides the opportunity for students to develop.
Interdisciplinarity	The content of Quadratonics SA is interdisciplinary: for example, business management, human relations, accountancy and ergonomics. It can be used by both social science and engineering students.
Social connectivity/e-collaboration	Quadratonics SA focuses on e-collaborative interactions between students. Students learn from each other in learner-to-learner interactions.
Real-world application	Quadratonics SA highlights real-world applications of Web 2.0 technology and social software.
Personal identification	Quadratonics SA enables digital native students to apply social software in ways that relate to their own interests.
Learning model	Social constructivism and connectivism.

Table 9. Digital competence assessment

CORE COMPETENCES	
USE OF ICT	Use of interactive tools and not only asynchronous email to communicate
	Use of specific online tools and software to support virtual team collaboration.
e-COMMUNICATION	Ability to produce a written text appropriate to the communicative situation (web environment) Design, development, publishing, and presentation of project results (e.g., web pages, blogs) using technological resources that demonstrate and communicate curriculum concepts.
TRANSFERABLE COMPETENCES	
e-COLLABORATIVE WORK (virtual team environment)	Active collaboration in planning teamwork, distributing tasks and setting deadlines Active collaboration with peers using telecommunications and collaborative tools to plan team work, distribute tasks among team members and fix deadlines.
	Ability to lead virtual meetings efficiently.
	Positive management of differences, disagreements and conflicts that arise in the team (in a virtual environment)

and in particular collaborative learning. At the same time, knowledge was constructed using the constructivist approach. Among the basic tools provided by Moodle, e-mail (the internal messaging service) and forums (for interactive discussions and conversations) were used for the purpose of constructing and transferring knowledge.

Alongside these objectives, this course was used as a base for developing a new learning resource (Quadratonics SA). Developing learning resources for web environments requires "preparing materials, reconfiguring existing materials, and drawing on a new pedagogical approach suitable for the online environment" (Samarawickrema & Stacey, 2007, p. 322). Table 8 summarizes pedagogical criteria for evaluating Quadratonics, SA as a social networking environment. They are based upon the previous work of (Bower, 2008; Hart, 2008; Storey, Phillips, Maczewski, & Wang, 2002). Most of these approaches analyse context and goals, and involve examining technology, pedagogy, learners, and resources for student development and support.

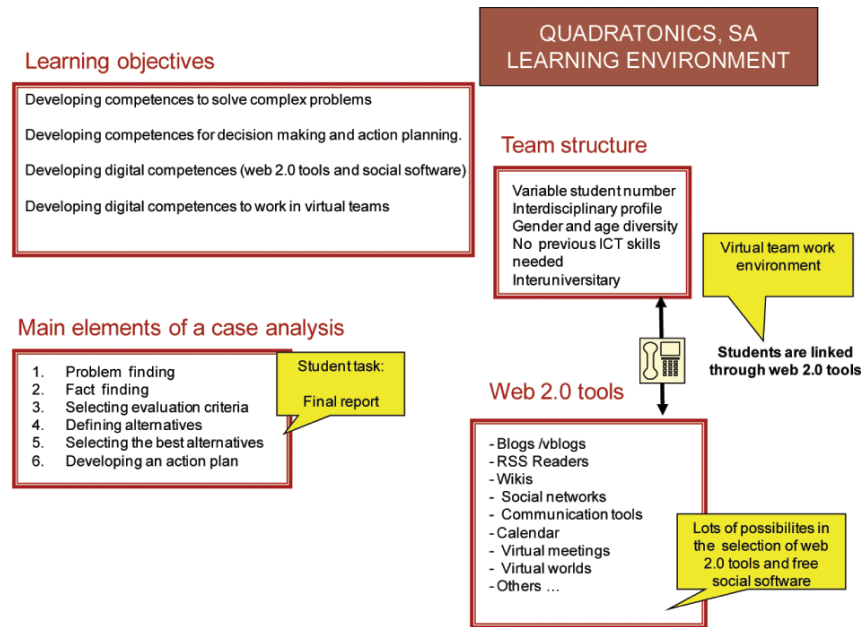
According to the constructivist perspective, knowledge is produced by the learner rather than processed from information received. It places students in a context, requires them to solve realistic problems, and makes learners acquire knowledge through interaction and collaboration.

Quadratonics SA is about forming collaborative teams. Team members work together to present their findings using 2.0 tools such as blogs. If we want students to develop their digital competences, then a connectivist approach should also be used. At the same time, developing digital competences through higher education must be understood as a substitutive product of professional practice. As a result, each learning process or learning activity should take into account that it must be designed to be open to the professional world and to the development of critical thinking.

Broadly speaking, the added value of Quadratonics SA can be seen in Figure 1, which displays the key elements of the learning environment:

This added value can be synthesized in the following way:

1. As well as the typical objective of resolving a case (developing skills for resolving cases and taking decisions) there are two further objectives that are necessary to work in the digital age: the ability to use web 2.0 tools / social software and the ability to work in virtual teams.
2. The case makes it possible to apply the six classical stages of the case method but working online.

Figure 1. The learning environment of Quadratonics SA


3. The teams and their design can be applied to different learning environments and educational levels.
4. Web 2.0 tools are extremely versatile and can be used by virtual teams and selected by teachers as a function of the number of students and their experience in using Web 2.0 tools.
5. Content is flexible and can be adapted to different subjects, university programmes and other educational contexts.

Quadratonics SA is a model to help us learn in a collaborative fashion using Web 2.0 tools and social software. The technologies exist to facilitate social networking for learning and social capital. Now we just have to learn how to use these technologies to continue learning and become true professionals in the digital age.

"Quadratonics SA" Learning Outputs

The work that students had to do to be awarded the certificate for having satisfactorily completed the summer course consisted of two parts. In the first part, students were expected to be able to handle Web 2.0 tools and learn to work cooperatively, especially with the group to which they had been assigned to carry out the task. In the second part, students were asked to analyze the situation of equality in the company to be studied, Quadratonics SA, following the instructions provided. To solve the equality problems found, students had to use Web 2.0 tools provided by the Quadratonics SA website.

The students' final assignments were evaluated using the method of heteroevaluation, understood as the "evaluation that one person makes of another's work, actions or performance" and which, in our context, is the teacher's evaluation of the students.

Using the descriptors displayed in Tables 2 to 7, the learning outcomes related to the development of digital competences and the corresponding descriptors have been adapted to the world of social software, as can be seen in Table 9. The results were evaluated by a total of 7 teachers who took part in the evaluation project.

Figure 2. Average score for digital competence among URV students
Figure 2 summarizes the learning outcomes achieved by students for each of the competences studied, which enables us to evaluate the students' learning. In turn, the figure reveals the extent to which competences have been acquired by means of a score that evaluates the level of mastery on a scale from 1 to 3.

In particular, we note that the core competence e-communication (C4) has the lowest mean score (1.73). Accordingly, on average, students have most difficulties in achieving the learning outcome: "producing a written text appropriate to the communicative situation". That is to say, they find it difficult to produce a blog with a written text on the issue to be analysed (equal employment opportunities in Quadratonics SA).

We should also point out the results obtained in the transferable competence of e-collaborative work (virtual team environment, B5), and with regard to the third level of mastery analyzed: Ability to work cooperatively as part of a team and to share the responsibility. In this case, students fail to acquire a satisfactory level of mastery for "Facilitates the positive management of the differences, disagreements and conflicts that emerge in the virtual group (score: 1.78). The results of the other two levels of learning are satisfactory, as are those for the core competence "Advanced user knowledge of the information and communication

technologies" (C2). The area of competence C2 that deals with the use of "online communication software: interactive tools", was divided into two parts to differentiate between those students who use interactive tools other than e-mail, and those who use online collaborative work tools.

Table 10 summarizes the use that students have made of Web 2.0 tools throughout the summer course. Since the work was done in teams of five, the table shows, for each one of the eight groups, what the various Web 2.0 tools have been used for. We should point out that, in general, students have used g-mail for e-communication. Likewise, we should also mention that Google Docs was largely used as an online office tool, and that the Moodle forums were used by students to communicate with one another.

Finally, Table 11 shows the students' perception of the use of Web 2.0 tools in Quadratonics SA. The first column shows the opinion of the expert, and the others the opinion of the eight student groups mentioned above. This enables the expert opinion to be compared with the students' opinions and shows that the difference between them is not excessive. The conclusion is that the competences that were being evaluated have been satisfactorily acquired and that the students have sufficient knowledge to use Web 2.0 tools in a work environment.

Table 10. Use of Web 2.0 tools in the collaborative work of the summer course

		COLLABORATIVE WORK 2.0							
		Team 1	Team 2	Team 3	Team 4	Team 5	Team 6	Team 7	Team 8

Students have chosen chats as an e-meeting tool. Social bonding is enhanced by using instant messenger technology and helps to bring about a more friendly communication atmosphere. The use of IM stimulates active learning.

FUTURE TRENDS

A range of subjects need to be explored in detail to step up research—educational, socio-economic and technological — in the field of learning 2.0 and in the use of web 2.0 tools and social learning in higher education.

- Special attention needs to be paid to using emerging technologies for the development of innovative applications in education and training. In this new technological environment, the question of how to motivate and socialize students as active learners also needs to be raised. As Hvid and Godsk (2006) state "e-learning platforms need an aesthetic perspective instead of mainly addressing usability and function" (p. 210).
- In the near future, portable and personal technologies will provide new opportunities for connecting people and creating new e-learning 2.0 environments. We are only just beginning to understand the opportunities that mobile technologies and social software provide for learning.
- Better digital competence rubrics and indicators need to be developed to monitor progress in the use of Web 2.0 in formal education for digital competence development. This step is needed to certify the degree of student competence.
- Another key issue for future research is to explore what forms of knowledge students obtain from social software and, most importantly, how students use such knowledge. In-depth qualitative research should

be carried out to understand how it is constructed by Web 2.0 technologies. In this context, the Open University of Catalonia is studying how social networks such as Facebook can be used for course delivery.

- The concept of virtual networks for collaboration needs to be revisited. We need to understand how these communities are formed and the ways in which they can facilitate the contribution of cybersocial networking to the learning and engagement of students and teachers.
- E-learning Web 2.0 may be able to reach learners who are disadvantaged by the digital divide. It is also important to define a research agenda which takes into account individual differences in learning, and special needs education so that the potential of web 2.0 technology can be exploited to provide remedial measures in the case of disability, exclusion or difficulty in gaining access to learning, or where conventional education does not work.

Bearing in mind all these agendas, e-learning 2.0 is likely to be a fertile research field and an appealing teaching and learning environment.

CONCLUSION

The new student generation has grown up in an environment where ICT has opened up opportunities of social interaction. The emergence of web 2.0 technologies and social software has enabled students to connect, collaborate and create new knowledge through computer-mediated communication and online communities. The influence of constructivist ideas on learning (Vygotsky, 1978) has led educators to implement more motivating environments, in which learning takes place in settings closer to real-life scenarios, such as the one we have described in this chapter. Web 2.0 fits not only into a constructivist model of learn-

ing but into a connectivist model such as the one postulated by Siemens (2006). From Siemens' point of view:

- learning and knowledge resides in the diversity of individual perspectives;
- learning is a process of connecting information sources;
- learning may reside in non-human appliances (e.g. a database, but also a community, a network, etc);
- the capacity to know more is more critical than what is currently known: Learning is a knowledge creation process;
- the ability to see connections between fields, ideas, and concepts is a core skill, since the individual is participating, as a node, in a network that learns;
- accurate and up-to-date knowledge is the aim of all connectivist learning activities;
- connections need to be maintained and enhanced to facilitate continual learning.

The Quadratonics' learning experience is much more than simply adding technology to the learning process. Quadratonics SA is a learning experience for the connected society. The learning dynamics and knowledge creation that take place in virtual communities like Quadratonics SA have clear similarities to the dynamics and knowledge creation in a learning society. Finally it is important to remember that "when staff move their on-campus teaching to more off-campus and blended environments, professional development is invaluable." (Samarawickrema & Stacey, 2007, p. 329). Teaching experiences, such as Quadratonics SA can encourage academics to adopt ICT thus increasing the human capital value of higher education institutions.

KEY TERMS AND DEFINITIONS

Collaborative Learning: An educational approach based the idea that learning is a naturally social act. The learner actively constructs knowledge by formulating ideas into words, and these ideas are built upon through reactions and responses of others. In other words, collaborative learning is not only active but also interactive. It

is a student-centered approach in which social software tools are currently used for building and sharing knowledge.

Connectivism: A learning theory for the digital era. It is based upon the idea that knowledge is networked and so the act of learning takes place inside virtual networks and communities through social interaction. It is a networked model of learning.

Digital Competence: The use of computers to retrieve, assess, store, produce, present and exchange information, and to communicate and participate in collaborative virtual networks. It requires a critical and reflective attitude towards the information available and responsible use of the interactive media.

Learning Process: Activities carried out to achieve educational objectives. They are carried out individually, although this takes place in a cultural and social context, in which people combine their new knowledge with their previous cognitive structures.

Social Capital: A cross-disciplinary concept referring to the benefits of social networks and connections. Social capital is constructed and maintained in the interaction between individuals or groups. Social networks promote different types of social capital: bonding –referring to horizontal ties between individuals-, bridging – referring to ties that cut across different communities- or linking –referring to vertical ties.

Social Software: Software that allows the creation of communities and resources in which individuals come together to learn, collaborate and build knowledge. It is also known as Web 2.0 and it supports social interaction and collaborative learning. Current typical examples include Flickr® and YouTube™ –as audiovisual social software.

Virtual Education: It includes aspects of both online and e-learning but goes somewhat further. While it is largely web-centric it does not necessarily limit itself to learners outside a conventional classroom. It uses multimedia and, besides delivering content, also enables a high

level of interaction among learners, content, teachers, peers and administration both synchronously and asynchronously.

ENDNOTES

1. The URV was created in 1991 by the Parliament of Catalonia, thus restoring the Tarragona University of the 16th century. From the very first day its aim has been very clear: to place knowledge at the service of society so as to contribute to the social and economic development of its environment. The URV trains professionals under the precepts of European harmonization. It provides 52 programmes of study in a wide variety of knowledge areas for over 12,000 students. The data show that the URV is not only one of the leading universities in Catalonia but also one of the leading universities in the European area for the quality of its teaching, its commitment to continuous training and the excellence of its research, development and innovation. Further information at http://www.urv.cat/

2. According to Queiruga, Del Hoyo and Queiruga (2008), Moodle, an e-learning platform, facilitates autonomous learning and makes it possible to have access to teaching resources at all times, thus providing a delocalized education system. The pedagogical model on which Moodle is based is so-called "social constructivism": that is to say, knowledge is generated to the extent that the various communities that form around it contribute or carry out activities, debates or forums. The educational activities that Moodle provides enable collaborative learning. Moodle is a tool that is based on free software which is available together with manuals, help, installation software and various useful links at http://moodle.org.

Chapter 27
Scientific Computing in the Context of a Successful Agricultural Research Enterprise

Geraldo da Silva e Souza
Brazilian Agricultural Research Corporation - Secretariat for Strategic Planning, Brasília, Brazil

Eliseu Roberto de Andrade Alves
Brazilian Agricultural Research Corporation - Secretariat for Strategic Planning, Brasília, Brazil

ABSTRACT

Embrapa (Brazilian Agricultural Research Corporation), a governmental agricultural research institution from Brazil, is a case of successful organizacional innovation that has as main characteristics: a public corporation model of organization; scale of operation at national level; spatial decentralization; specialized research units; enhanced training and remuneration of human resources and a vision of an agriculture based on science and technology. Moreover, from the beginning the organization has always been result oriented. Among the structural and political issues that led this enterprise to reach a well succeeded position, the authors argue that the strong application of scientific computing is the underlying reason that enabled high quality results achieved in research, development, and innovation. All of these reasons are presented in the next sections.

THE SUPPORT OF THE FEDERAL GOVERNMENT

This support has been critical to the survival of Embrapa. In the early years, it took the form of the federal government having understood the importance of technology for the development of agriculture. Once the results proved Embrapa

could be profitable as an option for the government, the battle for budget support remained, but it takes place in an environment where the corporation is one of the priorities of government, both in the sphere of executive and the National Congress.

In the first twelve years of its existence, Embrapa was a promise: of bold and modern design, but still a promise. During those twelve years, huge investments were made in the training of human resources and infrastructure - about six billion

dollars in 2008 value. The federal government paid for this investment based on the promise that Embrapa could be for the modernization Brazilian agriculture. Without the support from the federal government, Embrapa would not have been possible.

But Embrapa´s management has always been aware of the risk that the lack of achievements represented. For this, it led the research centers in a portfolio of research with short-term goals and to the conclusion of research already in progress. Moreover, it also gave special attention to the dissemination of existing results. And the media had a key role in creating the image Embrapa has. It is clear that the media not only operates on top of achievements, but also upon a consistent promise, provided it is not for long. In the early years of life of the corporation, the media bore the promise consistently, even in light of few existing results. This support was crucial to create a favorable image in society and in government. So, it has to be registered how important the development of competence to relate with the press, was for the success of the Embrapa. This relationship helped the government to justify the investment, over a period of lean achievements.

In a period of many macroeconomic imbalances and non-orthodox policies to deal with then, it is surprising that Embrapa´s budget support did not falter, which only shows the decisive support the federal government gave to it. At the stage where Embrapa was only a promise, the expenditures of Embrapa evolved linearly until 1982. This was essential to consolidate its image. From 1982 onwards, the corporation was no longer a promise, and its success will explain the government's continued investments.

SCALE AND DECENTRALIZATION

Many wished that Embrapa would be small and only coordinated a research program run by the existing institutes and universities. This option was rejected because it was soon realized that, in a country of continental dimensions, the success of Embrapa depend on its size and an accumulated critical mass of researchers, diverse for talent, and branched throughout the national territory. It was understood that Embrapa needed to have the scale as large as Brazil and that it needed to have its own research network, so it could be direct responsible for the results, allowing it to be well known and evaluated on its own merits. This model would also allow for it to seek cooperation with universities, research institutes, private sector and overseas in a position of equals. Being large, diverse and decentralized, Embrapa would have conditions to represent the federal government in an area as important as agriculture and receive priority, both in the allocation of resources and with regard to institutional development.

It was very important for Embrapa to have a presence throughout the national territory. This presence helped to attract sympathy of the state governments and the National Congress. Embrapa has a marked presence in the Federal District, where are located its Headquarters and: Embrapa Technological Information, Embrapa Cerrados, Embrapa Vegetables, Embrapa Genetic Resources & Biotechnology, Embrapa Agroenergy, Embrapa Technology Transfer. The units in the Federal District are an important window of Embrapa. Being in the proximity of power, they have had important role in helping establish and solidify the image of the corporation near the central power and the international market.

A CONCENTRATE ORGANIZATION MODEL FOR THE RESEARCH UNITS

Embrapa research units are distributed throughout the national territory and are specialized in products, natural resources or themes. For example, farmers know that the unit responsible for maize research is the Embrapa Maize & Sorghum, located in Sete Lagoas, Minas Gerais. Maize producers

know where to go with demands for information and results, which will give them ownership in the center, providing help with the political leadership and the economic area of government. Similarly, researchers have the exact notion of their responsibilities, and no ambiguities regarding goals and actions needed. Even more, there are strong ties of solidarity and spirit of corps, as if all employees are committed to having a winning team. Thus, Embrapa´s model has aimed to facilitate and encourage interaction - researcher - farmer and researcher - society. It had an important role in preventing the dispersal of efforts, which is one of his pillars, and is an objective way of identifying priorities for research.

HUMAN RESOURCES

The human resources policy is one of the main reasons for Embrapa success. The policy aims to develop the human capital of the corporation and it is from this capital that Embrapa derives its success. To stimulate creativity and by creating an environment that encourages coexistence is another specific role of this policy. The policy is based on the following specific points:

1. The establishment of a career that stimulates the desire to study and progress. It has three levels (called positions), where the level I is for someone who holds only a bachelor degree, level II for those with master's and, finally, level III is for those who hold Ph.D. degree. Each level has several sublevels;
2. A level of salary that allows the researcher to have a dignified living with his family based on the salary Embrapa pays him;
3. A retirement plan, with voluntary membership, paid by Embrapa and the employee, to support old age. The plan aims to supplement the retirement of the public social security;
4. A health plan paid by Embrapa and the employees, with two purposes: support the

researchers and his families for expenses in health care, and preserve the health of researchers, which is the most important capital of the corporation.

5. A series of activities to stimulate the researcher to accumulate knowledge and experience, allowing him or her to be productive and to love the Embrapa. There is a complex system of promotion on merit, based on individual, group and the research unity. The aphorism, ingrained in Embrapa, says that every year it has to deliver technologies to justify to society the investments made and produce better-trained researchers. Thus, there are two products that Embrapa has to deliver - researchers always more competent and technologies.
6. A training program at graduate and post-graduate levels, that meets both the interests of the corporation and researchers, and which seeks to train them at the same levels of the best centers of advanced countries;
7. The corporation recognizes that the technology generated incorporates the effort of all its employees. Thus, the training program is available for everyone, but graduate training focuses on researchers, but it is not exclusive of them;
8. Each research unit has a critical mass of researchers. It is organized around a specific target audience, a clear main problem to solve and the team's responsibility towards society. Each unit is in itself an instrument of concentrated effort in research and provides a work environment that encourages human development, creativity and sense of usefulness to society;
9. Embrapa seeks to stimulate the researcher to be an entrepreneur in his field, to seek resources, to interact with the outside world and ensure the dissemination of technology. Commands another aphorism: research results in the drawer of the researcher, means

that; it did not result in anything or the researcher is not good enough, or both;

10. Embrapa´s communication program aims to provide accountability for work, actions to disseminate research results, giving the corporation visibility and transparency and valuing its employers. This communication program is organized around many ceremonies, some connected with the anniversary of the corporation and the research units, carried out in other seminars, symposiums in Brazil and abroad, and they all provide opportunities for learning and enhancing the employers. Thus, the communication program is also considered part of the human resource development policy, but with independent living;

11. Although the corporation is always looking for opportunities to improve its human capital, one has to plan for the future and the principle of orderly replacement has to prevail. In Embrapa´s case the goal is to maintain an average age of 45 years old for the PhDs, imagining the following guideline: on the average a researcher should be finish his Ph.D. work around 30 years old, which would leave him with a horizon of around 30 years of productive work. Half of this is 15. So, 15 years should be added to 30, comprising 45 years. Thus, on average, a young doctor has 15 years of work alongside senior researchers. A complementary strategy is for the creation of conditions that would allow for competent and outstanding retiring researchers to continue to do some kind of work with Embrapa. There is much to be done in this regard.

12. In the beginning, an enormous effort was made to integrate the researchers to the spirit of Embrapa, in training courses, meetings and direct communication from the direction of the corporation. As the corporation was young, a world of opportunity was opened to those who joined the effort. The leadership did not have time to stratify on a separate level. For this and by having the support of society, there were no major difficulties to develop the spirit Embrapa. Today, the fame of Embrapa helps to develop the spirit Embrapa, but we should not overlook this point.

In research, it is natural over time that seniority develops, that is how leadership solidifies, founded on knowledge and recognition. If these leaders do not have the ability to integrate with new researchers as part of their work, they will be disappointed to learn that they have no help to develop their careers. This disappointment can be transformed into rancor, leading quickly to an anti Embrapa attitude. This kind of problem cannot be solved by employing more democratic procedures. What should be done is to find mechanisms for promotion for those who can work in teams and spread their knowledge. Procedures have no place in making a competent researcher share more than what he has already reported in text or oral communication. However, a competent researcher has much more to offer.

SCIENTIFIC COMPUTING

Scientific computing is the field of study concerned with constructing mathematical models and quantitative analysis techniques and using computers to analyze and solve scientific problems.

Much of agricultural research is based on decision under uncertainty. Modeling in such a context depends heavily on quantitative methods and ultimately on scientific computing. Sciences like Statistics, Econometrics, Operational Research and Biometrics among others are of importance to scientific computing.

With the increasing availability of computer resources new techniques of analysis have been developed to analyze data in general from which agricultural research has much to benefit. Research

data accumulated for years can now be accessed via data mining and experimentation optimized with the help of simulation.

Scientific computing allows complex modeling of world markets of commodities and the evaluation of trends and demand and supply elasticities of ultimate importance for the implementation of public policies.

In Brazil of today we experiment a revolution in scientific computing. This goes from teaching in elementary schools to research in general. Agriculture is no exception. Indeed Agriculture has been a leading sector in the usage of scientific computing. As early as 1976, close to its very foundation, Embrapa – the leading state company responsible for applied agricultural research in Brazil, had already realized the importance of scientific computing in agricultural research, and created a quantitative methods department – DMQ, embracing four divisions: statistics, operations research and software analysis. The main objective of this administrative structure was to provide continuous support to experimental research, mimicking the operations of other successful institutions like Rothamstead in Great Britain. The new DMQ was filled with the best possible in human resources. The department was so successful that its development spilled over other research groups in Brazil. Indeed DMQ's research and support activities seeded the graduate programs of Statistics, Operations Research and Computer Science in the University of Brasília. In the 80's all research groups in the country engaged in agricultural research were associated with Embrapa in general and with DMQ in particular.

Today, DMQ, regrettably, no longer exists, but its inheritances are still present. From DMQ were originated Embrapa Agriculture Informatics,

located inside the University of Campinas in São Paulo, a leading educational institution. This new entity certainly has less statistics and operational research but is still competent in the development of support software to agricultural applications.

Although critical to the analysis and development of agricultural research, scientific computing and its roll of disciplines, remains a bit obscure to a big chunk of the population of agronomists, foresters, agricultural engineers, zootechnicians, veterinarians and administrators responsible for research in agriculture. This is a symptom felt at the market and at the universities as well. This is the truth for Brazil and elsewhere. Quantitative methods require proper education. In essence they are pure art, servicing science and society, but they require sensitivity and intelligence for proper understanding and recognition of their necessity. When Embrapa was founded these features were abundant in its administration. It is of crucial importance to maintain agricultural research quality at a high level.

OTHER IMPORTANT FACTORS

Without any further discussion we are going to nominate other factors that were important for Embrapa success. They are close integration to international research, ample exposure to the media and, at the first ten years, some research results that impressed Brazilian society such as the development of modern agriculture in the savannah region, nitrogen fixation in soybean to the point of 100% fixation of the plant needs and technologies that reduce the application of agro toxic and protect soils against erosion.

Chapter 28
Introducing a First Step towards a Holistic Talent Management System Architecture

Andreas Eckhardt
Goethe University, Germany

Sven Laumer
Otto-Friedrich University Bamberg, Germany

Christian Maier
Otto-Friedrich University Bamberg, Germany

ABSTRACT

As one of the top issues for executives nowadays the recruiting, retaining, and skilling of scarce talent has received a lot of attention both in research and practice. While companies are in dire need of new strategies and integrated approaches in human resources, research has predominately observed the skill profile and general attitude of professionals to their work, their individual incentives, and consequentially, their turnover intention. We aim to relieve these needs in practice by introducing a first step towards a holistic system architecture of recruiting, retention, and development processes. For this purpose we use a design science approach to develop a talent management system architecture containing all respective processes and their related subsystems based on the next-generation holistic e-recruiting system invented by Lee (2007). This architecture could increase knowledge transfer and thereby improve the adjustment and performance of the entire HR process. Furthermore the increased amount of data gained through new implemented performance measurement subsystems offers management a variety of new strategic options for continuing to battle in a global "War for Talent."

INTRODUCTION

Threat pinpointed, threat averted – end of story? Not really. Already since the late seventies the potential threat of a *talent shortage* for specific profiles as IT was recognized by corporations as well as research (LaBelle et al., 1980). Today, more than three decades later, the threat not only still exists but gets even worse. In terms of IT talent in the early stages Igbaria and Siegel (1992) advised organizations to keep an eye on the growing shortages of IT personnel and the increasing demand on the labor market. But they also identified that there might be multiple forces within these organizations which delay this process and distract from its importance (Igbaria & Siegel, 1992). A study of the career anchors of IT personnel predicted that due to labor shortages staff turnover will become an even more critical issue in the near future (Crepeau et al., 1992). Despite being recognized by several researchers and a few corporations, public institutions in the States like the General Accounting Office (GAO) still raised questions about the validity of the shortage estimates and the methodologies applied in the market surveys that were conducted (Garner & Weldon 1998; Ferratt et al., 1999). Further organizations, labor market analysts and external experts showed similar concerns about the various estimates of the talent shortages as well, but after a while they started to identify the problem and deduce that a talent shortage really exists (Cappelli, 2000b; Brock, 2003; Sadin, 2003; Frank et al., 2004; Farrell & Grant, 2005; Acharya & Mahanty, 2008).

Given this situation, top management is compelled to develop new effective strategies to remain within this "War for Talent" (Chambers et al., 1998; Keim & Weitzel, 2006). The talent shortage demands that the companies compete effectively against competitors on the job market (Patel, 2002). One way is to use information technology to gain a competitive advantage regarding the recruiting of employees. A study with Germany's Top-1000 companies indicates that there is an increasing usage of IT to manage job postings (mainly on the Internet) and applications (mainly received by Internet channels such as e-mail or websites). At a level of 85.9 per cent, the majority of vacancies in 2006 were communicated to potential candidates by means of the company's website and 59.0 per cent were published on internet job boards such as monster.com. At a level of 26.6 per cent job postings, printed newspapers or magazines are far behind. Therefore it is not surprising that 64.1 per cent of the hires generated are due to job postings on the internet. Furthermore the increasing usage of IT can be shown in the use of application methods as well. At a level of 51.3 per cent, more than half of the incoming applications are received by electronic channels by the Top-1000 companies in Germany (Eckhardt et al., 2007b). Concerning the value of this increasing IT use, *e-recruiting* is known to lead to significant reductions of time and cost per hire as well as improvements concerning applicant data and applicants' overall quality (Eckhardt et al., 2009). These findings enable the thinking that these companies using e-recruiting perform better in the search for talent.

However, as several researchers have stated, managers who do not pay attention to all issues regarding scarce talent will face serious challenges in engaging and maintaining their workforce (Agarwal & Ferratt, 2002). The open contest for competitors' employees is no longer a rarity but is an accepted business method. Cappelli (2000a) described the central point in the following way: 'To poach is fine, to be poached is not" (Cappelli, 2000a). Not all recruiting is the same; *retention* and *personnel development* should be shifted from broad programs to highly targeted efforts aimed at individuals and groups of key employees (Cappelli, 2000a). However, it is not always the best way for organizations to recruit new staff and offer them important positions, because they do not know the peculiarities of the company and its culture. Organizations could also use other methods to find skilled employees. If they regard the

internal labor market, they have a many people with a high knowledge of the organization. These people could be trained and developed, so that they can carry out both present and future tasks (Hentze & Kammel 2001).

Based on the existence of these three critical issues for organizations the research question of our research paper is as follows: *How can recruiting, retention and, development processes be integrated in holistic talent management system architecture?*

To answer our research question we took a *design science approach* (Hevner et al., 2004). The approach is structured as follows. After the introduction we present the status quo of our method design science in research. In the proximate section 'Research Motivation' we discuss the problem relevance of our topic, especially the issue of a global talent shortage in the engineering and Information Systems field. The underlying literature review about the basic recruiting process, e-recruiting as an e-service as well as retention and development practices and strategies is shown in the section 'Theoretical Background'. The design of our *architecture* is provided after the literature review. In the further course the summarizing section 'Key Findings' offers implications for theory and practice by providing a number of suggestions for further research and about the way responsible managers could benefit by our proposed architecture. Finally we complete our design science approach with a short conclusion of our research contributions. But first of all we introduce design science as a research method in the following section.

DESIGN SCIENCE

Design science is part of the theory of design and action. It is a type of theory which tells the researcher 'how to do something' (Gregor, 2006). The theory is about the justification of theoretical knowledge and the related form, function and

methods (Gregor & Jones, 2004; Walls et al., 1992). There are many different types and parts of design theory. Corresponding research can be found as: software engineering in a constructive form of research (Iivari, 1991; Iivari et al, 1998), as prototyping (Baskerville & Wood-Harper, 1998), as systems development (Burstein & Gregor, 1999) and as design science (Hevner et al., 2004; March & Smith, 1995; Peffers et al., 2008). Design Science was introduced into IS research by the work of March and Smith (1995). The core of their work was a framework designed to demonstrate the relationship, activities and outputs of design and natural science research. In total they named four elements of design science research, on one hand the developed constructs and models and on the other hand the methods used and the implementations carried out (March and Smith, 1995). Our design approach is based on the seven guidelines of Hevner et al. (2004) with the exception that we left out the design evaluation of our architecture for further research. We start with our motivation and the need for more holistic research approaches in the fields of e-recruiting, retention and personnel development.

RESAERCH MOTIVATION

Talent shortage is not exactly a new problem for the global economy, but the process of recognizing the problem took a while. But after this cognition process was successfully completed, researchers first tried to define the threat and examine its source. Interestingly, the first approach to analyzing the whole situation of labor market shortage and increasing the importance of recruiting and retaining talent came from practice. The McKinsey consultant Elizabeth Chambers and her colleagues briefly described the state of affairs within their corporate quarterly publication and declared that there was for all corporations a "War for Talent" (Chambers et al., 1998). Management practices were identified as a major source of the

blatant disparity in the sense that driven turnover from the industry results in misplaced recruiting which makes it difficult to accommodate differences in contributions (Cappelli, 2000b). Within the "War for Technical Talent" project Cappelli (2000b) denied a real shortage of talents in IT and engineering but he identified a temporarily imbalance on the entire labor market due to rapidly rising wages and a shortage in the supply of talent. Increasing globalization and industrialization were mentioned by Stokes (2000) as particular reasons for regarding the shortage not just as a national problem but more and more as a worldwide shortage of talent. In 2003 the U.S. Bureau of Labor Statistics prognosticated a labor shortage of 10 million workers in 2008 (U.S. Department of Labor, Bureau of Labor Statistics, 2003). This situation was seen as a reflection of the boom period of the New Economy in the late 90s (Brock, 2003). *Demographic reasons* like the decelerated growth of the labor force due to the retirement of the big baby-boom generation were identified as an important reason for the massive talent shortage in the States (Frank et al., 2004). The percentage of children under the age of 18 years in the U.S. has dropped massively in recent years while the section of the population aged 65 or older is predicted to increase from 12 percent in 2000 to about 20 percent in 2030 (U.S. Census, 2000; Frank et al., 2004; Trauth et al., 2008). Frank et al. (2004) summarized the fact in the following way: '*In summary, the demographic time bomb fueled by aging baby boomers is not a guess it is an actuarial fact.*'

But, as forecast, the talent shortage did not remain a national problem: Its impact is felt globally (Stokes, 2000; Hewitt, 2002). In Europe the talent shortage is also occurring in important markets. For example in France by 2006 more people will leave the working population and retire than young people join the working population and start working. The situation in the neighboring country Germany is even worse. It is expected that in about 20 years 7 out of 10 Germans will be pensioners

(Sadin, 2003). Surprisingly even in Asia's boom countries China and India the talent shortage issue has become a serious issue for politicians, managers and researchers. China's '*looming talent shortage*' (Farrell & Grant, 2005) could be traced back to two different causes. Firstly, the birth rate dropped below the rate necessary to maintain the same population size (Kahn, 2004), and as a result the Chinese workforce will begin to scale down in just 10 years (Jackson & Howe, 2004; Frank et al., 2004). Secondly the country suffers from a '*skilled-labor gap*' (Farrell & Grant, 2005). The number of highly-qualified university graduates is far too small to supply the requirements of multinational companies. The need of elementary reforms is obvious against the background of a national young talent pool of engineers which is no larger than the United Kingdom's. Talent shortage threatens China's rapid economic growth as well as its way up the value chain (Farrell & Grant, 2005). The other boom country India faces a different situation. They do not have a demographic problem like declining birth rates or a shrinking workforce. Nevertheless, high turnover rates occur as individual workers sell their skills for incrementally higher payment and for that reason talent shortage is becoming a topic taken more and more into account in India (Frank et al., 2004; Acharya & Mahanty, 2008).

In the following section we will present one possible solution to the talent shortage problem by discussing an IT architecture which aligns recruiting and retention management processes. Therefore we will follow the design science approach by Hevner et al. (2004) and will present the theoretical background of our research first.

THEORETICAL BACKGROUND

To provide the research rigor of our design science approach we based our research artifacts on a comprehensive review of literature about the corporate recruiting and retention processes.

The results of this literature review are provided in the following subsections.

Recruiting Process

As it is one of the critical business processes, the design of the recruiting process is discussed by various researchers in papers which contain valuable approaches to defining the structure and standards of classic staff recruitment. The recruiting approaches differ a lot when comparing large multinationals and small and medium-sized companies as two extremes. In smaller enterprises recruitment is more related to the availability of a known individual than to the process itself. Atkinson and Meager (1994) found evidence of a correlation between business size and the adoption of formal recruiting procedures and confirmed this hypothesis. Within their recruiting process large-scale enterprises also focus on process quality determinants, such as time and costs per hire or the overall quality of the candidates hired (Eckhardt et al., 2007a). Furthermore they are interested to discover if it is useful to use information systems in applicant tracking. Strohmeier (2007) found that applicant management systems turn out to be a good investment if the company receives a mid high number of applications.

Different researchers provide evidence for a systematic procedure for starting a *recruiting process* based on 4 common stages; an assessment if vacancies need to be filled, a definition and broad analysis of the job profile, the production of a job description and a person specification (Carroll et al., 1999). The overall process was divided into three phases; generating applicants, maintaining applicant status and influencing job choice decisions (Barber, 1998). Several activities are identified which have to be fulfilled for these phases. For the generation of applications companies can publish the adverts for vacancies using paper based (such as newspaper) or digital (website, job board) media. Certain recruiting activities supported by information technology

may increase the possibility of an applicant's accepting a job offer (Barber, 1998).

Breaugh and Starke (2000) provide a phase-model to portray the recruitment process as a combination of activities, variables and strategic measures to achieve a number of recruitment objectives whose outcomes are compared afterwards. The phase model of the organizational recruitment process outlines the importance to view the entire process from a more holistic HR perspective integrating retention and development aspects as well. So recruitment objectives also include besides the cost and time of filling jobs and applicants' total number aspects as the corporate retention rate or concerning development as an individual's job performance or job satisfaction. After a comprehensive process with several recruitment activities all primary objectives are compared with the actual outcomes (Breaugh & Starke, 2000).

In addition Faerber et al. (2003) suggest a recruiting process integrating different recruitment functions. In their model Faerber et al. (2003) demonstrate the relationship of each recruiting task, its activities and objectives. Starting with the first contact between candidate and potential employer till the signing of the contract Faerber et al. provide a different structure. Based on prior work (Albert, 1998; Schneider, 1995) the process design contained the recruiter's five main tasks; short- and long-term candidate, applicant management, pre-selection as well as the final selection of candidates. Thus the management and tracking of applications in organizations is a main focus as well as the long-term attraction of applicants to build up an employer brand.

Beside these examples of research dealing with the design of the recruiting process and its related tasks little is known about the supporting IT function. An initial valuable approach to structure an e-recruiting process was made by Lee (2005a). He suggests a business process diagram illustrating an intra-organizational information flow and internal process events to simulate the

flow of a recruiting process. The main activities of the recruiting process are the submission of job postings and the management of applications. Alike the process example by Breaugh and Starke (2000) aspects and events outside recruitment as employee development do also affect the recruiting process. These figures illustrate that the use of IT to support recruiting is increasing. Within the process diagram hiring needs initiate the process. In a next step the job requisition will be prepared and send for approval via the system. When the job requisition is approved it will be posted online (e.g. in job boards) or offline (e.g. in newspapers). The job postings remain active till a target number of applications are reached. In the next process step the applications will be evaluated afterwards selected candidates will be invited for a job interview. After a further selection the candidates are pre-screened before employment to gain information regarding their further performance. Following this pre-screening contracts are offered to the successful final candidates.

Based on his prior work Lee (2007) suggested an architecture for a *holistic e-recruiting system* (see Figure 2 for our adapted version). This system was intended to align all the activities and IT tools that support the recruiting process of a company. Lee (2007) provided an idealistic architecture for an e-recruiting system supporting all relevant parts of the recruiting process with IT. For Lee (2007) the central systems of the architecture are systems to manage job requisitions, application tracking, prescreening, job agents, candidate relationship as well as a system to monitor the performance of the recruitment process. All these systems are linked with a workflow management system as well as a database management system to provide central workflow management of the recruiting process and central storage of all relevant data. For example the applicant tracking management subsystem is in charge for collecting job applications, recording candidate resumes or e-portfolios, managing the status of each candidate, providing information for decision makers and

for distributing information to other HR systems via interfaces. The job requisition subsystem is to structure and to streamline the management, development and publishing of job requisitions and online postings. The system enables HR managers to monitor current job postings and to close job postings as they are filled. The purpose of the prescreening management system is to assess the matching degree between applicants' qualifications and job requirements. Prescreen supports recruiters as it sorts a pool of resumes in order to rank them and to provide a list of top candidates. The communication with candidates is managed by the candidate relationship management system to establish long-term relationships with potential candidates. Furthermore *"it is the purpose of the system to provide applicants with a feeling they have an ongoing relationship with the company through a virtual human touch"* as pointed out by Lee (2007). This architecture is a holistic approach to summarize all possibilities how IT can support the recruitment process and how this support can be designed. As the figures of the German study illustrate (see introduction) there is an increasing usage of IT in recruiting, and companies have to structure their processes and IT architectures. Furthermore companies try to use innovative IT solutions to gain the competitive edge in the "war for talent".

Based on this previous work it is our aim to align the existing architecture of an e-recruiting process (Lee 2007) with retention process and suggest a way to combine different recruiting and retention management systems.

Personnel Recruiting as E-Service

The currently returning talent shortage in Europe (Thompson, 2007) demands not only new ways to recruit employees and more IT support, but also a new view of staff recruitment. The whole recruiting process needs to be more applicant-focused and task-orientated. Companies need to focus on corporate image and employer branding

to appear in applicants' minds in a much more transparent way (Jaeger, 2007; Eckhardt et al., 2007a). Therefore employers need to restructure not only their staff recruitment but also the whole human resources department. Attracting, recruiting, retaining and developing employees are no longer separate tasks for separate departments with different managers. They all need to be combined in one focused process also known as "talent management" (Frosch & Trost, 2008). A major demand for the holistic talent management approach is an underlying "talent management architecture" (Eckhardt et al., 2008).

Over the last years more and more of the vacant positions were published online and in addition the number of digital applications via email or a web-based form rose (Malinowski et al., 2005). The internet also brought a new phenomenon to the labor market, "the passive applicant". In this case the candidate does not contact the potential employer with an application: Instead of that the candidate expects the employer to contact him via a recruiting platform (Keim et al., 2005). Platforms for contacting these passive jobseekers are provided by business networking communities such as LinkedIn or internet job portals like Monster. Other newer opportunities to find high-qualified employees are virtual worlds like Second Life. The first approach was made here by IBM who opened a virtual recruitment center in Second Life to contact experienced software developers (Laumer et al., 2008). A further new possibility to attract potential candidates is offered by the combination of e-assessment tools (Buzzetto-More & Alade, 2006) and online gaming (Laumer et al., 2009). Within this self-assessment (George & Smith, 1990) the candidate could discover the potential employer from the point of view of a "virtual employee" (Caligiuri & Phillips, 2003). With the help of this process the companies guide the candidates through their company, increase their transparency and offer the candidates the service how they might fit in the corporate environment (Phillips, 1998). Innovative ways to recruit and attract with the help of diverse e-services are needed as the problem of talent shortage spirals downward.

For example, for the year 2011 Germany's Top-1,000 companies expect a talent shortage for different IT and engineering professionals in R&D (von Stetten et al., 2011), as illustrated by Figure 1. The lowest supply is expected for the group of engineers in the R&D field. Solely 19.0 per cent of the companies questioned expect enough talent for this group on external labor markets. For the group of IT professionals only 20.4% of the companies estimate a sufficient availability. For job profiles in the companies' production 31.0 per cent of the study participants expect enough new workers. Four of ten assume the same availability for sales talent and 43.3 per cent for talent in the controlling and finance field. The highest availability rates are expected for the fields of HR and marketing. 58.8 per cent and 62.1 per cent expect here a sufficient availability of new talent on external labor markets (von Stetten et al., 2011).

As discussed in the introduction companies in Germany are using e-recruiting as a preferred method to search for new employees and to address the talent shortage. For more than two third of the German Top-1,000 companies these e-recruiting systems provide improvements. For example, 89.8 per cent indicates that e-recruiting systems are useful for the company, 87.6 per cent pointed out that the use of e-recruiting systems increase the effectiveness of the recruiting process, 78.4 per cent declared hat e-recruiting simplifies and 77.6 per cent stated that e-recruiting speeds up staff recruitment.

Based on these reported benefits of e-recruiting for staff recruitment the support of retention and personnel development with *e-services* might have benefits as well for companies. Therefore the aim of our paper is to provide an architecture integrating recruiting, retention and development processes based on e-services. The general issues of retention and development are discussed in the next sub-sections.

Figure 1. Expected labor supply for 2011 (Author's diagram adapted by von Stetten et al. 2011)
Personnel Retention

The necessary corollary to the recruiting of new employees is the retention of the existing workforce. Cougar (1984) was one of the first to analyze employees' motivation and wants. It turned out that individual measures and compensations had to be developed and implemented to retain the existing workforce. But Cappelli (2000a) also mentioned that these '*Golden Handcuffs*' are no longer a deterrent: Recruiters are forced to unlock these retaining handcuffs by offering a large signing bonus.

Several research approaches identified environmental and task related factors which influence an individual's turnover intention. For example Igbaria and Siegel (1992) developed a number of recommendations for executives to reduce the turnover intentions of IT employees significantly. The reduction of stress factors like role ambiguity and role conflict was mentioned by Igbaria and Siegel (1992) as a way to make employees stay with the corporation. They also encouraged companies to organize boundary spanning activities and continuous face-to-face meetings with other internal and external firm units. The individual talent should be assigned to more challenging and interesting projects with a high degree of autonomy and creativity. Furthermore, Igbaria

and Siegel (1992) advised employers to show their high potentials individual recognition for their achievements and provide dual career paths which offer the opportunity for advancement within their respective field.

Other investigations found that individual career motives could also influence employees' retention. For that reason Agarwal and Ferratt (2000) provided two implications for further research. They took an extreme stand. On one hand they expected classic human resources strategies and practices not to influence an individual employee's decision to stay or leave a company. But they suggested that managers should understand the career motives of their staff as a first step and then build their retention measures around those motives in a second step. The *career motives* could be structured into three different subcategories; the preferred length of employment, the current career stage and career anchors in general. One strategy would be to recruit only those whose career motives fit in with the needs of the company (Agarwal & Ferratt, 2000). This strategy plays a particularly important role in the development of our *integrated IT architecture* in section 3. Agarwal and Ferratt (2000) examined the implementation of this strategy within their studies when one corporation hired only IT talents with an anchor of career development and security.

In a further study, Agarwal and Ferratt (2002) examined existing corporate practices for retaining IT professionals and summarized them in 11 different categories. To measure an IT professional's performance the companies often use an annual performance appraisal or 360 degree performance feedbacks. The factor of payment is implemented within compensation and benefits systems in the form of variable compensation or market anchor compensation (Agarwal & Ferratt, 2002). Another favored measure is the redesign of the individual's work arrangements by putting him in a job rotation process or letting him work in a team environment. Employability training in- or off-house could help to develop a talent's skills and his intention to stay respectively. Long-term career planning improves talent's business and leadership skills and lead to consideration of how they could achieve this career within the company (Agarwal & Ferratt, 2002). Opportunities for advancement or recognition in the form of non-monetary rewards (Laumer, 2009), monetary bonuses or extended vacations are also quite often used to retain a scarce talent as an IT professional within a corporation. Leadership training is often offered for both IT executives and regular employees. This could also be helpful to provide the IT talents with a feeling of belonging and being connected within a larger community. Female IT professionals in particular enjoy the opportunity of flexible work and time arrangements as well as child care services or telecommuting (Agarwal & Ferratt, 2002). Within their survey of key issues for IT executives Luftman et al. (2006) named the top six vehicles for retaining IT staff. They regarded the retention of IT professionals as an issue of top priority in order to avoid IT talent being poached by competitors (Cappelli, 2000). *'Organizations that do not have retention as a high priority will have a tough time'* (Luftman et al., 2006). The SIM members questioned said that open and honest communication is the key to retaining IT staff. An improved communication structure between IT professionals and their supervisors

helps to create a 'family-like' working environment (Warner & Zhu, 2000). It was also revealed that a useful measure to retain IT professionals would be to provide them with challenging work experience (Luftman et al, 2006). Trust among colleagues and coworkers were mentioned as an important issue for retention by exactly half of the respondents. Surprisingly, opportunities for advancement identified by Agarwal and Ferratt (2002) as an important retention method four years earlier were only mentioned by a third of all participants. A good balance between work and outside life should be fundamental for retention as well, but came in as less important in this survey (Luftman et al., 2006).

Personnel Development

Nonetheless, recruiting external talent is essential for the further development of the company, turning the viewpoint to the internal resources might also represent an interesting opportunity, as the required personnel can also be acquired internally by selecting members of the company's current staff and preparing them suitably for their new responsibilities (Donahue, 2001). To do this, it is often necessary to introduce training measures which will enable staff to develop their capabilities (Cappelli, 2008; Donahue, 2001). The concept of personnel development is, however, characterized by "great heterogeneity and lack of clarity" (Becker, 2005 p. 2). As a result, we find a large number of definitions of personnel development in the literature. To provide a consistent understanding of the concept of personnel development in the sections that follow, we base ourselves on the definition of (Hentze & Kammel, 2001), who regard personnel development as a function of personnel management, whose aim it must be to provide all members of staff with training and qualifications enabling them to carry out both present and future tasks. In this process, those individual capabilities of the personnel which serve the achievement of the company's goals

should be encouraged. This positive alteration in the qualifications of the staff is understood as a process consisting of a series of several linked activities (Hentze & Kammel, 2001).

Since a company may have several different reasons for developing the *capabilities* of its staff, we have chosen from the literature a personnel development process for our architecture which supports this aim. Such a process is defined by Scholz (2000). In this process the gaps in the capabilities of each employee are deduced from the difference between their 'capability profile' and the profile of requirements defined by the company. This reveals how suited an employee currently is for a given job. Building on this, those employees who are eligible to take part in development activities but have not yet been able to acquire competences that are available are given a deadline for completing the relevant training. Frequently, an employee's entire potential cannot be fully exploited because the company only has limited resources available. After successful completion of a training program the 'capability profile' is updated and checks are carried out to see whether the employee now satisfies the conditions of the required profile and/or whether the training program actually provides the desired competences (Scholz, 2000).

As shown in the last two subsections the retention and development of scarce talent is a significant challenge for management executives. While it is important to understand individual requirements, an integrated strategy could be the key to remain successful within a global talent shortage. In the following subsection we present our aligned architecture based on the work of Lee (2007).

THE TALENT MANAGEMENT ARCHITECTURE

"*Retention is king*" (Frank et al., 2004) and represents together with recruiting and developing

the top issues for managing scarce talent as IT professionals (Luftman & Kempaiah, 2008). Several researchers in information systems, human resources and management are discussing different approaches to each of these processes and tasks. Based on this previous work we will in this subsection align the recruiting process with retention and developing activities and provide an IT architecture to align retention, developing and recruiting supported by an information system. For this purpose we will extend the holistic e-recruiting architecture discussed by Lee (2007) by means of important processes and systems which support retention as well as developing and highlight the interface between these three essential HR tasks.

For Lee (2007) the central subsystem of e-recruitment is *a work-flow management subsystem* connected with a database management subsystem managing the communication with the enterprise-wide database. In this database all information and data related to the recruiting process is stored. Therefore the retention and developing parts of an aligned architecture will use the workflow management system, database management system and the enterprise-wide database as well to manage the information flow and storage. For retention we added two important processes and developing employees needs one additional process.

First, the development of retention activities based on key employees, an analysis of their incentives must be conducted. As Brannick (2001) highlights, one of seven strategies for retaining top talent is to "use a great employee profile to drive retention" (p.30). Based on face-to-face interviews, discussion and internet based questionnaires; companies have to collect information on what motivates a top employee to work for, to join and to stay in the company. Brannick (2001) provides a list of questions that must be asked and discussed. Based on these findings companies should develop possible retention actions and provide a collection of incentives and activities

that can be used to retain top talent. All findings must be stored in the enterprise-wide database.

Second, all retention approaches must be approved by top management. Therefore if there is a need for a retention activity an approval process must be started. Based on the findings made when developing retention activities, one must be selected or a new one must be developed based on the first process described. After the identification of retention needs and the suggestion of a retention action, the action must be approved and started. Finally its performance must be measured.

Third, the aim of the recruitment process is to hire the best candidate for a specific vacancy and to integrate them into the company's culture. Based on the findings of what the employee value proposition is (Brannick, 2001) and what the characteristics of retaining employees are, a sub-process must be designed to identify borderline turnover candidates while selecting applications for a vacancy.

Finally, to develop existing personal each position should be described by necessary skills, knowledge and competencies to be able to handle the tasks conscientiously. Moreover, each employee should also specify his strengths and weaknesses and store them in the database. If the organization identifies that one skill is missing particularly, they will be able ask their employees to take an active part in advanced educations to learn this special competency. Such a *skill-oriented advanced education program* could be particularly helpful if these skills are also missing on the external labor market.

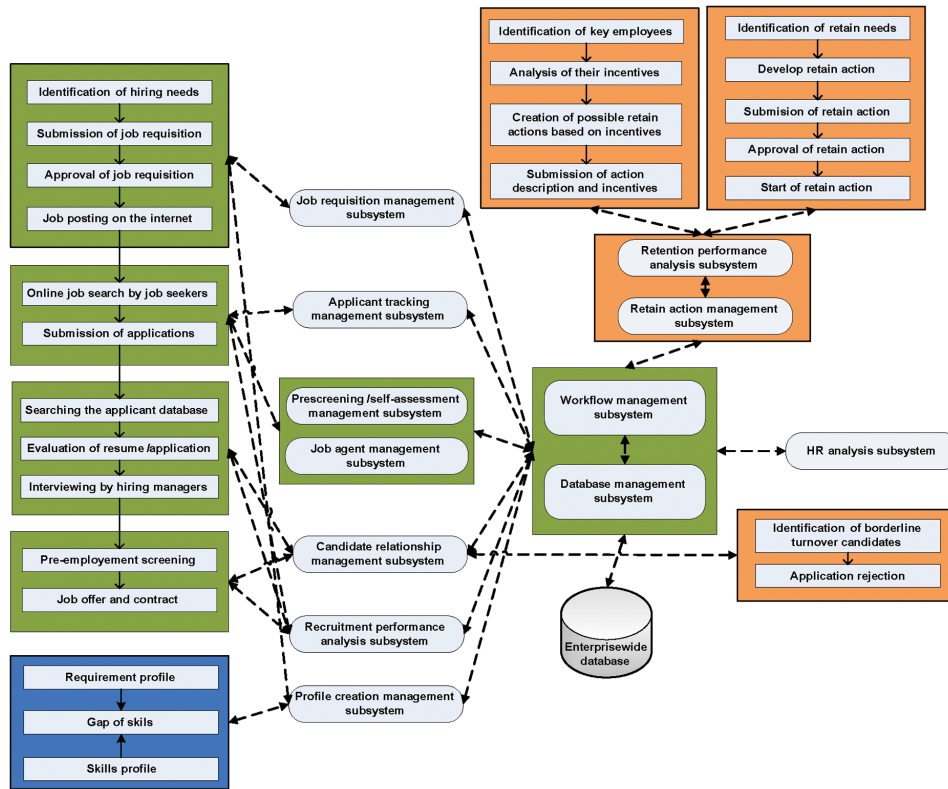
Three explicit artifacts have been designed and developed in our research. Two of them result from retaining processes and one due to the developing one. The first research artifact produced is the developed system architecture for the corporate retention processes based on the research of Agarwal and Ferratt (2000). Our second artifact is the *alignment* of this retention architecture with the holistic e-recruiting system invented by Lee (2007). The third artifact based

on prior research on personnel development, enables organizations to train their employees and identifies missing skills. Figure 2 illustrates the *process diagrams* for the processes discussed in this subsection and how subsystems can be used to support them. In the next section the design of the subsystems for supporting the retention process will be discussed.

Systems

The development of retention activities and the approval of a specific action are the two major retention processes. Both are managed using the "retain action management subsystem" and their performance is analyzed with the retention performance analysis subsystem. Both together are responsible for supporting retention processes with IT and manage the linkage to the recruiting process and subsystems. Thus the focus of the system is to streamline the developing of retention activities and to identify key employees as well as the need for retention for specific job profiles or tasks. Users are retention managers, top management and recruiting managers.

As Brannick (2001) highlights, it is important to "count what counts" (p. 30). Brannick (2001) explained that for improving a company's employee retention it is important to understand what the company is compared with what the company wants to be in terms of employee retention. Therefore turnover statistics must be provided by the human resources analysis system and the retention performance measurement system to measure on the one hand the actual retention or turnover rates and on the other how an implemented retention action is influencing these rates. Therefore it is important to break down turnover rates down by department, by job or by geographic region and to measure effectively. Brannick (2001) suggests, for example, measuring the "Major Employee Retention Rates" differentiated by voluntary and involuntary; overall, department and job; hourly and salaried; percentage of great employees who

Figure 2. An IT Architecture for aligning recruiting, developing retention processes (Author's diagram adapted by Lee 2007)


leave and come back. Based on the statistics, the need for retention activities can be monitored and key employees can be identified by the "retention management subsystem". The following paragraphs describe the subsystems in detail.

- **Retention Action Management Subsystem**: The main objective of the RAMS is to streamline the development of retention activities. Based on the identification of retention needs or the initiation of the retention performance analysis subsystem, the RAMS is the basis for the development and approval of retention activities. It supports communication with all stakeholders and provides the data needed to develop effective activities. The descriptions of the activities developed are stored

in the enterprise-wide database and can be accessed via the RAMS. The RAMS is responsible for every activity related to retention.

- **Retention Performance Analysis Subsystem**: Together with the human resources analysis subsystem the RPAS is responsible for the measurement of the performance of implemented retention activities. The system can identify retention needs and therefore initiates the development of retention activities. Furthermore it can identify key employees of the company. Based on this analysis the system can specify important target groups for retention activities and extract the key characteristics of key employees. These characteristics and the requirements of key

employees can be the basis for the development of effective retention actions.

- ***Candidate Relationship Management Subsystem***: This system offers recruiters the possibility of establishing a long-term relationship with candidates as well as employees. Lee (2007) points out that the CRM-System "is designed to provide applicants [and employees] with a feeling they have an ongoing relationship with the company through a 'virtual human touch'". In Lee's architecture for an e-recruiting system, the CRM-system is designed to increase the chance of job acceptance by candidates. Lee explained the importance of a CRM-system by highlighting that "only companies with a positive long-term relationship with job applicants will gain a competitive edge". For an aligned architecture of recruiting and retention processes the CRM-system is responsible for communication with candidates and employees. However, its main objective is to support the selection of appropriate candidates. Using data analyzed to identify potential turnover candidates, the CRM-system can identify borderline turnover candidates and therefore advise the rejection of an application.

- ***Human resources analysis subsystem***: As Brannick (2001) highlights, it is important to "count what counts". The human resources analysis subsystem is responsible for monitoring the performance of the human resources processes. One aspect is analyzing hired employees and their turnover intention. One possible number is the turnover rate of employees in a company. The HR analysis subsystem is the basis for decisions regarding the rejection of applications, the identification of retention needs or the identification of key employees.

- ***Profile creation management subsystem***: In order to train the employees in their

organization in an effective and efficient manner, an organization notes required skills for existing positions and matches these with existing skill profiles of their employees. Based on these analyses the subsystem gives an overview over essential skills which are not available to the necessary degree.

Interfaces

The retention management subsystem is the central system for managing retention activities. However, as outlined, retention cannot be discussed without recruiting. Thus, this section points out the interfaces between the recruiting management system and the retention management system.

First, as already discussed, there must be a sub-process for selecting borderline turnover candidates. If the company is looking for applicants for a job profile identified as critical for retention the "candidate relationship management subsystem" has to involve the additional process in the standard selection process of the recruiting function.

Second, if the company has implemented some retention activities which are major reasons for key employees to stay in the company, the company should use them to attract new employees while filling staff vacancies. Therefore the job requisition management subsystem has to search for implemented retention activities to include them in job ads etc. Thus the main arguments and motivations of key employees for working for the company, can be highlighted in the job ads and can attract candidates who were not sure whether to apply for the job or not.

Third, the recruiting performance analysis subsystem is aligned with the retention performance analysis subsystem to measure if the recruiting process selects candidates with low turnover rates or not, and how the staffing activities are influencing the retention rates of the company.

Fourth, if an employee is leaving the company, the candidate relationship management subsystem (in a long term focus) has to manage communication with the ex-employees in terms of initiating boomerang hires.

KEY FINDINGS

Our paper suggests an alignment of the architecture of a holistic e-recruiting system by Lee (2007) with a system for managing retention and personnel development. We aligned the model by including the concept of retention and modeled retention with two processes: developing retention activities based on incentives of key employees and approving retention actions. Therefore we connected the retention management subsystem and the retention performance analysis subsystem with the workflow management subsystem. In addition, for the need for statistics, and especially for turnover rates we introduced the HR analysis subsystem to measure key HR figures which can be used to identify key employees and the need for retention activities. Moreover, we introduced a deeper selection process to identify borderline turnover candidates and connected the process to the candidate relationship management subsystem. The profile creation management subsystem is responsible for identifying rare skills and to call attention to the need for training the staff to stop this development. The aligned architecture is a basis for developing an individual architecture to support recruiting, personnel development and retention with IT.

Limitations

Like any conceptual research our research is limited as well. We discussed a theory and literature based approach to align retention, developing and recruiting process in an integrated system architecture by reviewing Information Systems, HR and management literature. The concept we recommended must be validated by a case study or empirical research to highlight the benefits. Even so, as Lee (2007) discussed, the holistic e-recruiting system is expensive and complex and a lot of companies have to choose a part of the system to support their needs.

Implications for Research

Future research can benefit from this approach. The combination of different disciplines like human resources, recruiting, information systems, talent management, retention is needed to develop information systems as a discipline which highlights the impact of IS on business and on specific services in particular. Therefore a critical design evaluation of our architecture is needed to find out which subsystem is useful for different companies (like small and medium sized ones compared to large ones), and additionally if it could provide insights for the business value of IT.

Implications for Practice

Apart from our limitations, the suggested architecture could be a basis for the development of an information system supporting the recruiting, development and retention activities of an enterprise. This is indeed a major implication for practitioners. In the following paragraphs we discuss the managerial implications for every added component of the architecture.

- ***Retention Action Management Subsystem***: Although retention activities are used in HR management, they are often not systematically planned and are adopted in an undirected way. To streamline these activities the RAMS serves as kind of a steering tool for an appropriate retention program. The HR management benefits in two different ways from the RAMS, on the one hand by means of the tool for identifying key employees retention activi-

ties could be executed with a high degree of goal-orientation, and on the other hand by means of the alarm system for sudden retention needs the activities could be approved immediately. The identification of key employees and their individual retention needs constitutes an especially important factor for the recruiting process as well. With the help of the aligned recruiting and retention architecture the HR management is able to identify potential turnover candidates as early as the candidate selection phase in staff recruitment as they know which employee is easier to retain and which is not.

- *Retention Performance Analysis Subsystem*: The RPAS is responsible for the performance measurement of the retention activities implemented. A more focused human resources management based on clearly defined quality criteria in terms of time, cost and process quality is the future for HR. Companies need to be competitive like some who have already managed to effectively reduce their time and costs per hire and to increase the overall quality of their employees as well their employee related data due to standardization (Muenstermann et al., 2010a; Muenstermann et al., 2010b) or long-term employer branding (Gatewood et al., 1993). The RPAS permits the HR management to analyze their retention incentives in terms of time, cost and quality and so to improve the overall process.

- *Candidate Relationship Management Subsystem*: A shortage of highly qualified employees is not only an effect of demography and a shrinking workforce; it is also an effect of misleading recruiting. In boom periods companies tend to recruit nearly every acceptable candidate instead of analyzing their potential. In difficult economic times companies neglect the staff recruit-

ment altogether. The key to this complex situation is a new form of countercyclical staff recruitment. For a successful form of countercyclical recruitment companies need to take advantage of candidate relationship management (Lee, 2005b). A CRMS allows the HR management to build up a long-term relationship with prospective candidates in difficult economic times in order to recruit them in boom periods (Lee, 2005b). Examples of this relationship between company and candidate are invitations to corporate events, lectures and seminars or birthday and Christmas cards. Empirical research has shown that candidates expect companies to offer a lot more in the recruiting and retention process than they have done so far (Weitzel et al., 2009).

- *HR analysis subsystem*: As described in detail in the introduction, the future in HR is the combination of different tasks like attracting, staffing, retaining and developing "talents" in one overall function. In order to produce the success of the new "talent management" function (Frosch & Trost, 2008), all processes such as recruiting and retention need to be analyzed and compared in terms of efficiency and value adding to the overall HR. The HRAS supports the HR management by evaluating the quality criteria and producing management ratios for benchmarks with other internal processes or external HR processes in other companies.

- *Profile creation management subsystem*: In difficult economic situations, if an organization has too many employees, they could train their personal to acquire rare skills and competencies, to be prepared for the economic boom. In booming stages as organizations plan to expand, the PCMS can help to prepare such steps early. Organizations which are willing to

expand to China will benefit in such a situation from Chinese speaking highly skilled employees that are aware of the organizational culture of the parent group. Such a PCMS could be helpful to realize business strategies or to act foresighted. An example for the latter one could be the age distribution of an organization. If the system realizes that special skills are only allocated to elderly people, it will alert the HR department to train people to acquire these.

Our paper was motivated by the global rising shortage of talent and the problem of high turnover rates in the US, Europe and Asia. One can conclude that an aligned architecture for recruiting, retention and development is especially necessary for a competitive environment on the labor market. On the one hand the architecture suggested could protect a company from being poached (because the company knows why employees work for it and the architecture can support these incentives) and on the other hand it can support the poaching of employees for your company (because the company knows the reasons why it is a valuable employer).

CONCLUSION

"To poach is fine, to be poached is not" highlighted Peter Cappelli in 2000(a). Today retention and skilling is already a critical issue for managing scarce groups as IT staff (Luftman & Kempaiah, 2008) and the war for talent still exists. Therefore an integrated strategy of retention and development can prevent a company on the one hand from being poached and on the other hand can help them to develop poaching activities. We support a strategy like this by providing a system architecture based on a design science approach (Hevner et al., 2004).

Chapter 29
Lotus Workforce Management:
Streamlining Human Resource Management

Jerh. O'Connor
IBM, Ireland

Ronan Dalton
IBM, Ireland

Don Naro
IBM, Ireland

ABSTRACT

Human Resources departments are often burdened with administrative tasks performed on behalf of employees who lack the tools necessary to complete these tasks themselves. A software approach known as self-service aims to streamline HR processes by providing employees with access and control of their personal information. Different approaches to self-service have been developed, including solutions offered by SAP, Sage Software, and IBM®. This paper examines the approach taken by IBM Lotus® Workforce Management, which is a self-service solution for IBM WebSphere® Portal. Most of the self-service solutions available in the marketplace do provide HR capabilities for an organization's workforce, however, these solutions are usually designed as "out-of-the-box" software that require an organization to adopt a particular approach and a specific set of functionality. Lotus Workforce Management, on the other hand, focuses on providing three key features that allow organizations more choice and control over the implementation of a self-service solution. These features are extensibility, customization, and ease of integration. Extensibility is provided through the WebSphere Portal framework that lets users add or remove components and functionality and determine the structure of communication between portal resources. Integration with IBM WebSphere Portlet Factory gives users the ability to customize and design a solution that is tailored to their needs. Finally, ease of integration with HR resources that reside in a back end system is important as most organizations would be reluctant to change or make complex configurations to that system. For this reason, Lotus Workforce Management uses existing components for SAP ERP systems and provides functional code for rapid and simple integration without extensive configuration.

1. INTRODUCTION

This paper describes an approach taken to develop a solution that streamlines Human Resource Management tasks with an emphasis on openness and flexibility to focus on the work performed by employees, managers and HR staff.

Interaction with Human Resource departments is not without problems. These issues affect all participants from average employees to managers to customer service representatives. All these users stand to benefit from a solution that streamlines their tasks and processes and removes or reduces pain points. In this paper we share our experiences and insight gained during the design and development of Lotus® Workforce Management, a framework solution built on WebSphere® Portal. This framework provides a foundation to create flexible, extensible, and readily customisable HR self-service applications.

This paper begins with a description of the Human Resources Management space, the major players within this space, and the issues and ideas that led to the creation of the Lotus Workforce Management framework. This paper then describes the main components of the framework and explains how these components collaborate to fulfil the solution requirements. The paper closes with a summary of what we have learned about the technical challenges in the HR self-service domain from our customers as well as some plans for the future.

1.1 Human Resource Management

Human Resource Management (HRM) is the professional practice and academic theory that relates to the structure and management of a workforce. In nearly every major organization today, there exists a Human Resources (HR) department. Regardless or whether public or private, profit or non-profit, organizations rely on HR departments to ensure that they not only attract a talented and competent workforce, but that the individuals who make up that workforce gain a sense of personal fulfilment and are encouraged to improve their skills and professional abilities, thereby assuring the organization's retention of the workforce.

As HR evolved, the level of associated administrative duties increased proportionally. Research suggests that as much as 70% of the time spent by the personnel of many HR departments was performing administrative tasks (Barron, 2002). These tasks were largely manual, paper-based, and focused on maintaining employee records. Information was often difficult to locate and changing it was a time-consuming affair. Data inaccuracy was common. Correcting mistakes diverted even more time and effort away from business-related activities.

However, HR departments have increasingly been able to make use of software systems that streamline these administrative processes. In turn, HR departments have been able to gain back valuable time to focus on strategic goals such as the recruitment and training of employees, the development of specific business practices and policies, and all the other functions that focus on the efficiency and effectiveness of an organization's workforce.

Numerous HRM systems have been developed and implemented, all with varying degrees of success. For the most part, though, currently available HRM systems fail to deliver true value to HR departments. The failures of these software systems stem from a single cause; employees are unable to take control of their own information and must ultimately depend on the HR department to complete common tasks. Whether because their information was spread over multiple systems, requiring multiple passwords, or because they were unable to access their information at the time when they needed to, employees often find HRM systems problematic and end up contacting their HR department to either enter the required information or to verify that the information was entered correctly. This failure has two effects: the first is that employees feel frustrated and dissatisfied; the

second is that HR departments become weighed down in unnecessary administrative work.

A software approach known as self-service has taken shape to deal with the failures of previous HRM systems and not only give HR departments the ability to focus on their strategic objectives, but also to deliver a solution that is truly of benefit to a workforce.

1.2 Self Service

In the context of HRM, self-service is the ability of employees to manage their own HR information easily and at any time. Research has shown that HR departments benefit from self-service solutions, whether ESS (Employee Self-Service) or MSS (Manager Self-Service). Such benefits include gaining back time that would have been spent processing information and reducing data inaccuracy.

In one case study of a public sector organization in Australia, SAP's HR/Payroll module (4.0b), which included the ESS module and SAP's Workflow tool, was used to replace the existing system (Hawking, Stein, & Foster, 2004). In this study, the ESS module was shown to provide a number of benefits to the HR department such as an reduction of time spent processing payroll, an improvement in productivity, and an increase in strategic focus, while overcoming initial resistance from the workforce who were adapted to the previous system. The view taken by Hawking et al. was that the adoption of the ESS solution led to increased satisfaction among the workforce.

However, studies do suggest that the adoption of a self-service solution depends largely upon a positive reception by the workforce. Furthermore that the success of the self-service solution depends upon an intuitive user interface and verification of transactions (Marler & Dulebohn, 2005). Additional research indicates that employee satisfaction with self-service was also influenced by a single authentication mechanism and prompt access to HR information (Rahim, 2006).

Taking into account the conclusions drawn from such research, Web portals can be seen to offer much value to self-service applications as users can access portals through Web browsers, which presents a familiar and comfortable environment for users. Users do not need to learn how to use an entirely new client application and are familiar with entering data through Web forms and views. Additionally, when the Web interface to HR management systems are rendered through a Web portal, value can be added by connecting other Web applications and integrating more closely with the work environment. This integration makes the transition to self-service a much more seamless and cohesive experience for the workforce.

2 LOTUS WORKFORCE MANAGEMENT

IBM® Lotus® Workforce Management is a self-service accelerator for IBM WebSphere® Portal that improves employee productivity and performance by streamlining employee and manager-related activities. Lotus Workforce Management provides employees with personalised, online views into the specific content, self-service transactions, company intranet applications and third-party applications and services they require to operate more efficiently.

Lotus Workforce Management consists of a number of high-level components that collaborate to expose a wealth of Human Resource information and processes that are not traditionally accessible in a user friendly fashion.

The two Lotus Workforce Management components that users interact with most frequently are two portlets known as the checklist framework and the unified task list, UTL. Working together, these two components provide a means of launching and completing profiled events and activities in a uniform way even though individual activities may, and frequently do, occur on disparate back-end systems.

Lotus Workforce Management also provides specific pages and portlets that give managers a dynamic overview of the timesheets, leave requests, and general calendar-related activities for their employees.

The other components that give the checklists and UTL functionality are:

• an innovative approach to SAP data access
• a dynamic and flexible authentication framework
• IBM WebSphere Portlet Factory
• IBM WebSphere Portal and all its various features

The following diagram shows how all the UX and other components collaborate at run-time (Figure 1). The sections that follow the diagram describe the illustrated components in more detail.

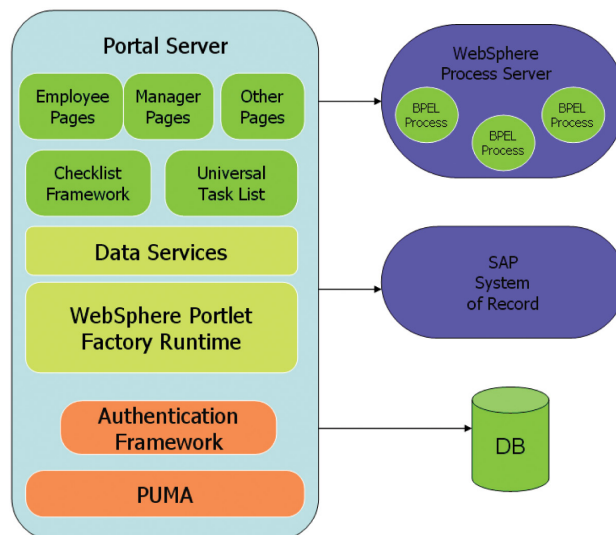
2.1 IBM WebSphere Portal

IBM WebSphere Portal provides the runtime environment for the Lotus Workforce Management application. As well as a JSR compliant portlet container there are a number of specific components for both Portal and the underlying IBM WebSphere Application Server, which make the resulting Lotus Workforce Management application more extensible and robust. This section provides a list of the most important of these components along with a brief description of what they do and which parts of Lotus Workforce Management use them.

2.1.1 Application Extension Registry

WebSphere Application Server has enabled the Eclipse™ extension framework that applications can use. Applications are extensible when they contain a defined extension point and provide the extension processing code for the extensible area of the application.

An application can be plugged in to another extensible application by defining an extension that adheres to what the target extension point requires. The extension point can find the newly added extension dynamically and the new function is seamlessly integrated in the existing application. It works on a cross Java™ 2 Platform, Enterprise Edition (J2EE) module basis. The application extension registry uses the Eclipse plug-in descriptor format and application programming interfaces (APIs) as the standard extensibility mechanism for WebSphere applications. Developers can use

Figure 1. Diagram showing how all the UX and other components collaborate at run-time


WebSphere Application Server extensions to implement their functionality to an extensible application, which defines an extension point. This is done through the application extension registry mechanism.

The architecture of extensible J2EE applications follows a modular design to add new functional modules or to replace existing modules, particularly by those outside of the core development team. Each module is a pluggable unit, or plug-in, that is either deployed into the portal or removed from the J2EE application using a deployment tool that is based upon standard J2EE and portal Web module deployment tooling. A plug-in module describes where it is extensible and what capability it provides to other plug-ins in the plugin.xml file.

The Lotus Workforce Management authentication and checklist frameworks both rely on the application extension registry to provide their dynamic extensibility.

2.1.2 PUMA

The Portal User Management Architecture (PUMA) System programming interface (SPI) provides interfaces for accessing the profiles of a portal User or Group. PUMA SPI is used to find, create, modify and delete users and groups. Profile information about the currently logged in user can also be retrieved.

PUMA is used extensively by Lotus Workforce Management, particularly by the authentication framework and in all components which profile content based on the logged in users and the groups to which users are members.

2.1.3 Credential Vault

The Credential Vault is a service that stores credentials and allows portlets to log in to applications on behalf of a user. The Credential Vault manages multiple identities for portlets and users. Using the Credential Vault, a portlet can retrieve a user's authentication identity and pass the information to a backend application.

The Credential Vault is a mature and easily used component which is core to the default authentication implementation that the Lotus Workforce Management authentication framework provides.

2.1.4 Portlet Wires

Portlet Wires are used to direct the information flow between portlets that communicate with one another using portlet events.

A wire connects a publishing event to a processing event of another portlet. When the source portlet fires an event source event has outgoing wires, the information is propagated to the target portlet(s). At the same time the corresponding handler code is invoked. Conversely, if an event is produced that is not wired to any targets, the event is simply discarded.

Creating wires is a part of page administration and requires appropriate access permissions. It is separated from the portlet development or deployment process, so that the portlet developer does not need to know the actual structure of inter-portlet communication. Communicating portlets can be developed independent of each other, as long as they agree on the same data type and semantics for data exchange.

Wiring is used wherever Lotus Workforce Management requires portlets to communicate with one another. Wiring not only provides the means of this communication but also enhances the ability of users to customise the solution by allowing for the wiring to be changed after deployment without any need to redevelop the core application.

2.2 IBM WebSphere Portlet Factory

WebSphere Portlet Factory is an Integrated Development Environment (IDE) and run-time environment for developing Java Web applications and portlets. While WebSphere Portlet

Factory has many different capabilities and can run on various platforms, we used WebSphere Portlet Factory to create solutions hosted on IBM WebSphere Portal. Most of the components of the Lotus Workforce Management solution are developed on WebSphere Portlet Factory as it provides foundational artefacts that deliver the functionality that Lotus Workforce Management required much faster.

WebSphere Portlet Factory has a design time component and a run-time component. The WebSphere Portlet Factory designer is an Eclipse plug-in that provides the IDE for developing with WebSphere Portlet Factory. To develop applications in WebSphere Portlet Factory, developers assemble builders into models and then build portlets from the models. Models are XML documents that define the order in which builders are called and what parameters are passed to the builders. Builders themselves are snippets of Java code that can do many things from generating a simple piece of HTML to retrieving data from a remote service. The builders assembled into a model are used to generate the contents of a Web application and a model is usually either consumed by other models or deployed as a portlet. Taken all together the models and builders in a WebSphere Portlet Factory project within the designer result in a web application for deployment on a portal server.

At run-time time the automation engine (a servlet) handles incoming requests and in conjunction with the WebSphere Portlet Factory profiling functionality provides dynamically profiled content.

2.3 SAP

SAP is a leading European software provider that is based in Germany. SAP products primarily focus on Enterprise Resource Planning (ERP). The company's main product is called SAP ERP. The current version is SAP ERP 6.0, which forms part of the SAP Business Suite. The previous version was R/3 and is still in widespread use.

SAP ERP is one of five enterprise applications in SAP's Business Suite. The other four applications are:

*   Customer Relationship Management (CRM)
    ◦   Helps companies acquire and retain customers as well as gain marketing and customer insight
*   Product Lifecycle Management (PLM)
    ◦   Helps manufacturers with product-related information
*   Supply Chain Management (SCM)
    ◦   Helps companies with the process of resourcing manufacturing and service processes
*   Supplier Relationship Management (SRM)
    ◦   Enables companies to procure from suppliers

2.3.1 SAP in HRM

SAP HRM or HCM (Human Capital Management) is also a part of SAP ERP and it is the part in which we are most interested as SAP is one of the leading providers of HCM solutions. Given SAP's dominance in the marketplace, engaged customers, and pre-existing software artefacts, SAP was chosen as the first system of record that Lotus Workforce Management would support.

The other driving force behind the decision to support SAP initially was the general dissatisfaction amongst customers with the user experience when interacting with SAP. This is especially true with regard to the older versions. To move to a more modern interface was not a simple upgrade when staying within the SAP product suite, which remains to be true today. The Lotus Workforce Management solution offers an attractive, non-proprietary, and complementary route to enhanced data interaction as well as the potential for integration with multiple other systems by leveraging the underlying capabilities of the WebSphere Portal and Application Server products.

2.3.2 SAP Integration

As discussed in the preceding section, SAP provides Enterprise Resource Planning software. Lotus Workforce Management leverages SAP's HR component as a system of record for its Employee and Manager Self Service functionality. Integration with SAP from Lotus Workforce Management is achieved by the use of SAP's Java Connector library. This Java Connector library, the SAP JCo, allows applications developed using the Java programming language access to SAP data via Remote Function Calls (RFCs). These RFCs are essentially remote enabled applications running on a deployed SAP system. SAP provides a suite of RFCs that can be called to perform a variety of operations. These RFCs provided by SAP are known as BAPIs. Lotus Workforce Management interacts with these BAPIs but also provides a set of additional RFCs that are deployed on an SAP system. These Lotus Workforce Management RFCs allow for a greater degree of access to information stored on SAP's HR component.

Data in SAP's HR component is structured as a set of infotypes. Infotypes are logical representations of data as this data exists inside the SAP HR component. The data to which we refer here is essentially employee related information. For example, you'd expect a HR management system to capture data about an employee's address, pay details, emergency contact information and so on. Each of these examples are stored on SAP's HR component as infotypes. Each infotype in turn can have a number of subtypes. As a generic infotype becomes specialised, this specialised infotype is referred to as a subtype. Again, an example may help with the understanding here. Take the address infotype, this address can be of varying types, for example a permanent address, a temporary address, a holiday address and so on. Each of these specialised types of address is considered a subtype of the address infotype.

SAP's BAPIs, the remote enabled applications we introduced above, provide access to these in-

fotypes and subtypes, but do so in a defined and somewhat restrictive manner. Calling a BAPI to read an instance of an infotype, requires that a defined set of parameters be passed when making the remote call and in turn a defined set of return values are made available. The return values made available when calling a BAPI on SAP do not reflect the entire Infotype data structure. Rather, a limited set of fields are returned, which may not meet the requirement of the calling application. Let us use an example to help illustrate. Let us say for example, we wanted to read an employee's permanent address from an SAP system. When reading a permanent address using a BAPI, we have access to only a subset of the infotype information on SAP. So where a permanent address infotype on SAP may include 50 fields, we have access to only 10 for example.

For this reason, the Lotus Workforce Management application delivers an implementation of an approach to retrieving all infotype data via remote function call. The implementation is delivered as ABAP code (the SAP specific programming language) by Lotus Workforce Management and is a fully functional RFC. By deploying this ABAP code on an SAP system, access is provided to all infotypes and subtypes available on the SAP HR component. This ABAP once deployed and configured as an RFC, can be called by a remote Java application using the SAP JCo connector. In this manner any application developed using the Java programming language has access to all SAP infotypes.

Lotus Workforce Management provides a tight approach to integration with this RFC by delivering a specially designed WebSphere Portlet Factory builder. This builder, called the SAP Infotype builder, leverages the existing SAP builders delivered by WebSphere Portlet Factory to connect with SAP via the SAP JCo Connector library. Having established a connection, the SAP Infotype builder interacts directly with the custom RFC delivered with the Lotus Workforce Management solution, providing services to create, retrieve, update and delete infotypes on SAP.

Using this and other builders as it's foundation, Lotus Workforce Management provides a means of interacting with the SAP system of record that is not possible using the traditional BAPI approach.

2.4 Custom Components

The following components are those we developed specifically to resolve issues in streamlining the HRM interaction action experience. These components leverage underlying application features as mentioned in previous sections.

2.4.1 Checklist Framework

When we need to do tasks that comprise a number of steps we work from a checklist. We do this in everyday day life when we work from a recipe or use a grocery list. In the content of human resource interaction these lists are for tasks such as hiring a new employee or changing of one's marital status. As we progress through these lists we check off completed items. So put simply a checklist is a list of activities to be carried out to accomplish a particular task. Within Lotus Workforce Management this task, or event, can be anything and comprises a list of activities which can involve interaction with people and applications. An oft used example of a checklist is that of the change address event.

To extend flexibility there are many attributes which activities possess:

• They can be organised into related groups
• They can be mandatory or optional
• They can have a required completion order
• They can integrate with various external systems
• They can exist on various backend repositories

Moreover the containing checklist can:

• Be unique or multiply occurring for the owning user
• Restricted in access particular groups
• Have its status changed based on its age

Both checklist templates and in-flight checklists are represented as xml documents the storage of which is provided and abstracted by a persistence layer. This representation allows for simple manipulation of the checklists as well as enhanced readability of the checklist contents outside of the Lotus Workforce Management application.

2.4.1.1 Presentation

Checklists are presented to the user by one of three portlets.

The My Resources Portlet

The My Resources portlet (Figure 2) provides a profiled and categorised list of checklists to the logged in user. This profiling provides for targeting of function so that a manager can for example exploit resource management events such as promotion which would not be presented to an employee.

The UTL Task List Portlet

The task list portlet of the UTL displays in-flight checklists that are owned by the current logged in user. This is the users' primary means of accessing active checklist instances.

The Checklist Portlet

The checklist portlet is responsible for rendering checklists and presenting the activities to the user. Most of the heavy lifting here is performed by the checklist builder, a custom built WebSphere Portlet Factory artefact.

2.4.1.2 Operation

New events are initiated by the user via the My Resources portlet. A user simply selects one of the categorised events and typically a new checklist instance is created and displayed in the checklist portlet. If however the selected event is unique and pre-existing it is the pre-existing instance of the checklist which is presented to the user. An

Figure 2. The My Resources portlet

example of one such event is the change marital status event which is unique per user at any given time.

With the checklist available in the checklist portlet the user can proceed with completing the listed activities. Unsequenced activities can be completed in any order and non-mandatory activities can marked complete by the user or simply ignored. At any stage the user may save the state of the checklist and proceed to do other things.

To return to an in-flight checklist the user typically uses the UTL task list portlet. On the selection of the required task from this portlet the checklist portlet restores the previous state of the checklist and work can proceed.

Each individual activity in a checklist delegates its function to an activity handler. Activity handlers can be as simple as URL handlers handling redirection to another portal page or as complex as a handler to interact with a workflow engine.

Lotus Workforce Management ships with a number of pre-built handlers including those for interacting with WebSphere Portlet Factory models and portal page redirects. Additional handlers can easily and dynamically be added via the implementation of an extension class or statically added with the creation of a new WebSphere Portlet Factory model.

As in real life as time passes the status of incomplete checklist instances changes, the checklist sub-component of the checklist framework runs on a configurable schedule and visits each in-flight checklist in turn. For each instance it compares the current time with the creation time of the checklist and based on a set of customer configurable values it changes the status of the checklist and/or sends email alerts to specified parties.

2.4.2 Unified Task List

The UTL task list portlet aggregates tasks and activities from multiple systems into a single user interface. WebSphere Portal users access the unified task list portlet to complete these tasks and activities in order to advance workflows.

2.4.2.1 Presentation

The UTL presents a simple and easily understood interface to the business user as well as a comprehensive range of configuration options to an administrative level user. As with all the major components used in Lotus Workforce Management the UTL is also flexible and dynamically extensible. Some of its capabilities are listed in the following table by user role (Table 1).

The tasks presented to the user are those the individual task providers decide the user is eligible to see (Figure 3). This may mean simply that the user is the owner of the task as in the case of a checklist task or that the user is one of the potential owners of a WebSphere Process Server hosted process task.

2.4.2.2 Operation

When the task list portlet is loaded it determines the logged in users attributes via PUMA, the Portal User Management Architecture, SPI. The central task dispatcher then passes this information to each of the listed task providers. It is then the individual task provider's responsibility to return a list of relevant tasks to sort and display. In the current version there are task providers for Checklist tasks, IBM WebSphere Process Server tasks, and SAP workflow tasks.

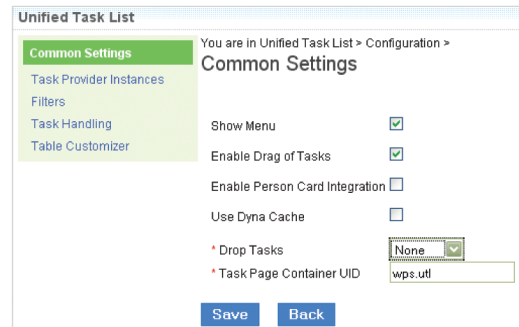
The user can now select any task from the list. Each task type is handled by a task details portlet the launching of which is user configurable. We have already seen that the checklist portlet provides the task details UI for checklist tasks and whilst a generic UI is provided for the out of the box task types the pattern of usage would be that the details portlets would very much be task specific and need to be developed by the customer of a case by case basis.

2.4.3 Authentication

The Lotus Workforce Management authentication solution was designed to provide a dynamic and extensible framework for single sign-on between the portal resident Lotus Workforce Management application and the HR repository of choice at the backend. It has a generic approach to authentication which allows for the dynamic alteration of authentication mechanism with no observable impact on the end user. The framework comprises largely WebSphere Portal server artefacts with companion WebSphere Portlet Factory client artefacts to allow for its use in portlet factory base applications.

Table 1. UTL capabilities

Role	Task
All	add task list providers at runtime via the portlet configuration view
All	enable the filtering and sorting of the aggregated task list
Administrator	enable or disable caching
Administrator	configure how task pages should be launched

Figure 3. Unified task list


The framework leverages WebSphere Application Server's implementation of the Eclipse extension framework and it is this which allows for the flexibility and extensibility of the solution. Additional authentication mechanisms can be added to the application server and these are automatically detected by the Lotus Workforce Management authentication administration portlet. This portlet then allows the administrator to chose a new authentication mechanism and configure its settings all without any code change to the pre-existing deployment.

An authentication broker, implemented as WebSphere Portal service, is the single point of contact between the Lotus Workforce Management application and the pluggable authentication mechanisms. This allows applications to be developed without being tied to a particular authentication mechanism.

2.4.3.1 Identities

There are three main artefacts when it comes to authentication and identification between the Lotus Workforce Management application and the HR backend. These are the credentials used to authenticate with the portal system, the credentials used to authenticate with that backend, and the employee's identifier in the HR backend.

The following sections describe each of these artefacts in turn and explain how they interoperate to surface information to the Lotus Workforce Management user.

2.4.3.2 Portal Authentication

By default WebSphere Portal uses the Custom Form-based Authentication mechanism of IBM WebSphere Application Server to prompt users for identity. Users type their user ID and password in the login portlet or the login screen of the portal. It has support for many other types including SSL, custom forms, and third party authentication with Tivoli® Access Manager for example.

2.4.3.3 SAP Personnel Number

In SAP employees are identified but their personnel number, a system wide unique string which is used in most interactions with the SAP backend system. The personnel number supplied to the backend ensures that the employee information specific to that personnel number is returned to the requestor. For example a call to get an address will only return address information for the personnel number passed to the get address call. There are temporal and other standard parameters that also affect the information returned but for the purposes of this section we are only interested in the personnel number.

2.4.3.4 Backend Authentication

Obviously before one can retrieve information from the HR system the request must be authenticated. As our solution is Java based we use the SAP Java Connector to connect to the SAP backend. The connection methods of the java connector require credentials to authenticate requests and subsequently return information. The Java Connector supports SSO with username and password credentials and logon tickets. It also supports x509 certificates. Whilst the Lotus Workforce Management authentication framework is flexible enough to accommodate all there, and more, the out of the box authentication implementation uses the common username and password credential combination. The username has no relation to the personnel number. It is used purely to authenticate with the backend and determine authorisation rights. Depending on the rights of the username, information on more than one personnel number may be retrieved or altered.

2.4.3.5 Interoperation

WebSphere Portal stores information about it's users in a user registry and access to this registry is provided programmatically via PUMA, the Portal User Management Architecture, SPI. Our solution leverages the WebSphere Portal user registry and

its credential vault component to provide a single sign-on mechanism between the Lotus Workforce Management application and the HR backend.

We map the SAP personnel number to an attribute in the Portal user registry. This provides the linkage between the user's identity in Portal and their identity in SAP. Independently if this link we store the SAP logon credentials in Portal's credential vault. The credentials stored are determined by the mapping type chosen by the portal administrator. The default mapping is n-1 where multiple portal users logon to SAP with the same shared credential. The other mapping supported by the username and password authentication mechanism is a 1-1 mapping where each portal user has their own SAP credential in the vault.

These mappings provide two distinct runtime paths on initial logon to the Lotus Workforce Management application:

- n-1 mapping
  - There is no credential challenge as only the administrator can set the password. If the password is set and valid the user notices nothing. If the password is invalid (unset or expired for example) the user is presented with a customisable error message.
- 1-1 mapping
  - If a valid credential exists in the vault for the user they seamlessly go to the Lotus Workforce Management application. If the password is invalid the user is presented with a challenge. On successful completion of the challenge the new valid credential is persisted to the vault and the user continues to the Lotus Workforce Management application.

The challenge is determined by the authentication mechanism in use and in the case of the default username and password implementation the challenge is the familiar dual text entry field

for username and password. The framework allows for any type of challenge as long as the accompanying authentication mechanism can handle the returned credential.

2.4.4 Builders

A set of WebSphere Portlet Factory builders we developed and released with the Lotus Workforce Management solution. These builders were designed to provide rapid application development capabilities for the Portlet Factory developer creating HR portlets in particular. The builders themselves are broken into three broad categories:

1. Base builders
2. SAP builders
3. Checklist builders

The Checklist builders form part of the previously discussed checklist framework and provide a solution for lightweight workflow type applications running on WebSphere Portal. SAP builders and Base builders are designed specifically to build HR portlets using data from SAP. The sections that follow discuss each category in more detail.

2.4.4.1 Base Builders

The Base builders delivered with Lotus Workforce Management provide essentially two core services for the SAP builders. Firstly the Base builders operate as a point of integration with the Authentication Framework. Tightly coupled with services provided by the Authentication Framework, the Lotus Workforce Management Credential builder will determine whether a user has already supplied valid credentials to access SAP. If no valid credentials are present, the user will be asked to enter a user name and password for SAP. Once these credentials are verified, the builder will then store these values in WebSphere Portal's credential vault. Secondly, the Lotus Workforce Management Base builder will provide

access to a range a valuable data from SAP to a Portlet Factory model developed using the Lotus Workforce Management SAP builders. This data is core information about the logged in user that may be required numerous times in the life of the application. This Lotus Workforce Management Base builder will retrieve relevant information via a one time call to SAP, store the information in local variables and make this information available via a set of public methods that can be called by other builders in the model.

2.4.4.2 SAP Builders

The SAP builders delivered with Lotus Workforce Management aim to abstract away from the complexity of calling Remote Function Calls on SAP. Five builders are included in this category of builders with specialised functions to

- Read table data on SAP
- Perform create, retrieve, update and delete (CRUD) operations on HR data on SAP
- Provide a presentation layer for the data access functions listed above

The SAP Infotype builder is one of the foundational builders in this category. Responsible for performing the CRUD operations on HR data mentioned above, this builder is designed for use by the business analyst that has no specific knowledge of working with SAP APIs known as BAPIs. Creating a web application or portlet that interacts with SAP as a HRM system would typically require expert knowledge of SAP's BAPIs. Clever logic inside the SAP Infotype builder removes this onus from the developer, empowering the business analyst to develop SAP HR portlets in just minutes.

This category of SAP builder should not be confused with the SAP builders delivered with the WebSphere Portlet Factory product itself. WebSphere Portlet Factory's SAP builders are raw data access builders that require the user be skilled

in working with SAP's BAPIs when developing a web application. These builders certainly have a place in the SAP web application development space but the Lotus Workforce Management SAP builders are of particular value when leveraging SAP as a Human Resources Management System. Technically, the Lotus Workforce Management SAP builders have a dependency on the WebSphere Portlet Factory SAP builder and in fact leverage the SAP Function Call builder delivered with WebSphere Portlet Factory. This dependency is of course by design, leveraging the connection pooling already implemented by Portlet Factory.

3 CONCLUSION

In this paper we described the motivations behind the development of the Lotus Workforce Management solution; the desire for a customisable solution, the need for ease of integration, and the requirement for extensibility. We showed how each of these goals were met and what technologies and assets were used to create Lotus Workforce Management. During the course of the project we strove to reuse as much as possible of the underlying stack components. Both WebSphere Portal and WebSphere Portlet Factory provided us with a significant amount of functionality out of the box, for example, the user management feature of Portal and the SAP feature set in Portlet Factory. WebSphere Portal and WebSphere Portlet Factory also provided the ability to customise and extend Lotus Workforce Management. The Eclipse extension framework in Portal and the builder/model architecture in Portlet Factory are perhaps the most pertinent examples of the capacity for customising and extending Lotus Workforce Management.

The following sections enumerate some of the experiences of the team during this project and provide a view on the future direction of work on Lotus Workforce Management.

3.1 Lessons Learned

The development of the Lotus Workforce Management solution involved a relatively large team of developers, some with experience of Java, some with SAP, and some more with Portal. During the course of the project we encountered the usual issues development teams hit as well as some more specific ones. This section aims to share a synopsis of those issues.

3.1.1 Knowledge Acquisition

Throughout this project we had SAP domain experience in two key areas of SAP; the functional area of human resources within SAP and the development of Advanced Business Application Programming, ABAP, the COBOL like language used to develop on SAP.

These skills enabled us to develop the SAP resident functionality we required and administer the SAP systems we used for test. However, even with such expertise onboard there was still much effort involved in determining the information we required to interact with SAP at the level we wanted to. The experience of our SAP resources allowed us the mine this information more quickly but knowledge acquisition was still something that took longer than originally anticipated.

3.1.2 User Experience

The main purpose of this project was to streamline access to HR data. The presentation of such data to the end user, as well as the paths to access this data, is one of the most important means of achieving this streamlining. With the use of the Universal Task List, the My Resources portlet and its companion the checklist framework, as well as the themed portal pages we feel we successfully achieved this user experience goal.

As always some things slip through however and in our case the most obvious of these is the need for a user to specifically save a checklist to persist state. It would be better if activities could be auto-saved on completion. So doing would prevent users losing state if they were to forget to manually save a checklist before moving on.

The lesson here is that experienced UX resource involvement at all stages of the project and most especially at the beginning and end is invaluable.

3.1.3 Testing

As we have shown the Lotus Workforce Management solution comprises a number of collaborating components used at both design time and run-time. Both of these types of components presented their own challenges from a test point of view.

The design time builders had to be tested for integration with the rest of the WebSphere Portlet Factory artefacts and also for integration with the WebSphere Portlet Factory builders on which some of them are built.

The run-time components, both those produced via WebSphere Portlet Factory and the authentication framework, naturally had to be system and performance tested as a whole. The development of a test harness and the allocation of unearthed defects proved to be the most troublesome aspects here due to the number of moving parts.

When going through a similar project in future planning and implementation effort will be expended to system and performance the larger components in isolation before the whole solution is subjected to these tests.

Chapter 30
Applicability Assessment of Semantic Web Technologies in Human Resources Domain

Valentina Janev
The Mihajlo Pupin Institute, Serbia

Sanja Vraneš
The Mihajlo Pupin Institute, Serbia

ABSTRACT

To meet the challenges of today's Internet economy and be competitive in a global market, enterprises are constantly adapting their business processes and adjusting their information systems. In this article, the authors analyze the applicability and benefits of using semantic technologies in contemporary information systems. By using an illustrative case study of deployment of Semantic Web technologies in Human Resources sector at the Mihajlo Pupin Institute, this paper shows how the latest semantic technologies could be used with existing Enterprise Information Systems and Enterprise Content Management systems to ensure meaningful search and retrieval of expertise for in-house users as well as for integration in the European research space and beyond.

INTRODUCTION

In order to meet the challenges of today's information economy and be competitive in the global market, enterprises are constantly adapting their business processes and adjusting their information systems. Whereas in the 1990s the

companies concentrated on implementing systems with re-automated functions to provide specific benefits in-house, today's market demands new applications and better integration within and between the organizations. Nowadays, the modern enterprise information systems represent an interconnection of heterogeneous systems like frameworks, knowledge management systems, enterprise resource planning, databases, data ware-

houses, etc. Resources are more often distributed over multiple sites, thus requiring utilization of different technologies and approaches for data/ document access and retrieval.

Semantic technologies provide standards and structures that allow information to be described in a way that captures what it is, what it means and what it's related to, all in a machine-readable form. This enables machines as well as people to understand, share and reason with them at the execution time. Semantic Web (SW) technologies are designed to extend the capabilities of the information on the Web and to enable enterprise systems to be networked in meaningful ways. This opens new perspectives that are far beyond the traditional approaches to information management.

In the present article we shall first more closely define the semantic technologies and the Semantic Web, and then, using an illustrative case study of deploying Semantic Web technologies at the Mihajlo Pupin Institute (Belgrade, Serbia), we will discuss the transition from the older models of information management to new ways of data integration and leveraging the diversity of resources using Semantic Web technologies. In order to locate the types of problems semantic technologies can solve, we will analyze the W3C collection of Case Studies and Use Cases and discuss the extent of adoption of Semantic Web technologies in practice.

RESEARCH FRAMEWORK

Semantic Web is one of the fastest developing fields within the ICT sector and, as such, under constant examination by scientists and IT professionals. Most of the academic work, up to now, has focused on the global public gains of adopting SW technologies (Alani et al., 2008), and to a significant degree has neglected the industry development and migration needs to meet the SW challenges.

Having in mind this situation, the present work will focus on:

- Presenting a brief account of the key application areas of Semantic Web technologies and a summary of the achieved benefits from them (based on the analysis of the W3C collection of Case Studies and Use Cases), that will give a picture of the present status of the SW technology implementation and needs thereof in industry development sector, and
- Presenting the results of a case study of the use of semantic technologies for integration and meaningful search and retrieval of expertise data, as an example of the new approaches to data integration and information management.

Semantic Web Background

The Semantic Web was envisioned by Tim Berners-Lee, inventor of the World Wide Web (Web), and is now being further refined by researchers and visionaries within the World Wide Web Consortium (W3C), which Berners-Lee directs. In (Berners-Lee, Hendler, & Lassila, 2001), Semantic Web is defined as '…an extension of the current Web in which information is given the well-defined meaning, better enabling computers and people to work in cooperation'. The main standardization body the W3C was created in October 1994, to "lead the World Wide Web to its full potential by developing common protocols that promote its evolution and ensure its interoperability."

Semantic Web is an extension of the conventional Web based on the HyperText Markup Language (HTML) and the Extensible Markup Language (XML). A markup language is a set of markup tags used to describe the web pages. A HTML Web document contains HTML tags and plain text. XML is a generic markup language for describing the structure of data. Unlike in the HTML, neither the tag set nor the semantics of

XML are fixed. XML can thus be used to derive markup languages by specifying tags and structural relationships. Semantic Web languages, indeed, use XML syntax. Since the Semantic Web was conceived, numerous web technologies have been accepted as standards or recommendations by the W3C's Semantic Web Activity (Ayers, 2009). In an attempt to structure and relate these technologies, Berners-Lee presented several versions of the Semantic Web architecture where these technologies were layered into a so-called stack of increasingly expressive languages for meta-data specification (Gerber, van der Merwe, & Barnard, 2008). In short, W3C recommends implementing the Semantic Web in the layers of Web technologies and standards where the Application layer should be developed on top of the Ontology layer, which in turn is developed on top of the Resource Description Framework (RDF) layer. RDF is a general-purpose language for representing information on the Web. It defines a framework in which independent communities can develop vocabularies that suit their specific needs and share vocabularies with other communities. In order to share vocabularies, the meaning of terms must be specified in detail. The descriptions of these vocabulary sets are called RDF Schemas. A schema defines the meaning, characteristics, and relationships of a set of properties, and this may include constraints on potential values and the inheritance of properties from other schemas. The RDF language allows each document containing metadata to clarify which vocabulary is being used by assigning each vocabulary a Web address. RDF Schema uses Uniform Resource Identifier (URI) references for naming. URI reference is a string that represents a URI, i.e., name or address of an abstract or physical resource on the Web. Ontology Web Language (OWL) facilitates greater machine interpretability of Web content than that supported by RDF and RDF Schema by providing an additional vocabulary along with formal semantics.

W3C does not prescribe ways of implementation semantic applications, and the Semantic Web layer cake (see W3C, http://www.w3.org/2007/03/layerCake.png) is not a technology stack in the engineering sense. After the standardization of the RDF and the Ontology layer, main efforts of the Semantic Web research community during last several years have been (and still are) devoted to: standardization of technologies (WSDL - Web Services Description Language and SAWSDL - Semantic Annotations for WSDL and XML Schema, recommended in 2007) for development Semantic Web Services and provision of tools that enhance interoperability; development of rule languages (SWRL - Semantic Web Rule Language, RuleML), development of Rule Interchange Format (RIF) and provision of engines (ontology reasoning and rule) that enhance reasoning; improvement of OWL and invention of new knowledge representation formalisms.

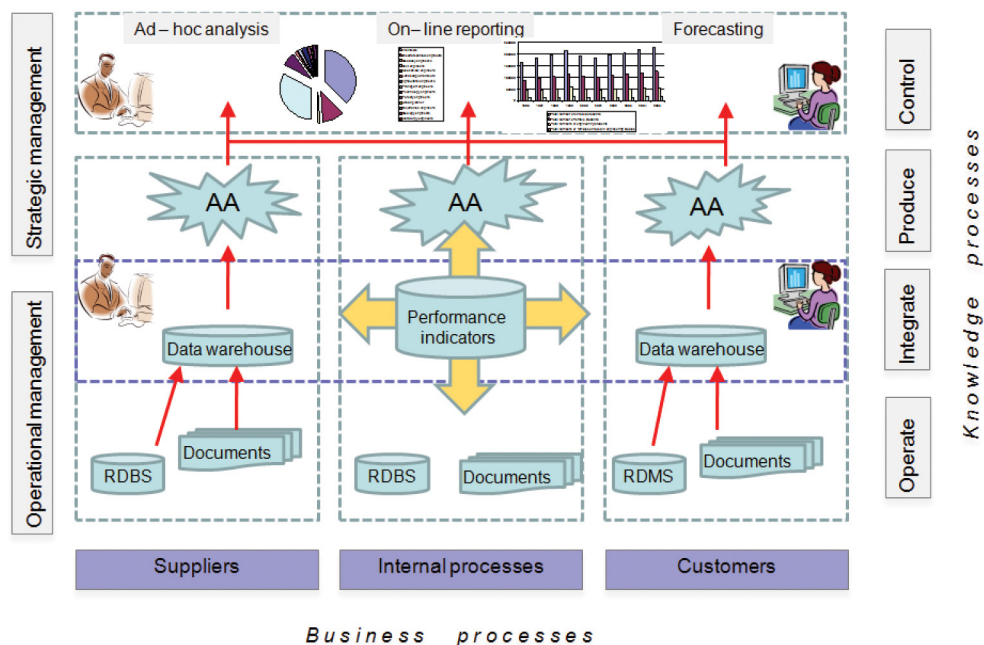
Knowledge Technologies and Processes in Traditional EIS

An enterprise is an independent legal economic entity, established with the aim to carry out particular business activities with a positive outcome. Depending on the type of primary economic activities, we distinguish manufacturing enterprises, retail enterprises, service enterprises, public enterprise, etc. The primary economic activities of an enterprise define also the structure of its enterprise business processes. For instance, the business processes of a research and development organization (R&D) will slightly differ from the enterprise business processes of a retail company. Roughly speaking, enterprise information flows could be divided into external and internal flows. External flows are directed towards clients, suppliers, partners and other legal entities. Internal flows are results of information exchange and business interactions between employees inside the enterprise. Both types of processes together form the enterprise business processes, such as:

marketing, sales, purchase, customer support, research and development, manufacturing and management.

As shown in Figure 1 (Janev & Vraneš, 2005), enterprise management processes vertically can be divided into operational business processes and strategic business processes. Operational business processes that are aimed at carrying out the daily activities in an effective and an efficient way are based on transactional databases (DB). On the lowest level (Layer 1 in Figure 1), enterprise resource management (ERP) systems integrate and automate all aspects of operational business activities from manufacturing and warehousing to sales and finance. Built around a centralized or distributed database, ERP systems are often preserved as back office systems for managing the internal information flows. The ERP systems' integrated functionalities ensure prompt connection of the employees with the customers, suppliers or partners. Information technologies that have an integrative role on the enterprise level are (Layer 2 in Figure 1): data warehous-

ing technologies, collaboration solutions, portals, document management, workflow solutions and other ontology based and SOA oriented solutions. While managers on the operational level are concerned with the optimization of workflows, reduction of costs, and utilization of resources, the strategic managers (Layers 3 and 4 in Figure 1) are concerned with establishment of good position on the market, improving the customer satisfaction, meeting the business objectives and creating profit, protection and development of intellectual capital, etc. On upper levels specialized executive information systems that support strategic activities, such as goal setting, planning and forecasting and tracking performance, are used. Executive information systems, also called Business Intelligence (BI) systems, include decision support applications, operational research techniques, knowledge production technologies and enterprise performance measurement systems (Colomo-Palacios, Hernández-López, García-Crespo, & Paniagua-Martín, 2009).

Figure 1. Relating information and knowledge technologies to business processes in traditional EIS


Driving Forces for EIS Development

In order to increase the efficiency of business processes, organizations outsource business processes to service providers or use information technologies to shift the front-end process completely to the customer self-service and automatic retail of digital goods without any human interference at the provider side. New organizational models such as a "virtual organization" (Cruz-Cunha & Putnik, 2009), whose members link their individual core competencies (Lahti, 1999) through cost-sharing and risk-sharing agreements so that the virtually integrated organization can act as a larger, single entity, invoke challenges such as inter-enterprise cooperation, interoperability and integration, migration and heterogeneity management. From here we can see the growing importance of inter-organizational (cross-organizational) applications of enterprise information systems, in particular in the e-business context (Nayak, Bhaskaran, & Das, 2001). This includes dynamical aspects in external links, e.g. with respect to offered functionality and/or with respect to collaborating parties. To provide integrated solutions, new approaches, technologies and architectures have emerged during the last decade (Gu, Xia & You, 2006) that include ontologies, Web services and Components technology, Workflow technology, Service-oriented architecture, Model driven architecture, the Grid Computing, etc. The Semantic Web technologies are the subject of investigation in this paper, especially their role in the contemporary software engineering and the ways researchers and practitioners are using them in practice.

APPLICABILITY ASSESSMENT OF SEMANTIC WEB TECHNOLOGIES

New technologies are usually subjected to experimentation, refinement, and increasingly realistic and exhaustive testing. This kind of information gathering, which looks beyond the immediately obvious and attempts to analyze a given technology's ramifications in as wide-ranging and far-sighted a manner as possible, is known as *technology assessment* (Braun, 1998). It is usually based on different forecasting methods, such as extrapolation, expert opinion (the Delphi method) and modeling, cost-benefit analysis, and cross-impact analysis. Prior to incorporating a specific technology into a system or subsystem, many of the world's larger companies and government agencies use a measure called *the technology readiness level*. At the lowest level, researchers begin to translate scientific data into applied research and development. At the middle level, they test the prototype system (or technology) in a real environment, and at the highest level, they integrate the new technology into an existing system.

Aiming at providing an updated picture of the applicability and adoption of Semantic Web technologies in practice, we have analyzed the collection of W3C Semantic Web Case Studies and Use Cases (www.w3.org/2001/sw/sweo/public/UseCases/). The W3C, the main standardization body for the Semantic Web, established a collection of Semantic Web case studies and use cases in 2007, based on an enterprise survey conducted by the SW Education and Outreach Interest (SWEO; www.w3.org/2001/sw/sweo/) Group. The "case studies" include descriptions of systems that have been deployed within an organization and are now being used in a production environment. The "use cases" include examples of built prototype systems that have not yet been used in practices. As of this writing, the database stores 40 entries, in which 27 are case studies.

For better understanding the usability of SW technologies in real applications, we have used the cross-tabulation analysis to find relationships between variables such as the enterprise *Activity area of*, the *Application area of SW technologies*, the *SW technologies used*, and the *Benefits of SW technologies*. Researchers typically use cross-tabulation analysis, also known as contingency table analysis, to analyze categorical (nominal

Table 1. Semantic Web technologies' application domains

Status	Definition
Data integration	Data integration is a process of retrieving, merging and storing of data originated in heterogeneous, expanding set of corporate/public data sources using ontologies and web services.
Semantic Search	Semantic search is based on methods (i.e. faceted-based) that aim to augment and improve traditional search results by using not just words, but concepts and logical relationships.
Content discovery	Semantic content discovery is based on using taxonomies and ontologies for describing different types of content and for dynamic linking between content items.
Semantic annotation	Semantic annotation is a process of assigning unambiguous meaning to resources (e.g. assigning types to single terms or semantic relations to pairs of terms) in order to enable a more efficient discovery mechanism.
Social networks	W3C standards, natural-language processing, statistical analysis, graph analysis capabilities and other technologies are used to help people track, discover, and share content around topics they are interested in, thus forming social networks.
Natural language interfaces	W3C standards, natural-language processing, machine learning methods are used to provide natural, human-like interaction with the computer.
Service integration	Adding semantics to Web services with the aims to augment service integration i.e. discovery, composition, ranking, selection and mediation of services.

measurement scale) data. A cross-tabulation is a two- (or more) dimensional table that records the frequency of respondents with the specific characteristics described in the table's cells. Our primary objective was to identify the W3C SW technologies applied in a particular application domain (see Table 1) and the benefits gained. The results are summarized in Table 2.

Looking at the *Activity area* of early adopters registered in the W3C collection of Semantic Web

Case Studies and Use Cases, we found that 37.5% of the companies are public institutions. Further on, 17% of applications are e-government applications, 12.5% are applications for the health sector, while only 7% are life science applications. Looking at the technical problems solved by using semantic technologies and comparing them by frequency of occurrence, we have obtained the following list (see also Table 2): data integration (65%), search (42%), portal (40%), content dis-

Table 2. Relating Benefits of SW to SW technologies used

	23 - DSR	22 - IS	10 - ECR	6 - INR	4 - P	4 - RRC	2 - RTM
34-RDF(S)	18	20	10	6	4	2	1

covery (25%), semantic annotation (25%), social networks (10%), content management (7.5%), customization (7.5%), domain modeling (7.5%), natural language (5%) interfaces, and service integration (5%). Semantic technologies are by far most often used for data integration and to improve search. However, according to these statistics, they have the potential for dynamic customization/composition of services and, hence, for building flexible architectures.

Our analysis has also indicated some of the *Benefits* that end-user organizations gain by utilizing the SW technologies, including data share and re-use (57.5%), improved search (55.5%), incremental modeling (27.5%), explicit content relation (25%), identifying new relationships (15%), dynamic content generation (10%), personalization (10%), open model (12.5%), rapid response to change (10%), reduced time to market (5%), and automation (5%). From the results presented in Table 2, it is obvious that SW technologies are very suitable for data sharing and reusing, as well as knowledge search. Using the faceted navigation technique, knowledge bases could be full-text searched, as well as filtered and sorted using semantic relations. Analyzing the SW technologies that have been applied, this analysis has shown that in comparison with RDF(S), that is used in almost all data integration applications, the OWL is used in less than half. It is interesting to notice that SPARQL Protocol and RDF Query Language (SPARQL), which is a standard query language for RDF, is more exploited for data integration i.e. syntactic matching of different knowledge schemas, than for querying and retrieval. The search and content discovery function rely both on public and in-house vocabularies. It is encouraging that, besides the mature SW technologies (RDF and OWL), technologies such as OWL-S and Web Service Modeling Ontology (WSMO) that are still in the process of standardization are considered to be used for service integration.

One of the benefits reported is that "semantic technologies make the content relationships explicit and hence machine processable". Semantic Web is an extension of the conventional Web, and therefore existing contents should be available on Semantic Web as well. For this purpose, W3C recommended several technologies including Gleaning Resource Descriptions from Dialects of Languages (GRRDL) mechanism, RDFa, and microformats. In addition, both the research community and the commercial sector offer various semantic annotation and ontology learning tools for online conversion of the existing unstructured contents on the web into a format understandable by computers. However, this process is not trivial and generally not an easy solvable task.

DEPLOYING SEMANTIC WEB TECHNOLOGIES: A CASE STUDY OF THE MIHAJLO PUPIN INSTITUTE

The business process of a modern organization (such as the Mihajlo Pupin Institute - MPI) in the information and communication technologies – ICT sector, is a very complex one and is driven, on one hand, by market "pool" factors and relations with the industry (public and private sectors) and, on the other hand, by science "push" factors, societal needs and expectations (public sector). Since MPI performs applied research in the ICT sector, with outcomes directly applicable in the industry, it takes advantage of it and successfully performs technology transfer from academia to industry. As the most precious asset, apart from knowledge artifacts and standardized business processes, the MPI knowledge resources include the creative human resources and their explicit and tacit knowledge and experience. Since R&D organizations' innovation charter demands a focus different from that of other types of organizations, specifically, to nurture open access to human resources' extensive knowledge and experience, explicit and tacit, significant adjustment of standard information management solutions and practices are necessary to suit their needs.

In this Section, we shall discuss to what extend the semantic technologies can address these specific needs.

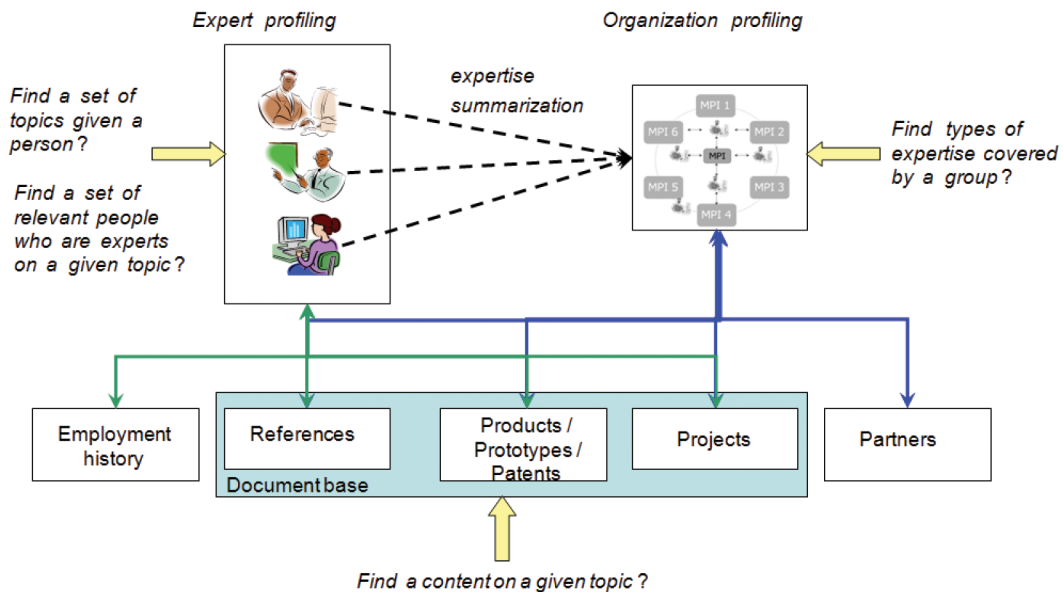
Knowledge Management in HR Sector

Knowledge management systems (KMS) support all aspects of knowledge processing and sharing, including knowledge extraction, representation and retrieval. KMS in HR domain should respond to challenges such as management of entities in the HR domain (organizational units, people, jobs, competences) by continually recording the experts' knowledge, expertise profiling and by building community oriented competency repositories, expertise gap analysis, expertise planning and development, etc. They should answer questions such as those presented in Figure 2.

In 2008, MPI introduced the *SAP® Enterprise Resource Planning* (ERP) system and thus has integrated in-house processes related to material management, sales and distribution, financial and management accounting, human management,

project management, etc. The *SAP® Human Capital Management* (SAP HCM; www.sap.com), that is part of SAP ERP, supports core HR processes including employee administration, organizational management, time management, benefits, payroll, and legal reporting. SAP HCM covers the whole life-circle of an employee from her/his recruitment, training, development, deployment to retirement and thus enables tracking of employee movements and adequate tracking of changes in organizational structure. It supports skill management and gives managers and HR professionals reporting and analysis options that provide a real-time insight into employee qualifications.

During its introduction (Janev, Đokić, Minić & Vraneš, 2008), it was concluded that considerable modifications have to be made in the standard SAP HCM solution in order to meet the specific MPI requirements and the adopted ISO 9001 Quality Assurance standards (Mihajlo Pupin Institute, 2004). Modifications concern, firstly, the specifics of the MPI organizational structure and, secondly, the specifics of human resources data

Figure 2. Expert profiling vs. organization profiling


in the research sector. Taking into consideration the recommendations of the Serbian Ministry of Science for compilation of the Researchers files (Serbian National Scientific Council, 2008), the SAP employee master data was supplemented by data specific for scientific research environments including: scientific and professional skills and expertise, information about engagements in projects with details about roles and competences, scientific achievements (patents, technical solutions, scientific articles / books), other achievements / awards, etc. Presently, this system stores the information for about 450 current MPI employees and the complete employment history of 900 past MPI employees from 1960 until now. The established knowledge pool of employees' professional and scientific results and achievements is used by HR department staff on everyday basis for different reporting purposes.

With regards to expertise management, the disadvantage of this approach is that the resulted personal profiles rely on the self declared expertise. This approach is error-prone since the experts are typically subjective/biased and reluctant to update their files regularly. Also, manually created key qualification lists cannot be an exhaustive description of the person's expertise areas. Further on, the data centric approach in SAP HCM does not offer integration of whole documents, e.g. scientific papers or other publications that document the employee's expertise. Finally, the exported personal profiles documents are in a form of PDF document without possibilities for assigning explicit meaning to the document contents.

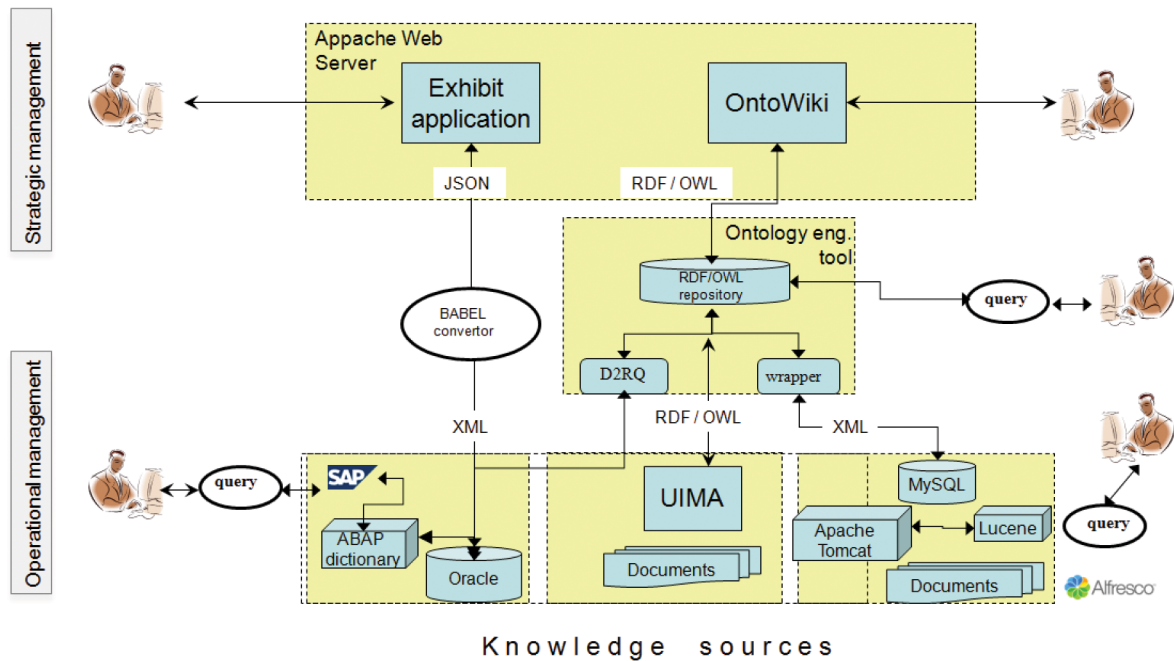
Semantic Web Based Approach to Expertise Profiling and Retrieval

Semantic Web technologies (i.e., ontologies and semantic web services) offer new possibilities for employees' expertise data integration and competency management (Schmidt, & Kunzmann, 2006; Müller-Riedlhuber, 2009; Bizer, Heese, Mochol, Oldakowski, Tolksdorf, & Eckstein,

2005). Roughly, ontologies correspond to generalized database schemes made up of concepts, and the relations between them, that are relevant for a specific domain of knowledge. However, an ontology not only provides a database scheme for storing metadata but also facilitates semantic content annotation, i.e, assigning semantics to a set of knowledge sources (documents), and definition of rules that are both tractable by machines and understandable for humans. Therefore ontologies, as was shown in the above analysis, are nowadays very often used for building integrated inter- and intra-organization business services, and to make the search and retrieval both efficient and meaningful.

Figure 3 depicts the components (building blocks) of the proposed holistic MPI knowledge infrastructure for the HR domain. Instead of proposing a data warehouse for data/knowledge integration (as it was practice 10-15 years ago), we are suggesting ontologies because they are explicit knowledge representation forms and made the instance data locked in legacy systems interoperable with similar applications at other sites. Using inference services, the explicit data could be checked for consistency and new knowledge could also be generated.

The holistic MPI knowledge infrastructure is based on three disparate knowledge sources: the SAP® HCM, Alfresco open-source Enterprise Content Management (ECM) software (www. alfresco.com) and UIMA (Unstructured Information Management Architecture, incubator.apache. org/uima/) framework. The Alfresco document base serves to integrate knowledge items such as published research papers, products' documentation, marketing materials, etc. Alfresco ECM is based on a set of document management (to import, classify, store, search, access and control content) and collaboration services. The Alfresco workflow engine enables organization and automation of the process activities. In addition, Alfresco integrates WebDAV server and Apache Lucene full text indexing and searching service. Using Lucene

Figure 3. The MPI human capital management solution


one can explore the document contents as well as the automatically extracted and user defined metadata. The new social software functionalities (e-mail, forum and blog support) enable capturing the additional valuable information about the users' expertise. In March 2009, OASIS, the international open standards consortium (see Organization for the Advancement of Structured Information Standards, http://www.oasis-open.org/) approved UIMA (Unstructured Information Management Architecture, http://incubator.apache.org/uima/) as standard technology for creating text-analysis components. This was a reason for exploring the functionalities of the UIMA architecture for analysis of unstructured content in the HR domain and introducing user-defined text-analysis components in the latest version of MPI HR knowledge infrastructure.

On top of SAP® HCM and Alfresco ECM we can use an engineering tool for establishing and managing an ontological knowledge base. Tools such as the *TopBraid Composer™* (www.topquad-rant.com), that is one of the most comprehensive commercially available semantic modeling and development environments, or the open source *Protégé Ontology Editor and Knowledge Acquisition System* (protege.stanford.edu) can integrate and further process the personal profile documents exported from SAP® HCM knowledge pool and metadata extracted from documents stored in the Alfresco document base. This approach allows enhancing the personal profiles with information automatically extracted from the user business activities.

The MPI ontological knowledge base was established using common ontologies such as FOAF, SIOC, DOAC, Dublin Core, and others. On the top of this knowledge base, the OntoWiki Portal was mounted that allows searching the ontological base and exporting the data in format recognizable for the broader Semantic Web community.

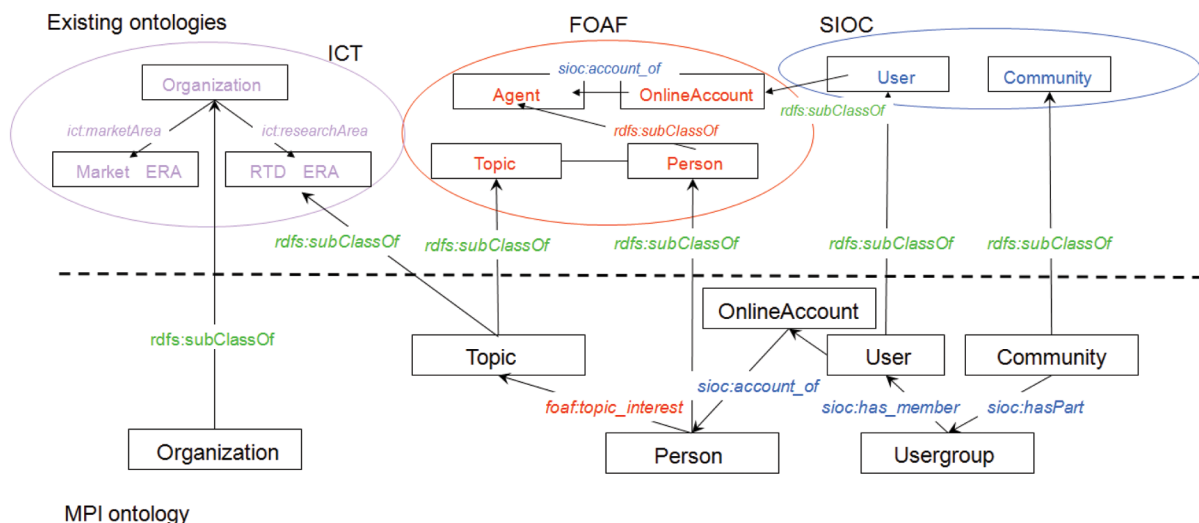
Table 3. Common public vocabularies/ ontologies applicable in the human resources domain

Vocabulary / Ontology	Definition
FOAF	Friend of a friend, a vocabulary for expressing personal profile and social networking information. It defines machine readable information/metadata for people, groups, organizations and other related concepts. Further information at: http://xmlns.com/foaf/0.1/.
DOAC	Description of a Career, a vocabulary for describing professional capabilities of workers gleaned, for example, from CVs or resumes. DOAC has been designed to be compatible with the European CV. Further information at: http://ramo-nantonio.net/doac/0.1/.
SIOC	Semantically-Interlinked Online Communities, an ontology for expressing information contained within online community sites (weblogs, message boards, wikis, etc.). Further information at: http://rdfs.org/sioc/.
bibTeX	A vocabulary for describing bibliographic data. Further information at: http://zeitkunst.org/bibtex/0.1/.
ICT	ICT taxonomy for describing the ICT research areas. Further information at: http://ec.europa.eu/research/era/index_en.html.

Building the MPI Ontological Knowledge Base

Prior to importing source data/documents into an ontological knowledge base, we have to model the ontological knowledge base in a way that it is optimized for semantic expertise search and retrieval. Common public ontologies relevant for building an expertise finding system in ICT domain are given in Table 3.

Figure 4 illustrates the interoperability between the MPI ontology and the public vocabularies/ ontologies. The main "components" of the MPI ontology are defined as subclasses of the public concepts (*foaf:Person*, *foaf:Organisation*, *foaf:Document*, *foaf:PersonalProfileDocument*, *doac:Education*, *doac:Skill*, *doac:Experience*), while links/relations between the components are defined as sub-properties of *foaf:interest*, *foaf:made/maker*, *foaf:topic*, *foaf:primaryTopic*, *foaf:homepage*, etc. Additional classes and prop-

Figure 4. Reusing existing ontologies


erties specific to the MPI are defined manually with elements from the RDF Schema (www.w3.org/TR/rdf-schema/) or defined automatically via the mapping facilities of the engineering environment during the data import from the relational database. As a result, the ontological database is a set of interlinking public ontologies and in-house ontologies in RDF/OWL format as is shown with the following code:

```
<owl:Ontology rdf:about="">
<owl:imports rdf:resource="http://
www.imp.com/publications.owl"/>
<owl:imports rdf:resource="http://
www.institutepupin.com/projects.
owl"/>
<owl:imports rdf:resource="http://
www.imp.com/ict.owl"/>

>Created with TopBraid Composer</
owl:versionInfo>
</owl:Ontology>
```

In order to profile the MPI activities with the topics relevant for MPI ICT fields we have initiated the MPI Business Topic Hierarchy with the following topics: Information and Computer Science, Automation and Control, Sensors and Measurements, Telecommunications, Traffic Management, and Robotics. The subtopics of the Information and Computer Science topic are: Business Information Systems, Communications, Databases, Document Management, DSS and Artificial Intelligence, Groupware and Collaboration, Semantic Web, System Architectures, etc.

Extracting Expertise Data from Unstructured Sources

Applying procedural programming, the UIMA ConceptMapper Annotator can be used to extract information from unstructured documents (e.g. published papers, project reports) and convert them into RDF instances. In order to extract topics of interest of experts from their working documents (publications and project reports), we used the CISTRANA ICT European Research Area taxonomy. The new properties *ict:topic_interest_project* and *ict:topic_interest_reference* were defined as subproperties of *foaf:topic_interest*. In addition, we included in the UIMA dictionary model a domain specific taxonomy that classified the computer skills of the experts with respect to ability of using tools/technologies. The new properties such as *ict:useModellingTool*, *ict:useDBMS*, *ict:useOperatingSystem*, *ict:useSoftwareSolution*, etc. were defined as subproperties of *doac:skill*. The exported output from the user-defined text-analysis component looks as follows:

```
<ict:Person rdf:ID="ID_1526">
<Global_ID rdf:datatype="http://
www.w3.org/2001/
XMLSchema#integer">1526</Global_ID>
<ict:topic_interest_project
rdf:resource="http://www.institute-
pupin.com/ict.owl#Semantic_Technolo-
gies"/>
<ict:topic_interest_reference
```

pin.com/skills.owl#SAP_ERP"/>

  …

  </ict:Person>
```

Searching the MPI Ontological Knowledge Base

Expertise profiling is a technique for identifying and classifying knowledge and expertise of individuals. Assuming that information sources described previously could provide plenty of data about an employee's expertise, we have introduced

- *imp:PersonalProfileDocument*, based on *foaf:PersonalProfileDocument* class that aims to integrate all expertise data for an employee, and
- *imp:RnDProfile* that serves to infer the R&D profile of an organization.

Using semantic relations such as *foaf:topic_interest*, *foaf:primaryTopic*, *doac:organization* links can be established between the classes *imp:Person*, *imp:Organization*, *imp:PersonalProfileDocument*, *ict:RTD_ERA* and questions can be answered such as the ones presented in Figure 2 using the SPARQL Query Language for RDF.

Figure 5 gives an example of a search for experts with "System Analysis" qualifications in "Semantic Technologies" area when SPARQL query is run interactively via the SPARQL query editor in TopBraid Composer.

A far more comfortable way for querying the ontological base is, however, to use free of charge open-source tools, such as the OntoWiki (ontowiki.net), in order to improve the expertise search, analysis and retrieval. OntoWiki (Auer, 2008) uses SPARQL to access the underlying databases. Using the OntoWiki tool (see Figure 6), the RDF/OWL expertise data can be full-text searched (see the "Search" panel in the upper left corner), browsed using semantic relations (see the "Classes" panel in the lower left corner) and searched using faceted navigation method (see the "Filter" panel in the right most side).

CONCLUSION

The study presented in this article analyses the current status and trends in the Semantic Web and discusses the adoption the Semantic Web

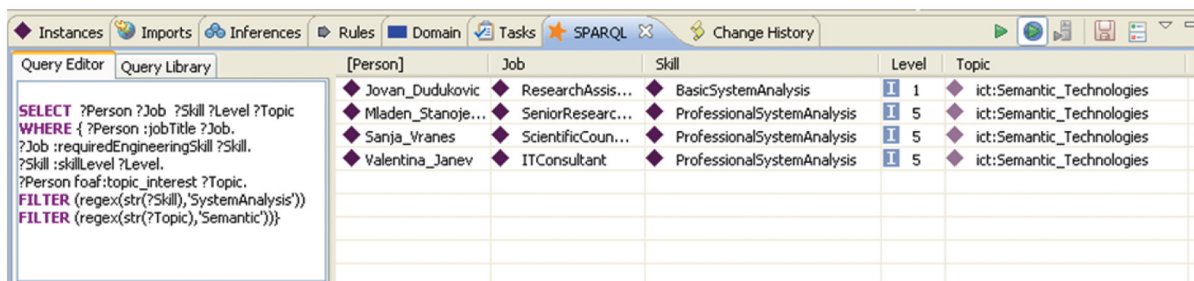
Figure 5. SPARQL sample query against the ontological knowledge base


Figure 6. Expertise search with OntoWiki
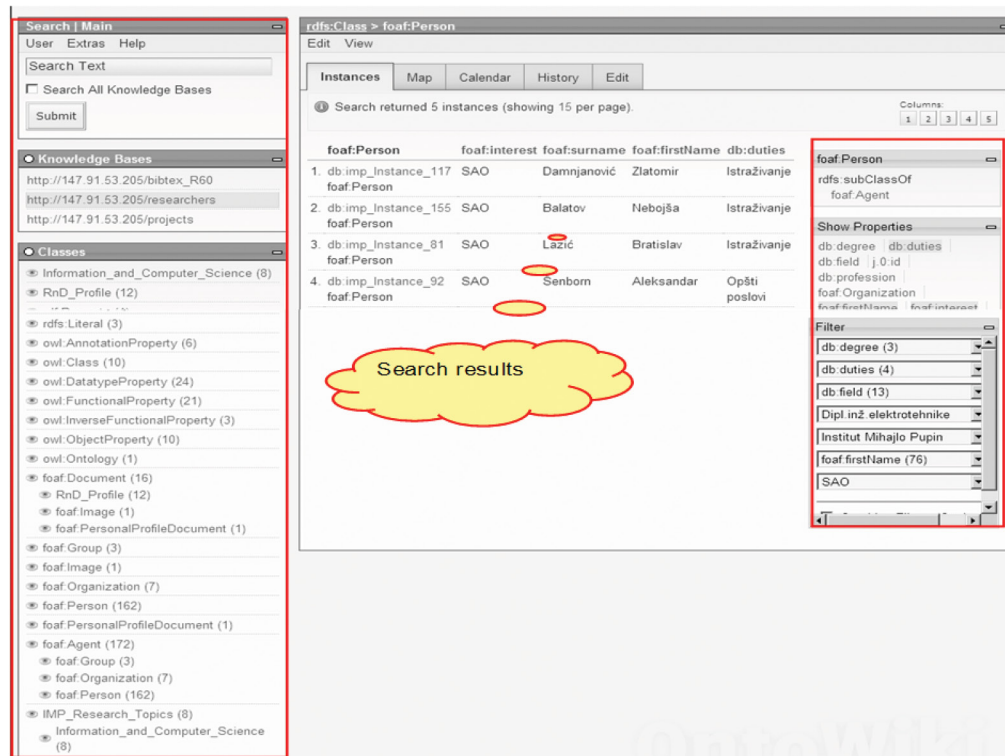

technologies in practice. The results of the analysis have shown that semantic-based technologies have been increasing their relevance in both the research and business worlds in recent years. W3C, together with universities and IT research organizations, and in cooperation with the major software companies and government agencies, has already accepted many specifications, guidelines, protocols, software, and tools that are the basis for realization of the Semantic Web vision. Innovative enterprises (the Mihajlo Pupin Institute, for instance) interested in catching new opportunities from the Semantic Web and also developing new business models are already introducing semantic technologies that facilitate data integration and interoperability, as well as improve search and content discovery. Considering the benefits from introducing SW applications, the analyzed early adopters from the W3C collection of Case Studies and Use Cases report that SW technologies are useful for sharing and reuse of data, to improve search and to establish explicit content relations.

From the presented Mihajlo Pupin Institute case study and the overall analysis, we may conclude that the Semantic Web technologies are finding their ways to applications, and that rather than being another research issue, the Semantic Web technologies have emerged as solutions for the new requirements and challenges of future enterprise information systems.

ACKNOWLEDGMENT

ABSTRACT

Talent management is a very crucial task and demands close attention from human resource (HR) professionals. Recently, among the challenges for HR professionals is how to manage organization's talents, particularly to ensure the right job for the right person at the right time. Some employee's talent patterns can be identified through existing knowledge in HR databases, which data mining can be applied to handle this issue. The hidden and useful knowledge that exists in databases can be discovered through classification task and has been widely used in many fields. However, this approach has not successfully attracted people in HR especially in talent management. In this regard, the authors attempt to present an overview of talent management problems that can be solved by using this approach. This paper uses that approach for one of the talent management tasks, i.e., predicting potential talent using previous existing knowledge. Future employee's performances can be predicted based on past experience knowledge discovered from existing databases by using classification techniques. Finally, this study proposes a framework for talent forecasting using the potential Data Mining classification techniques.

INTRODUCTION

Human capital is a definitely critical issue and it demands close attention from the top management and Human Resource (HR) professionals in any organization. Human Resource Management (HRM) that deals with human capital aims to facilitate organizational competitiveness; enhances productivity and quality; promotes individual growth and development; and complies with legal and social obligation (DeNisi & Griffin, 2005). Besides that, an organization needs to struggle effectively in term of cost, quality, service and innovation in order to achieve organization's target. All these depend on having enough right people, with the right skills, employed in the appropriate locations at appropriate points in time. Recently, among the challenges for HR professionals is managing talent, especially to ensure the right person for the right job at the right time. These tasks involve a lot of managerial decisions, which are sometimes very ambiguous, uncertain and difficult. On the other hand, HR decision practices depend on various factors such as human experience, knowledge, preference and judgment. These factors cause inconsistence, inaccuracy, inequality and unforeseen decisions. Consequently, in promoting individual growth and development, this situation can often make people sense injustice and this can also influence the productivity of an organization. In talent management, to identify the existing talent for the right job is the topmost challenge for HR professional (A TP Track Research Report, 2005); and at present, most of the determination processes use human experience knowledge that is supported with evidence to justify the potential talent.

The advancement of technology has proposed some new approaches that can be used to solve some decision making problems. Data mining (DM) and also known as Knowledge Discovery in Database (KDD) approach is a computer technology that can be used to handle some talent management issues. DM is one of the Artificial Intelligent (AI) technologies that have been developed for exploration and analysis in large quantities of data to discover meaningful patterns and rules. In HRM, HR data can provide a plenty of resource for knowledge discovery and decision support tools. Therefore, the application using DM approach has not attracted much attention in HRM field (Ranjan, 2008) compared to other fields such as in marketing, financial, manufacturing, medical and many others. DM approach has several tasks such as classification and prediction; concept description; association; cluster analysis; outlier analysis; trend and evaluation analysis; statistical analysis and others. Over the years, data mining has evolved various techniques to perform tasks including database oriented techniques, statistic, machine learning, pattern recognition, neural network, rough set and etc. Classification and prediction technique is among the popular task in DM. For that reason, in this article we attempt to use DM classification techniques for managing talent tasks especially to identify existing talent by predicting the performance using past experience knowledge. Finally, this study aims to suggest the framework for talent forecasting using selected DM classification techniques.

This paper is organized by describing related work on HR decision system that uses Artificial Intelligent technology. Next, some issues in talent management are discussed while reviewing HR researches that use the DM approach. Then DM classification techniques are discussed followed by an explanation on how talent management tasks use the DM approach in their problems solving and suggests framework for talent forecasting using DM classification techniques. Finally, the paper ends with the concluding remarks and future research directions are also identified.

HR DECISION APPLICATION

Nowadays, HR has been linked to improve productivity, good customer service, greater profit-

ability and on the whole organizational survival. Successively to reach such link, management must not only face contemporary issues of human resource but also deal with future challenges to HRM effectively (Stavrou-Costea, 2005). HRM tasks involve a lot of managerial decisions and professionals that are highly needed to focus the goal for each of HR activities such as: staffing task is to locate and secure competent employees; training and development task to adapt competent workers to the organization and help them obtain up-to date skill, knowledge and abilities; motivation task to provide competent and adapt employees who have up-to date skill, knowledge and abilities with an environment that encourage them to exert high energy level; and maintenance task is to help competence and adapt employees who have up-to date skill, knowledge and abilities and exert high level energy level to maintain their commitment and loyalty to the organization (DeCenZo & Robbins, 2005).

Among the challenges for HRM professionals are issues regarding health, managing talent, employee rewards, retention, training and development, technology innovation, tribalism, nepotism and corruption. However, among the major potential prospects for HRM is technology's innovation, selection and implementation (Okpara & Wynn, 2008). In addition, the benefits of technology applications and innovation in HRM are to easily deliver information from the top to bottom workers in an organization, easily to communicate with employees and it is easier for HR professionals to formulate managerial decisions. Nowadays, HR decision application can be widely used in any type of decision making tasks as contribution to the achievement of HR goals. The potentials of HR decision applications are to increase the productivity, consistent in performance and the institutionalized expertise where the system capabilities are embedded into the specific programs (Hooper, Galvin, Kilmer, & Liebowitz, 1998).

The technology's innovation in HRM can help HR manages and makes decision in some decision making process especially for decisions which involved human judgment. Artificial Intelligent technology is a current and useful technology that can be embedded with any HR decision making tool towards producing more precise decision in decision making process. In fact, there are many techniques or approaches in Artificial Intelligent that can be used in a development of the advance decision making tools. Besides that, this technology was adopted in many fields such as in manufacturing, management, development, planning, finance, medical and many others (Jantan, Hamdan, & Othman, 2008b). Most studies in the HR decision application that use Artificial Intelligent techniques focus only on the specific HRM domains such as in personnel selection, training, scheduling and job performance (Table 1). Besides that, the advance computer technologies used for most of the HR decision applications are expert system or Knowledge-based system (KBS), and focuses especially on HR personnel selection and training tasks. The commercial emergence of KBS information technology applications represents a tremendous opportunity to improve the practice of HRM (Martinsons, 1995). The KBS benefits are more permanent, easier to duplicate, less expensive and automatically documented. On the other hand, the limitations of KBS systems are difficult to capture informal knowledge; knowledge has not been documented and difficult to verbalize. The techniques used to verify and validate the conventional systems are considered to be insufficient and KBS-specific methods are still immature. Due to these reasons, currently, the new HR decision application researches use other computer technology approaches especially that are related to Artificial Intelligent technologies. In this case, for personnel selection, they use Data Mining (Chien & Chen, 2008; Tai & Hsu, 2005) and Neural Network approaches (Liang Chih Huang, Huang, Huang, & Jaw, 2004; Huang, Wu, Kuo, & Huang, 2001) (Table 1).

Table 1. HR decision applications using AI technology

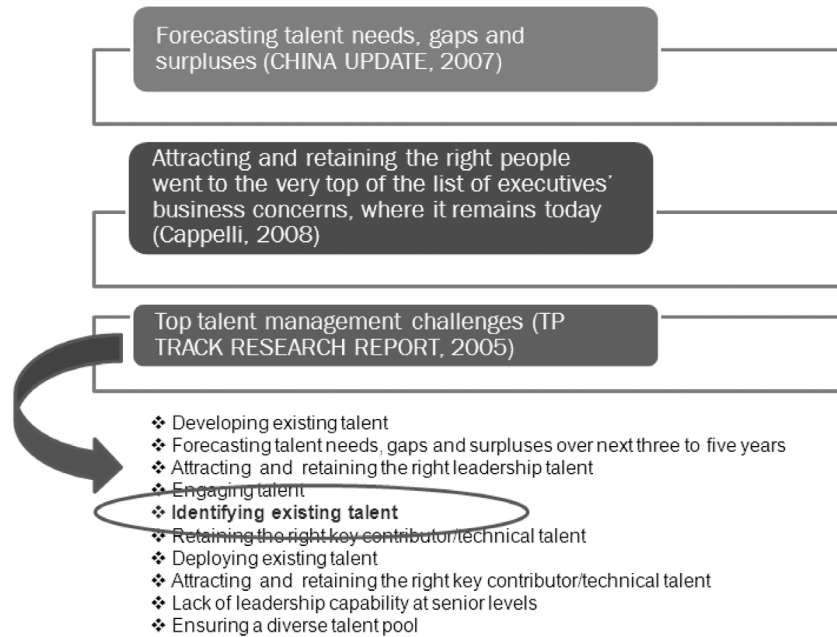
Category	Techniques used
Staffing Personnel Selection	*Expert system/* *Knowledge-based system (Hooper et al., 1998) and (Mehrabad & Brojeny, 2007)* *Data Mining (Huang, Tsou, & Lee, 2006) and (Chien & Chen, 2008)* *Artificial Neural Network (Liang Chih Huang et al., 2004)and (Huang et al., 2006)*
Training and Development Training Development	*Knowledge-based system (Liao, 2007)* *Expert System (Chen, Chen, Wu, & Lee, 2007)* *Rough Set Theory (Chien & Chen, 2007)*
Motivation Job Attitudes Performance appraisal	*Artificial Neural Network (Tung, Huang, Chen, & Shih, 2005)* *Fuzzy logic (Ruskova, 2002)*
Administration Meeting scheduling	*Software agent (Glenzer, 2003)*

However, in this study, there are very few researches that use Artificial Intelligent techniques and do research in HR decision application field. Besides that, the focus domains are also limited to the specific problem such as in personnel selection and training activities. Recently, in information technology era, advance HR decision applications that are supported by Artificial Intelligent techniques can be used as a tool to help human resource managers in their decision making problems.

TALENT MANAGEMENT

In any organization, talent management has become an increasingly crucial method of approaching HR functions (American Management Association, 2009; Hart, 2006; Hiltrop, 1999; Personneltoday, 2008; PricewaterhouseCoopers, 2008; SuccessFactors, 2007; Wilkins, 2008). Talent management involves human resource planning that regards processes for managing people in organization especially to develop existing talent and forecasting talent needs (A TP Track Research Report, 2005; Taleo Research, 2009). In other studies, talent management can be defined as an outcome to ensure the right person for the

right job; process to ensure leadership continuity in key positions and encourage individual advancement; and decision to manage supply, demand and flow of talent through human capital engine (Cubbingham, 2007). Failures in talent management are an ongoing source of pain for executives in modern organization and it will cause surpluses to shortfalls of talent (Cappelli, 2008). Talent is considered as any individual who has the capability to make a significant difference to the current and future performance of the organization (Lynne, 2005). However, talent can also be categorized as valuable, rare and difficult to-imitate but the specific prescription regarding talent are not always clear. Besides that, talent is critical because it is the role of a strong HR function to manage everyone for high performance and business trends now place talent in general more valuable (Lewis & Heckman, 2006). In HRM, talent management is very important and needs full attentions from HR professionals since this task deals with organization's valuable asset. Nowadays, most organizations concentrate on how they can attract and retain talent to achieve organization target. Figure 1 shows some issues related to talent management; and the top talent management challenges (A TP Track Research Report, 2005), and one of them is to identify the

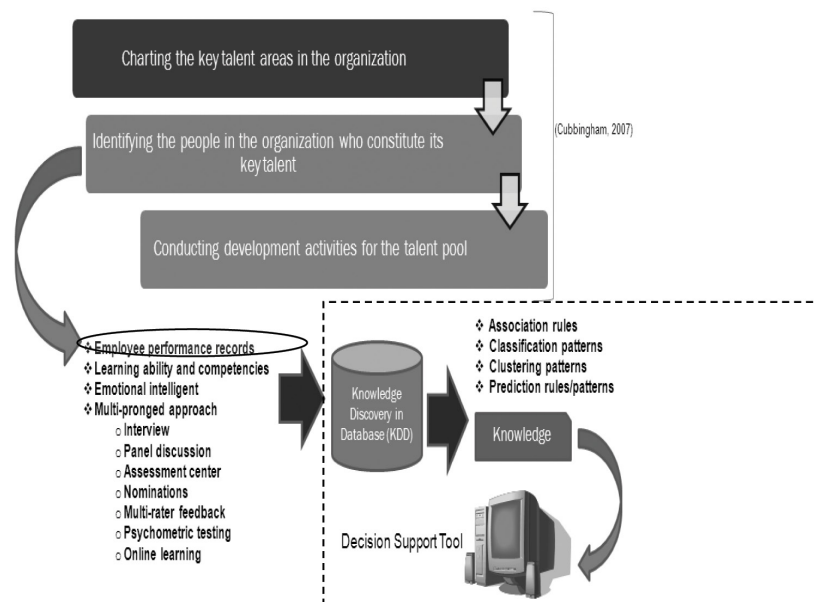
Figure 1. Talent management challenges


existing talent which is closely related to talent forecasting (Jantan, Hamdan, & Othman, 2008a).

Recently, in modern organization, a new way to think about talent management is by looking at manufacturing sector. In that case, we can say how forecasting product demand is very important in manufacturing, which is comparable to forecasting talent needs in an organization. In talent management, talent is an organization product, which is how employee advance through development jobs and experiences are remarkably similar to how products move through a supply chain; reducing bottlenecks the block advancement, speeding up processing time, improving forecast to avoid mismatches (Cappelli, 2008). For those reasons, we can apply the same approach to identify existing talent in an organization by using forecasting idea. Figure 2 shows processes involved to identify the people in the organization who constitute the key talents using some common evaluation approaches (Cubbingham, 2007; Taleo Research, 2009). Besides that, it also demonstrates how Knowledge Discovery in Database

(KDD) approach can be used to solve some talent management problems.

Furthermore, forecasting future talent for an organization is similar to forecasting product demand in business field. In other words, we can apply any suitable prediction approaches to predict future talent. In the literature study, prediction approaches can be categorized into two approaches; the first approach is statistical approach and the second one is intelligent approach which is concerned with Artificial Intelligent technology. There are many intelligent approaches are used in prediction application such as KDD, Artificial Neural Network, Artificial Immune System (AIS), Support Vector Machine (SVM) and many others (Jantan et al., 2008b). Due to that reason, this study attempts to apply KDD approach for talent identification which is regarding the key talent in an organization. The employee performance and talent records that are stored in databases will be used to discover talent patterns and prediction model for selected category of employee in an organization. The talents

Figure 2. Talent management and KDD approach


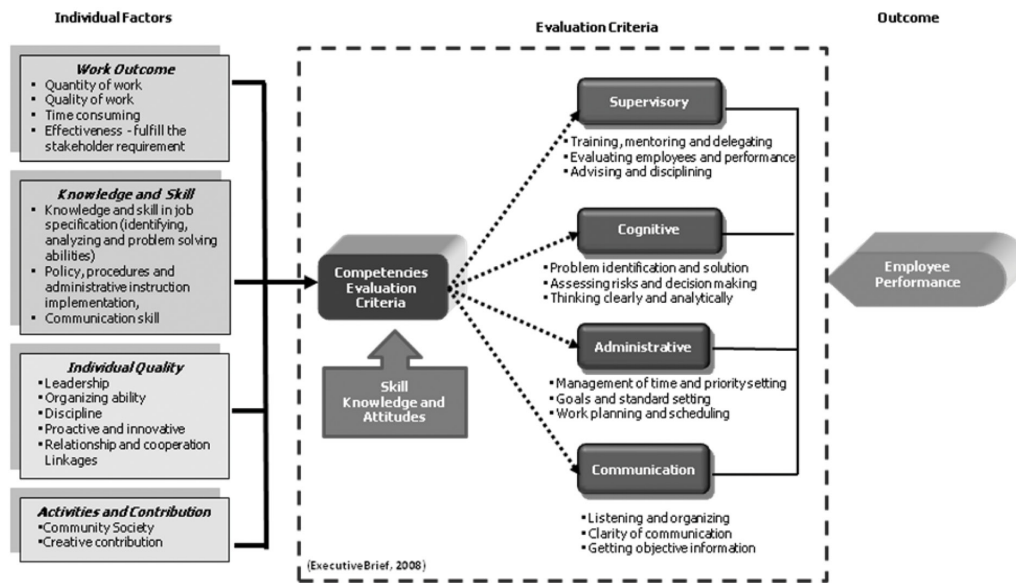
of employee in general are according to the evaluation criteria that involved in evaluation process. However, different employee has different criteria of evaluation and the most significant factor involved in evaluating employee's performance is individual factor. In that factor, the work outcome; knowledge and skill; individual quality; and activities and contribution area are among the main criteria especially for management talent (Adobor, 2004). Besides that, in management and professional performance evaluation, the competency-based criteria are used and it involves skill, knowledge and attitude factors. The competency-based evaluation criteria can be categorized into four main components; supervisory, cognitive; administrative; and communication (Executive-Brief, 2008). Each of the components contains performance criteria that should be considered in the evaluation process, as stated in Figure 3.

In many organizations, information regarding employee's performance can be gathered through affiliated sections in HR department, such as personnel, training, employee development and others. HR databases contain rich, meaningful and hidden knowledge that can be used for future

planning. In the advancement of technology, we can get all information especially related to employee's performance through the respective HR databases. The selected data that are used for prediction is associated to the factors involved in prediction. In Data mining process, all evaluation criteria for each factor will be represented as attribute. The attribute contains information regarding data that we have. KDD or Data mining approach can be used to discover the hidden and meaningful knowledge for the existing data and that will be discussed in the next section.

DATA MINING IN HRM

DM and Knowledge Discovery in Database (KDD) are used interchangeable in this article. DM is a step to KDD and currently receives great attention and is recognized as a newly emerging analysis tool (Tso & Yau, 2007). Recently, DM has given a great deal of concern and attention in the information industry and in society as a whole. This is due to the wide accessibility of enormous amounts of data and the important need for turning

Figure 3. Talent factors in evaluation process


such data into useful information and knowledge (Han & Kamber, 2006). Data mining is a machine learning approach, which has several tasks such as classification and prediction; concept description; association; cluster analysis; outlier analysis; trend and evaluation analysis; statistical analysis and others. Computer application interfaces with DM tool can help executives to make more informative and objective decisions. Besides that, it can help managers to retrieve, summarize and analyze decision related data to make wiser and more informed decisions. Over the years, DM has involved various techniques including statistics, neural network, decision tree, genetic algorithm,

and visualization techniques. Moreover, DM has been applied in many fields such as finance, marketing, manufacturing, health care, customer relationship and etc. Nevertheless, its application in HRM is rare (Chien & Chen, 2008) (Table 2).

Nowadays, there are some interests on solving HRM problems using DM approach (Ranjan, 2008); and Table 2 lists some of the HR tasks that use DM techniques as a tool to solve some HR problems. There are very few studies related to prediction application in HR that uses this approach. However this approach is quite popular in HR personnel selection problems. From the literature study, prediction applications in HRM

Table 2. Human resource researches that use data mining techniques

Activity in HRM	*Data Mining Techniques*
Project Assignment (Huang et al., 2006)	*Fuzzy Data Mining and Fuzzy Artificial Neural Network*
Personnel selection (Chien & Chen, 2008), Job attitudes classification (Tung et al., 2005) Performance Evaluation (Xin, 2008)	*Decision tree*
Training (Chen et al., 2007)	*Association rule mining*
Personnel Selection – Recruit and Retain Talents (Chien & Chen, 2007)	*Rough Set Theory*
Personnel Selection (Tai & Hsu, 2005)	*Fuzzy Data Mining*

are infrequent, there are some examples such as to predict the length of service, sales premiums, to persistence indices of insurance agents and analyze mis-operation behaviors of operators (Chien & Chen, 2008). In Data mining researches, classification and prediction techniques are among the popular task. The classification techniques are known as supervised learning, where the class level or classification target is already identified. In that case, we can classify the new data with classification target as our prediction result. Due to these reasons, in this study, we attempt to use DM approach for talent management as a method to predict the potential talent in an organization by using Data mining classification techniques.

CLASSIFICATION IN DATA MINING

DM tasks are generally categorized as clustering, association, classification and prediction(Chien & Chen, 2008; Ranjan, 2008). DM has involved various techniques to perform tasks including database oriented techniques, statistic, machine learning, pattern recognition, neural network, rough set and etc. Databases or data warehouse are rich with hidden information that can be used to provide intelligent decision making. Intelligent decision refers to the ability to make automated decision that is quite similar to human decision. In other words, prediction and classification techniques are among the methods that can be used to produce intelligent decision. Prediction and classification in Data mining are two forms of data analysis that can be used to extract models describing important data classes or to predict future data trends (Han & Kamber, 2006). Besides that, classification process has two phases; the first phase is learning process where the training data are analyzed by classification algorithm (Figure 4). The learned model or classifier is presented in the form of classification rules or patterns. The second phase is the use of model for clas-

sification and, test data are used to estimate the accuracy of classification rules. If the accuracy is considered acceptable, the rules can be applied to the classification of new data or for unseen data. Nowadays, many classification methods have been proposed by researchers in machine learning, pattern recognition, and statistics. Some of the techniques that are used for classification in Data mining are decision tree, Bayesian methods, Bayesian networks, rule-based algorithms, neural network, support vector machine, association rule mining, k-nearest-neighbor, case-based reasoning, genetic algorithms, rough sets and fuzzy logic. Thus, decision tree and neural network are found useful in developing predictive models in many fields (Tso & Yau, 2007). Some of the techniques that are used for data classification are decision tree, Bayesian methods, Bayesian network, rule-based algorithms, neural network, support vector machine, association rule mining, k-nearest-neighbor, case-based reasoning, genetic algorithms, rough sets, fuzzy logic. In this study, our discussion focuses on three classification techniques, i.e., decision tree, neural network and Nearest-neighbor that shown in Table 3.

Decision tree and neural network are found useful in developing predictive models in many fields (Tso & Yau, 2007). The advantage of decision tree technique is that, it does not require any domain knowledge or parameter setting, and is appropriate for exploratory knowledge discovery. The second technique is neural-network which has high tolerance of noisy data as well as the ability to classify pattern on which they have not been trained. It can be used when we have little knowledge of the relationship between attributes and classes. The Nearest-neighbor technique is an instance-based learning that uses distance metric to measure the similarity of instances. All these three classification techniques have their own advantages and disadvantages and depend on the type of data used. Due to this reason, we attempt to explore selected techniques from three main classification techniques in the next experiment.

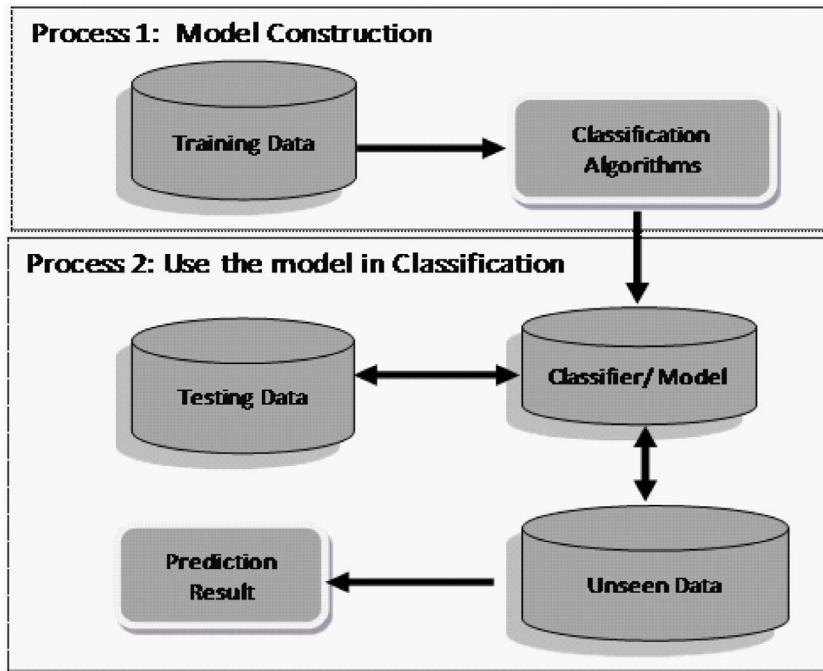
Figure 4. Classification in data mining process


Table 3. Potential data mining classification techniques

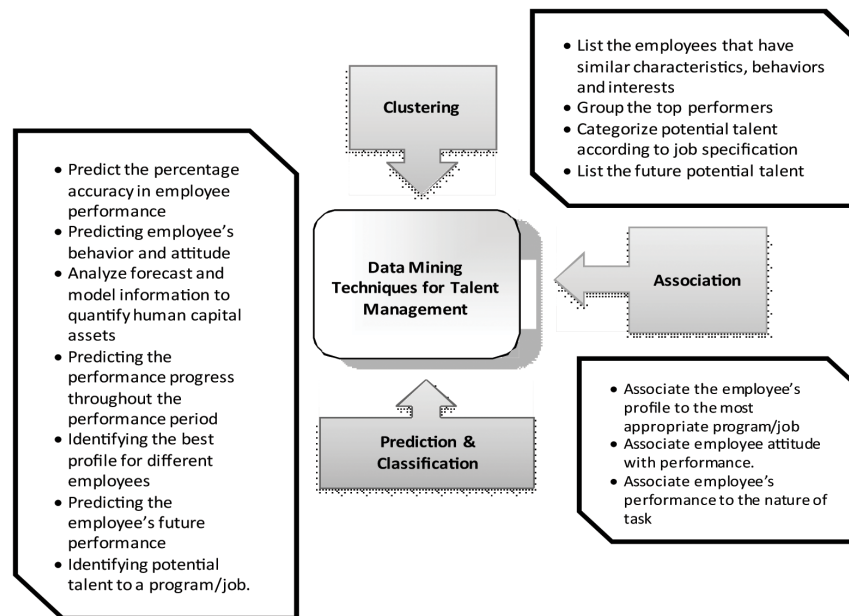
Data Mining Techniques	Classification Algorithm
Decision Tree	**C4.5** *(Decision tree induction – the target is nominal and the inputs may be nominal or interval. Sometimes the size of the induced trees is significantly reduced when a different pruning strategy is adopted).* **Random forest** *(Choose a test based on a given number of random features at each node, performing no pruning. Random forest constructs random forest by bagging ensembles of random trees).*
Neural Network	**Multi Layer Perceptron** *(An accurate predictor for underlying classification problem. Given a fixed network structure, we must determine appropriate weights for the connections in the network).* **Radial Basic Function Network** *(Another popular type of feed forward network, which has two layers, not counting the input layer, and differs from a multilayer perceptron in the way that the hidden units perform computations).*
Nearest Neighbor	**K*Star** *(An instance-based learning using distance metric to measure the similarity of instances and generalized distance function based on transformation*

TALENT MANAGEMENT USING DATA MINING

In the literature studies, most of the DM researches in HR problems focus on personnel selection and very few discussions in other activities such as planning, training, talent management and etc (Table 1). Recently, with the new demand and increased visibility of HR management, therefore,

HRM seeks a strategic role by turning to DM methods (Ranjan, 2008). This can be done by identifying generated patterns from the existing data in HR databases to useful knowledge. In this article, we focus on identifying the patterns related to talent. The patterns can be generated by using some major DM techniques and it is shown in Figure 5.

Figure 5. Data mining for talent management


The matching of Data mining problems and talent management needs are very important, in a way to determine the suitable Data mining techniques. In this study, we propose talent forecasting framework using KDD approach and we attempt to hybrid the suitable Data mining classification technique and knowledge-based system (KBS) approaches in system development for HR application. This integration between KBS and Data mining approaches can allow users to interact with the system and get the forecasting results and explanations about the decision made by the knowledge discovered from the database shown in Figure 6. The proposed talent forecasting framework contains three main modules as follows:

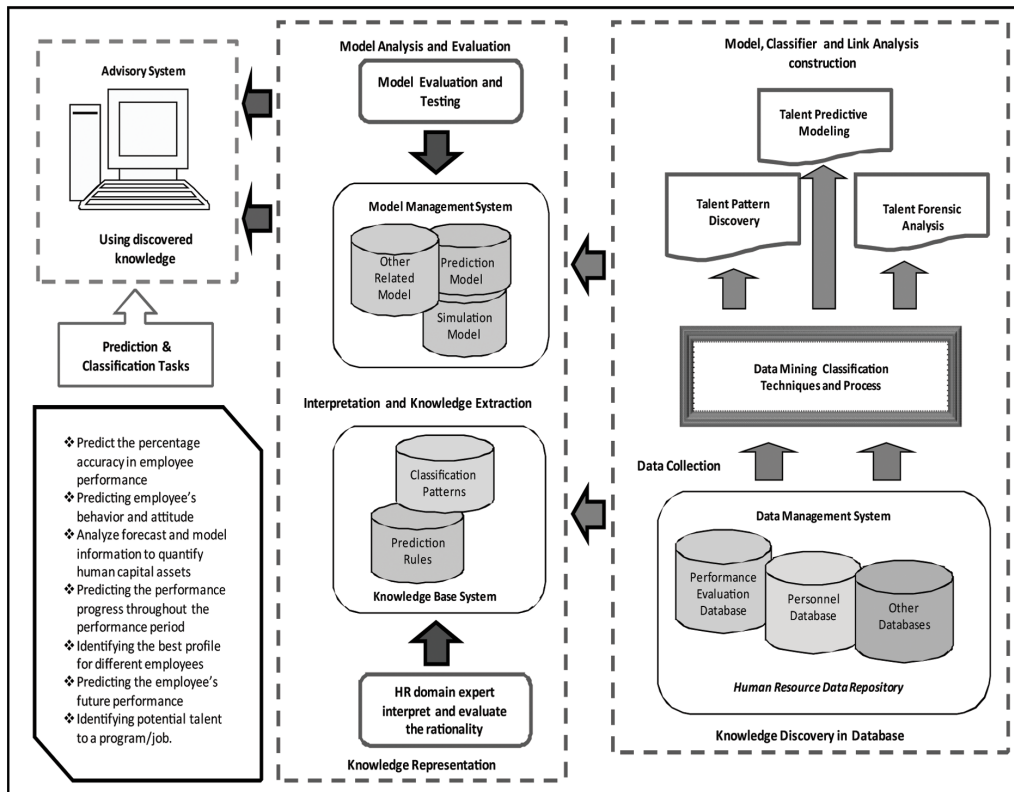
Knowledge Discovery in Database

This module uses Data mining approach to develop predictive model by using machine learning approach. The meaningful talent pattern and rules are discovered from existing HR database system. In this case, we will use HR databases that are related to talent performance such as data from personnel, training, administrative, performance evaluation data and other related databases. The selected databases need to be evaluated through data preprocessing process. This process is a major task in Data mining. Data preprocessing have data cleaning, data integration, data transformation and data reduction processes.

Besides that, all these processes involved tasks such as dataset selection, dealing with missing values, reducing data dimension and complexity; and data enrichment. The relevant data will be transformed into useful knowledge as predictive model through talent predictive modeling, generated rules by talent pattern discovery and extracted patterns to find unusual data elements by forensic analysis. All these hidden and meaningful knowledge are very useful for talent management tasks.

Model and Knowledge Based System

The model based system is used to store constructed model, existing simulation model and any related models that can be used in decision

Figure 6. Suggested framework for talent forecasting


making process especially related to talent forecasting. In fact, before we can embed the talent performance predictive model in this application, the model must be evaluated and tested through model analysis and evaluation phase that involves the domain experts. The knowledge based system is known as interpretation and knowledge extraction phase. This component contains a set of facts and rules regarding decision making elements. In the suggested framework, KBS will store information about talent patterns, association rules, forensic analysis results which is related to the talent forecasting. The potential talent in future will be recognized by using facts and rules in this component. The rules and pattern will be evaluated and interpreted by the HR domain experts.

Advisory System

This module will react as inference engine in this application. This component supervises the interactions among the various parts of application such as knowledge-base and model based components. Basically, the component will respond as interface between user and the system itself, especially to display the prediction results, justify and explain the decision and sometimes if needed it can instruct KBS to update the existing knowledge. In this study, the advisory system will display the potential talent with some reasons and advises, and in advance can suggest the possible tasks for them.

In this article, the suggested framework concentrates on talent management purposes which are used to identify the potential talent that is suitable with the talent management needs. On the

other hand, this framework can also be applied to other DM tasks such as association, and clustering to solve some talent management problems.

CONCLUSION

This article has described the significance of the study and discussed issues in talent management and Data mining approach in HR application. As a result, we propose a HR application framework using Data mining classification technique for talent forecasting to identify potential talent in an organization. From the literature study, most researchers have discussed HR applications using Data mining from different approaches. However, there should be more HR applications and Data mining techniques applied to different problem domains in HRM field to broaden our horizon of academic and practice work on HR applications using Data mining classification approach. Some experiments to identify the most suitable Data mining classification will be conducted and the predictive model will be generated through the selected technique. The generated model will be embedded to the system as decision support tool in decision making process through system development phase. Finally, the ability to continuously change and obtain new understanding is the power of HR application, and this can be one of the HR application future works.

Chapter 32

An Introduction to Structural Equation Modeling (SEM) and the Partial Least Squares (PLS) Methodology

Nicholas J. Ashill
American University of Sharjah, UAE

ABSTRACT

Over the past 15 years, the use of Partial Least Squares (PLS) in academic research has enjoyed increasing popularity in many social sciences including Information Systems, marketing, and organizational behavior. PLS can be considered an alternative to covariance-based SEM and has greater flexibility in handling various modeling problems in situations where it is difficult to meet the hard assumptions of more traditional multivariate statistics. This chapter focuses on PLS for beginners. Several topics are covered and include foundational concepts in SEM, the statistical assumptions of PLS, a LISREL-PLS comparison and reflective and formative measurement.

MAIN FOCUS

What is Structural Equation Modeling?

Structural equation Modeling (SEM), also referred to as 'causal Modeling', has become a popular tool in the methodological arsenal of social science researchers (Bagozzi & Baumgartner, 1994;

Chau, 1997). SEM is a method for representing, estimating, and testing a theoretical network of (mostly) linear relations between variables, where those variables may be either observable or directly unobservable (Hair, Black, Babin, Anderson, & Tatham, 2006). The multivariate technique combines aspects of multiple regression (examining dependence relationships) and factor analysis (representing unmeasured concepts or factors with multiple variables) to estimate a series of inter-related dependence relationships simultaneously.

The issue of simultaneity is especially important since the measures often derive their meaning from the conceptual network within they are embedded. SEM is grounded in three main premises. First, from the field of psychology comes the belief that the measurement of a valid construct cannot rely on a single measure. Second, from the field of economics comes the conviction that strong theoretical specification is necessary for the estimation of parameters. Third, from the field of sociology comes the notion of ordering theoretical variables and decomposing types of effects. Taken as a whole, these ideas have emerged into what is called latent variable structural equation modeling (Falk & Miller, 1992).

The two common approaches for SEM are the covariance-based approach used in LISREL (Linear Structural Relations), AMOS (Analysis of Moment Structures), and EQS (Anderson & Gerbing, 1988; Bentler, 1995; Bollen, 1989; Bollen & Long, 1993; Byrne, 1994; Jöreskog & Sörbom, 1982 1988), and the variance-based approach used in PLS-PC, PLS-Graph, Smart-PLS and XLSTAT-PLS (Chin, 1995 1998; Esposito Vinzi, Chin, Hensler, & Wang, 2010; Fornell & Cha, 1994; Hansmann & Ringle, 2004; Wold, 1985). Both approaches belong to the family of techniques that Fornell (1987) and Lohmoller (1989) call "*the second generation of multivariate data analysis techniques*". Unlike first generation techniques such as multiple regression, principal components and cluster analysis, canonical analysis, discriminant analysis and others, second generation models are able to bring together psychometric and econometric analysis in such a way that the best features of both are exploited (Fornell & Larcker, 1981; Fornell, 1987). SEM can therefore be viewed as an extension of several first generation multivariate techniques (Hair et al. 2006) because they incorporate the psychometrician's notion of unobserved latent variables (constructs) and measurement error in the same estimation

procedure. In social sciences research theoretical constructs are typically difficult to operationalize in terms of a single measure, and measurement error is often unavoidable. Therefore, given an appropriate statistical testing method, structural equation models are recognized as indispensable for theory evaluation in this type of research.

Traditional first generation techniques have a number of limitations. First, the statistical tests of the regression coefficients (and the use of procedures like stepwise regression) make assumptions of the data that may not hold, such as sufficient sample size and multivariate normal distribution. Second, the two-step process of aggregating variables to form variate scores and then testing the relationships among these variates presumes that the relative importance of items in each composite is portable across theoretical contexts, an assumption that may not be valid (Fornell, 1982). In traditional multiple regression and path analysis, scales of the latent variables are created by either averaging, summing, or according to some kind of factor analysis of observed variables, the results are then imported into a regression (or path) model. The assumption is that such scores are portable, an assumption that Fornell (1987) argued is not tenable. This two-stage analysis can potentially result in invalid estimates, since it assumes that the relationship among the measures of a construct is independent of the theoretical context within which the measures are embedded (Fornell, 1982; Fornell & Yi, 1992; Hirschheim, 1985). Third, all measurement is made with error, and though error may be estimated using methods such as factor analysis, these error estimates do not explicitly figure in regression analysis, nor are they estimated within the context of the theory being tested (Fornell, 1982). Fourth, each first generation technique can examine only a single relationship at a time i.e., a single relationship between a dependent variable and an independent variable (Hair et al. 2006). In contrast SEM can

estimate many equations at once, and they can be interrelated, meaning that the dependent variable in one equation can be an independent variable in other equations.

Both covariance-based and variance-based approaches such as LISREL and PLS allow for causal interpretations of the relations between the latent variable and the indicators, as well as the relations among the latent variables. Both techniques also allow constructs to be measured with multiple indicators, thus minimizing biases imposed by measurement error (Herting, 1985; Kenny, 1979). SEM also has the added benefit of being able to model both direct and indirect relationships among constructs (or latent variables) to determine the relative importance of antecedent constructs, making it possible to test complex theoretical models. This is an advantage over traditional path analysis where the indirect effects need to be calculated by hand (Barclay, Higgins, & Thompson, 1995). Three types of effects may be distinguished with SEM: direct, indirect and total effects. The direct effect is that influence of one variable on another that is unmediated by any other variable in a path model. The indirect effects of a variable are mediated by at least one intervening variable. The sum of the direct and indirect effects is the total effects, in other words, one variable's total effect on another is the sum of its direct effect and indirect effects (Bollen, 1989).

SEM also provides the means to resolve thorny problem of multicollinearity (Rigdon, 1998). By using multiple items in a questionnaire, the items are modeled as measures of the same common factor, and only the factor is used as a (single) structural variable. The principal component i.e., the factor explaining the most variance is used as the most reliable and valid observable indicator reflecting each of the unobservable research constructs (latent variables). Thus, all of the multiple measures are included in the model, but only one variable enters the prediction equation.

High correlations among the multiple items actually improve the stability of the factor analytic measurement model.

Structural Equation Modeling Using Partial Least Squares

Partial Least Squares (PLS), a relatively new, powerful multivariate analysis technique with roots in path analysis (Wold, 1985), is ideal for testing structural models involving multiple constructs with multiple latent variables (Fornell, 1982 1987; Lohmoller, 1989; Wold, 1982 1985). The PLS estimation approach is discussed in detail in many books and articles that deal with the theoretical and application issues in SEM (Barclay et al. 1995; Bollen, 1989; Chin, 1998; Esposito Vinzi et al. 2010; Fornell & Larcker, 1981; Fornell, 1982 1987; Fornell & Bookstein, 1982; Fornell & Cha, 1994; Hayduk, 1987 1996). PLS has gained interest and use in various disciplines in recent years including information systems (Chin & Gopal, 1995; Compeau & Higgins, 1995; Rivard & Huff, 1988; Thompson, Higgins, & Howell, 1994), marketing (Ashill & Jobber, 2009; Hulland, 1996; Hulland & Kleinmuntz, 1994; Johnson & Fornell, 1987), and organizational behaviour (Howell & Higgins, 1990; Lee, 2007).

SEM with PLS is a conceptual approach to data analysis involving the interplay of theoretical thinking and empirical data. This approach to inquiry embraces abstract and empirical variables simultaneously and recognizes the interplay of these two dimensions of theory development. Empirical data need not achieve high-level precision but simply represent realistic attempts to observe the world around us. Falk and Miller (1992, p.92-93) comment:

"The more sophisticated the theory and precise the observations, the more our work approaches the scientific goal of understanding causal mecha-

nisms. Before we reach that point however, we need a research tool that allows us to examine the immense complexity that exists in the social and behavioral sciences. Professor Wold had this in mind when he developed soft modeling".

The term "Soft Modeling" indicates that model building applies when theoretical knowledge is scarce and stringent distribution assumptions are not applicable. Soft modeling provides a system for expressing theoretical ideas about a sequence of events (Falk & Miller, 1992; Lohmoller, 1989; Wold, 1980) and can be viewed as a method of estimating the likelihood of an event given information about other events. It is not intended to be a system for the assessment of causation, but is particularly applicable when the conditions of a closed system i.e., a set of theoretical, measurement and distributional conditions, are not met. That is, with soft modeling, the theoretical component simply accounts for as much of the variance in the measured variables as possible. Using this procedure, the highest percentage of common variance among the measured variables is extracted. As a result, the component maximally predicts the variance of the individual manifest variables. As one moves away from the powerful conditions required for a closed system, the concept of causation must be abandoned and be replaced by the concept of predictability (Wold, 1980 1985).

Within the context of multivariate statistics, PLS, unlike LISREL, is a least squares estimation procedure that makes few assumptions about the nature of the data. In PLS optimal linear relationships are computed between latent variables and are interpreted as the best set of predictions available for a given study considering all the limitations. PLS thus has a philosophical as well as statistical/mathematical position. Wold (1980 1982) contends that the work of science is an interplay between ideas about the world and our

observations. Such a position is consistent with the modern philosophy of science, which views science as the union of theory and empirical observations (Ackermann, 1985). Some sciences are endowed with both strong theory and precise empirical observations. Under these conditions there are well known data analysis procedures available. In the social sciences however, soft theory and soft empirical observations are the rule where there are conditions of low information. Although PLS has a rigorous mathematics base, the mathematical model is soft in that it makes no measurement, distributional or sample size assumptions. Lohmoller (1989, p.64) states that "*it is not the concepts nor the models nor the estimation techniques which are 'soft', only the distributional assumptions*".

A Comparison of LISREL and PLS

The fundamental differences between LISREL and PLS are reflected in the PLS and LISREL algorithms and their optimum properties. The purpose of LISREL is to model the covariance structure of the manifest variables (Wold, 1985). This technique is based on maximum likelihood or generalised least squares and is used where prior theory is strong and further testing is the objective of the research (Jöreskog and Sörbom, 1984; Pedhauzur, 1982). LISREL is a model for theory testing and a general method for covariance structure analysis in which a theoretical model is specified in terms of covariances and tested against empirical data (Fornell & Bookstein, 1982). The aim of LISREL is therefore to estimate causal model parameters (e.g., loadings and paths) such that the discrepancies between the initial empirical covariance data matrix, and the covariance matrix deduced from the model structure and the parameter estimates, are minimized. It is concerned with the entire covariance matrix. The focus is of LISREL is thus on fitting the data to

the structural model proposed and generating the path coefficients that have the greatest likelihood of being from this sample's population data set. Accordingly, it is concerned with regenerating covariance structures in the data and not explaining variance in the dependent measures. The emphasis is on overall model fit, i.e., testing a strong theory as a whole (Barclay et al. 1995). Indicators are also reflective of constructs. Data are assumed to be multivariate normal, and sample sizes must be relatively large (Wold, 1985).

In contrast, PLS is not a model in the same sense. The objective in PLS is to estimate the model parameters based on the ability to minimize the residual variances of dependent variables (both latent and observed) (Chin, 1998). Instead of covariance structure analysis, it belongs to the same class of models as canonical correlation, principal components, and regression analysis. The conceptual core of PLS is an iterative combination of principal components analysis relating measures to constructs, and path analysis permitting the construction of a system of constructs. Being a components-based structural equations modeling technique, PLS simultaneously models the structural paths (i.e., theoretical relationships among latent variables) and measurement paths (i.e., relationships between a latent variable and its indicators). The path coefficients obtained from a PLS analysis are standardized regression coefficients, while the loadings of items on individual constructs are factor loadings (Hulland, 1999). Factor scores created using these loadings are equivalent to weighted composite indices. Thus, PLS results can be easily interpreted by considering them in the context of regression and factor analysis.

PLS provides an advantage over regression for two reasons: (1) it considers all path coefficients simultaneously to allow the analysis of direct, indirect and spurious relationships, and (2) it estimates the individual item weightings in

the context of the theoretical model rather than in isolation. Rather than assume equal weights for all the indicators of a scale, the PLS algorithm allows each indicator to vary in how much it contributes to the composite score of the latent variable. Thus indicators with weaker relationships to related indicators and the latent construct are given lower weightings. Chin (1998) states that PLS is preferable to techniques such as regression, which assume error free measurement (Lohmoller, 1989; Wold, 1982, 1985). This makes LISREL '*closer to the model, more confirmatory and more model analytic*', and PLS '*closer to the data, more explorative and more data analytic*' (Lohmoller, 1989, p. 213). The objective of the researcher therefore, and the stage of development of the theory under consideration, become key criteria in methodology selection (Barclay et al. 1995).

There are other features of LISREL which are more theoretically compelling but may not apply in a given research situation. For example, LISREL is more elegant with respect to the types of models that can be proposed. It handles non-recursive relationships, permits the comparison of the fit of a model between groups, and allows the modeling of correlated error terms. PLS does not allow for these specifications and assumes uncorrelated errors as in regression. In addition, LISREL offers a number of measures of overall model 'fit' such as χ^2 goodness-of-fit. PLS does not yet have these overall measures, relying instead on variance explained (i.e., *R*-square) as an indicator of how well PLS has met its objective (Cohen, Cohen, Teresi, Marchi, & Velez, 1990).

The philosophical distinction between these two approaches is whether to use SEM for theory testing and development or for predictive purposes (Anderson & Gerbing, 1988; Chin, 1998). Barclay et al. (1995) recommend PLS for predictive research models in the initial exploratory stages of theory development, when the conceptual model and the measures are not well developed,

whereas covariance based estimation methods such as LISREL, AMOS and EQS are more suited for testing, in a confirmatory sense, how well a theoretical model fits observed data, generally requiring much stronger theory than PLS (Fornell & Bookstein, 1982; Jöreskog & Wold, 1982). With covariance based approaches to SEM, a complete description of the theory is represented in a structural model and a theoretical rationale is offered for each proposed causal relationship. These two assumptions require a well-developed and stable theory in order for the proposed causal relationships to represent real-world phenomena. In contrast, in soft modeling such as PLS, a set of relationships may be formulated derived from embryonic theory, or previous research findings, or the problem at hand (Wold, 1985).

Chin (1998) also states that compared to the better known factor-based covariance fitting approach for latent structural modeling (e.g., LISREL), the component-based PLS avoids two serious problems: inadmissible solutions and factor indeterminacy (Fornell & Bookstein, 1982). PLS incorporates defined constructs, as in principal components analysis, which means the constructs are estimated as weighted linear aggregates of their indicators are therefore completely defined by their indicators, and component scores are readily available. Constructs in LISREL are indeterminate of factors in the factor analytic tradition, which means the constructs contain surplus, untapped meaning. This results in an inability to develop factor scores. Due to this indeterminacy of factor score estimates, there exists a loss of predictive accuracy. However, the PLS approach estimates the latent variables as exact linear combinations of the observed measures, thus avoiding the indeterminacy problem and providing an exact definition of component scores (Chin, 1998). This makes PLS much more predictive in a traditional regression sense and can enhance 'knowledge' without making causal claims (Fornell & Bookstein, 1982;

Blili, Raymond, & Rivard, 1998). Jöreskog and Wold (1982, p. 270) state:

"Maximum Likelihood is theory-orientated, and emphasizes the transition from exploratory to confirmatory analysis. PLS is primarily intended for causal-predictive analysis in situations of high complexity but low theoretical information."

PLS is also considered better suited for explaining complex relationships than LISREL (Fornell & Bookstein, 1982; Fornell, Lorange, & Roos, 1990) since it readily accommodates complex theoretical and measurement models (Barclay et al. 1995). As stated by Wold (1985, p. 589),

"PLS comes into the fore in larger models, when the importance shifts from individual variables and parameters to packages of variables and aggregate parameters". Wold (1985) states later (pp. 589-590), "In large, complex models with latent variables PLS is virtually without competition."

A large variable model in PLS can be estimated because a) least squares algorithms are highly efficient and, b) in PLS, the analysis is segmented or partitioned.

Wold (1982) states that LISREL comes to the fore in problem areas where the models are relatively simple, namely where the stringent assumptions behind its optimality aspirations are realistic, and when the LISREL technique is not bogged down by too many parameters to estimate. When the problems under analysis become more complex, the stringent frequency assumptions of LISREL become less tenable, and the optimality aspirations become more or less illusory. The complexity of a model, in terms of the number of latent constructs and manifest variables, often makes identification, convergence, and goodness of fit difficult to achieve with the LISREL algorithm, and results in improper solutions (e.g.,

negative variances, correlations > 1). PLS does not encounter these situations. Soft modeling comes to the fore with the PLS estimates technique that aims at consistency in the statistical inference rather than optimality, and which provides "instant estimation" even for large models with a large number of parameters to estimate" (Wold, 1982). For example, Noonan (1979) examined 16 constructs measured with 59 manifest variables with over 1100 cases and claim that the LISREL algorithm would find this too difficult.

PLS also have the advantage of being able to provide a robust estimation procedure with respect to various potential deficiencies in the model specification, such as multicollinearity and skew response distributions (Cassel, Hackl, & Westlund, 2000; Wold, 1980). No specific distributions are required with PLS and there are no assumptions about the independence of observations. PLS is thus distribution-free allowing non-multivariate normal and non-interval scaled data. This is not the case with the maximum likelihood estimation method used in LISREL, which assumes a multivariate or normal distribution. Data from non-normal or unknown distributions violates one of the major assumptions for hard modeling procedures. A calculation requirement of maximum-likelihood is that the probability distribution be known and used. If the data do not conform to the distribution, then all estimates are biased. PLS on the other hand does not require a normal or known distribution. Rather, given any distribution, PLS produces the best set of predictive weights. Because the procedure is based on the least squares method, it provides unbiased with minimum variances around the estimates (Falk & Miller, 1992; Wold, 1985). When the average of many estimates of a particular value is close to the true parameter value, the estimate is said to be unbiased. Thus, if a parameter is estimated many times by a least squares method, the mean of the estimates will be close to the actual parameter

and therefore unbiased. The size of the variance of the estimates i.e., the variance of the random sampling distribution of parameter estimates, will be smallest when least squares methods are used; and they always will provide the best linear approximation to the true parameter value (Falk & Miller, 1992).

PLS is also the approach of choice with smaller sample sizes. A problem with LISREL is its strong assumptions of large sample sizes, whereas PLS can handle small sample sizes (Fornell, Tellis, & Zinkhan, 1982). PLS can deal with small sample sizes because the iterative algorithm behind PLS estimates parameters in only small subsets of a model during any given iteration. Once specified, the measurement and structural parameters of a PLS causal model are estimated in an iterative fashion using traditional ordinary least squares simple and multiple regressions. The PLS algorithm takes segments of complex models and applies the same process until the entire model converges. At any given time, the iterative procedure is working with one construct and a subset of measures related to that construct, or to adjacent constructs in the model. It is this segmenting of complex models that allows PLS to work with small sample sizes (Wold, 1985). This data reduction procedure in PLS is fundamentally no different than adding the answers to several questions to create a scale score and then using the scale scores in subsequent analysis (Hulland, 1996). It is very similar to obtaining factor scores through principal component analysis and using the factor scores in future analysis.

The subset estimation process consists of simple and multiple regressions so that the sample required for statistical analysis is that which would support the most complex multiple regression encountered in the model. In general, the most complex regression will involve: (1) the indicators from the most complex formative construct, or (2) the largest number of predictors leading to

an endogenous construct, as predictors in an OLS regression. Sample size requirements, using the general rule of thumb of 10 times per predictor, become 10 times the number of predictors from (1) or (2) whichever is greater (Barclay et al. 1995; Wold, 1985)[1]. A weak rule of thumb, similar to the heuristic for multiple regression (Tabachnik & Fidell, 1989) would be to use a multiplier of 5 instead of 10 for the preceding formulae. An extreme example is given by Wold (1989) who analyzed 27 variables using two latent constructs with a data set consisting of 10 data cases. Lohmoller (1982) also presents an example of a model with 96 indicators and 26 constructs estimated with 100 cases. Using the general rule of thumb, 200 usage responses would be sufficient for statistical analysis using PLS if there are no more than 20 items for the most complex formative construct and if no construct has more than 20 incoming or out-going paths (endogenous construct). Smith and Barclay (1997) for example, examined 16 variables to test a model of selling partner relationship effectiveness. Each construct had between 2 and 9 items and there were no more than 4 in-coming or out-going paths. Statistical analysis using PLS was performed using 135 usable responses. In this case, the minimum sample size required to meet PLS criteria would have been 90 responses (the number of items on the most complex formative construct is 9 and this is greater than the number of incoming or out-going paths).

Finally, PLS can model both formative (cause) and reflective (effect) indicators (Fornell & Bookstein, 1982; Fornell & Cha, 1994). A key decision for the researcher is whether formative or reflective indicators should be used in the data analysis. An underlying assumption for hard-modeling approaches such as LISREL, EQS and AMOS is that the items or indicators used to measure a latent variable are reflective in nature to be consistent with the statistical algorithm. In LISREL, formative indicators can be used indirectly by summing the weighted formative indicator scores to create a single-item measure. The weights may be unity or estimated using factor analysis outside the LISREL procedure. The single-item measure is then used to measure the emergent latent construct during model estimation in LISREL. On the other hand, PLS is better suited to handle formative indicators since it can estimate the formative indicator weights and loadings along with the structural model estimation. That is, in PLS, the measurement model for both the reflective and formative indicators is optimized in conjunction with the structural model. As a result, the formative indicators in PLS explain the highest amount of variance for the emergent construct as well as for the criterion construct of the predictor emergent construct. Since one of the strengths of structural equation modeling (SEM) lies in simultaneously estimating the measurement and structural models, using externally estimated construct scores diminishes this advantage of SEM when using LISREL with formative indicators (Bagozzi & Baumgartner, 1994; Diamantopoulos & Winklhofer, 2001; Fornell & Bookstein, 1982).

Reflective vs. Formative Indicators

SEMs incorporating both exogenous and endogenous constructs[2] can be modeled with formative or reflective indicators as dictated by theory. In the questionnaire design phase of the study, the researcher confronted the decision to model indicators as reflective or formative. A reflective variate or construct is one where the variables are expressed as a function of the variate (the observed variables are assumed to be caused by the latent variable). As the name suggests, *reflective* measures reflect an *existing* latent, unobservable construct. These measures are also called *effect* indicators since they are the effect of the latent construct (Bollen, 1989; Bollen & Lennox, 1991; Chin & Todd, 1995; Chin, 1998; Cohen et al. 1990;

Fornell & Larcker, 1981; Fornell & Bookstein, 1982). Most social science researchers routinely use reflective indicators in their models, which means that observed variables (and their variances and covariances) are regarded as manifestations of underlying constructs. Reflective indicators are more consistent with how researchers typically view relationships between constructs and measures. In IT research for example, the perceived ease of use of an information system is typically specified as a reflective construct i.e., the ease of use of an information system is reflected in answers to a series of ease of use questions (Adams, Nelson, & Todd, 1992; Davis, Bagozzi, & Warshaw, 1989; Hendrickson, Massey, & Cronan, 1993).

An alternative and, in the information systems literature, practically ignored measurement perspective is based on the use of formative (cause) indicators, and involves the construction of an index rather than a scale (Bollen & Lennox, 1991; Chin & Todd, 1995; Diamantopoulos & Winklhofer, 2001). If the latent construct is a categorization and measurement device for a complex phenomenon, the indicators can be specified as formative. An example is personal computer utilization i.e., utilization of a personal computer can be formed by length of use, frequency of use, number of different software packages used, and

the variety of tasks performed (Chin, 1998). As the name suggests, a formative variate or construct is one where the observed variables are assumed to cause a latent variable (the variate is expressed as a function of the observed variables). *Formative* measures are termed *cause* indicators since they cause or form the *emergent* latent unobservable construct (Bollen & Lennox, 1991; Chin & Todd, 1995; Chin, 1998; Edwards, 2001). Unlike reflective indicators, whereby "*the latent variable causes the observed variables*" (Bollen, 1989, p. 65), formative indicators can be viewed "*as causing rather than being caused by the latent variable measured by the indicators*" (MacCallum & Browne, 1993, p. 533).

As shown in Figure 1, in the case of reflective indicators (R1, R2, R3, R4), the arrows point from the existing latent construct to the observed indicators, whereas in the case of formative indicators (F1, F2, F3, F4), the arrows point in the opposite direction, from the observed indicators to the emergent latent construct[3]. Since the direction of measure-construct relationship for reflective indicators is opposite to that for formative indicators, the decision to model indicators as either reflective or formative is an important one when using Structural Equation Modeling (SEM). The decision is even more critical when using the

Figure 1. Reflective vs. formative indicators
R1, R2, R3, R4 Reflective Indicators   F1, F2, F3, F4 Formative Indicators
SEM-based partial least squares (PLS) methodology. This is because in PLS, the measurement for reflective as well as formative indicators can be estimated along with the structural model.

The designation of reflective or formative rests on the theoretical underpinnings of a construct. One cannot simply arbitrarily link sets of items to constructs. According to Bollen (1989) and Chin (1998) the decision to model indicators as reflective or formative is based on two important considerations. First, the choice between using formative or reflective indicators for a particular construct should always come back to what makes sense theoretically, that is the causal priority between the indicator and the latent variable (Bollen, 1989; Cohen et al. 1990). In other words, the researcher must establish whether the measures define the construct (formative), or whether the construct gives rise to the measures (reflective). Fornell et al. (1990) suggest that the researcher must provide a clear argument for choosing one form of epistemic relationship over the other for each construct. In doing so, it is necessary to employ strong theory and multiple measures to ensure acceptable content validity. Similarly, Hulland (1999) suggests that the researcher needs to think carefully about whether it is more correct to think of the underlying construct as 'causing' the observed measures i.e., a reflective relationship, or of the measures as 'causing; (or defining) the construct i.e., a formative relationship. "*When researchers use formative or reflective relationships in their models, their choice of a particular form of epistemic relationship should be both justified clearly and applied consistently*" (Hulland, 1995, p. 11).

Second, for a decision to model indicators as reflective, the measures should be highly (and positively) correlated – both theoretically and empirically. Reflective indicators are created under the perspective that they all measure the same underlying phenomenon. With reflective measurement there should be no resistance to replacing one indicator with another indicator as long as the latter's correlation with the first indicator is of a similar magnitude (Chin, 1998). In other words, a change in the latent construct or one of the measures of the latent construct should result in a reasonably large change in the same direction for all the other measures of the latent construct. A change in the latent variable will be reflected in a change in all indicators, since the "*latent variable determines its indicators*" (Bollen & Lennox, 1991, p. 306). If replacing indicators with equally reliable indicators causes any unease or skepticism, this probably signals that a reflective model may not be appropriate (Diamantopoulos, 1999). This is because "*with effect indicators of a unidimensional construct... equally reliable indicators are essentially interchangeable*" (Bollen & Lennox, 1991, p. 308). Being interchangeable is a key principle of reflective measures (Churchill, 1999; Diamantopoulos, 1999; Nunnally & Bernstein, 1994).

Chin (1998) states that if indicators are not interchangeable, they should be modeled as formative. With formative measurement, the latent variable is formed by its indicators, which means that a change in the latent variable is not necessarily accompanied by a change in all of its indicators. For example, the latent variable socio-economic status with the indicators of income, occupational prestige, and education, can be thought of as a summary index of observed variables (Fornell & Larcker, 1981; Fornell & Bookstein, 1982). If an individual loses his job, then socio-economic status would be negatively affected. But to say that a negative change has occurred in an individual's socio-economic status does not imply that there was a job loss. Furthermore a change in an indicator such as income does not necessarily imply a similar directional change for the other indicators i.e., education and occupational prestige. Unlike reflective indicators, formative indicators can

have positive, negative or no correlation with one another (Bollen & Lennox, 1991). Other examples of formative indicators would be the amount of beer, wine and hard liquor consumed as indicators of mental inebriation. Reflective indicators would be blood alcohol level, driving ability, MRI brain scan, and performance on mental calculations. If truly reflective, then an improvement in the blood alcohol level measure for an individual would also imply an improvement in the MRI activity and other measures since they are all meant to tap into the same concept or phenomenon. Whereas for the formative measures, an increase in beer consumption does not imply similar increases in wine or hard liquor consumption. Therefore, formative indicators need not be correlated.

Existing measure development guidelines (Spector, 1992) focus almost exclusively on scale development, whereby items (i.e., observed variables) composing a scale are perceived as reflective (effect) indicators of an underlying construct (i.e., latent variable). Diamantopoulos and Winklhofer (2001) state that unlike scale development, for which detailed step-by-step guides exist (Churchill, 1999; Spector, 1992), guidelines for constructing indexes based on formative indicators are much harder to find. They suggest that four issues are essential to successful index construction: a) content specification, b) indicator specification, c) indicator collinearity, and d) external validity. With formative indicators, since the observed indicators are conceptualized as a mix of variables that in combination lead to (cause) the formation of the latent variable, examination of correlation or internal consistency is considered to be inappropriate and illogical (Bagozzi, 1994; Bollen, 1984; Chin, 1998). The very nature of formative measurement renders internal consistency inappropriate for assessing the suitability of indicators. "*The best we can do... is to examine how well the index relates to measures of other variables*" (Bagozzi, 1994, p. 333). Since reliability measures such as Cron-

bach's alpha, internal consistency and average variance extracted cannot be used for measuring the reliability of formative indicators (Chin, 1998), it is important to measure the emergent construct with a large number of indicators to adequately tap into the multidimensional and multifaceted domain of the construct (Bollen & Lennox, 1991). Nunnally and Bernstein (1994) state that 'breadth' of definition of a construct is extremely important to causal indicators because failure to consider all facets of the construct will lead to an exclusion of relevant indicators and thus exclude part of the construct itself.

Given that correlation between the item scores and the true score of the latent variable is not presumed with formative measurement, the researcher needs to consider whether a set of indicators are the critical antecedent variables in the formation of the latent variable. To say that a construct combines into a broad factor is neither compelling nor complete. All constructs that form a construct should be included (a census of indicators rather than a sample) which means that a construct cannot be defined independently of its measures (Bollen & Lennox, 1991; Hulland, 1995). More specifically, the items used as indicators must cover the entire scope of the latent variable as described under the content specification. Hulland (1995) further notes that if the epistemic relationship is formative, additional measures of the construct are not possible and the researcher can never remove any of the measures regardless of how well or poorly they may load on the construct. However, Diamantopoulos and Winklhofer (2001) argue that the literature is unclear as to how to assess the suitability of formative indicators and virtually silent on the circumstances calling for the removal of invalid indicators from the index. From a theoretical perspective, elimination of indicators carries the risk of changing the construct itself and should always be approached with caution (Diamantopoulos & Winklhofer, 2001).

Another issue particular to formative indicators is that of multicollinearity. This is because the formative measurement model is based on a multiple regression and therefore the stability of the indicator coefficients is affected by the sample size and the strength of the indicator intercorrelations. Excessive collinearity among indicators thus makes it difficult to separate the distinct influence of the individual manifest variables on the latent variable. Chin (1998) warns that if the indicators are modelled as formative, it is important that the '*indicators are relatively independent of one another, that is, there are no multicollinearity problems, and the sample size is large enough*' (Chin, 1998, p. 307). Also, the formative modeling option may be moot if the estimates are not stable, and the lack of multicollinearity is important if the researcher is concerned with understanding the formation process of the latent variable. Multicollinearity occurs when any single independent variable is highly correlated with a set of other independent variables (Churchill, 1999; Hair et al. 2006). The simplest and most obvious means of identifying collinearity is an examination of the correlation matrix for the independent variables. The presence of high correlations (generally .90 and above) is the first indication of substantial collinearity. However, the lack of high correlation values does not ensure a lack of collinearity and its existence may be due to the combined effect of two or more other independent variables. The two most common measures for assessing multicollinearity are tolerance and its inverse, the variance inflation factor (see Hair et al. 2006 for an overview of how these are calculated).

In summary, the decision to model indicators as reflective is based on two important considerations. First, it should be possible to conceptually argue that the measures are the effects of the latent construct; second the measures should be highly (and positively) correlated – both theoretically and empirically. If both conditions are not fulfilled, it may be more appropriate to model the indicators as reflective. Where items are developed to reflect a single latent construct, the latent variable is regarded as the cause of each of the item scores. As a result there is a presumed correlation between the item scores and the true score of the latent variable (DeVellis, 1991). With formative indicators, correlation between the item scores and the true score of the latent variable is not presumed.

Structural Equation Modeling Components and Data Analysis using PLS

The first step in studies involving structural equation models (SEM's) is to explicitly specify both the structural (path) model and the construct-to-measures relationships in the measurement model. The standard notation for specifying SEM models is: an exogenous construct (an independent variable) is specified as ξ and is shown as predicting or 'causing' an endogenous construct (a dependent variable) and is specified as η. Exogenous constructs are labelled $\xi 1, \xi 2, \xi 3$ etc while endogenous constructs are labelled $\eta 1, \eta 2$, etc. In the first stage, the researcher needs to ensure that the items used as measures of the underlying constructs are both reliable and valid. The measurement model consists of the relationships between the observed variables (items) and the constructs, which they measure. With traditional first generation techniques, Cronbach's alpha coefficients and/or factor analysis are used. In PLS, the loadings of the measures on their corresponding construct are examined. The characteristics of the measurement model demonstrate the construct validity of the research instruments i.e., the extent to which the operationalization of a construct actually measures what it purports to measure (Peter, 1981). Two important dimensions of construct validity are (a) convergent validity, including reliability, and (b) discriminant validity.

Once convinced of the adequacy of the measurement model, the researcher can then proceed

to interpret the resulting model coefficients. The structural equations represent the paths among the constructs, and measurement equations represent the relationships between the indicators and the constructs that they measure. To assess the structural model, PLS produces standardized regression coefficients using ordinary least squares to minimize the residual variance. This evaluation consists of an assessment of the explanatory power of the independent variables, and an examination of the size and significance of the path coefficients, which represent hypotheses to be tested. Together the measurement and structural models form a network of measures and constructs (Fornell, 1982 1987; Fornell and Bookstein, 1982). The item weights and loadings indicate the strength of measures while the estimated path coefficients indicate the strength and sign of the theoretical relationships.

Since PLS makes no distributional assumptions in its parameter estimation procedure, traditional parameter-based techniques for significance testing and model evaluation are considered to be inappropriate (Chin, 1998). The evaluation of PLS models is therefore based on prediction-orientated measures that are non-parametric (Chin, 1998). The PLS measurement (outer) model for reflective measures is evaluated by examining the convergent and discriminant validity of the indicators, and the composite reliability of a block of indicators. On the other hand, the formative measures are evaluated on the basis of their substantive content, by comparing the relative size of their estimated weights, and by examining the statistical significance of the measure weights (Chin, 1998). Wold (1982) argued that rather than based on covariance fit, evaluation of PLS models should apply prediction-oriented measures that are also nonparametric. Consistent with the distribution free, predictive approach of PLS (Wold, 1980 1982), the structural (inner) model is evaluated by assessing the percentage variance explained,

that is, the R-square for the dependent latent constructs, by using the Stone-Geisser Q-square test for predictive relevance (Geisser, 1975; Stone, 1974), and by examining the size of the structural path coefficients. The stability of the estimates is examined by using the t-statistics obtained from the bootstrap resampling procedure (100 resamples) in the PLS software (Efron & Gong, 1983; Wold, 1982). These statistical techniques are now briefly discussed.

LISREL and other covariance structure analysis modeling approaches involve parameter estimation procedures, which seek to reproduce as closely as possible the observed covariance matrix. In contrast, PLS has its primary objective the minimization of error (or, equivalently, the maximization of variance explained) in all endogenous constructs. One consequence of this difference in objectives between LISREL and PLS is that no summary statistic or overall goodness-of-fit measures such as the likelihood ratio chi-square statistic exist for models using the latter. Instead, the variance explained (the *R*-square value) and the sign and significance of path coefficients are used to assess nomological validity i.e., how well each of the endogenous constructs is predicted (Cohen et al. 1990). *R*-square indicates the predictive power of the model and the values are interpreted in the same manner as *R*-square in a regression analysis. Moreover, the number of iterations required to converge on a solution provides an indication of how well the model fits the data (Hulland, 1999).

In PLS, the structural (inner) model is also evaluated by using the Stone-Geisser Q-square test for predictive relevance (Geisser, 1975; Stone, 1974). The Q-square statistic represents a measure of how well the observed values are reconstructed by the model and its parameter estimates (Chin, 1998). The PLS adaption of the predictive sample reuse technique as developed by Stone (1974) and Geisser (1975) follows a blindfolding proce-

dure that omits a part of the data for a particular block of indicators during parameter estimations and then attempts to estimate the omitted part using the estimated parameters. This procedure is repeated until every data point has been omitted and estimated. As a result of this procedure, a generalized cross-validation measure can be obtained (Chin, 1998).

Finally, to assess the statistical significance of the estimated path coefficients using PLS, researchers can use a jackknife or bootstrap analysis to determine t-values for each path (Fornell & Barclay, 1993). With jackknifing, the researcher does not have to assume that the underlying data are multivariate normal. Jackknifing is a nonparametric technique that is robust in the sense that it is not as affected by violations of the usual assumptions of normality associated with regression analysis (Fornell and Barclay, 1983). The jacknifing procedure creates a series of subsamples, removing one or more cases from the total data set in each case (Lohmoller, 1984). PLS is then run using each of the subsamples to arrive at separate path estimates. The distribution of estimates is then examined, yielding both a standard error and a corresponding t-value.

The bootstrap also represents a nonparametric approach for estimating the precision of the PLS estimates. *N* samples are created in order to obtain *N* estimates for each parameter in the PLS model. Each sample is obtained by sampling with replacement from the original data set (Chin, 1998). The bootstrapping approach treats a random sample of data as a substitute for the population and resamples from it a specified number of times to generate sample bootstrap estimates and standard errors. These sample bootstrap estimates and standard errors are averaged and used to obtain a confidence interval around the average of the bootstrap estimates (Schumacker & Lomax, 1996). This confidence interval is used to determine how stable or good the sample statistic is as an estimate of the population parameter. Obviously, if the random sample initially drawn from the population is not representative, then the sample statistic and corresponding bootstrap estimator obtained from resampling will yield misleading results. The Bootstrap approach is used in research situations where replication (in which additional samples are obtained) and cross validation (in which the sample is split) are not practical (Barclay et al. 1995). The jacknife estimation tends to take less time for standard error estimation under the joint assumption that the bootstrap procedure utilizes a confidence estimation procedure other than the normal approximation and the number of resamples are larger than those of the Jackknife. Conversely, the jackknife is viewed as less efficient that the bootstrap (Efron & Tibshirani, 1993).

Summary of the PLS Methodology

As a SEM technique, PLS offers greater flexibility in testing theoretical models with empirical data, since it allows researchers to handle latent constructs, model relationships among several latent predictor constructs, and incorporate errors in measurement. Because of this flexibility, PLS provides a powerful way to understand the interaction between theory and data. The technique thus provides a better platform than traditional multivariate techniques from which to construct and verify theory.

PLS is more appropriate than LISREL when models are complex, the goal of the research is explaining variance, where measures are not well established, and where any data distributions are appropriate. PLS is also ideally suited to the early stages of theory building and testing, and can be used to suggest where relationships might or might not exist and to suggest propositions for later testing. PLS is particularly applicable in research areas where theory is not as well developed as that demanded by covariance based

approaches such as LISREL. Other strengths that make PLS appropriate for this study include its ability to handle formative constructs and its small sample requirements. At its core, PLS combines principal components analysis and path analysis to simultaneously estimate the parameters of a causal model. Because the analysis is partitioned, sample size is less important in the overall model. The only requirement is that the sample size be larger than the number of manifest variables in the largest block.

Covariance based approaches such as LISREL requires large sample sizes (e.g., 200 to 400 respondents), multinormal data, and a strong theoretical base for consistent estimators. The main problem lies with the theoretical basis and the use of formative indicators in the measurement model. PLS users do not have to contend with improper or inadmissible solutions and problems with assessing model fit sometimes encountered with LISREL.

The following appendix illustrates the step-by-step procedures for using PLS-Graph version 3 (developed by Wynne W. Chin and Tim Frye). It is strongly recommended that the reader first consult the PLS-Graph User's Guide which details the process of model creation, and generating measurement and structural model statistical output. The user guide can be found at: http://www.pubinfo.vcu.edu/carma/Documents/OCT1405/PLSGRAPH3.0Manual.hubona.pdf.

KEY TERMS AND DEFINITIONS

Boostrap and Jacknife: Approaches to validating a theoretical model by drawing a large number of subsamples and estimating models for each subsample.

Covariance-Based SEM: Techniques estimate path coefficients and loadings by minimizing the difference between observed and predicted variance-covariance matrices.

Formative Indicators: A formative construct is one where the observed variables are assumed to cause a latent variable (the construct is expressed as a function of the observed variables).

Multicollinearity: Multicollinearity reflects the extent to a single independent variable is highly correlated with a set of other independent variables. As multicollinearity increases it becomes more problematic to parcel out the effect of any single construct owing to their interrelationships.

Partial Least Squares (PLS): A powerful multivariate analysis technique with roots in path analysis.

Reflective Indicators: A reflective construct is one where the variables are expressed as a function of the construct (the observed variables are assumed to be caused by the latent variable).

Soft Modeling: Applies when theoretical knowledge is scarce and stringent distribution assumptions are not applicable. Soft modeling can be viewed as a method of estimating the likelihood of an event given information about other events.

Structural Equation Modeling (SEM): A method for representing, estimating and testing a theoretical network of (mostly) linear relations between variables.

ENDNOTES

[1] LISREL requires the use of large sample sizes to ensure correct estimates of the unknown parameters and their standard errors. Although there is no widely cited minimum, numerous authors refer to a minimum requirement of 200 cases (Haydul, 1987; Jöreskog & Sörbom, 1996).

[2] An exogenous construct is an independent variable and is shown as predicting or 'caus-

ing' an endogenous construct, an dependent variable (Hair et al. 2006).

3   When pointing the arrows from the circle to the squares, the block becomes outwardly directed. This means that the circle is estimated in a fashion similar to that of a first principal component i.e., factor loadings are identified that represent the predictable, common variance among the manifest variables. When the arrows are pointed from the squares to the circle, the block is inner-directed. In this case the circle is estimated as a regressed variate and factor weights are identified.

Section 4
Utilization and Application

This section discusses a variety of applications and opportunities available that can be considered by practitioners in developing viable and effective Human Resources Management programs and processes. This section includes 10 chapters that review topics from best practices in Asia to ongoing research in the United States. Further chapters discuss Human Resources Management in a variety of settings (business process modeling, succession planning, outsourcing, etc.). Contributions included in this section provide excellent coverage of today's IT community and how research into Human Resources Management is impacting the social fabric of our present-day global village.

EXECUTIVE SUMMARY

This chapter aims at describing the networks within the Research and Development in Empirical Studies (REDES) Project, an intercultural enterprise aimed at promoting empirical studies of culture. Probably the first and only international project in the Humanities which prepares new researchers through on-line communication, the experience is believed to be scalable to other areas as it enables students to acquire the methodological techniques needed to undertake and carry out research in an environment totally different from the traditional university classroom. The chapter traces the history of the project from its foundation in 2002, explains in detail how it was set up, and evaluates the contributions of this joint effort. The problems met along the way are also pointed out. The chapter concludes with the challenges still to be faced. This case report stands as a proof of the impact of technology in preparing human resources for the Humanities.

INTRODUCTION

Perhaps one of the most distinguishing aspects of human beings, one which has never changed and has enabled us to survive as a species, is our need to communicate and live in social groups. What has actually changed, however, is the way in which communication has been carried out. As we enter the 21st century, a new group of human beings, also known as the "Net Generation" (Baron & Maier, 2005), is on the make. These youngsters, born in many parts of the world after 1980s, have grown up with technology, which they have used for communication. Baron & Maier (2005, p. 57) describe them as "digitally literate; connected; social; prefer to working in groups; achievement oriented; require structure and guidelines; crave interactivity; have short attention spans; are ex-periential, visual, kinaesthetic learners; and prefer working on things that matter". They also state that the Net Generation is representative of the population in all the universities around the world. Still, they are a large group, who, to some extent, are trying to show us that a new way of learning must find its way into the curriculum. Indeed, if one of the major goals of the university is to pro-duce new knowledge, working online in a research community which goes beyond geographical boundaries is one of the most effective ways to prepare students to become budding researchers and thus effectively participate in the scientific knowledge production. It may be argued that the idea of research communities is not new and hence presents no innovation. However, roughly until the turn of this century, research groups depended on the physical presence of their members and were generally affiliated to a single university or to those within a similar geographical area. Nowadays, technology has opened the access to exchange which hardly knows space or time limitations. The Internet has made some aspects of research quicker, more economic and more accessible to all, especially to students. As Geer (2001) rightly

notes, there are still limitations but they may be of a cultural nature. She writes that:

Although as human beings, we communicate with others in many ways and across many mediums, communication is not always easy, even when we feel we know the other person. Cultural influences are often at the root of the communication challenge where misunderstandings and misinterpretations occur. Interaction and collaboration become much harder when communicating with total strangers in the online environment (p. 557).

It must be stressed, however, that before the Net Generation was born, scholars were already discussing the implementation of projects aimed at providing researchers in the Humanities with personal computers (Andersen, 1984) so as to facilitate communication among research groups. Fortunately, the world has moved beyond this stage. According to De Smedt (1999), "[t]he fact that students and staff have a computer on their desks instead of a pile of books is one visible change affecting the learning and teaching situ-ation, even if it is a superficial one" (p. 2). Still, the way computers and their distance-learning advantages influence the process of producing and disseminating knowledge could be much dif-ferent – from simply helping literature searches and storing information to full-scale research col-laboration crossing the boundaries of classrooms, laboratories, libraries, universities, and countries.

This chapter aims at presenting a case study showing how to prepare new researchers in the Humanities through online communication. Relying on the Internet for about seven years, it has been possible to create a research group that works simultaneously in four different countries. Additionally, it has allowed the development of cross-cultural studies that would be impossible to carry out if students had to travel to all of the countries involved (Fisher & McGeveran, 2006). The present chapter indicates in a sense that the

New Generation may be growing in several different places around the world.

BACKGROUND

The project to be focused in this chapter is the Research and Development in Empirical Studies[1] ('REDES'), which was founded on September 10, 2002. At the moment this chapter is being written, the group is active in four different countries, as illustrated in Figure 1.

The major concept within REDES is to bring together both senior and junior researchers[2] in order to promote the development of empirical studies in the area of the Humanities. Members are appreciated for the kind of work they do in spite of the titles they may hold. This practice entails that B.A., M.A. and Ph.D. students equally participate in the group provided that they want to do so. In other words, the same opportunities are offered to all those who meet the minimum requirements to be a member.

One of the most important aims of REDES is to engage students in carrying out research as soon as possible in their career. It is believed that they will profit the most from it if they are immersed in the culture of inquiry (Brew, 2006; Bender, 2006) at the earlier stages of their studies. According to Freire (1970/1987, p. 58), traditional forms of education tend to see teaching as making 'deposits' of knowledge into learners' minds. Within REDES, however, the idea that knowledge should be produced by junior researchers during (and also after) their academic lives is crucial to the project's operation. These researchers are expected to develop high-quality work and to present it as papers at conferences whether local, national, or international. To this end, encouragement, support and guidance are offered by both senior researchers and by more experienced junior colleagues, which may range from designing a study to submitting it to a journal.

One of the most essential tenets of REDES is maintaining ethical standards. Especially when working collaboratively, an ethical approach is of the highest importance. At the simplest level, it entails giving credit to those who have helped one in the course of an investigation. Such standards are no less vital when international collaboration or the use of information technology is at play.

SETTING THE STAGE

REDES had been developing mainly by means of e-mail since its foundation in 2002, but after the seminar on 'Intercultural Reading' in the summer of that year, some of the Munich students with an interest in the possibilities for communication over the Internet started setting up a website. Junior members of the project from Ludwig Maximilian University Munich began constructing a portal for international communication between the various groups participating. This was an initiative deployed first and only by the students, without any interference from senior researchers in the group. It was done out of the need to acquire the

Figure 1. REDES and its national centers
necessary tools for communication. The structure of the project, whose members are dispersed all over the world (and in different time zones), demanded a simple and cheap form of communication that could be used by all without extra costs or infrastructure. The World Wide Web offered itself as a viable way to allow this communication and the means to achieve it was an Internet forum. Thus, every member was able to read and distribute news, ideas and private greetings (which certainly in the beginning made out a good deal of the communication). Initially, the local REDES groups in Brazil, Germany and Ukraine, showing a high continuity of members, were especially active in the forum.[3]

Shortly afterwards new requirements to the forum arose: it soon emerged that exchanges of the form 1:n (one participant writes to n potential readers) led to problems in the asymmetric cooperation between local groups and subgroups (see Auracher, Schwaiger & Tiourikov, 2007). On the one hand, it was not possible to respond only to parts of a message in the forum, which meant that many messages soon contained several different 'threads', which in turn were replied to by different people, leading – after a few exchanges – to serious problems maintaining an overview of the ongoing discussion. Although contributions in a forum may be ordered thematically, participants often deviated from the theme or brought up new ones. However, because of the chronological order of contributions, this often led to the situation where it was no longer possible (even for participants in a particular thread) to realize to which aspect individual comments responded. Such problems could be solved by direct communication between some members, for instance, through direct email contact, which meant that other participants could feel excluded.

An attempt was made to circumvent this problem by extending the forum (toward the end of 2004) with a content management system (henceforth CMS). This had two advantages. First, it created a dynamic Internet performance,

in which one could optionally add further content and modules. This functionally modular structure allowed each individual participant a free choice between various communication styles adapted to diverse types of messages and their expected reactions by different participants. In this way, a highly flexible system in which a wide range of options of a truly dynamic Internet lay just a few mouse clicks away. Second, this allowed a choice of all possible combinations of direct or relayed communication and of 1:1 or 1:n messages. The forum was furthermore extended with a Wiki, a picture gallery and a download facility, where members could download minutes of meetings, questionnaires to be tried out, or other such documents. While chat rooms (which had been available from the beginning) allow a simultaneous exchange – preventing that an idea is frayed out in time – a Wiki provides every member the possibility to contribute to one specific topic together with other participants producing after some time a common text to which diverse authors have contributed. Direct exchange with individual participants also remained possible via private messages.

Because the Internet forum also presented the REDES project to the public at large, the dynamic aspects were complemented with static pages, where an interested visitor might learn about the history, aims and contents of the project.

This initial portal ran on the public German university server as CMS, in order to optimally increase the use of Internet resources and also allow static information. Structurally, only open source software was used (which was changed in 2008) as a functional modular construction. It was construed in an open-ended fashion, so that it could be extended as the need arose. A number of facilities were offered in this user-friendly tool. Registered members could post stories, add/see pictures, download/upload files, add/check relevant web links, send private messages, use chat rooms and describe themselves and their interests in the profile section. However, the most important aspect of the portal was the possibility of enabling

researchers to communicate with one another. This tool both guaranteed the networking within REDES and helped enhance a sense of community. The portal contained a forum in which members could discuss their research projects, ask for help and try to find international partners, but also exchange general information, for instance reviews of recent publications, critical discussions and the like. In addition, members attending courses offered by the different area coordinators posted projects, comments or questions. This way, the portal also functioned as a site where discussions initiated in the classroom were extended and further developed online within the REDES community.

Participation in the forum required a posture which promoted criticism of their peers' work, and thus helped them develop their research. This openness entailed a change in attitude. The portal was a real revolution within REDES. The first reactions in the group were almost euphoric: all of a sudden individual participants disposed of technologies that made it possible to link up people separated geographically by large distances. Part of the success was certainly due to this enthusiasm for these new technological possibilities. As soon as it was operational, it began to be visited by the Brazilian, German and Ukrainian groups to such an extent that soon subcategories of communication had to be created, like 'General', 'Suggestions for reading', 'Technical questions', 'Research Projects', which themselves developed into further subdivisions. A lively interaction over the portal ensued for several years. To give an example: the rubric 'Research Projects' generated 432 posts to 34 threads, being viewed more than 5,000 times.

In addition to the forum, international meetings[4] were held at major international events.[5] During these meetings, administrative issues were dealt with, prospects for future developments discussed and, most importantly, members had their sense of community enhanced once they got to know their colleagues in person and were able to socialize with them.

However, the world is not perfect, and a breaking point occurred when the original generation that had built the portal left the university. The old portal can still be read at http://www.redes.lmu.de/portal/modules.php?name=Forums. Yet, it is no longer functional and only works as an archive. The main problem here was that the portal came under attack from hackers, posting pornography on the site, and later (when the previous damage was repaired) from ultra-rightist groups who posted their materials. This made the site unclear for a long time, since repairing it cost a good deal of time and money. These problems raised the question of how to secure the site from attacks. Still believing that the portal was needed, the new forum was launched and can now be found at www.redes.lmu.de/forum. This was again taken care of by junior members of the REDES group in Germany.

Until the middle of 2008 the old portal used PHP-Nuke for the simple posting of content on the website. For communication, phpBB was used, a software that, like PHP-Nuke, is freely available over the Internet. Extensions and improvements of these programs are produced worldwide by volunteers, which are then made available free to the audience at large. This means that they enjoy wide dissemination. But exactly this extensive diffusion of open source software, which in itself is to be greatly appreciated, also harbors a downside: security. The more a system is used, the more also it will be attempted to bypass its security mechanisms. Windows and Linux are good examples: the by large greater amount of harmful software is programmed especially for computers using Windows, since these computers are much more widespread than computers using Linux. The same befalls, unfortunately, both PHP-Nuke and phpBB, which are victims to hacker attacks time and again. This happened to the REDES portal twice, as mentioned above. Although extra security updates were installed several times, the maintenance of such is in the long run hardly possible, also because of costs.

Hence it was decided to further use a form of commercial software, in this case the well established system vBulletin. It contained all functions that used to be installed complementarily before. Besides, it is relatively simple to keep the system updated, as one is regularly informed about latest developments in the administrator's part. Everything is managed from one central point, while before all changes had to be carried through from various areas. Security in this software is not only checked regularly by users: the firm Jelsoft, in addition, constantly ferrets out and closes security holes. What is more, the use of the program reCAPTCHA averts that spam-bots (programs that register automatically in forums and install advertising) can access the forum.

The contributions and contributors from the old portal, however, could not be transferred to the new one. In the former, no new users could register. Additionally, one of the greatest security gaps, the upload of documents, was blocked. Finally, no new themes or replies could be posted. Finally, with the changeover to a real forum software an important separation was reintroduced, namely, that between communication and information platforms. Information purposes are served by the REDES main page, which is managed for a limited number of users through a self-developed CMS. For interaction, the communication platform is used.

CASE DESCRIPTION

The REDES group has been carrying out collective research for about seven years now. One of the most relevant contributions of joint work was the writing of *Muses and Measures: Empirical Research Methods for the Humanities* (van Peer, Hakemulder & Zyngier, 2007), totally conceived and written online by three REDES senior members over a period of five years. In the meantime, collaboration between two of the chapters, Brazil (REDES-BRA) and Ukraine (REDES-UA), also stands as an example of activity based on purely technologically supported long-distance contacts. In these countries where financial constraints are an issue, such projects would never have taken off if senior and especially junior members had had to travel worldwide to meet their colleagues.

The REDES research group brought a real change to the way students of Literature and Language, especially undergraduates, had studied so far: it opened up the road to conducting their own independent research for the first time. Studies in the Humanities had long relied on a hermeneutic tradition (Wiseman, 2002, p. 13), and imaginative texts have normally been viewed from a 'literary' perspective, which usually means paraphrasing parts of a text, providing comments to it, reviewing previous scholarship on the passage, or proposing ways to interpret it. As it will be clear from the examples, such methods can hardly be called 'research' from a scientific point of view. In this sense, researchers in literary studies tend to work independently from one another, and the very idea of combining the traditional literary view with technology may be quite alien to them. It should be emphasized here that the kind of research carried out in the framework of REDES is still genuinely 'literary' or 'linguistic' or 'cultural' since it deals with such objects of study like texts, readers, authors, etc., but that the approach differs from the more traditional one. The range of questions asked is considerably stretched: whereas previously the focus was mainly on the texts themselves, what they mean, how to interpret them, the range was now broadened to include questions to do with the functioning of these texts in the lives of individuals or groups, the various kinds of effects the reading of such texts may have, or why such texts are there in the first place, following the tenets of the Empirical Science of Literature (Schmidt, 1982). In a way, REDES has moved from a text-centered approach to encompass a larger scope which involves the sociology and psychology of literature (Schram & Steen, 2001).

This is a significant widening and deepening of perspective, which does not do away with the

older and more philological methods. However, it now embeds these in a social framework where such traditional questions and methods may be critically reviewed and, in some cases, left for other ones. After all, literature is not created for commentators at universities, but to fulfill real functions in people's lives. Neglecting to investigate these has greatly impoverished the study of literature and culture over the past decades. This is in itself strange, since the beginnings of literary studies in the West owe their existence precisely to such social perspectives. Both the literary theories emanating from the writings of Plato and Aristotle, the foundations of Western poetics and literary studies, start from the question about what literature contributes to society, and only later ask how the poets do this textually. Without ignoring traditional analytical strategies, REDES members set out to enrich them with questions and methods better adapted to analyze the psychological, sociological and anthropological aspects of literature. All this has been possible and has been made faster through the easy, fast and efficient communication of present-day information technology.

For REDES researchers, observation, theory, and application are equally important, and technology is part of the methodological tools. Consequently, actively using the REDES portal and establishing day-to-day on-line contacts between junior and senior researchers acquired extreme importance in supporting and encouraging participants' efforts. New topics appeared, and the number of posts both in general and regional sections grew every day.

This kind of trust in long-distance technology was especially relevant to Ukrainian and Brazilian junior and senior researchers, who tend to remain on the margins of mainstream Euro-centered exchanges. The cooperation resulted in a number of full-scale projects presented at various international forums and a history of joint publications, as mentioned above.

One specific product of cooperation between REDES-BRA and REDES-UA was testing strate-gies for Literary Awareness (Zyngier, 1994a) in the Ukrainian context. The methodology to increase readers' sensitivity to imaginative texts had been applied in Brazil for several years before the idea was expanded to the Ukrainian context. It would have been hardly possible to have such development without the information technology as all discussions were carried out on-line through the REDES portal under the topic 'A new idea about literary research'. All in all, the topic attracted 1,993 views and 190 comments in 27 months. The first post was submitted on January 14, 2005 by a Brazilian member, who invited other groups to join her in applying the method in different contexts. Three days later, a reply was posted by a Ukrainian REDES member, and the discussion started. The participants shared their ideas about the content and structure of the classes, about the material to be used during practical sessions, etc.

Many of the resources themselves were sent to the Ukrainian group by their Brazilian colleagues as DOC or PDF files; simultaneously, local meetings in Brazil and Ukraine were held on a regular basis. The Brazilian senior member in charge of REDES in this country, who actually conceived the program of Literary Awareness, then joined the discussion on March 10, 2005 to ensure the project would get off the ground and cooperation would start between junior members. The Ukrainian REDES chapter coordinator also participated in shaping up the project. PowerPoint presentations of the research in progress were discussed as well and presented at a conference in Brazil, at the REDES seminar in Germany, and at the UNESCO conference in Ukraine.

As a result of the on-line cooperation, in 2005, the course on Literary Awareness (Zyngier, 1994a, 1994b) was launched at Kyiv National Linguistic University and then expanded to yet another Ukrainian university, Horlivka State Pedagogical Institute of Foreign Languages. Both Ukrainian groups of teachers who were delivering the course as well as their students communicated long-distance – not to mention their frequent consultations with the

author of the book, who was thousands of miles away from both schools. In October 2005, she was invited to Kyiv to conduct a workshop on Literary Awareness, which materialized in April 2006. The preparation for the visit, including planning the workshop, was also carried out long-distance.

The pedagogical component of introducing Literary Awareness in Ukraine by way of on-line cooperation is crucial to Ukrainian education, in the Humanities in particular. In many countries today, university education faces a serious threat, as Barreto & Fialho (2005) put it: "the students do not experience *flow* while reading a literary text […], do not have a positive response towards literary texts and tend to build an emotional and critical distance towards them" (p. 95), though it is well known that "[r]eading, in any age, also means reading the world, attempting to interpret, to come to terms with, to assimilate, perhaps even one day to understand what surrounds us, in order that we be better equipped to live in the world" (McRae, 1997, p. 19).

The cooperation reported above resulted in a publication (Fedorova et al., 2006) and in a paper (Zyngier, Chesnokova & Viana, 2007) which was also written collaboratively on-line. The Literary Awareness course is to the present moment still being taught at KNLU as an optional subject for 20 undergraduates each academic year.

Continuing with the cooperation, another research project was carried out in 2007–2008 to examine how Brazilian and Ukrainian readers responded to Poe's "Annabel Lee" in Portuguese and Ukrainian. As the project was being developed, the Ukrainian coordinator traveled to the USA and expanded the scope by involving North American participants. The results of this joint project have been published (Chesnokova et al., 2009).

Other research projects also resulted from the cooperation between the Brazilian and the German groups (Fausto, 2006; Teles, 2006) as regards reactions to anti-smoking advertising campaigns, and movie subtitling and dubbing. More recently, Coachman & Weigert (2008) looked at the way

Brazilian, German and Japanese respondents reacted to vulgar language in a comparable short text.

Over seven years of stable cooperation (2002 – 2009) have inspired many other research projects and enabled the creation of a global research community where distance communication tools help cross the boundaries of cultures and continents. This is especially valuable for students as they become more and more skilled to operate various computer programs, work with statistics, present their projects before international audiences and work in a team (often under severe time pressure) to successfully progress in their careers – in academia but also beyond it.

All these examples stand as illustrations of the REDES philosophy, itself a product of cooperative work, which states that in this academic global online community "we share experience and knowledge, doing as much teamwork as possible, and using the Internet as a meeting ground" (see www.letras.ufrj.br/redes/philosophy.htm).

CURRENT CHALLENGES

The experience of budding Humanities researchers over the Internet does not go without problems. Nowadays the research group faces different challenges, which may be grouped into three main areas – namely administrative, personal and technological issues.

As regards administrative matters, the first issue to be considered is that of academic calendars. As the project involves at present four different educational systems (Brazilian, Canadian, German, and Ukrainian), it is not always easy to carry out research as part of a relevant course taught and this problem is enhanced further by the non-synchronization of university calendars around the world. For instance, in Brazil, the academic year is divided into two semesters: from February through July and from August through December. In Ukraine, the first term or semester starts in September and ends in late December with

January being an examination period; the second semester comprises February to May, and exams are usually taken in June.

Another administrative problem is related to where each branch coordinator is located. In the Brazilian context, the senior researcher is part of the Postgraduate Program in Applied Linguistics, which allows her to offer her courses as optional subjects. In the Ukrainian situation, the area coordinator is currently taking her full-time post-doctoral course and teaching part-time, which only includes term papers and the supervision of Ph.D.'s as well as graduation exams. The German coordinator has, at the moment, taken upon himself more administrative load and, although still involved in research, has been kept away from tutoring.

The status each coordinator has at his/her university also influences the project because freedom at taking decisions is subject to different university constraints. The Ukrainian area coordinator, for example, in spite of being the Head of the Department for several years, could not fully influence the academic program, as curricula are usually predefined by the Ministry of Education, and introducing new courses involves years of changes and paperwork. In Brazil and Germany, however, the coordinators have had more freedom of action as regards their courses and what to focus on.

Research traditions in each of the four countries should also be considered. Whereas in all of them literary studies are not geared toward empirical investigation, the Brazilian group is stimulated to work in an interdisciplinary way. In Canada, the rigid disciplinary boundaries are aggravated by the bureaucracy with getting permissions to do empirical research. In Ukraine, literary studies and language research are conducted within two different majors and their intersection, together with extensive reference to psychology, philosophy and sociology is not welcome. In Germany, the problem now arising is trying to get students who need to pay for their studies opt for research instead of a seminar they can get away with quickly.

As for personal matters, the most serious problem is that of motivation. More recently, junior researchers have shown a decrease in motivation, especially due to lack of funds. Participation in the group depends on the willingness to see it as an opportunity for personal and academic growth. However, when junior researchers do not get any grants, they also have to finance themselves through their university life. This competition the research group meets with the job market is unfair, since the job opportunities students find outside academia are often more appealing. When having to choose between carrying out independent studies or accepting a job which will provide them with the means to survive – junior researchers have to opt for the latter even though they would rather become full-fledged researchers. In Germany and Canada, the panorama is even more somber. Participants mainly get involved in the project because they get credits in return. As one may anticipate, this situation threatens the group's cohesion and makes long-term projects nearly impossible. In the German and the Canadian settings, voluntary involvement does not seem to work as it does in the Brazilian and the Ukrainian context. In both latter settings, the successful functioning of the group mainly depends on the individual efforts of highly interested students who find enough motivation to see the project as a fruitful ground for their intellectual and personal growth while also financing themselves so as to attend national and international conferences. Finding such individuals in everyday academic environment is always hard, but not impossible.

These problems have raised complex situations. Junior researchers need to understand that carrying out intercultural research implies first and foremost strong commitment with a colleague in another country. They cannot, for instance, decide to leave the research study they may be carrying out unfinished, since this will implicate a student from another group who started working with them. Even if they do need to leave the group, they must

help their partners complete the study, as this is what is ethically expected of them.

There are also linguistic issues involved in interpersonal relationships. As five different languages are involved in project (Brazilian Portuguese, English, German, Ukrainian and Russian), there is the need to use English as a language of integration. Most Brazilian and Ukrainian participants spontaneously use English in the forum in spite of some linguistic inadequacies. German participants, however, have often to be reminded that they must not communicate in their mother tongue unless they risk losing interest and international cooperation.

Over the past seven years work in REDES has shown that junior researchers need to understand that their participation in the research group is a great opportunity to be tutored by experienced senior researchers in their field of study and to share this experience with colleagues from different parts of the world, people they might never have a chance to meet. Moreover, in REDES, they are introduced to empirical methods of research in the Humanities, which is also unusual. Finally, they will be encouraged to carry out their studies autonomously from the very beginning, again not a common practice. Autonomy does not mean that they will work alone. Instead, they get the needed guidance on how to plan and carry out their study, prepare oral presentations, write papers, and so on.

The use of an online discussion forum already solves some problems such as that of time differences. The asynchronous mode of interaction enables participants to access it at their convenience. However, if participants do not visit the forum on a regular and frequent basis, this may cause some problems. In fact, a vicious circle may be created: if the forum is not accessed, there are no new posts; and if participants do not post, they do not feel compelled to visit the forum. With time, this setting may lead to collapse, bringing the forum to a halt. As with several online communication platforms, it is of utmost importance that participants promptly reply to posts. This is why sometimes members need to be reminded to do so as one of the area

coordinators did in the following excerpt from the forum: "[Name] has been waiting for a reply as of OCTOBER 9th last year!!! Please make sure you reply to her and get your project off the ground!" If there is no immediate feedback, members may experience frustration. In turn, this may affect one's motivation and engagement in the activity.

Another problem is avoiding the forum and communicating through parallel means. Once participants establish contact with their research partners, cooperation should take place in the forum itself. On some occasions, junior research members have used their private e-mails to exchange messages on a research project. When this occurred, other REDES members were excluded from the exchange and could not comment on the study. In the same post quoted above the area coordinator also draws a junior researcher's attention to this issue: "And please do not use your personal e-mail to discuss the project. Use the Portal... otherwise we won't be able to comment on it." One of the tenets of this community is that advice and/or positive criticism must be offered by all members. If interaction is carried out by e-mail, this becomes a private exchange which does not benefit from the group as a whole.

At present, the group is looking for new ways to make the project thrive. In order to do so, answer to three main questions must be found:

(a) How to reshape the research group?
(b) How to draw/raise active participants' interest?
(c) How to expand research projects to other countries?

The results obtained so far have shown the project is worth the effort and should be continued.

CONCLUSION

Although there are a fair number of problems, they do not prevent the group from producing

and preparing future researchers in the field of Humanities as early as possible in their academic lives. The experience so far has shown how to do away with individualism in the university and stress the importance of collaborative work. In fact, the case described above is applicable to many different disciplines in higher education which aim at preparing budding researchers. REDES has shown that it is a new way of doing research and of preparing independent, creative, and autonomous researchers who abide by the following tenets of its philosophy.

(a) The purpose of university education lies first and foremost in the training of critical abilities which are fostered through the production of new knowledge. The members of REDES are of the opinion that traditional ways of handling knowledge in Humanities departments are not conducive toward such aims, but remain largely confined to the dissemination of existing knowledge.

(b) Even where some allowance is made that students gather research experience, this is usually offered to them at the very end of the study period. We are of the opinion that doing research at the end of their studies is not only far too late, it is also counter-productive, in that it often produces frustration (because students are ill-prepared) rather than interest, confidence and enthusiasm. REDES attaches great value to instruction into modes of knowledge-production from the very beginning of university training.

(c) Members of REDES are dedicated to the insight that the aims of the group can only be achieved through active participation in the research process of all concerned, including beginning students.

(d) Methodological training is underdeveloped in the Humanities; this is paradoxical, because the level of complexity in culture is many times higher than that in natural phenomena. Nevertheless, it is students of the natural

sciences who are initiated in methodological matters at a deeper level. We are of the opinion that this situation should be redressed, and, therefore, attach great importance to serious education in methodology.

(e) The REDES project puts emphasis on empirical methods of investigation: we believe that there is a too one-sided emphasis on hermeneutic-interpretative and subjectivist methods in the Humanities. Such methods may have merits, but should be complemented by more scientific investigations of culture.

(f) Those who take part in REDES see research not as an individual enterprise, but as a form of team work that is carried out by groups of people who actively communicate about their plans and progress.

(g) Such groups do not stop at national borders, but should be essentially transnational and cross-cultural forms of cooperation.

(h) Members of this project actively engage with cultural products and propagate the value that cultural products bring to individuals' lives and to society as a whole. Emphasis on empirical ways of investigation is in no way a depreciation of culture, high or low. On the contrary, participants are deeply respectful of cultural artifacts, traditions and preferences.

REDES was born out of the need to offer students a more intense and involved journey towards knowledge. It implies commitment, self-discipline, academic generosity, mutual respect, and, in many cases, volunteer work. In this online research community, we want to prepare qualified thinkers by developing and promoting the exchange of knowledge and ideas, and thus to collaborate for a better world.

In fact, years of cooperation have shown that this community works and functions as a source of cultural education and international exchange, where friendships develop and where differences are recognized. Members understand they are

part of a scientific group as individual beings and thus help each other on several different levels. Belonging to this online project has proven to be a long-term commitment to working together and supporting others' efforts in their research and lives, a dedication which requires more than a minimal engagement during normal office hours. As a consequence, the goals of working towards an ideal academic setting which aims at scientific advancement and the feeling of personal growth, of learning and of sharing has been achieved, mediated by the Internet as a meeting ground.

Besides offering the conditions where learning outside the classroom and the curriculum takes place, the Internet has enabled REDES to become more than just a formal research group. It has turned out to be a place where interpersonal relationships are established and friendships develop. It is this bond of affection between researchers that guarantees that knowledge and experience become long-lasting and memorable. And all this has only been possible because of the advent of information technology. It is true that this work requires a higher than usual level of energy, enthusiasm, openness and dedication. But to those who have made this possible, research has been a thrilling, rewarding and unusually enriching experience.

ENDNOTES

[1] Previously, the group has been referred to as 'Research to the Development of Empirical Studies' and 'Research Development in Empirical Studies'. Although the final version of its name has been used for a couple of years by now, references to these previous versions may still be found.

[2] We opt to refer to mature scholars and students alike using the same term, namely, 'researchers'.

[3] A former Dutch group contributed very little to the discussions presumably because of the high turnover of its members. The Canadian group had not joined the project at that time.

[4] Due to financial constraints, not every RE-DES member can take part in these meetings

every year or two. Efforts are made so that at least one representative per national center is present.

5   There have also been several REDES meetings at the events organized by its national centers.

Chapter 34
An Ontological Business Process Modeling Approach for Public Administration:
The Case of Human Resource Management

ABSTRACT

In this chapter, an electronic model of Public Administration's operation using an ontology as a means to a formalized representation of knowledge is presented. According to the proposed model, every public administration procedure is viewed as a service offered to some external entity and is represented as a (Semantic) Web service, semantically annotating its functional parameters, profile, and workflow. The modeling of public administration services/procedures involved the commonly used IOPE (Inputs – Outputs – Preconditions – Effects) model of OWL-S for Semantic Web Service description. This chapter also presents a specific use case about the Human Resource Management department of the Region of Central Macedonia. In order to do so, certain extensions/adaptations of the general methodology were needed. In this chapter the authors fully present and justify these adaptations that were deployed in order to turn the general methodology into a really flexible and re-usable tool to model any public administration procedure. Furthermore, the authors describe the full knowledge engineering cycle for developing the ontology of this department's business processes.

INTRODUCTION

The main objective of e-Government is the development of user-friendly and efficient services for citizens and businesses. Semantic interoperability between public administration (PA) procedures of different governmental agencies, as well as between public administration's procedures and citizens' and businesses' understanding of them, is a vital issue to solve within this domain. Public organizations produce daily a great volume of administrative documents, in order to fulfill their mission, which is to serve citizens and businesses adhering to constitution and laws. This requires the use of certain procedures incumbent on law provisions and executives' experience. Web powered semantics could help the e-Gov by engineering inter-operable PA procedures, facilitating the performance of daily routine procedures and helping inexperienced civil servants with new tasks, leading "knowledge based government, in a knowledge based economy and society". Knowledge is now a major driving force for organizational change and wealth creation, and effective knowledge management is an increasingly important source of competitive advantage and a key to the success of modern organizations.

In order to capture knowledge that is inherent in PA's operation and procedures, a formal representation framework, such as ontologies, is needed. Ontologies (Staab and Studer, 2009) have been proposed as the main means to capture semantics and organize information in the (semantic) web (Berners-Lee et al., 2001), since they provide a formal description of concepts, terms, and relationships within a given knowledge domain. An ontology provides a shared vocabulary, which can be used to model a domain - that is, the type of objects and/or concepts that exist, and their properties and relations. In addition to describing a domain, an ontology is also used to reason about the entities within that domain.

Business Intelligence (BI) refers to technologies, applications and practices for the selection, integration, analysis and presentation of operational information. The future trend is the expansion of BI applications to more users inside and outside of an organization and a shift to a further automation of the decision making processes. Business Intelligence covers a broad area of practices that can be used in order to improve efficiency and effectiveness of many internal procedures in an enterprise. In the end BI will aim to the big mass of the end users of the enterprise applications which today are not available to them. Intelligent automation of procedures is called Intelligent Process Automation (IPA) (IDC, 2006). IPA is the merger of BI and of the technologies of operational procedure management. It is an automation of the repetitive operational decisions (not the strategic ones). Formal process modeling is needed in order to efficiently address the problem of representing, analyzing and managing knowledge about an organization and its processes (Koubarakis and Plexousakis, 2000).

In this chapter we describe our proposal which envisions an electronic model of PA's operation in a certain field with a possibility of reuse in lots of applications. Ontologies can be a means to the representation in a formalized manner of knowledge fields as they can capture knowledge and provide a commonly accepted conceptualization which can be reused in a variety of applications and by a variety of people. They can provide a common vocabulary of a field and define with different levels of formality of the terminology and the relationship between different entities. Thus knowledge can become a shared property.

The vision of web services is the description of services using semantics understandable by computers. Semantic annotation is a critical point in order to automate retrieval, composition and execution of services. Ontologies are used to help web service technology to be realized worldwide. OWL-S is a representation language of the different characteristics of semantic web services (Martin et al., 2007). OWL (Web Ontology Lan-

guage) is the official language of W3C which is used in web ontologies (OWL Overview).

Our methodology, an extension of (Savvas and Bassiliades, 2009), uses OWL to represent the PA's structure and the entities involved in its procedures and the information (public administration documents) exchanged among them during the execution of these procedures, and OWL-S service models for representing the steps and workflow of these procedures.

In the new era of e-government it is possible to improve service provision by removing redundant tasks and/or simplifying procedures and this can only be performed after a thorough and precise modeling of the involved procedures. To this end, this chapter also presents a specific use case of the general methodology, which is about the Human Resource Management department of the Region of Central Macedonia (RCM). This public administration unit is responsible for providing services, such as staff recruitments, transfers, retirements, etc. For each service provided there is a specific procedure followed. The knowledge of these procedures is usually kept in the minds of the public servants who work in this department. Necessary preconditions for the usage of this knowledge from other servants and citizens are, a) capturing the tacit knowledge that public servants reserve, as well as b) representing captured knowledge in an explicit and formal way.

Actually, this use case is a joint research project between the Logic Programming and Intelligent Systems (http://lpis.csd.auth.gr) research group of the Department of Informatics of the Aristotle University of Thessaloniki and the Region of Central Macedonia (http://www.rcm.gr). The aim of this project was first the acquisition of knowledge held within the Human Resource department's staff of the most critical public administration procedures of the department in order to produce certain public administration acts. In order to do so, these procedures were analyzed in primitive actions/steps (tasks) and the workflow among them. For each task, the entities involved and

the documents exchanged between entities were recorded. Finally, these steps were aggregated in larger chunks of conceptually coherent actions that constitute independent sub-procedures within the whole administration procedure, according to the general methodology of (Savvas and Bassiliades, 2009). In order to do so, certain extensions/adaptations of the general methodology were needed. In this chapter we fully present and justify these adaptations that were needed in order to turn the general methodology into a really flexible and re-usable tool to model any public administration procedure.

In the next sections we shall present, firstly, background and related work information, then the ontological public administrator process modeling framework we have devised, along with a full modeling example, and finally conclusions and future work directions.

BACKGROUND

Semantic Web

Today's Web is suitable for human consumption and is organized around content presentation and not information meaning. Getting in touch with other people, seeking information about hotels and tickets, searching for lower prices and ordering products on-line are the majority of activities that take place on the WWW. However, these activities utilize only a small amount of information available on the World Wide Web.

Search engines do a relatively good job, but only in simple queries. Complex queries may yield results not related to the ones the user expected to see or, even worse, the relevant pages may be amongst thousands of others mildly relevant or totally irrelevant to the query. However, even when the search is successful, the information needed may be spanned across various documents and the user must manually put the information pieces together. That would often require more queries

using synonyms of the original keyword or using other sources to find more possible relevant pages.

The Semantic Web initiative (W3C) tries to solve problems related to knowledge representation by suggesting standards, tools and languages for information annotation. Semantic Web can be considered as an extension of the current Web where information has unambiguous and well-defined meaning, enabling machines/agents to understand the semantics of the information and not only base on the syntax. The Semantic Web vision emerged after Information Retrieval (IR) received great attention in the late 90s and the term *metadata* was coined. Metadata is often described as "data about data" and is used to facilitate the understanding, use and management of other data. The aim of the Semantic Web is to allow the creation of advanced knowledge management systems that will organize the knowledge and support easy maintenance and access to it. Tasks like these require the metadata to be machine-readable and machine-interchangeable. Ontologies play a key role to the evolution of the Semantic Web and are widely used to represent knowledge by describing data in a formal and explicit way.

Ontologies

Ontologies are of basic interest in many different fields, largely due to what they promise: a shared and common understanding of some domain that can be the basis for communication ground across the gaps between people and computers (Staab and Studer, 2009). Ontologies are used not only to represent a domain of interest, but also define concepts, describe relations among them and insert individuals. So, an ontology is not just a taxonomy. Sometimes ontology concept is confused with taxonomy, which is a classification of the data in a domain. The difference between them is in two important contexts. Firstly, an Ontology has a richer internal structure as it includes relations and constraints between the concepts too and

secondly an Ontology claims to represent a certain consensus about the knowledge in the domain.

To describe information appropriately, knowledge representation languages based on XML have been proposed, such as RDF (RDF) and OWL (OWL). Both languages are used to annotate the information in a formal and explicit way by defining *ontologies*, using classes, properties and instances of classes. The ontologies are used in order to organize knowledge in conceptual hierarchies, providing a controlled vocabulary of concepts, each with explicitly defined and machine processable semantics. The difference between the two most commonly used ontology languages (RDF and OWL) is the degree of expressiveness they offer. Thus, while RDF is capable of defining only subclass and subproperty relationships between classes and properties respectively, OWL goes a step further by offering a higher degree of expressiveness. Having been built on top of RDF, OWL introduces more relationships between classes, properties and instances, allowing the use of property constraints and Boolean operators (union, intersection, etc) in class definitions.

To fulfill the goal of the Semantic Web - a Web understandable by machines - the annotation of information is not enough by itself. The need for a variety of appropriate tools such as reasoners, graphical editors, visualization tools and environments that successfully integrate the various technologies and languages involved in such applications also exists. Reasoners play a significant role, since they can handle and apply the semantics of the ontology language. The formal semantics of the OWL language enable the application of reasoning techniques in order to make logical derivations, involving class membership, equivalent classes, ontology consistency, and instance classification. Therefore, reasoners are important since they are able to extract new information that is not stated explicitly, based on the formal semantics of the language used for annotation (Haarslev & Möller, 2003; Tsarkov & Horrocks, 2006; Sirin, et al., 2007; Medits-

kos & Bassiliades, 2010)0. The rest of the tools mentioned above are equally important, since they can greatly assist the end user in exploiting the Semantic Web to its full extend as well as for gradually increasing the user trust towards the Semantic Web.

Web Services

The advent of Web services is a proof that nowadays the need for communication among loosely coupled distributed systems is bigger than ever. Web services offer a well-defined interface through which other programs may interact by sending messages based on Internet protocols and Web standards (WS Architecture). They may also be combined in order to achieve a complex service whose functionality cannot be achieved by a single one, a procedure that is called *service composition*.

Web Services and their technologies are based on XML. That is because XML as a language allows a platform-independent exchange of data at a basic level. XML and its great adaptation, combined with the rest of the Web Service technologies, allow for global co-operation between organizations. The description of a service interface is based on the Web Service Description Language (WSDL) that describes the syntax of the input and output messages using XML, as well as other details needed for the invocation of the service.

The communication is based on the Simple Object Access Protocol (SOAP) (SOAP, v 1.2), an XML-based framework that provides a message construct that can be exchanged over a variety of underlying protocols. Anyone that consumes a Web Service is not tightly connected to it – the service may change during time and the client will still be able to interoperate with the Web Service. This is called *loose coupling*. In the exact opposite case, the slightest change in the service side would require change in the client side and vice versa.

Semantic Web Services

Web services make functional building-blocks accessible over standard Internet protocols independent of platforms and programming languages, promising a communication revolution in heterogeneous domains where the efficient service-based collaboration among different parties is important, such as in e-commerce and e-business. Although this perspective is quite promising, Web services have not managed yet to reach a widespread adoption in a Web scale (Davies, et al., 2009)0. As an implementation technology of Service Oriented Architecture (SOA), Web services constitute a great solution for modular and component-based software development in closed and isolated business environments. However, businesses and individuals are quite reluctant to publish their Web services mainly because the technologies involved are quite complex. Furthermore, the interface, namely the format of what goes in and out of the service, is often described formally. However, what the service is actually doing, semantically speaking, is usually not described formally, making, thus, difficult to find a Web service with a specific functionality and integrate it in a software system.

In an effort to improve the machine interpretability of Web services, the notion of *semantic Web services* has emerged, where Web services are combined with Semantic Web technologies in order to allow data and service providers to semantically describe their resources using third-party ontologies. Semantic Web services aim at making Web services machine understandable and use-apparent, utilizing Semantic Web technologies for Web service annotation and processing. The idea is to provide ontology-based descriptions of Web services that could be processed by ontology reasoning tools. In that way, intelligent agents would be able to automatically understand what a Web service does and what it needs in order to perform a task.

Service discovery and composition are two fundamental tasks in service oriented architectures. Web service discovery can be defined as the problem of locating suitable Web services to fulfill a given objective. Web service composition refers to the combination of simple Web Services in order to create a complex service of enhanced functionality. Composition can be either manual, where the user participates by selecting appropriate Web services from a set of available ones, or automated, where the composition is generated automatically, based on initial requirements about functional and non-functional properties. In the SWS paradigm, both service discovery and composition are performed over the semantic descriptions of Web services.

There are three major frameworks for the semantic description of Web services: OWL-S (Martin, et al., 2004)0, SAWSDL (Kopecký, et al., 2007) 0and WSMO (Roman, et al., 2005)0. OWL-S consists of three main parts: the *Service Profile*, the *Process Model*, and the *Service Grounding*. More details are given in the next subsection. WSMO defines four top-level concepts in its own specification language WSML (WSML): *Ontologies*, *Goals*, *Web services* and *Mediators*. Ontologies actually constitute the domain knowledge that is used. Goals are representations of an objective for which fulfillment is sought through the execution of a Web service. Web services consist of non-functional, functional and the behavioural aspects of a Web service. Finally, Mediators are used for enabling interoperability and handling heterogeneity. Furthermore, WSMO is a goal-driven approach, in the sense that client's goals are matched against Web service capabilities (Kaufer & Klusch, 2006; Domingue, et al., 2008)00.

Both WSMO and OWL-S follow a top-down approach, requiring first the definition of the conceptual aspects of Web services and then connecting them to the actual Web service. SAWSDL follows a bottom-up approach by extending WSDL. More specifically, SAWSDL consists of mappings of XML schema definitions to ontology concepts and extensions to WSDL attributes for referencing ontology concepts.

OWL-S Ontology

OWL-S (Martin, et al., 2004) is an OWL ontology that offers the conceptual model for semantically annotating Web services. The modeling is performed based on three upper ontologies, namely Service Profile, Process Model, and Service Grounding.

Service Profile

The Service Profile provides the information needed for an agent to discover a service (*advertisement*). An advertisement contains descriptive information, such as the service name, and information about the provider. It describes also the functional properties of the service, that is, inputs, outputs, preconditions, and effects, and nonfunctional properties, such as quality. Each advertisement can be either a direct instance of the OWL-S Profile concept or it can be defined based on a Profile subclass hierarchy. The Profile-based Web service discovery involves the procedure of matchmaking service requests and advertisements, both represented as Profile instances. Inputs and outputs (I/Os) are annotated with ontology concepts (signature), and preconditions and effects (specification) are described using a rule formalism.

Process Model

The Process Model provides information for an agent to make use of a service. It tells a client how to use the service by detailing the semantic content of requests, the conditions under which particular outcomes will occur, and the step by step processes leading to those outcomes. In other words, it describes how to ask for the service and what happens when the service is carried out. For

complex (composed) services, the description is used by an agent in order to: (1) perform a more in-depth analysis of whether the service meets its needs; (2) compose service descriptions from multiple services to perform a specific task; (3) coordinate the activities of the different participants; and (4) monitor the execution of the service.

A Process Model can be viewed as a *process* and it is defined in practice as an instance of the OWL-S ontology class Process. There are two types of processes: an *atomic process* is a description of a service that expects one (possibly complex) message and returns one (possibly complex) message in response. It corresponds to the actions a service can perform by engaging it in a single interaction and it is directly invocable (by passing them the appropriate messages). Atomic processes have no subprocesses and execute in a single step, as far as the service requester is concerned. They take an input message, do something, and then return their output message.

A *composite process* maintains some state and each message the client sends propagates it through the process. It is decomposable into other (non-composite or composite) processes and their decomposition can be specified by using control constructs such as Sequence and If-Then-Else, e.g., if a composite is a Sequence, then the client sends a series of messages that invoke every step in order.

A process either generates and returns some new information based on information it is given and the world state or it provokes a change in the world. In the first case, the information production is described by the *inputs* and *outputs* of the process, whereas in the second case the transition is described by the *preconditions* and *effects* of the process. The inputs represent the information that is required for the execution of the process and the outputs represent the information that the process provides to the requester. There can be any number of preconditions, which must all hold in order for the process to be successfully invoked (the process cannot be performed successfully unless the precondition is true) and any number of effects that denote the condition that should hold after the execution of the process.

Service Grounding

The grounding of a service in OWL-S specifies the details of how to access a particular service. The details mainly concern protocol specification and message formats, serialization, transport and addressing. Actually, the grounding specifies a mapping from an abstract to a concrete specification of those service description elements that are required for interacting with the service. The central function of an OWL-S grounding is to show how the inputs and outputs of an atomic process are realized as messages, which carry those inputs and outputs in some specific transmittable format. In most cases, this realization describes how the abstract specifications of the Process Model are mapped on WSDL artifacts.

Interoperability

Interoperability means working together - collaboration of systems, services and people. When people work together, they need to communicate and make agreements. They need to agree on the tasks they will perform and how they will exchange results. If their nationality is different, they also need to agree on the language in which they will communicate. Moreover, they need to overcome cultural and legal differences. An Interoperability Framework can be defined as the overarching set of policies, standards and guidelines which describe the way in which organizations have agreed, or should agree, to do business with each other. An Interoperability Framework is, therefore, not a static document and may have to be adapted over time as technologies, standards and administrative requirements change.

Administrations that provide electronic services (eServices) are faced with the same situation; they need to elaborate a set of agreements

on a large number of issues, considering organizational, semantic and technical aspects. For example, when administrations exchange data, they must ensure that each party shares the same meaning of the data (semantic interoperability): for instance, when referring to 'price', there is a variety of interpretations, such as the actual price or the price per item.

The European Interoperability Framework (EIF)[1] addresses these issues in order to facilitate the interoperability of eGovernment services at pan-European level. EIF supports the European Union's strategy of providing user-centred eGovernment services by facilitating, at a pan-European level, the interoperability of services and systems between public administrations, as well as between administrations and the public (citizens, businesses). EIF is based on the premise that each Member State has, or is in the process of developing, its National Interoperability Framework (NIF). Consequently, EIF focuses on supplementing rather than replacing, NIFs by adding the pan-European dimension. By providing recommendations and defining generic standards with regard to organizational, semantic and technical aspects of interoperability, it offers a comprehensive set of principles for European cooperation in eGovernment.

EIF is supplemented by the well-established IDABC Architecture Guidelines (IDABC, 2004) that approach interoperability from a more technical and pragmatic viewpoint. The IDABC Architecture Guidelines - and other documents foreseen in the IDABC Work Programme - aim at practical guidance and the building of common standards and infrastructures needed for the implementation of interoperability.

EIF covers the exchange of information at a pan-European level between:

- administrations, citizens and businesses;
- administrations and other Member states administrations.

Member States that wish to interoperate at a multilateral, pan-European level and make their services available to citizens and businesses in other Member States should use the guidance and recommendations provided by this Framework and incorporate the relevant aspects in their National Framework. As a consequence, the ultimate beneficiaries will be citizens and businesses who need the provision of such eServices from governments at a pan-European level.

Dimensions of Interoperability

Three aspects of interoperability need to be considered, according to EIF:

- *Organizational interoperability*: This aspect of interoperability is concerned with defining business goals, modeling business processes and bringing about the collaboration of administrations that wish to exchange information and may have different internal structures and processes. Moreover, organizational interoperability aims at addressing the requirements of the user community by making services available, easily identifiable, accessible and user-oriented.
- *Semantic interoperability*: It is concerned with ensuring that the precise meaning of exchanged information is understandable by any other application that was not initially developed for this purpose. Semantic interoperability enables systems to combine received information with other information resources and to process it in a meaningful manner. Semantic interoperability is therefore a prerequisite for the front-end multilingual delivery of services to the user.
- *Technical interoperability*: It covers the technical issues of linking computer systems and services. It includes key aspects such as open interfaces, interconnection

services, data integration and middleware, data presentation and exchange, accessibility and security services.

RELATED WORK

Related work concerns various aspects of the problem we address, namely use of semantic web technologies, like metadata, ontologies, web services, etc., for e-government and PA knowledge. PA ontology modeling is a fast evolving field as ontologies are considered critical knowledge infrastructure to address semantic interoperability problems. They provide the necessary basis for further development of SW and SWS eGovernment applications. Due to the fast development of SW and SWS technologies and the research interest in applying such technologies in PA, we expect to see in the next few years a substantial growth on demand for reusable and scalable PA domain models and ontologies. Nevertheless, ontologies are considered mainly a social construct and as such the acceptance and adoption of these models is a complex social process which is heavily influenced by various sociotechnical factors.

Interoperability among PA agencies has been identified as a central issue and a critical prerequisite for the effective functioning of contemporary PA systems (Peristeras, et al., 2007). The "European Interoperability Framework", discussed above, defines three interoperability types at the technical level, semantic level and at organizational level. Our main aim in this work is to address semantic interoperability coping with different meaning and usage of documents and information, as well as, organizational aspects dealing with different business processes of different PA units.

Currently there are several research efforts that try to address interoperability/integration issues in eGovernment in all three EIF dimensions. The UK e-GIF (e-Government Interoperability Framework) (UK LAWs Project, 2005) model focuses on 4 perspectives: interconnectivity, data integration, e-services access, and content management. In (Guijarro, 2007) a survey of existing e-Government interoperability initiatives and enterprise architectures in the EU and USA is presented. Park and Ram in (Park and Ram, 2004) also give a description of semantic interoperability conflicts regardless of the application domain, while in (Ram and Park, 2004) the resolution of these conflicts is proposed using an ontology. The Semantic Interoperability Community of Practice (SICoP, 2005) has identified the semantic conflict types in information systems and has recognized the importance of Semantic Web (SW) technologies in this area.

In a recent survey paper (Peristeras, et al., 2009), model-driven initiatives and efforts to achieve eGovernment interoperability are reviewed and compared. This type of modeling supports PA interoperability in an indirect though effective way. They are usually introduced as standards/specifications or blueprints to be consulted, or open standards to be followed. According to this survey the various initiatives and efforts can be categorized according to their scope (global, national, sub-domain), their owner (governmental programs, research initiatives) and modeling perspective (data, process/service, organizational).

Our research effort, mainly concerns "normative" countries' PAs (Billiets et. al., 2006), namely PAs that their operation and relations between public entities and civil society are governed by a distinctive type of law, called public law. Moreover as "in all democracies across the world the use of documentary evidence to support PA operations is a common feature" (Sabucedo and Rifon, 2006) according to the scope criterion there is no reason why our generic model could not be applicable and reusable across different countries, thus becoming global, according to (Peristeras, et al., 2009). Finally, we have already applied our general model in three different domain areas, such as state project funding, naturalization and human resource management; therefore, we have

managed to delve into different sub-domains, which helped our general model to evolve.

According to the modeling perspective criterion, our research effort focuses both on modeling the objects/entities involved in the PA, namely the "administrative act", so it can be characterized as a *Data Modeling* approach and also on modeling the services offered by the PA as well as the processes that these services are based on, being thus a *Process/Service Modeling* approach, too.

Two types of data models that enhance interoperability exist:

- *Domain models*; these are attempts to model the basic entities of a specific PA domain following an application-independent approach.
- *Generic data models*; these are more abstract models that cover the overall PA domain. Amongst other things, these models can be used for constructing lower level and domain specific models.

In our case, we re-use the OWL-S ontology for Semantic Web Services as a generic data model for describing processes of PA procedures that lead to services offered by PA, and we extend it with PA domain-specific classes, which are independent of any application. Thus, we use a *domain model*. However, in the case of describing PA entities and documents (such as acts and laws), we follow a *generic data model* approach, using OWL, covering the overall PA domain in the top-level classes and properties of the ontology. In both cases, our scope covers the global public administration system with top level (reference) descriptions reusable in several PA sub-domains, taking a holistic view. Finally, the representation power of our model is OWL-DL (description logics).

The advantages of generic data models lie on their reusability, the development of a common understanding/language and the anticipated cross-domain conformance to standardized conceptual descriptions. Generic data models are applicable across the PA domain, taking a top-level, abstract view and are used as blueprints for the construction of more concrete and domain/case specific models.

Several research efforts and governmental initiatives fall into this category, such as the UK Government Common Information Model (Office of e-Envoy UK, 2002), the Governance Enterprise Architecture (GEA) (Peristeras, 2006), as well as, a large number of national and international attempts to propose eGovernment metadata descriptions based on the Dublin Core Metadata Initiative, described thoroughly in (CEN, 2003).

In the following we will briefly describe the UK GCIM effort, which is the most representative one of the generic data model category. Specifically, the GCIM is a high-level information model for all activities undertaken by PA. It is part of the more general UK e-Service Development Framework (Office of e-Envoy UK, 2002). The central GCIM concept is the Service Interaction. According to GCIM, every PA service is different and the only way to enable reuse of components is to use an agreed reference structure. GCIM provides such a structure, which ensures that stakeholders share a common view of the domain. While each e-service development project can develop its own domain model, the classes used in the various domain models should be categorized under the top-level GCIM concepts.

Based on its purpose, the view of the GCIM model is focused on the transactional aspects of electronic service provision by PA. According to the GCIM model, the operational level of the model consists of objects Subject, Identifier, Location, Evidence, Outcome, Rule, Service, Service Interaction and relationships amongst them modeling transactional aspects. Service Interaction is typically an exchange of information with a common set of identifiable participants (Subjects/Identifiers) in a certain Location and involves a type of a Service, governed by Rules, requiring Evidence and generating Outcomes.

Process modeling has become a popular aspect of business modeling during the last fifteen years with the rise of the Process Reengineering and Innovation imperative and the subsequent process-oriented approach of contemporary organizational systems. The use of Service Orientated Architectures (SOAs) has shifted modeling attempts from process orientation to service orientation. These architectures are specifically focused on issues related to advertise, discover, invoke, compose and monitor services available from multiple providers over the web. This shift of interest resulted in the development of the Web Services (see Background section).

More recently the Semantic Web (SW) (Berners-Lee, et al., 2001) initiative provides models and methods that have led to the emergence of the Semantic Web Service (SWS) technologies. The core of a Semantic Web Service (SWS) remains the service: its description is a key concept. This description should be computer-interpretable, thus formal. There is a growing literature on formal service description, such as OWL-S, the Web Service Modelling Ontology (WSMO), the Semantic Web Services Framework (SWSF) and the Semantic Annotations for WSDL and XML Schema. For more details, see the Background section. Based on these service ontologies, work has been already conducted in Web Service discovery and composition. There is a growing interest in instantiating these generic service ontologies to the eGovernment domain.

Following a Semantic Web Service approach, the Ontology enabled E-Gov Service Configuration (ONTOGOV) project (OntoGov, 2006) has proposed an eGovernment domain specific service ontology, also called meta-ontology. The proposed ontology is heavily based on the two major generic service ontologies, namely OWL-S and WSMO, but ONTOGOV claims not to reuse OWL-S or WSMO as such. The reason for developing a PA specific service ontology was claimed to be inefficiencies in the generic ontologies. However, the PA specific concepts introduced in the model are rather limited and the PA service is modeled with rather poor PA specific semantics.

The ONTOGOV meta-ontology specializes and instantiates in the eGovernment domain some features of the two generic frameworks (but mostly of OWL-S). It consists of two parts: the profile that is used for the service discovery and the process model that is used to describe the process flow. To define the ONTOGOV meta-ontology profile, the OWL-S service profile ontology has been extended.

Initially, the property "hasReferencedBusinessRule" was introduced, that establishes a reference between the service description and the business knowledge in the form of a Business Rule ontology, namely a Legal Ontology, in the case of E-Government. Secondly, an extension from the business process modeling point of view was introduced. In order to model the resources involved in a business process, some new entities were added, namely "requires" property and "Resource" concept, establishing a bridge between the common language used by business people to describe the business processes and the ontology language used for describing web services. Finally, the CEN Application Profile v.1.0 metadata standard (CEN, 2003) was used to describe the non-functional aspects of a PA service, considering the standard metadata defined for the particular domain.

Regarding the process model, several differentiations to the OWL-S process ontology were introduced, relevant to e-Government. First, each service is associated to the law it is based upon. Also, each service is associated with the software component that implements it, along with security levels. Finally, information about cost and time restrictions has been specified. Since it is required that inputs/outputs are defined in the domain ontology, the additional concept "Reference" was introduced. This allows a property may be attached to several domain concepts. Furthermore, a concept defined in the domain ontology may have a number of properties and only a subset

of them is used as an input. This is achieved via the properties "hasConcept" and "hasProperty".

While OWL-S uses preconditions and effects to refer to the changes in the state of resources, ONTOGOV uses the WSMO interpretation. Preconditions are used for defining what a service expects for enabling it to provide its service, while postconditions define what the service returns in response to its input. Composite services have the property "hasFirst" to indicate the first service in the process flow and the transitive property "consistsOf" to indicate all included services. There are some consistency preserving rules, such as that if a part of a service is related to some part of the law, then the service itself is related to the same part of the law. The control structures supported are Sequence, Split, Join and If-Then. Services and control constructs are connected through the properties "hasNextControlConstruct" and "hasPreviousControlConstruct" whose domain is "Service" and range is "ControlConstruct" and their inverses "hasNextService" and "hasPreviousService".

Governance Enterprise Architecture (GEA) has been proposed as a top-level, generic (and thus reusable) Enterprise Architecture for the overall governance domain. Following a Model-Driven Development (MDD) approach, GEA claims to be a Computational-Independent Model describing the business context and business requirements (ATHENA Project, 2005). Thus, a key aspect of GEA is that it attempts to be technology neutral. This means that the GEA models may be applicable to different technological environments. A GEA overview can be found in (Peristeras, 2006).

GEA adopts a two-dimensional framework in order to build a set of inter-related models that describe the overall governance system. In the horizontal dimension, the process versus object modeling perspective has been introduced.

According to the object model of GEA for service provision, a Societal Entity requests a Service. A PA entity can have one of the four roles: a) Service Provider that provides the service to the Societal Entities (clients), b) Evidence Provider that provides necessary Evidence to the Service Provider in order to execute the PA Service, c) Consequence Receiver that should be informed about a PA Service execution, and d) Service Collaborator that participates in the service execution workflow.

PA Services are governed by Preconditions usually specified in Laws, which set the general framework for the service and the business rules that should be satisfied for its successful execution. Preconditions can be expressed formally as a set of clauses and are validated by a Piece of Evidence, stored in numerous alternative Evidence Placeholders. For example, the age of a citizen, which is a Piece of Evidence for a service that depends on age limitations, can be contained in alternative Evidence Placeholders, such as the ID card, the passport or the birth certificate.

A PA Service may have different types of results (Outcomes): Output, Effect and Consequence. Output is the documented decision of the Service Provider regarding the service asked by a Societal Entity, similarly to our notion of "Act". This "documented decision" is embedded and reaches the client in the form of an administrative document or decision. The execution of a service may result in a change in the state of the world (e.g. transfer of money to an account). This is the Effect of the service as defined also in OWL-S and WSMO. In the PA domain, the service Effect is the actual permission, certificate, restriction or punishment the citizen is finally entitled to. A Consequence is information about the executed PA Service that needs to be forwarded to interested parties.

Among other efforts that concern e-government ontologies is the Smartgov project (SmartGov Project)0 where an e-government service ontology about generic business activities is described, using the KAON modeling tool 0. The ontology comprehends four broad categories: Activity, Organization, Strategy and Marketing. Another initiative taken by the Essex County Council within the DIP project (DIP project)

aims to develop a whole governmental Ontology, modeling a very wide range of concepts related to the British government and other important community agencies, their services and citizens.

Legal ontologies aim at achieving semantic interoperability through the modeling of the legal domain with respect to legal concepts and law discipline. A number of projects, including e-Court, e-Power, FF Poirot, "Financial Fraud Prevention-Oriented Information Resources using Ontology Technology", CLIME, and SEKT (SEKT Project), aim at improving the access and understanding of large collections of legal information through the Internet, exploiting Semantic Web technologies in the legal domain.

The SEKT project provides support to newly recruited judges, based on ontologies of professional legal knowledge (Casanovas, et al., 2005) rather than ontological models for theoretical legal knowledge, as most previous attempts. The ontology was built in OWL Lite as a specialization of the Proton upper ontology and its structure resulted from the answers that judges gave to a questionnaire in order to reflect everyday tasks.

Our ontology refers to administrative entities, procedures and documents rather than legal hierarchies. Public administration serves its own goals and objectives by producing acts that have their own rationale, which is quite different from the one of the courts. Acts use laws, as well as jurisprudence and administrative precedents. Our approach models administrative act, a "performative" document, as an object using the right legal and institutional framework. Furthermore, it gives emphasis to the structure of the public administration in order to better represent the units that are pertinent to the production of documents as well as the workflow among them. Procedural aspects of the ontology are represented in a Semantic Web Service framework, namely OWL-S. The purpose for this is twofold: firstly, to allow easy sharing and re-use of the process models among different administration units and, secondly, to cater for future integration into e-government services.

PA's structure is specified by laws and it is not a result of the consensus of professionals. Laws are usually needed, in specific circumstances described by a settled context. Organization of legal norms into legal areas that reflect scientific or professional fields or notions raise complexity for PA since a legal field may refer to entirely different administration areas. PA and whoever interacts with it copes with procedures. These procedures may combine legal rules in a unique way. This might lead to a unique rationale, which is not the aggregation of a number of norms. Therefore, PA's procedures are the result of a combination between legal knowledge and administrative practice. This requires interpretation of the legal framework by the senior officers and the explication of the tacit knowledge of everyday practice.

In this work we mainly regard PA's entities as production units. We focus on the backoffice operation for the production of PA's outputs. Communication issues between citizens and businesses and PA for service retrieval are not yet fully addressed. In accordance to GCIM, every PA service is different and the only way to enable reuse of components is to use an agreed reference structure, which in a sense could be a meta ontology like in the case of ONTOGOV.

AN ONTOLOGICAL PUBLIC ADMINISTRATION PROCESS MODELING FRAMEWORK

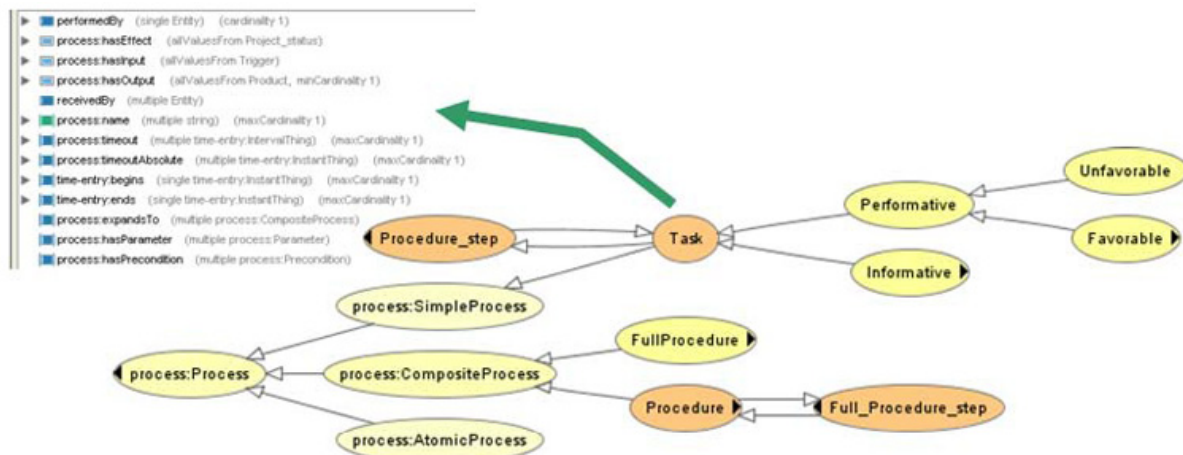
Each public organization produces a huge amount of public documents, both administrative acts ("performatives") and informative ones. An administrative act is produced by an authorized body and it is directed to the external environment of PA, i.e. it concerns citizens and businesses. As already mentioned, knowledge is usually captured in ontologies.

Ontology of Greek Public Administration Procedures

The ontology of Greek public administration procedures, based on (Savvas and Bassiliades, 2009), represents which types of *documents* are produced by which public administration *units* and how these documents *flow* among these units. The ontology consists of two parts. The first part represents, in OWL, the Greek public administration *structure* (i.e. administrative units and their hierarchical relationships) and *documents*, which are either used by these units as a legal framework or they are produced by them. Thus, documents are further divided in Judicial/legislative and Administrative/citizen. In the second part, the *procedures* are represented in OWL-S service models. The ontology is updated continuously as new laws, administrative regulations and procedures are issued.

Note that Public administration structure is hierarchical and it is regulated by laws and decisions. On the "structural aspect" of the ontology, all agents (actors) of the administrative universe of discourse are included (Figure 1), namely the three independent authorities (judicial, administrative and legislative), as well as citizens and businesses. In this work we consider in detail only the structure of the administrative authority. Moreover, the public administration document type hierarchy is distinguished in four major classes (or entity types):

- Administrative documents, i.e. documents produced by PA, which can be either *informative*, i.e. they do not have actual impact on the real world but they just inform a citizen or an administrative unit about something, or *acts*, i.e. the decisions have an impact for citizens or business (e.g. an approval for funding). Administrative documents also play the role of *products* of PA procedures.
- Citizen documents, i.e. simple documents that are produced by the citizen and are used as input to procedures, such as requests and declarations,
- Laws, i.e. documents that set the legal framework of the PA and have a general validity, i.e. they are applied in any case,
- Case Law, i.e. decisions made by the Supreme Court or an administrative court in the past and are regularly used for decision making. Case Laws are usually made on individual cases and they are used as a guideline for new cases, but sometimes

Figure 1. The public administration procedure ontology as an extension of OWL-S


they refer not to individual citizens but to a broader category of people (regulatory acts).

The public administration procedure ontology is represented as an extension to OWL-S (Figure 1). The key concepts of the ontology are procedures, full procedures, and tasks. Full procedures (or total procedures, as called later in the revised ontology) are composed by one or more procedures and procedures are composed by one or more tasks. Every procedure (and task) has a name which declares or indicates its objectives. The language used to depict this objective might not be strictly administrative. Thus, each procedure has a name, title and a short description providing the possibility to citizens and inexperienced civil servants to understand its aim. The title of an administrative act is used as a title for the procedure that produces this act.

Tasks are atomic activities that cannot be further cut down to smaller ones, performed by a single administration unit. Every task has just "title" as it is always used in the framework of a procedure. The title of the task is the same with the title of the administrative act or the informative document the task produces. Every task has as input any kind of text, namely administrative, legal, etc. The output of the task is the document that it produces.

We call *procedure* each integrated part (or step) of a *full procedure* (service), which includes at least one informative task (i.e. it tries to find or notify some information from/to another unit) and only one "performative" task (i.e. it produces a single act). "Performative" and informative tasks in the same procedure may not be performed by the same administrative entity. In certain circumstances, where only one act is produced by an administrative unit, the informative part may be included in the announcement/notification of the act. No further informative task is performed then.

Furthermore, in certain procedures and due to communicative barriers, set by the administration

hierarchy, the unit which produces an act and the unit that communicates it to the interested parties may be different. The latter is the one that receives the act in the first place, as it affects its world.

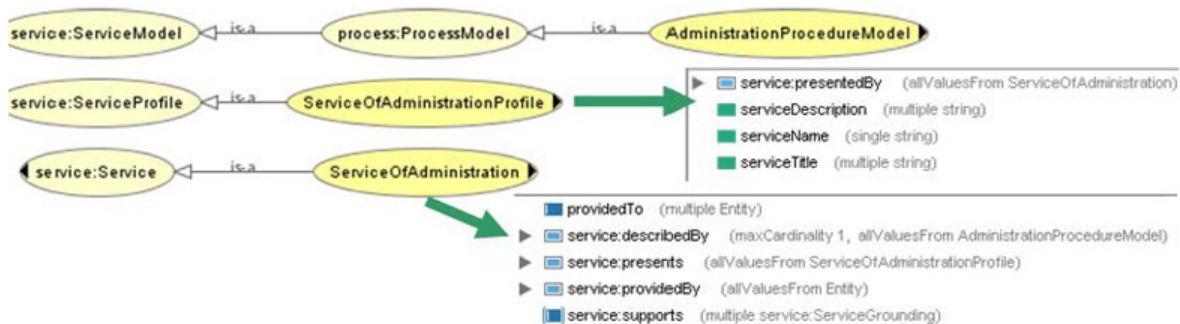
We study public administration procedures whose products address to the organization's external environment. This environment includes citizens/businesses, other public organizations and public servants acting as citizens. Thus we are not interested in internal trivial, routine processes that produce no document for one of the previous actors/entities.

We call *Full procedure* a number of procedures intertwined. A full procedure may reflect to the provision of a service to one or several entities (property *providedTo*). Figure 2 shows the specializations of the OWL-S service, service profile and service process model classes. Procedures may be sequential or in an acyclic graph. In our ontology, we adopt the control constructs of OWL-S. Some examples of procedures that can be represented using our ontology are:

1. Hierarchical control that is anticipated by a law.
2. Hierarchical control that is performed due to objections/appeals.
3. Communication between public organizations due to joint responsibilities for the expression of agreement in order for a project to accomplish.
4. Sequential procedures that lead to the provision of a service.

THE HUMAN RESOURCE MANAGEMENT TESTBED

Human Resource Department of the Region of Central Macedonia like any other HRM department of the Greek PA is responsible for executing cervices concerning public servants and their transitions. The purpose of this project was to set the base for knowledge management in the HRM

Figure 2. Specializations of OWL-S service, service profile and service model


department. In this department certain repetitive tasks are executed in a daily basis concerning the whole spectrum of public servants' transitions. Moreover these tasks concern the whole of Public Organizations as the code and the laws that rule Greek Public Administration and Servants are the same regardless of their territorial or thematic responsibility. Therefore the registration and formalization of this knowledge is a prerequisite in order to remain in the organization as public asset. This could help to the improvement, simplification and support of the service provided. Furthermore, it could be used as training material for the novice public servant of the department.

Knowledge Engineering Process

In the Human Resource Management use case, we have initially analyzed the organogram of the Human Resource Department of the Region of Central Macedonia and the operations of the Department. Then, we have studied the Greek legislation on human resource management for public servants. Finally, we have concluded that a hybrid knowledge engineering process should be followed in order to acquire the necessary knowledge for constructing the ontology for the human resource department and the PA processes this department performs.

PA is a special knowledge-based formation/structure as most of its procedures are based on

law; therefore, they are defined in a rigid and explicit manner (explicit knowledge). However, there are cases where legislation only defines a general lawful framework in which the PA must provide its services to the citizen, constraining its actions, without dictating a unique procedure that must be followed. This means that the same service could be provided by different PA units following (slightly) different procedures, without violating the law. Therefore, there is ground for a knowledge acquisition/elicitation process in a PA unit, in this case the Human Resource Management Department of the Region of Central Macedonia. Several concepts, entities, processes, roles, restrictions and preconditions of processes/services can be found in the legislation, whereas some of the above can only be accurately acquired by the personnel of this PA unit (aka "the domain experts").

In our case, knowledge acquisition was initiated with interviewing the director of the department, who is considered to be the primary domain expert (Medsker, et al., 1995). The primary expert set the knowledge framework, describing the organogram (structure) of the department, defining its main services/procedures, listing the relative acts that its produces and indicating the relevant legislation that these acts are based on, and finally, recommending secondary experts, namely appropriate personnel of the department, that would

fill-in the knowledge acquisition process with all the necessary details about the unit's procedures.

Then, the knowledge engineering team, which consisted of multiple knowledge engineers in order to cross-verify the understanding of the acquired knowledge (Gaines and Shaw, 1993), studied carefully the acts produced by the department, the documents exchanged and the underlying procedures in order to identify the entities involved and the legislation about the human resource management in the PA. Furthermore, the knowledge engineering team tried to identify those laws that instead of defining the exact procedures for the PA services, they just set the framework and let each PA unit work out for itself the best (legal) way to conclude them.

After the knowledge engineers have acquired the adequate domain knowledge background they interviewed the secondary experts suggested by the primary expert in order to confirm that the entities involved in each procedure have been correctly identified, to record the exact procedure, namely the individual steps involved and the workflow among them, to define exactly which documents are exchanged between the procedure steps, and to clarify all the preconditions, inputs, outputs and effects of each step and procedure. All the above are necessary according to the PA service modeling scheme of our approach, which has been presented in the previous section.

During interview sessions, knowledge engineers presented to the secondary experts some preliminary flowcharts of the procedures, which illustrated the entities, the sequence of steps of the procedure, as well as the exchanged documents between each step. These flowcharts were prepared by the knowledge engineers during the study period of the domain background knowledge, as a preliminary model of the domain. More on these flowcharts will be presented in the next subsection. In this way, the secondary experts could visually confirm the proper understanding of the procedure from the knowledge engineer and, in some cases, to suggest corrections or extensions to the flowchart model, when these preliminary flowcharts did not reflect reality in an accurate way.

Procedure Flowchart Template

As explained in the previous subsection, in order to elicit and record the domain experts' knowledge about the PA entities, procedures and documents, a series of procedure flowcharts were prepared by the knowledge engineers during their familiarization with the background domain knowledge by studying the relevant legislation. Then, these flowcharts were presented to the secondary domain experts of the PA unit in question, in order to approve them, correct them, or enhance them. In this subsection we will give details on the structure of the flowcharts, presenting an abstract template.

The procedure flowchart template we designed consists of six modules, presented in Figure 3.

- Entities: individuals, PA units, ministries, etc.
- Preconditions.
- Inputs: e.g. prerequisite documents such as applications.
- Procedure Steps.
- Outputs: output documents.
- Effects: i.e. changes made in the real world.
- Procedure diagram.

Each of the above pieces of information has been chosen to closely reflect the structure of our ontological modeling approach, as it will be clearly demonstrated in a full example in the next sections. For example, entities correspond to subclasses of the entity class of our ontology. The literals that appear in this field during knowledge acquisition will be later matched against existing classes of the ontology. When no such class is found a new class, subclass of the entity class, should be created. However, the placement of such a class in the ontology hierarchy requires knowledge about the hierarchy of PA units; therefore, the knowledge

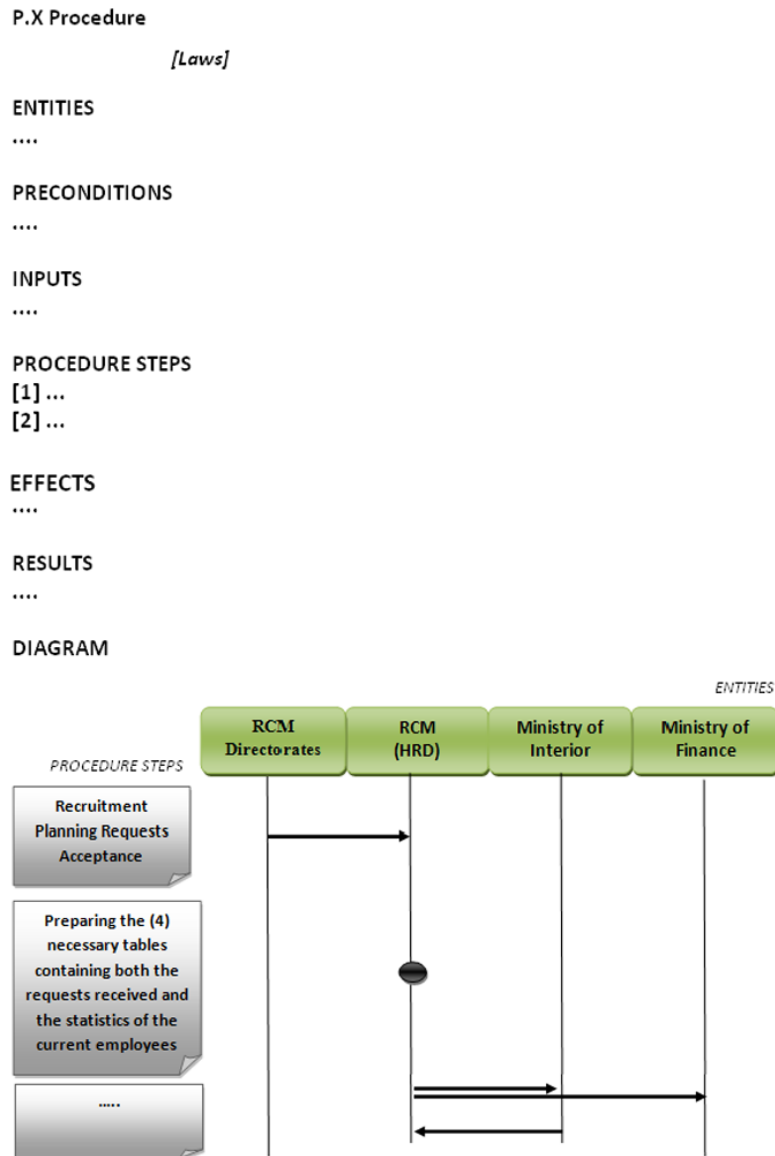
DIAGRAM


engineers have to go back to the (primary) expert to ask for advice on where to place the new entity in the hierarchy.

Preconditions, Inputs, Outputs, and Effects are all related to the corresponding properties of the final service modeled. Therefore, Inputs and Outputs correspond to a document (administrative text) class. In the same spirit above, either an existing class is used, or a new one is created

and placed in the hierarchy using the opinion of the primary expert. Preconditions and effects are handled as SWRL conditions.

The Procedure Steps and diagram define the workflow of the tasks and (simple) procedures. Typically the sequence construct is used. Each step is a simple task. Some steps are grouped together to form a simple (procedure). All the simple procedures together form a total procedure,

which is the procedure attached to the final service. The diagram also indicates document exchanges between the tasks. Actually, these are of the same nature as Inputs and Outputs that concern the inner (simple) services or tasks, rather than the total service. Therefore, their treatment is much the same as we mentioned above.

Extensions / Adaptations of the Generic Object / Process Models

What we have learned by the knowledge representation phase is that the initial generic PA procedures modeling ontology of (Savvas and Bassiliades, 2009) does not always cover our use case. Therefore, some (but not many) adaptations should be performed to this generic modeling framework. These adaptations should be general enough, in order to be applicable not only to the current use case, but to be re-applicable to the use cases already developed using the generic framework.

A significant development in the (revised) generic object / process model is the modeling of the performative task. More specifically, the new ontology contains two types of administrative documents that harmonize with the products' role produced by the performative procedure found in Public Administration:

1. *Act*: It includes all the acts that can be produced by the Public Administration's procedures.

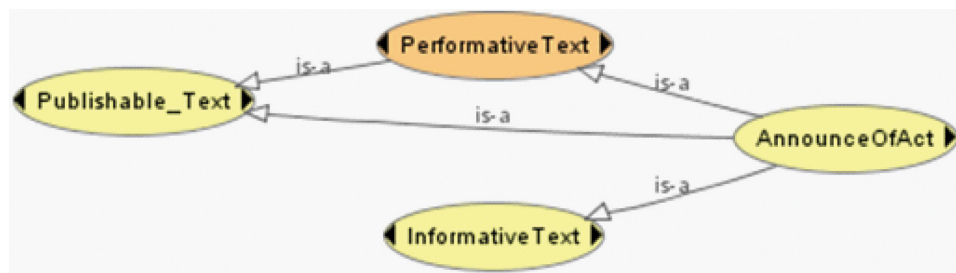
2. *Announcement of Act*: It includes only the acts that are announcements of decisions either to another PA unit or to individuals. Announcements, although sound like informative tasks only, because they just deliver information to the interested parties, we consider them as performatives, because according to the Greek Law, the enforcement of an act begins only after its announcement; therefore, the announcement of an act has effects on the real world.

In the revised PA procedure modeling framework, every task that produces an act or an announcement of act is considered to be a performative task. The rest of the tasks are considered as informative ones. Thus, a *procedure* consists of:

1. One or more informative tasks
2. Exactly one performative task (Act or Announce of Act)

A *total procedure* consists of at least one or more (simpler) procedures; therefore, a total procedure is usually composed of:

1. One or more informative tasks,
2. One or more performative tasks, one for each (simple) procedure,
3. One announcement of act, usually in the last (simple) procedure of the process.

Figure 4. The document (product) types involved in the Public Administration


Note that a task is considered performative for a PA unit (say RCM) only when the act is carried out by the RCM. That means that the same task could be performative for one PA unit and informative for another depending on the point of view. When modeling RCM, for instance, acts performed by other PA units, external to RCM are informative tasks. However, this happens only because we have chosen to model PA procedures only internal to the RCM. In a case of modeling the entirety of PA procedures, this duality would not exist.

Ontology Statistics

This revised ontology, as already mentioned, was based on the generic ontology presented in the previous section. The revised ontology extended the initial with a variety of new classes, properties and instances. More specifically, there was an increase of 88%, 125% and 375% in classes, properties and instances, respectively. Statistics can be found in Table 1.

Entities and Documents Hierarchy

The entities and documents hierarchy was maintained in the revised ontology. However, it was enriched with various new classes. For instance, three new classes were added in the entities hierarchy (presented in Figure 5). Mention that the new classes are in capitals.

Additionally, in the documents hierarchy there was an increase of 95% as shown in Figure 6. This large difference from the entities case is because the ontology has already been used for modeling other RCM's departments and processes. Therefore, the entities coming from the RCM's structure were almost already there, whereas the documents are mostly new, since each department issues different documents from each other.

Table 1. Ontologies' statistics

Statistics	Initial	Revised
Metrics		
Class Count	156	293
Object Property Count	45	109
Data Property Count	23	44
Individual Count	145	688
DL Expressivity	SHOIN(D)	SHOIN(D)
Class Axioms		
SuClassOf Axioms Count	250	374
EquivalentClasses Axioms Count	4	14
DisjointClasses Axioms Count	0	6
Hidden Gci Count	8	14
Object Property Axioms		
SubObjectPropertyOf Axioms Count	2	12
EquivalentObjectProperties Axioms Count	0	5
InverseObjectProperties Axioms Count	6	19
ObjectPropertyDomain Axioms Count	25	90
ObjectPropertyRange Axioms Count	26	91
Individual Axioms		
ClassAssertion Axioms Count	149	689
ObjectPropertyAssertion Axioms Count	341	1351
DataPropertyAssertion Axioms Count	63	29
Annotation Axioms		
AnnotationAssertion Axioms Count	2	71

Finally, the performative documents hierarchy was also enriched by 70% (presented in Figure 7).

Example of Modeling a Procedure: The Case of Recruitment Planning

In this subsection we present a full example of modeling one of the procedures of the human

Figure 5. Entities hierarchy

resource department of RCM using the methodology presented above.

First of all the total procedure was analyzed in sub–procedures, as shown in the flowchart presented in Figure 8.

The recruitment planning procedure in particular is composed by four sub–procedures described below:

1. *Recruitment planning Requests Acceptance***:** Upon receiving requests from all Directorates of the RCM, the RCM's Human Resources Department (HRD) prepares the necessary tables containing both the requests received and the statistics of the current employees. This procedure therefore requires the cooperation of all departments of the RCM.

2. *Covering Report Writing***:** Based on the data obtained by the requests, the Secretary General of RCM writes the accompanying report containing the reasons for recruitment needs.

3. *Special Substantiation Writing***:** Based on the above report and the accompanying, the RCM's HRD prepares a special substatiation for each branch and specialty.

4. *Recruitment Decision Announcement*: The RCM sends all these data, ie tables, the accompanying report and the special substantiation to the Ministry of Interior and the Ministry of Finance and as soon as it receives the respective approvals announces the decision.

Figure 6. Informative documents hierarchy

Task Categorization

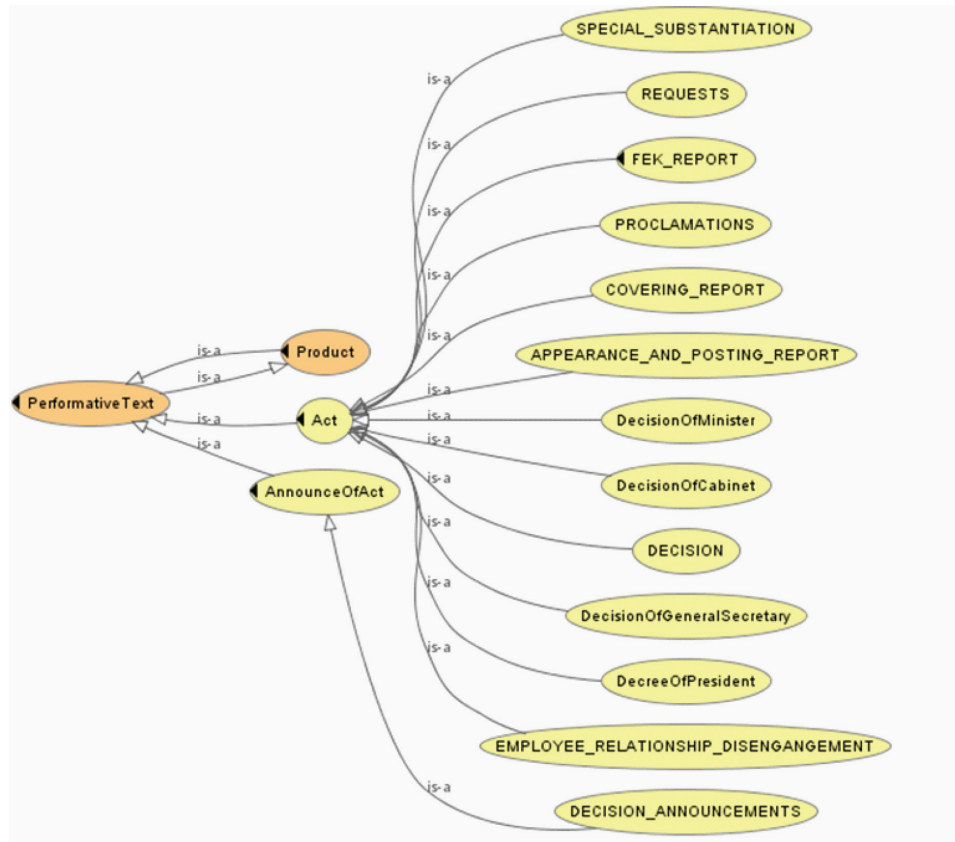
1. Informative
   a. Recruitment Planning Requests Acceptance Task
2. Performative
   a. Recruitment Decision Publication Task
   b. Special Substantiation Compilation Task
   c. Covering Report Compilation Task

Note that informative tasks produce informative documents and performative tasks produce performative documents.

Procedures Definition

The procedures are actually task clusters that describe a critical semantic act. In the above case there are three procedures:

1. **Covering Report Writing**, that is composed by the two tasks below:

Figure 7. Performative documents hierarchy


a. Recruitment Planning Requests Acceptance Task
b. Covering Report Compilation Task
2. **Special Substantiation Writing**, composed by:
a. Special Substantiation Compilation Task
3. **Recruitment Decision Announcement**, composed by:
a. Recruitment Decision Publication Task

Total Procedures Definitions

A total procedure is referred to the sequence in which its sub–procedures are performed. As mentioned above, the recruitment planning's total procedure is composed of three simpler procedures. First has to be performed the cover-ing report writing procedure, then the special substantiation writing procedure and finally the recruitment decision announcement procedure.

Ontology Modeling

Task Modeling

The tasks are modeled according to their type, informative or performative in particular.

Similarly for performative tasks are created subclasses of class Performative (Figure 10).

As already reported, for each class is gener-ated an object that defines the properties and the setting values of the ontology. An action described by the following attributes:

- *hasInput*: refers to the required inputs.

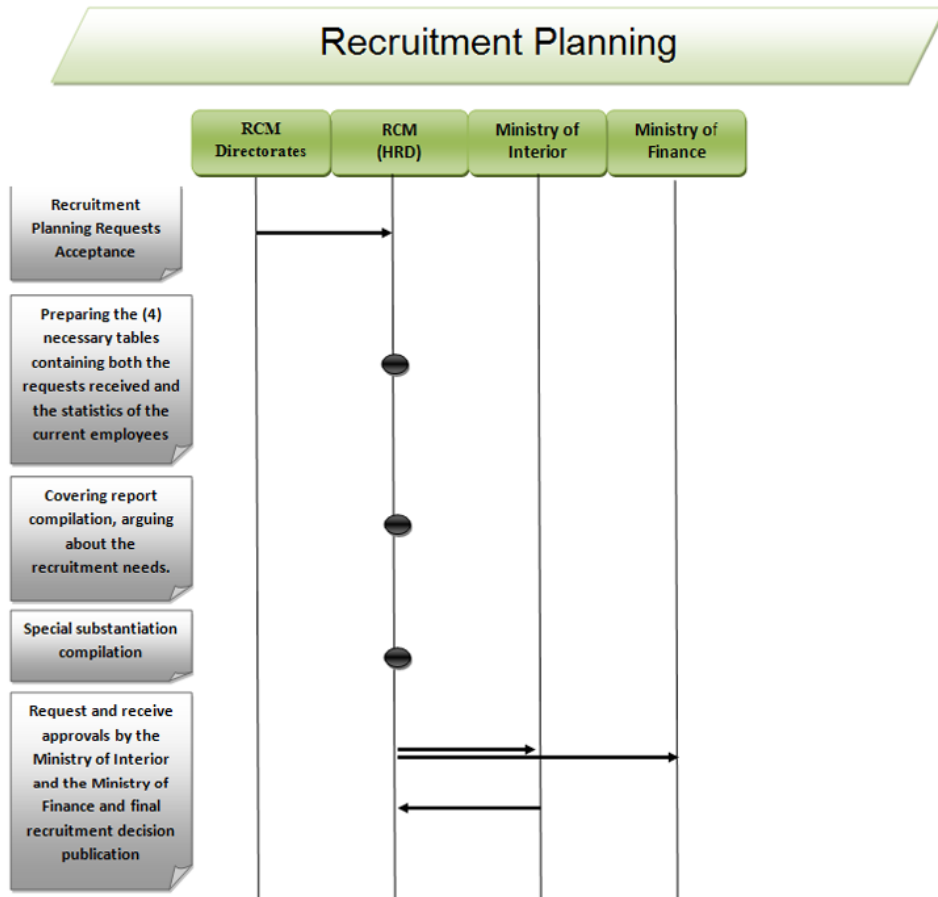
Figure 8. Recruitment planning flowchart


Figure 9. The informative's subclass that is used for the case's informative task

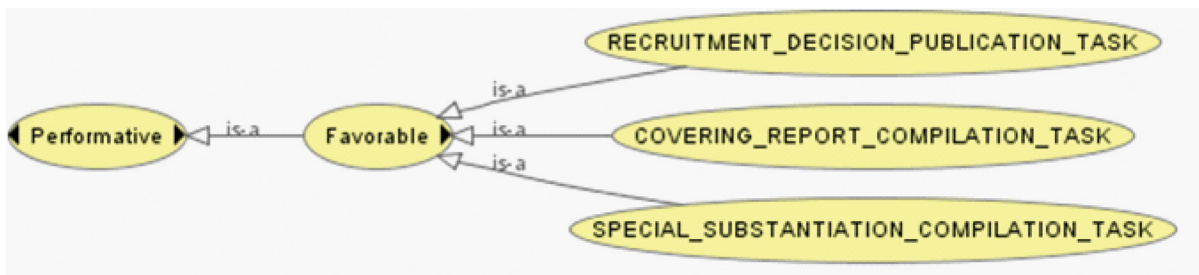
Figure 10. The performative's subclasses that are used for the case's performative tasks


- *hasOutput*: refers to the task's results, ie produced documents.
- *performedBy*: refers to the entity that performs the task.
- *receivedBy*: refers to the entity that receives the task's results.

For example, the recruitment planning requests acceptance object (Class EMPOYMENT_PRO-GRAMMING_REQUESTS_ACCEPTANCE_TASK) contains the values (Figure 11).

More specifically, the task has as input the directorates requests (i.e. instances of class DI-RECTORATES_REQUESTS) and produces the necessary tables (instances of class RECRUIT-MENT_PLANNING_TABLES). This task was performed by the RCM's HDR. All values are actually objects of different classes available in the ontology. For example, the HDR is part of the entities hierarchy (class ENTITY) which defines the various entities encountered in the procedures of the Public Administration. Respectively, the documents are objects belonging to the documents hierarchy (class TEXT).

Similarly are modeled the rest ontology's objects. Thus, new objects are created for each of the classes, namely Classes COVERING_RE-

PORT_COMPILATION_TASK, RECRUIT-MENT_DECISION_PUBLICATION_TASK andSPECIAL_SUBSTANTIATION_COMPILA-TION_TASK. It should be noted that these acts are performative, thus the produced documents are performative too, according to the document hierarchy (Figure 12).

Procedure and Total Procedure Modeling

Following the same principle, both the procedures and the total procedures are modeled as class objects. These classes are actually subclasses of the (OWL-S) CompositeProcess class (Figure 13).

Thus each procedure and total procedure has an associated object in the ontology which refers to its acts or procedures, respectively. For this purpose are used objects of the class ControlConstruct that allow the determination of the tasks' sequence (workflow – procedures) or the procedures' sequence (in the case of total procedures).

Web Services Modeling

For each procedure are defined all the necessary OWL-S objects, in order to model eventually each

Figure 11. Recruitment planning requests acceptance object's values

Figure 12. Part of the documents hierarchy
Figure 13. Part of the procedures hierarchy
of the procedures as web service. For this purpose are defined three important classes, namely Service, ServiceProfile and ProcessModel. In the case studied here, the object of the ServiceProfile class is referred to the Service class through the presentedBy attribute. Similarly, the object of the Service class is referred to the ServiceModel class through the describedBy attribute. Finally, the object of the ServiceModel class is referred to the whole modeled procedure. Thus, the web service is consisted of a total procedure that includes two procedures; each of them consists of a number of tasks.

CONCLUSION AND FUTURE RESEARCH

Achieving e-government requires radical organizational redesign of public administration. In this context, ontologies are the mean to reduce or even eliminate the public administration's disparity. This chapter presented the modelling process of the Human Resource Management procedures in OWL language. The developed ontology contains concepts and entities found in the Region of Central Macedonia use case and it is used to represent semantic processes in the form of Web services in order to produce a well-

defined and formal knowledge base that can be reused and extended.

In the future, our research will focus on enriching the semantic web services ontology with non-functional properties, namely attributes concerning the monitoring of efficiency and effectiveness of Public Administration services and units. To this end, efforts for the development of an algorithm which could be detect inefficiencies and malfunctions of Public Administration units, using these non-functional properties, have already been made.

Another line of research is to study in more details ways to bring closer our modeling effort with similar modeling and standardization efforts presented in the related work section. This would allow a more pan-European aspect of our PA modeling effort, at least in "normative" countries. However, in order to do this, all the interoperability dimensions defined in the EIF guidelines need to be addressed, whereas the focus of our work so far has been only the semantic interoperability level.

KEY TERMS AND DEFINITIONS

Interoperability: The ability of information and communication technology (ICT) systems and of the business processes they support to exchange data and to enable sharing of information and knowledge.

Ontology: A specification of a shared conceptualization using a formal language.

OWL-S: An OWL ontology that offers the conceptual model for semantically annotating Web services.

Semantic Web Services: Ontology-based descriptions of Web services that could be processed by ontology reasoning tools.

Semantic Web: The extension of the current Web where information is given well-defined meaning, enabling computers and people to work in better cooperation.

Web Ontology Language (OWL): The W3C recommendation for creating and sharing ontologies on the Web.

Web Service: The server end of a client–server system for machine-to-machine interaction via the World Wide Web.

Chapter 35
Developments of e–Government in Sri Lanka:
Opportunities and Challenges

Kanishka Karunasena
RMIT University, Australia

Hepu Deng
RMIT University, Australia

Anuradha Karunasena
RMIT University, Australia

ABSTRACT

This chapter investigates the status of e-Government development, explores the opportunities created for citizens and government, and identifies the challenges for an effective implementation of e-Government in Sri Lanka. The study reveals that the dissemination of public information online, the provision of call centre services, and the establishment of tele-centres in rural areas have generally improved the well-being of citizens. It further shows that the development of information and communication technology infrastructure and the taking of the human resource capacity building initiative in public organizations have had a positive impact on the performance of public organizations. The study, however, reveals that the continuous development of e-Government in Sri Lanka is troubled by the uneven access of rural citizens to e-Government services, the low e-Readiness of citizens, the delay in implementing major e-Government projects, and the insufficient funding for successfully implementing all the e-Government initiatives.

INTRODUCTION

Electronic government (e-Government) is commonly referred to as the delivery of government information and services through the use of

Information and Communication Technologies (ICTs) (Akman, et al., 2005; Horan & Abhichandani, 2006). It can be approached from different perspectives including e-Citizens and e-Services, e-Administration, and e-Society. E-Citizens and e-Services focus on developing the relationship

between government and citizens by improving public service delivery, encouraging the participation of citizens in government, and informing citizens about governmental activities (Heeks, 2002; Ndou, 2004). E-Administration aims to improve public processes by cutting costs, linking processes and public organizations, empowering public employees, and improving transparency and accountability in government (Heeks, 2002). E-Society tries to develop the relationship between government, businesses, and societies (Heeks, 2002) through improving the interaction between government and business and building the social and economic capacity of a civil society (Heeks, 2002).

Significant benefits are promised from the rapid development of e-Government worldwide. Such benefits include providing quality public services to citizens, improving organizational effectiveness, increasing transparency and accountability in government (UNDESA, 2008), improving the quality of life, reducing the communication and information cost, bridging the digital divide, and encouraging the participation of citizens in government (Jaeger & Thompson, 2003; Akman, et al., 2005). As a result, e-Government is widely considered as the new way for governments to improve their performance in developing countries (Dada, 2006).

There is no exception in the development of e-Government in Sri Lanka (Hanna, 2007; Karunasena & Deng, 2010a). In 2002, the government of Sri Lanka officially launched the e-Sri Lanka initiative with the assistance of World Bank (ICTA, 2005; Hanna, 2007; Hanna, 2008). Under the umbrella of the e-Sri Lanka initiative, the re-engineering government program is proposed for reforming the public sector to provide citizens with transparent, effective, efficient public services and to improve the quality of the life of citizens (ICTA, 2010a). Numerous e-Government projects were initiated—leading to the rapid development of e-Government in Sri Lanka. A recent study reveals that Sri Lanka is the first runner-up in the South Asian region in e-Government development (UNDESA, 2008). The Network Readiness Index (NRI) shows that Sri Lanka is at the 72nd position worldwide concerning e-Government development in 2009/2010, which is 14 positions up from 2006 (Mia & Dutta, 2007, 2008, 2009, 2010). There is, however, a lack of studies assessing the status and the future of the e-Government development in Sri Lanka.

To fill this gap, this chapter aims to assess the progress made concerning development of e-Government in Sri Lanka. It investigates the opportunities generated for both citizens and government and identifies the challenges that Sri Lanka comes across as a developing country in its pursuit of implementing various e-Government projects. It is assumed that this study will eventually serve as a lesson on the various aspects of e-Government being investigated to other countries, especially those in the developing world context.

RESEARCH METHOD

The objective of this study is to evaluate the progress of e-Government development in Sri Lanka, to explore the opportunities generated through e-Government, and to identify the challenges that Sri Lanka faces in the implementation of e-Government projects. To fulfill these objectives, several research questions have been formulated as follows:

1. What is the status of e-Government developments in Sri Lanka?
2. How is this status achieved?
3. What are the opportunities generated in Sri Lanka through the implementation of e-Government projects?
4. What are the challenges that Sri Lanka faces in the implementation of e-Government projects?

To adequately answer these research questions, a mixed-method approach is used in this study. The use of such an approach helps answer both quantitative and qualitative questions in the study (Creswell & Clark, 2011). The power of numbers (quantitative data) can be expanded and elaborated with the rich context of the lived experience of people (qualitative data) (Sosulski & Lawrence, 2008). As this research aims to answer quantitative and qualitative research questions (what and how questions), the use of the mixed-methods approach in this study is appropriate.

Quantitative data is collected from various sources such as survey reports, Internet, books, and government reports for answering the quantitative type questions. As summarised in Table 1, such data includes the statistics relating to e-Government and network readiness and statistics on government ICT usage, public staff training, public staff and citizens' attitudes towards e-Government, telecommunication users, household computer literacy, and availability of e-Mail and Internet. Survey data is obtained from various government organizations including the Statistical Survey Department (Satharasinghe, 2007; DCS-SL, 2007; DCS-SL, 2009), Telecommunication Regulatory Commission of Sri Lanka (TRCSL, 2009), and the Information and Communication Technology Agency (ICTA & MGC, 2008a, 2008b, 2008c, 2008d). Furthermore, there are several global e-Government surveys (UNDESA, 2003, 2005, 2008, 2010; Dutta & Mia, 2007, 2008, 2009, 2010) used for extracting useful data in evaluating the performance of e-Government development in Sri Lanka.

The qualitative data for this study is obtained from interviews with fifteen participants. Open-ended interviews were conducted with the Information and Communication Technology Agency (ICTA) officials and Chief Innovative Officers (CIOs) of respective government organizations. Initial contact with ICTA officials and CIOs was made through telephone conversations with a brief description of the purpose of the research. Interview questions were pre-tested with the help of academic experts, e-Government specialists and e-Government users. An approximately two-hour interview was conducted with each of the eight staff members. Such interviews with the ICTA officials and CIOs are useful for (a) identifying the e-Government development programs implemented in Sri Lanka, (b) understanding how these programs have been implemented, (c) identifying the opportunities created for government, and (d) identifying the challenges for an effective implementation of e-Government in Sri Lanka. To obtain citizens' perceptions on e-Government, volunteers were recruited from those who visited tele-centres to access the Internet. Approximately thirty to forty-five minute interviews were conducted with seven volunteers. All the interviews were recorded with the permission of the participants. The collected qualitative data was transcribed for performing thematic analysis. Table 1 summarises the data collected in this research.

Table 2 summarises the demographic characteristics of the interview participants. As presented in Table 2, interview participants had varied

Table 1. An overview of the quantitative and qualitative data in this study

Quantitative Data	Qualitative Data
• government ICT usage and staff training, • staff's attitudes towards e-government, • the usefulness of the tele-centres centres, • fixed and mobile telecommunications users, • households computer literacy, • household computers and Internet penetration, • socio-economic data.	• e-Government programs implemented, • how these programs have been implemented and what results have been achieved, • opportunities generated for the government, citizens and businesses, • challenges in implementing e-government, • direct benefits of e-Government.

Table 2. Demographic characteristics of interview participants

Age Profile		Educational Profile		Employment Profile	
Age Group	No. of Participants	Highest Education Level	No. of participants	Category	No. of Participants
16-20	1	School Level	2	CIO	4
21-30	3	Undergraduate	6	ICT sector	4
31-45	4	Postgraduate	4	Finance	3
46-60	6	Professional	3	Agriculture	1
Over 60	1			Education	2
				Unemployed	1

demographic characteristics. For example, out of fifteen participants, a majority is in the age group of 46-60 and most of them have university education.

IMPLEMENTATION OF E-GOVERNMENT IN SRI LANKA

Sri Lanka has used computing in government for nearly 48 years, even before the notion 'e-Government' came into play. Using computers in the Sri Lankan public sector was initiated in 1962, with the introduction of IBM accounting machines to the Insurance Corporation, followed by the introduction of computers to some other public organizations such as State Engineering Corporation, and Department of Census and Statistics (Hanna, 2008). Subsequently, many computerization programs in the public sector were initiated. Most of these initiatives, however, failed to make any significant contribution to the overall development of e-Government in Sri Lanka until the e-Sri Lanka initiative was launched in 2002.

The concept of e-Sri Lanka originated from the private sector with the involvement of the National Chamber of Commerce, local software industry leaders, and the United States Agency for International Development (USAID) (Hanna, 2007). Motivated by the achievements of the Indian software industry, the initial e-Sri Lanka concept

mainly focused on developing the software industry in Sri Lanka (Hanna, 2007). With the active involvement of the World Bank, public service, civil society, consultative groups and many donor agencies, the e-Sri Lanka concept was revised and expanded (Hanna, 2007) by recognizing ICT as key for achieving growth, equity, and peace through technological transformation of all sectors in Sri Lanka (MOST, 2002). As a result, improving the delivery of public services, bridging the digital divide, uplifting the quality of life of citizens, improving social development, and supporting the country's growth and poverty reduction through the development of e-Government became the objectives of the e-Sri Lanka initiative (ICTA, 2005; Hanna, 2007, 2008). ICTA was established under the Information Communication Technology Act 27 for coordinating and funding these e-Government initiatives.

To achieve the objectives of the e-Sri Lanka initiative, six e-Development programs have been adopted including the following:

1. a re-engineering government program for providing transparent, effective, and efficient public services;
2. an information infrastructure development program for ensuring affordable access to information, communication, electronic services, and other content;

3. an e-Society development program for empowering the most vulnerable communities in Sri Lanka;
4. a human resources capacity building program for building up a skilled workforce;
5. private sector capacity development program for developing the domestic ICT sector to ensure a sustainable economic growth in the country; and
6. a regulatory environment development program for creating policy and regulatory environment, and developing leadership and institutional capacity building to support ICT based developments and reforms (Karunasena & Deng, 2009; ICTA, 2010).

Sri Lanka has implemented a unique e-Government program with the implementation of various re-engineering government projects (Karunasena & Deng, 2009, 2010a, 2010b). The uniqueness of the e-Government program is due to the specific context that Sri Lanka is in as a developing country with a majority of citizens living in rural areas, low ICT literacy among citizens, low householder Internet users, poor information infrastructure, and low e-Readiness in government (Hanna, 2007, 2008). Implementing e-Government projects is bound to have a significant impact on Sri Lankan citizens and the society (Karunasena & Deng, 2009; Karunasena, et al., 2011). The re-engineering government program is facilitated by four e-Development programs including (a) an information infrastructure development program, (b) a human resources capacity building program, (c) a policy, regulatory environment, and institutional development program, and (d) an e-Society development program. These four programs create an enabling environment for the effective development of e-Government in Sri Lanka. Figure 1 shows an overview of the e-Government development programs adopted in Sri Lanka.

The re-engineering government program aims to improve the efficiency and effectiveness of the delivery of the public services by re-engineering processes with the implementation of various e-Government applications (ICTA, 2010a). A number of e-Government projects are initiated including website development, call centre services, data hubs, e-Services developments, and government process re-engineering. To equip the public staff with appropriate skills, upgrading ICT infrastructure in public organizations, interconnecting public organizations, and creating an enabling environment for facilitating the successful implementation of e-Government are identified as the key objectives of this program (ICTA, 2010a).

The information infrastructure development program promises (a) efficient and effective ICT infrastructure for public organizations and (b) an affordable access to information, modern communication and electronic services at any time regardless of their geographical location (ICTA, 2010b). In this context, the Lanka Government Network (LGN) development project is implemented for setting up an underlying information infrastructure for connecting all the public organizations in a cost-effective manner to provide Internet, e-Mail, IP based voice services (VIOP), and exchange e-Government data in a secure and reliable manner (ICTA, 2010b).

The Regional Telecommunication Network project (RTN) has been identified as a priority under the information infrastructure development program which seeks to ensure affordable access to telecommunication, Internet services, e-Services, and e-Content to all rural communities. This project invests on laying two fiber backbones along with the necessary infrastructure covering rural Sri Lanka. Development of this project is extremely important since access to the telecommunication and other ICT infrastructure is unaffordable to citizens in rural areas. Sri Lanka is a country where 85% of the total population lives in the rural areas (UN, 2008), and the total contribution by the rural sector to total poverty of the country is 82.1% (DSC-SL, 2007). Develop-

Figure 1. An overview of e-government development in Sri Lanka

Information Infrastructure Development

- Lanka government network (LGN)
- Rural telecommunication network (RTN)
- Tele centres in rural and semi urban areas
- Lanka gate initiatives

Human Resources Capacity Building

- Empowering CIOs through leadership and e-government training (MBA in e-governance, e-champions, e-government awareness)
- Empowering CIOs through management & technical training (management training, advanced technical training, network & systems administration)
- General training for other staff (ICT training, ICT awareness)
- ICT training for citizens

e-Government Development

- Government websites
- A country portal
- Government information centre
- Prioritized G2C services and data hubs (e-divisional secretariat, e-population registry, e-pension, e-motoring, e-land database, e-National identity card, birth death marriage certificate, e-foreign employment)
- Prioritized G2G services (Human resources management system
- for government)
- Re-engineering the government processes
- Prioritized G2B services (Laksala)

e-Society Development

- Content for rural communities (agricultural, health information etc)
- Content/applications for children's education (e-learning tools, Wikipedia, English/Science/ Maths teaching software)
- Content for people with special needs
- Content for most vulnerable communities

Policies and Institutional Development

e-Laws and Acts

- The electronic transactions
- Computer crimes
- Payment and settlement system
- Payment devices fraud
- Data protection
- Intellectual property rights

Policies

- e-Government policy
- Government ICT policy
- National ICT policy

Local Language Initiatives

- ICT standards for Tamil & Sinhala languages
- Unicode fonts
- Training font developers

ment of affordable information infrastructure is, therefore, highly important.

The Nenasala' (Knowledge centre/tele centre) development project is introduced for ensuring equal and affordable access to e-Government resources for rural and semi-urban communities. A Nenasala centre is supplied with telephone connections, a minimum of five computers, broadband Internet connectivity, a scanner, a photocopier, webcams, and other computer devices to facilitate rural and semi-urban citizens' access to the computers, Internet, and e-Services (Nenasala, 2007). Development of this project is necessary because of the low ICT readiness among citizens. As at 2003 there were only 13.2 personal computers and 10.56 Internet users per 1000 persons in Sri Lanka (UNDESA, 2003). Moreover, only 3.1% of rural households had computers in 2004 (Satharasinghe, 2007).

The policy and institutional development program focuses on developing policy and institutional environment necessary for achieving the overall objective of e-Government in Sri Lanka. One of these goals is '*to create a pro-active policy and a regulatory environment that is supportive of ICT reform and ICT-based development, to develop ICT leadership and capacity, and to communicate these initiatives and policies to the wider stakeholder audience*' (ICTA, 2010c). In the context of a regulatory environment, the government has developed laws and regulations relating to electronic transactions, data protection, computer crimes, payment devices frauds, payment and settlement, privacy, and intellectual property rights protection (ICTA, 2010c). Such laws are essential to protect e-Government users. Intellectual property rights protection laws are extremely important for generating innovation in terms of overall ICT development in the country (Dutta & Mia, 2010). Adequate training is provided to judges, lawyers, and other law enforcement personnel to execute these e-Laws.

As shown in Figure 1, supporting local language initiatives is another sub-program of the policies and institutional development program. Under the local language initiatives, the government has facilitated the development of ICT standards for Sinhala (SLS 1134, 2004) and Tamil (SLS 1326, 2008) languages, and Unicode compliance fonts. Moreover, training is provided to local font developers (ICTA, 2010c). All these activities are useful for the government as they facilitate the delivery of e-Government information and services in local languages.

The ICT related policy development is another sub-program of the policy and institutional development program. The e-Government policy document is extremely important for the effective development of e-Government at the organizational level. This document acts as a blueprint for government institutions for planning, developing, procuring, using e-Government, and creating an enabling environment for e-Government development at the organizational level. The e-Government policy approved by the Cabinet in 2009 emphasises that all government organizations should aim to achieve the following:

1. establish an ICT unit and appoint a Chief Information Officer (CIO) to lead e-Government related activities in their organizations;
2. draft and implement an annual ICT plan which indicates how ICT is used for realizing the organization's mission and vision;
3. allocate an adequate budget for e-Government related activities;
4. use e-mail for all types of official communications;
5. develop trilingual websites which comply with the government's website standards and register them under the 'gov.lk' domain;
6. use Sinhala and Tamil Unicode fonts;
7. connect to the LGN for using government's common network service;
8. use Lanka Gate as the middleware infrastructure and the country portal for delivering government services through electronic means;

9. use licensed software or use open source software; and
10. assess the training and skills needs of public staff at all levels and incorporate them in the annual ICT plan (ICTA, 2010b).

The human resources development program is aligned with the e-Government development program. The prime objective of this program is to develop an e-Leadership capability in government staff for leading and driving the process of e-Government development. Under this initiative, the government has appointed CIOs across all government ministries, departments, statutory bodies, and other grass root level public organizations for driving e-Government and ICT-based transformation processes within those organizations. Therefore, empowering CIOs with strategic ICT planning, e-Government practices, IT project management, outsourcing and managing projects, government process re-engineering, change management, and knowledge management is a key objective of this program (ICTA, 2010d).

The e-Society development program is another program implemented under the e-Sri Lanka initiative. Although it does not directly contribute to the adoption of e-Government, it facilitates the social development of most vulnerable groups in Sri Lanka using ICT (ICTA, 2010e). Among many other objectives of this program, increasing awareness among disadvantaged groups of how ICT can improve the quality of their lives, empowering women and youth with ICT, increasing economic opportunities and equity by facilitating wide use of ICT in agriculture, health, and education, and developing local content are important (ICTA, 2010e).

STATUS OF E-GOVERNMENT DEVELOPMENT IN SRI LANKA

The e-Sri Lanka initiative has been operational for the last 7 years. The implementation of the e-Sri Lanka initiative has a positive impact on increasing the e-Readiness of the country. This is demonstrated through the continuous improvement in (a) the United Nations e-Government development index, (b) the individual readiness index, (c) the government readiness index, (d) the individual usage index, (e) the government usage index, (f) the political and regulatory index, and (g) the infrastructure environment index.

The United Nations e-Government readiness survey (UNDESA, 2003, 2005, 2008) is a popular survey for measuring the "*capacity and willingness of countries to use e-Government for ICT-led development*" (UNDESA, 2005, p. 14). Figure 2 below shows a significant growth in Sri Lanka's e-Government readiness score from 0.385 in 2003 to 0.4244 in 2008 (UNDESA, 2003, 2005, 2008). In 2008, Sri Lanka was the runner-up in the e-Readiness score in the South Asian region with the Maldives occupying the top spot. Sri Lanka's e-Government readiness score (0.4244) was below the world average (0.4514) but well above the regional average (0.3395) in 2008. The recently developed United Nations e-Government development index (UNDESA, 2010), which examines how far governments have actually advanced in e-Government development, indicates that Sri Lanka is at the 111th position out of 183 member countries. Although Sri Lanka is ranked at the 111th position, e-Readiness scores indicate that the country has been gradually progressing as far as e-Government development is concerned over the past several years.

The NRI is another popular index for examining the overall ICT performance of individual countries (Dutta & Mia, 2010). It examines the enabling factors for ICT readiness in a country from the perspective of government, individuals, and businesses (Dutta & Mia, 2010). Existing statistics reveal that Sri Lanka has gone up in the NRI rank and NRI score although the overall ICT development is not mature like that in developed countries. Sri Lanka's ranking has improved from the 86th position in 2006/2007 to the 79th in

Figure 2. Sri Lanka's e-government readiness
2007/2008, and to the 72nd in 2008/2009 and 2010 among 133 countries (Dutta & Mia, 2007, 2008, 2009, 2010). In other words, the country's rank has gone up by 14 positions since 2006. This is strong indication that the e-Development programs have positively influenced the overall ICT development in the country.

NRI consists of several sub-dimensions such as readiness, usage, and the environment for examining the ICT readiness in a country (Dutta & Mia, 2010). Several indicators are usually utilised in this dimension including individual's readiness, government's readiness, individual's usage, government's usage, political and regulatory element, and infrastructure element (Dutta & Mia, 2010). Individual readiness measures citizens' preparedness to use ICT by considering those aspects of telecommunication, Internet and their costs. Government readiness is reflected by government efforts to incorporate ICT in the national agenda and procure high-tech products to improve the organizational efficiency and innovation (Dutta & Mia, 2010). The individual usage element measures ICT penetration and diffusion at the individual level. Individual usage is exemplified by mobile users, broadband users, Internet subscribers, availability of personal computers, and so forth. The government usage assesses the actual usage of ICT by the government (Dutta & Mia, 2010). Political and regulatory element measures the degree to which the national legal framework facilitates innovation and ICT development

(Dutta & Mia, 2010). The infrastructure element assesses the quality of the ICT infrastructure in respect to the telephone lines, Internet bandwidth, secure Internet servers, digital content, electricity production, and human resources (Dutta & Mia, 2010). As shown in Figure 3, Sri Lanka's overall ICT development has been leaping up in all the dimensions since 2006. All these statistics reveal that the e-Development programs are immensely contributing to the creation of an enabling environment necessary for effectively pursuing the e-Government development in Sri Lanka.

OPPORTUNITIES FROM E-GOVERNMENT DEVELOPMENTS IN SRI LANKA

In Sri Lanka, government agencies are under represented in rural and semi-urban areas. Hence, people living in these areas have to visit Colombo, the financial capital of Sri Lanka, for transactions with government agencies, and even to obtain information or obtain relevant documents. This caused a lot of significant inconveniences to citizens before e-Government was introduced. As a result of the e-Government initiatives, however, this situation has been dramatically changed, and tremendous opportunities have been created for citizens and the government itself. To date, there are more than 100 central government departments and ministries which disseminate public

Figure 3. An overview of the progress of the overall ICT development in Sri Lanka
information through websites giving anytime and anywhere access to the public. As at 2008, nearly 35% of government agencies had their own websites (ICTA & MGC, 2008a). Most of these government agency websites nowadays disseminate information in local languages and in English. Information dissemination in local languages is extremely important because Sri Lanka is home to multiple ethnic groups and a majority of citizens communicate in local languages (Karunasena, et al., 2011). Almost all the grass root level public services delivery entities (divisional secretariat offices) have been linked to the divisional secretariat Web portal counting up to a total of 356 mini-sites. Moreover, Gov. lk is a trilingual static portal which provides links to individual government agency websites. Lanka Gate was developed to fulfil the need of a country portal (www.srilanka.lk) by providing a single window access to government services and information. A recent survey shows that government websites are the most used e-Government channel in Sri Lanka (ICTA & MGC, 2008a).

A trilingual call centre operates from Monday to Saturday to provide information to citizens about 1300 different government services of more than 90 government organizations. The purpose of the call centre is to respond to the general inquires of citizens such as how to get services from the public sector, which government agency should be contacted, which documents should be filled and so forth (Karunasena, et al., 2011). This information could not be accessed by the citizens previously unless they went to the respective public organizations holding the information. The call centre receives nearly 2500 calls per day and about 85% of which are responded to successfully. The call centre service is the second most used e-Government channel in Sri Lanka (ICTA & MGC, 2008a).

Many e-Service projects are being implemented for providing maximum benefits to citizens. These e-Services initiatives include (a) the e-Divisional secretariat project for facilitating an efficient and effective delivery of public services at grass root level public organizations, (b) the e-Samurdhi project for maintaining up-to-date data relating to income and livelihood of low income communities, (c) the e-Population registry for maintaining unique ID numbers and basic information of citizens enabling the registration of life events such as births, marriages, and deaths, and enabling access and exchange of citizen information by other relevant agencies regardless of geographic location, (d) the e-Foreign employment project for helping people seek jobs overseas, (e) the e-Pension project for developing a high responsive pension application

process system, and (f) the e-Motoring project for maintaining motor vehicle registration and issuing drivers' licenses. The birth marriage and death certificate issuing system is currently in operation at selected divisional secretariat offices for increasing the efficiency and effectiveness of issuing certificates. Citizens are now able to obtain these certificates within 5 minutes from ICT enabled front office counters which took several days to be issued using a manual system which was previously used.

There are several Government to Government (G2G) and Government to Business (G2B) services which were promised under e-Sri Lanka initiatives. For example, Human Resources Management System (HRMS) was introduced as a G2G application for effectively managing the records of 40,000 public sector employees who belong to 14 all island services and working in public agencies scattered all over the island (ICTA, 2010a). As a G2B service, 'Laksala' project was initiated for promoting and protecting Sri Lankan handicrafts. It provides opportunities and livelihoods for handicraftsmen by allowing them to purchase and sell their items through a Web portal (www.laksala.lk).

More than 350 government organizations around the country are now connected to a high speed secured network through the implementation of LGN. These organizations are supplied with broadband Internet connectivity, computers, and other relevant computer peripherals. Moreover, official email accounts are supplied for public staff. To date, these organizations have had a tremendous opportunity of saving a significant amount of public money through the use of VOIP phones to communicate with other organizations.

To provide the rural and semi-urban citizens with equal access to e-Government information and services, 600 tele-centres (Nenasala) have been established in those areas. Using these resources, rural and semi urban citizens can access government information and services. Low income people are given vouchers to access the resources

available in these centres. Some of these centres are also being operated as e-Libraries. Some other centres are being operated as distance learning centres. Some of these centres also conduct ICT training to rural children for affordable rates (about US$2 per month). Moreover, these centres further contributed to social and economic developments in rural and semi-urban areas. For example, nearly 41% of Nenasala users claim that they found jobs as a result of computer training provided in the centres and 26% users found jobs by using the Internet facility available at the centres (ICTA & MGC, 2008c). Furthermore, 31% centre operators believe the Nenasala centres help them improve their existing business or develop new business opportunities (ICTA & MGC, 2008c).

Skilled people with appropriate ICT skills are essential for successful implementation of e-Government. Therefore, the government has taken necessary steps to fulfil the requirement of a skilled work force, by implementing the human resources capacity building program. As a result of this program, to date about 450 CIOs actively participate in various ICT-based public sector reforming activities. Moreover, government offers the CIOs an opportunity to undertake a specialized Masters degree in e-Governance. Furthermore, various other staff at various levels are also provided with trainings such as management training, general ICT training, advanced technical trainings, network and system administration, and e-Government awareness. 10,000 public organizational staffs have been trained to support public sector reform. Moreover, statistics reveal that 66% of executive staff and 64.5% of non-executive staff have been formally trained (ICTA & MGC, 2008d). Developing the ICT skills of citizens is a secondary objective of this program. As result of this program, about 3000 citizens have been trained with ICT.

A recent study revealed that the government staff's attitudes towards e-Government are positive. 66% of executive staff and 74.3% of non-executive staff strongly believe that e-Government

can improve organizational efficiency (ICTA & MGC, 2008d). About 11.3% of executive staff and 10% of non-executive staff believe that e-Government can reduce the difficulties faced by the public in accessing public services. About 8% of the executive staff and 7.6% of non-executive staff think that e-Government can improve the quality of public service. This shows that there is an extremely strong support from the public staff for an effective implementation of e-Government in Sri Lanka. Table 3 presents a summary of the e-Sri Lanka initiatives' objectives and achievements.

The next section presents the general challenges to effective e-government implementation in Sri Lanka.

Table 3. High-level program objectives and achievements

Program	Objectives	Achievements
Re-engineering the government	To improve the efficiency and effectiveness of the delivery of the public services	• More than 100 central government agencies disseminate information through websites • Country portal and government official web portal provide single access to services and information • Grass root level public service delivery entities are connect to a web portal which contains 356 mini-sites • Trilingual call centre services provide information on 1300 government services • G2C projects including, e-divisional secretariat, e-population registry, e-pension, e-motoring, e-land database, e-foreign employment and e-NIC are being implemented • Birth marriage death certificate issuing systems help citizens obtain these certificates within 5 minutes which previously took several days • The Laksala project is developed for promoting handicraft • e-Human resources management systems are implemented
Information infrastructure development	To provide efficient and effective ICT infrastructure to public organizations, and to provide citizens anywhere any time access to ICT and its applications	• More than 350 public organizations are connected to a high speed secured network • 600 tele-centres (Nenasala) have been established in rural and semi-urban areas for providing equal access to e-Government information and services • Nenasala centres operate as distance learning centres • Low cost ICT training for rural children • 41% of Nenasala users claim that they found jobs as a result of computer training provided in the centres, 26% users found jobs by using the Internet facility available at the centres and 31% centre operators believe that the Nenasala centres help them improve their existing businesses or develop new business opportunities.
Policies and institutional development	To develop policy and institutional environment necessary to achieve the overall objective of e-Government in Sri Lanka	• Developed laws and regulations relating to electronic transactions, data protection, computer crimes, payment devices frauds, payment and settlement, privacy and intellectual property rights protection • Training is provided to judges, lawyers and other law enforcement personnel on e-laws • The e-Government policy is established • Local language initiatives: ICT standards for Sinhala (SLS 1134: 2004) and Tamil (SLS 1326: 2008) languages, and Unicode compliance fonts are developed.
Human resources capacity building	To develop an e-leadership capability in government staff to lead and drive the process of e-Government development	• About 450 CIOs were trained and they actively participate in various ICT-based public sector reforming activities • Another 10,000 public staff have been trained to support public sector reform. 66% of executive staff and 64.5% of non-executive staff have been formally trained. • 3000 citizens have been trained with ICT • Positive attitudes towards e-Government developments
e-Society development	Social development of most vulnerable groups	• Increased awareness among disadvantaged groups of how ICT can improve the quality of their lives • Women and youth empowered with ICT • Economic opportunity and equity through using ICT

CHALLENGES TO AN EFFECTIVE IMPLEMENTATION OF E-GOVERNMENT

Sri Lanka faces numerous challenges in its pursuit to achieve an effective implementation of e-Government initiatives. These challenges include (a) ICT infrastructure related issues pertaining to the lack of computers, Internet, telecommunication infrastructure to access e-Government, (b) human capital development related problems including the lack of skills to use e-Government applications, (c) leadership issues such as the lack of political and organizational support, lack of motivation, and unnecessary external influences, (d) budgetary constraints that affect investment in e-Government at the organizational level, and so forth (Ndou, 2004; Chen, et al., 2006; Hanna, 2007). Among them, lack of ICT infrastructure for rural citizens to access e-Government resources, the low e-readiness among citizens, budgetary constraints are prominent as barriers to effective implementation of e-Government (Karunasena & Deng, 2009, 2010a; Karunasena, et al., 2011).

Telecommunication is a catalyst for a country's development (Tripathi, 2006). Sri Lanka is a country with a moderate access to telecommunication infrastructure (ITU, 2008). The current telecommunication network comprises 16.1% fixed line and 62% mobile phones (TRCSL, 2009). Since fixed lines are the dominating Internet carriers in Sri Lanka, poor telecommunication infrastructure in rural areas means that access to the Internet is uneven and unaffordable (Hanna, 2007; Karunasena & Deng, 2010a). Statistics reveal that 42% of the total fixed line subscribers represent the province (Western Province) where the country's capital city is located (TRCSL, 2009). As shown in Figure 4, as of December 2009, fixed lines were distributed unevenly throughout the provinces in Sri Lanka (TRCSL, 2009).

Existing statistics reveal that only 11.1% of the rural household population have Internet access (DCS-SL, 2009). This is a significant barrier to the deployment of e-Government in Sri Lanka where the majority of the population live in rural areas. Inability to access the available e-Government resources due to the unavailability of connectivity for a majority of citizens can result in the failure of e-Government (Karunasena & Deng, 2010a). The Rural Telecommunication Network project, which promises rural citizens affordable and anytime anywhere access to the Internet, is a viable solution to this problem. However, this project has not been implemented. Alternatively, there is potential to use mobile phones as a channel to deliver e-Government services since, as shown in Figure 5, there has been a tremendous growth in mobile phone sub-

Figure 4. The provincial distribution of fixed phones in Sri Lanka
Figure 5. The growth in mobile phone subscribers
scribers over the last several years in Sri Lanka (Karunasena, et al., 2011).

The low e-Readiness of citizens increases the challenge for e-Government deployment (Karunasena & Deng, 2009; Weerakkody, et al., 2009; Ali, et al., 2009; Karunasena, et al., 2011). In Sri Lanka, only 20.3% of households are IT literate. 31.1% of urban households have computer literacy while the computer literacy of rural households is at 19.3%, and of the estate sector (estate sector is defined as the plantation areas, which are more than 20 acres in extent and having not less than 10 residential labourers) is at 8.4% (DCS-SL, 2009). Moreover, there are significant differences in computer awareness across the sectors. The highest (60%) computer awareness was reported from the urban sector households and the lowest (15.8%) awareness was reported by the estate sector households in 2009. In Sri Lanka, 11.4% of households have computers. Again, significant differences are evident across the different sectors of the country. As at 2009, 26.3% of urban households, 9.8% of rural households, and 3.3% of estate sector households had computers (DCS-SL, 2009). Furthermore, Internet and email usage in Sri Lanka is very low. As statistics reveal, only 13.1% of households use Internet and 12% use email (DCS-SL, 2009). All these statistics show the low e-Readiness among citizens. Due to these reasons, providing equal

opportunities to every citizen through e-Government is extremely challenging in Sri Lanka.

Delays in implementing major e-Government projects are another problem in Sri Lanka. As noted before, e-Sri Lanka initiative contains several e-Services delivery projects such as e-Population registry, e-Foreign employment, e-Pension, e-Motoring, e-Land registry, and so forth. Although the e-Sri Lanka initiative has been in effect for several years, these projects are still at the early stages of development at the time of this study (Karunasena & Deng, 2010a). Since there is a significant delay in implementing these initiatives, the citizens in Sri Lanka have not yet had the opportunity of enjoying the full benefits of e-Services (Karunasena, et al., 2011). Moreover, significant delay in implementing RTN is further challenging to the sustainability of Nenasala centres. The RTN was supposed to provide connectivity for these centres at affordable rates. Due to the delays in implementing the RTN project, some centres have to depend on expensive satellite connectivity, which is not viable for long term sustainability.

Poor ICT usage in government is still a challenging factor in Sri Lanka. As a result of unimplemented major e-Services projects, the ICT usage of a majority of government organizations' is confined to the use of simple databases, spreadsheets, word processors, and presentation tools. Most of the public organizations heavily

use these software packages. For an example, 100% of ministries, departments, and statutory boards use word processing packages (ICTA & MGC, 2008a). Moreover, use of emails for official communications among public sector staff is really low, being less than 10% across all public organizations (ICTA & MGC, 2008d). Only about 13% ministries, 7% departments, 22% statutory boards, and 3% divisional secretariat offices use emails for official communications (ICTA & MGC, 2008a).

Limited funding for e-Government development is another challenge faced by Sri Lanka (Weerakkody, et al., 2009; Ali, et al., 2009). The e-Sri Lanka initiative heavily depends on international donor agencies including the World Bank and the Korean EXIM bank (ICTA, 2005). Sri Lanka has implemented a centralized funding model rather than a decentralized model for e-Government investment. In other words, major e-Government projects implemented at the organizational level are funded by the ICTA. Therefore, the majority of government organizations do not have adequate fund allocations to implement their own e-Government projects. Only 7% of the government organizations had a separate budget for IT as at 2008 (ICTA & MGC, 2008a). This creates negative impacts on e-Government project development at the organizational level. However, the e-Government policy introduced in the year 2009 emphasises that all the government organizations should have an ICT budget for implementing e-Government initiatives at the organizational level.

FUTURE RESEARCH DIRECTIONS

It is clear from the study that the Sri Lankan government has invested millions of dollars in developing various e-Government initiatives to provide maximum benefits to citizens while facing various barriers to the effective implementation of e-Government. With the increasing pressure on

accountability for government investments nowadays, conducting a comprehensive and in-depth investigation of the effectiveness of e-Government initiatives in Sri Lanka would be a worthwhile next step in the research in this area (Karunasena, et al., 2011). Conducting such a study can not only help the Sri Lankan government to understand the effectiveness of their investment in e-Government initiatives, but it can also facilitate formulation of effective strategies and policies for improving the performance of e-Government in Sri Lanka (Deng, 2008; Karunasena, et al., 2011).

CONCLUSION

This study evaluates the progress of e-Government in Sri Lanka and explores the opportunities generated through e-Government, and identifies the challenges that Sri Lanka faces in implementing e-Government. It reveals that Sri Lanka has been progressing well in e-Government development with the implementation of various e-Government initiatives, including developments of government websites, call centre services, a government wide network, tele-centres for rural communities, building the capacity of public sector staff, and development of a legal and regulatory framework to support e-government.

Several challenges, however, hinder the effective development of e-Government in Sri Lanka. Uneven access of rural citizens to the information and telecommunication infrastructure, low e-Readiness among citizens, delays in implementing major e-Government projects, and insufficient funds to implement e-Government initiatives at organizational levels are some of the barriers to an effective implementation of e-Government. From the results obtained in this study, it can be concluded that a country with a majority of citizens living in rural areas, poor ICT infrastructure, and low ICT literacy among the citizens faces enormous challenges in deploying e-Government initiatives.

KEY TERMS AND DEFINITIONS

CIO: Chief innovative officer.

E-Development: Use of ICT to bring about social and economic development in a country.

E-Government: Delivery of government information and services through the use of ICT.

e-Sri Lanka: An e-development initiative implemented in Sri Lanka which recognizes ICT as a key factor for achieving growth, equity and peace through technological transformation of all sectors in Sri Lanka. Improving the delivery of

public services, bridging the digital divide, uplifting the quality of life of citizens, improving social development, and supporting the country's growth and poverty reduction are the key objectives the e-Sri Lanka initiative.

ICT: Information and communications technologies.

LGN: Lanka government network is a wide area network implemented in Sri Lanka which connects public organizations across the country.

VOIP: Voice over Internet protocol.

Chapter 36

A Systematic Review of Distributed Software Development
Problems and Solutions

Miguel Jiménez

ABSTRACT

In last years, software development activity tends to be decentralized, thus expanding greater development efforts towards more attractive zones for organizations. The type of development in which the team members are distributed in remote sites is called distributed software development (DSD). The main advantage of this practice is mainly that of having a greater availability of human resources in decentralized zones with less cost. On the other hand, organizations must face some disadvantages due to the distance that separates the development teams related to project organization, project control and product quality. Coordination becomes more difficult as the software components are sourced from different places, and new processes and tools are needed. This chapter presents a systematic review of the literature related to the problems of DSD with the purpose of obtaining a vision about the solutions proposed up to the present day.

1 INTRODUCTION

Nowadays, software industry tends to relocate their production units to decentralized zones with greater availability of skilled workforce, taking advantage of politic and economic factors (Aspray, et al., 2006). The objective consists of optimizing resources in order to develop higher quality products at a lower cost than is in co-located developments. In this sense, Software Factories (Greenfield, et al., 2004) is an approach that, automate parts of software development by imitating industrial processes originally linked to more traditional sectors such as those of the automobile and aviation, decentralize production units, and promote the reusability of architectures, knowledge and components.

Distributed Software Development (DSD) allows the team members to be located in various remote sites during the software lifecycle, thus making up a network of distant sub-teams. In this context the traditional face-to-face meetings are no longer common and interaction between members requires the use of technology to facilitate communication and coordination.

The distance between the different teams can vary from a few meters (when the teams work in adjacent buildings) to different continents (Priklad-nicki, et al., 2003). The situation in which the teams are distributed beyond the limits of a nation is called Global Software Development (GSD). This kind of scenario is interesting for several reasons (Herbsleb and Moitra, 2001), mainly because it enables organizations to abstract themselves from geographical distance, whilst having qualified human resources and minimizing cost (Werner, et al., 2001), increasing their market area by producing software for remote clients and obtaining a longer workday by taking advantage of time differences (Ebert & De Neve, 2001). On the other hand we must confront a number of problems (Layman, et al., 2006), caused mainly by distance and time and cultural differences (Krishna, et al., 2004), which depend largely on the specific characteristics of each organization.

In this context, "offshoring" refers to the transfer of an organizational function to another country, usually where human resources are cheaper. We speak about "nearshoring" when jobs are transferred to geographically closer countries, thus avoiding cultural and time differences between members and saving travel and communication costs. Outsourcing is a way to contract an external organization, independently of its location, instead of developing in-house (McConnell, 1996).

The aforementioned development practices have as a common factor the problems arising from distance that directly affect the processes of communication as well as coordination and control activities (Damian, et al., 2003). In these environments, communication is less fluid than in colocalized development groups, as a consequence, problems related to coordination, collaboration or group awareness appear which negatively affect productivity and, consequently, software quality. All these factors influence the way in which software is defined, built, tested and delivered to customers, thus affecting the corresponding stages of the software life cycle.

In order to mitigate these effects and with the aim of achieving higher levels of productivity, organizations require facilities to support collaboration, coordination and communication among developers through new technologies, processes and methods (Damian and Lanubile, 2004). Iterative approaches are commonly used in contrast to traditional waterfall or sequential methods, but they become more difficult to use consistently when teams are geographically distributed (Cusumano, 2008).

This work presents a systematic review of the literature dealing with efforts related to DSD and GSD with the purpose of discovering the aspects upon which researchers have focused until this moment. The objective is to identify, evaluate, interpret and synthesize most of the important studies on the subject, by conducting a rigorous and objective review of literature which will allow us to analyze the issues and the solutions contributed

up to the present about de-located development with the aim of obtaining information with a high scientific and practical value through a rigorous systematic method.

2 THE IMPORTANCE OF SYSTEMATIC REVIEWS

A systematic review of literature (Kitchenham, 2004) permits the identification, evaluation and interpretation of all the available relevant studies related to a particular research question, topic area or phenomenon, providing results with a high scientific value by classifying studies between primary studies and secondary or relevant studies, by means of synthesizing existing work according to a predefined strategy.

This systematic review has been carried out within the context of the FABRUM project, whose main objective is the development of a process with which to manage the relationships between a planning and design center and a software production factory, serving this work as starting point to focus future research to carry on

In order to carry out this study we have followed the systematic search procedure proposed by (Kitchenham, 2004), and the selection of primary studies method followed in (Pino, et al., 2007).

2.1 Question Formularization

The research question is: What are the initiatives carried out in relation to the improvement of DSD processes?

The keywords that guided the search to answer the research question were: *distributed*, *software*, *development*, *global*, *enterprise*, *organization*, *company*, *team*, *offshore*, *offshoring*, *outsource*, *outsourcing*, *nearshore*, *nearshoring*, *model*, *strategy* and *technique*.

During a first iteration, we also included the keywords CMM, CMMI, COBIT and ITIL in an attempt to obtain studies based on these standards, but due to the scarcity of good results these words were misestimated in subsequent iterations.

The ultimate goal of this systematic review consists of identifying the best procedures, models and strategies employed, and to determine the most important improvement factors for the main problems found. The population will be composed of publications found in the selected sources which apply procedures or strategies related to DSD.

2.2 Sources Selection

By combining the keyword list from the previous section through the logical connectors "AND" and "OR", we established the search strings shown in Table 1.

The studies were obtained from the search sources: *Science@Direct*, *Wiley Interscience*, *IEEE Digital Library and ACM Digital Library*. The quality of this sources, guarantee the quality of the studies. The basic search chains had to be adapted to the search engines of each source.

2.3 Studies Selection

The inclusion criteria for determining whether a study should be considered relevant (potential candidate to become a primary study) was based on analyzing the title, abstract and keywords from the studies retrieved by the search to determine

Table 1. Basic search strings

	Basic search strings
1	("*distributed software development*" OR "*global software development*") AND ((*enterprise* OR *organization* OR *company* OR *team*) AND (*offshore* OR *offshoring* OR *outsource* OR *outsourcing* OR *nearshore* OR *nearshoring*))
2	("*distributed software development*" OR "*global software development*") AND (*model* OR *strategy* OR *technique*)

whether they dealt with the DSD subject orientated towards process improvement, quality, coordination, collaboration, communication and related issues that carry on any improvement about the subject.

Upon analyzing the results of the first iteration of the systematic review, we decided to exclude those studies which, despite addressing the issue of DSD, did not contribute to any significant improvement method, and we also dismissed those studies which focused solely upon social issues, cultural or time differences or focused solely upon free software, although we have taken into account other articles that address these topics in a secondary manner.

To obtain the primary studies we have followed the iterative and incremental model proposed by (Pino, et al., 2007). It is iterative because the search, retrieval and information visualization of results is carried out entirely through an initial search source and then repeats the same process on the rest. It is incremental because the document evolves incrementally, including new studies to complete the final version.

By applying the procedure to obtain the primary studies, 612 initial studies were found, of which 467 were not repeated. From these, we selected 135 as relevant and 60 as primary studies (the complete list of primary studies is shown in Appendix A). Table 2 shows the distribution of studies found according to the sources employed.

2.4 Information Extraction

The process of extracting information from the primary studies followed an inclusion criterion based on obtaining information about the key success factors, improvement strategies employed, processes improved and the most important ideas in each study, thus establishing a categorization between objective and subjective results. All articles were categorized by attending to the methodology study followed according to the models presented in (Zelkowitz & Wallace, 1998). We used the following categories: case studies, literature review, experiment, simulation and survey. The nonexperimental model for studies which makes a proposal without testing it or performing experiments was also applied.

3 TRENDS IN DISTRIBUTED SOFTWARE DEVELOPMENT RESEARCH

This section analyzes and discusses proposals and success factors in order to extract relevant information from the information provided by the primary studies. In (Prikladnicki, et al., 2008) is studied DSD attending to its evolution providing quantitative analysis. They indicate that distributed software development should be better contextualized. Their main conclusions were referred to the lack of studies related at the level of projects or focused on technical aspects.

Table 2. Distribution of studies found

Sources	Search date	Studies				
		Found	Not repeated	Relevant	Primaries	%
Science@Direct	30/04/2008	170	140	52	**19**	32,0
Wiley InterScience	30/04/2008	27	18	15	**12**	20,0
IEEE Digital Library	30/04/2008	7	7	5	**5**	8,0
ACM Digital Library	02/05/2008	408	302	63	**24**	40,0
	Total	612	467	135	**60**	100,0

Attending to our results, Figure 1 (*left*) shows that most of the primary studies analyzed are case studies and experimental articles. Surveys and nonexperimental studies also have a significant representation, in which members involved in the distributed development take part in outlining their difficulties.

On the other hand, as is shown in Figure 1 (*right*), the majority of primary studies are focused upon the enterprise field, but studies in the university environment also appear, in which groups of students carried out developments in different locations. Near 45% of the studies did not indicate their field of work or their characterization did not proceed, while 10% were from organizations which did not specify their corporate or university environment.

3.1 Publications Tendency

After attending to the number of relevant studies found through the systematic search carried out, it can be concluded that the subject of DSD is evidently an area which was not widely studied until a few years ago, and it is only recently that a greater number of publications have appeared; thus in Figure 2 we can see that 2006 is by far the year in which most studies were published, bearing in mind that the data shown for 2008 only reflects the studies found before May.

3.2 Improved or Analyzed Processes

Taking the primary studies analyzed as a reference, we carried out a classification in terms of processes in the software life cycle to which improvements were proposed or success factors or areas to be

Figure 1. Type of articles analyzed (left) and environments of study development (right)
Figure 2. Trends in publications about DSD
improved related to DSD were discussed. Primary studies were classified according to the improved or studied processes, in each case based on the ISO/IEC 12207 standard (2002), with the aim of obtaining a vision of the processes life cycle that requires special attention when working in a distributed environment and discovering the improvement efforts carried out until that moment.

The ISO 12207 standard establishes the activities that may be carried out during the software life cycle, which are grouped into main processes, support processes and general processes. The results are presented graphically in Figure 3 where for every process, its frequency in function of the number of studies that address it is indicated.

The results obtained indicate that greater efforts are focused on human resources, infrastructure, software construction and management and project organization processes. From these data we can infer that communication between team members is a critical factor. On the other hand, other processes, such as software installation or usability are not mentioned in any study. This information will be useful in the focusing of future research efforts.

3.3 Employed Standards

Attending to the standards followed by the organizations, we found that there is a need for more studies focused on capability models.

Figure 4 presents the standards that the analyzed articles address. Based on the available data, it may be inferred that few studies indicate the use of specific standards. In part, this is attributable to the fact that the great majority of studies deal

Figure 3. Improved or analyzed processes by the primary studies adjusted to ISO 12207
with issues such as communication difficulties in which the standard used does not matter. The standards supported by most primary studies are CMM and ISO 9001, it being common to jointly apply both. All applications of CMM and CMMI studied employed a maturity level 2 with the exception of one which was certified at CMM level 5. No studies relative to ITIL or COBIT models were obtained.

3.4 Contents of the Studies

Table 3 shows in a schematic way the lines towards which the primary studies have focused. Most of the works study tools or models designed specifically for DSD which attempt to improve certain aspects related to development and coordination. Another large part of the studies are related to communication processes and integration of collaborative tools, combining tools such as e-mail or instant messaging, and studying their application by means of different strategies. Most of the studies address the subject of communication difficulties in at least a secondary manner, presenting this aspect as being one of the most important in relation to the problematic nature of DSD.

On the other hand, 63% of the studies analyze or provide strategies, procedures or frameworks related to DSD. The remaining 37% study tools were designed specifically for distributed environ-

ments. As an example, tools such as FASTDash (Biehl, et al., 2007), Augur (Froehlich and Dourish, 2004) or MILOS (Goldmann, et al., 1999) may be of particular interest.

4 PROBLEMS AND SOLUTIONS

In this section, we synthesize the problems and solutions identified through the systematic review, discussing the main subjects.

4.1 Communication

The software life cycle, especially in its early stages, requires a great deal of communication between members involved in the development who exchange a large number of messages through different tools and different formats without following communication standards and facing misunderstandings and high response times. These drawbacks, combined with the great size of personal networks which change over time, are summarized in a decrease in communication frequency and quality which directly affects productivity. To decrease these effects, both methodologies and processes must be supported by collaborative tools as a means of avoiding face-to-face meetings

Figure 4. Standards employed in the studies
Table 3. Thematic areas dealt with in the primary studies

Thematic areas	Studies (%)
Process control, task scheduling and project coordination	43,6
Collaborative tools, techniques and frameworks orientated towards communication and integration of existing tools	35,9
Configuration management	6,4
Multi-agent systems	5,1
Knowledgement management	5,1
Defects detection	2,6
Test management	1,3

without comprising the quality of the results, as is proposed by M. A. Babar et al. (2007). K. Mohan and B. Ramesh (2007) discuss the need for user-friendly tools, integrating collaborative tools and agents to improve knowledge integration. M. R. Thissen et al. (2007) examine communication tools and describe collaboration processes, dealing with techniques such as conference calls and email.

Cultural differences imply different terminologies which cause mistakes in messages and translation errors. Different levels of understanding the problem domain exist, as do different levels of knowledge, skills and training between teams. The use of translation processes, and codification guidelines is therefore useful (Carey, 1998; Prikladnicki, Audy, Damian, & de Oliveira, 2007).

4.2 Group Awareness

Members who are part of a virtual team tend to be less productive due to feelings of isolation and indifference. They have little informal conversation across sites, and their trust is reduced. Developers need to know the full status of the project and past history which will allow them to create realistic assumptions about how work is done on other sites. Frequent changes in processes, lack of continuity in communications and lack of collaborative tool integration cause the remote groups to be unaware of what is important because they do not know what other people are working on. As a consequence, they cannot find the right person and/or timely information which will enable them to work together efficiently, resulting in misalignment, rework and other coordination problems.

M.-A. D. Storey et al (2005) proposes a framework for comparing and understanding visualization tools that provide awareness of software development activities, giving a solid grounding in the existing theoretical foundation of the field. In this way, it is described Augur, a visualization tool that supports DSD processes by creating visual representations of both software artifacts and software development activities, thus allowing developers to explore relationships between them.

J. D. Herbsleb et al. (2001) present a tool that provides a visualization of the change management system, making it easy to discover who has experience in working on which parts of the code, and to obtain contact information for that person.

4.3 Source Control

Distributed environments present problems derived from conflicts caused by editing files simultaneously. Coordination and synchronization become more complex as the degree of distribution of the team grows. Source control systems must support access through internet, confronting its unreliable and insecure nature and the higher response times.

To reduce these drawbacks, S. E. Dossick and G. E. Kaiser (1999) propose CHIME, an internet and intranet based application which allows users to be placed in a 3D virtual world representing the software system. Users interact with project artifacts by "walking around" the virtual world, in which they collaborate with other users through a feasible architecture. With the same purpose, J. T. Biehl et al. (2007) present FASTDash as a user-friendly tool that uses a spatial representation of the shared code base which highlights team members' current activities, allowing a developer to determine rapidly which team members have source files checked out, which files are being viewed, and what methods and classes are currently being changed, providing immediate awareness of potential conflict situations, such as two programmers editing the same source file.

A. Sarma et al. (2003) presents Palantír, which complements existing configuration management systems informing a developer of which other developers change and calculating a measure of severity of those changes.

4.4 Knowledge Flow Management

The team members' experiences, methods, decisions, and skills must be accumulated during the development process, so that each team member can use the experience of his/her predecessor and the experience of the team accumulated during development, saving cost and time by avoiding redundant work. For this purpose, documentation must always be updated to prevent assumptions and ambiguity, therefore facilitating the maintainability of the software developed. Distributed environments must facilitate knowledge sharing by maintaining a product/process repository focused on well understood functionality by linking content from sources such as e-mail and online discussions and sharing metadata information among several tools.

To solve the drawbacks caused by distribution, H. Zhuge (2002) presents an approach that works with a knowledge repository in which information related to every project is saved, using internet-based communication tools and thus enabling a new team member to become quickly experienced by learning the knowledge stored.

K. Mohan and B. Ramesh (2007) present an approach based on a traceability framework that identifies the key knowledge elements which are to be integrated, and a prototype system that supports the acquisition, integration, and use of knowledge elements, allowing knowledge fragments stored in diverse environments to be integrated and used by various stakeholders in order to facilitate a common understanding.

4.5 Coordination

Coordination can be interpreted as the management of the right information, the right people and the right time to develop an activity. Coordination in multi-site developments becomes more difficult in terms of articulation work, as problems derived from communication, lack of group awareness and the complexity of the organization appear which influence the way in which the work must be managed. In this sense, more progress reports, project reviews, conference calls and regular meetings to take corrective action are needed, thus minimizing task dependencies with other locations. Collaborative tools must support analysis, design and development, allowing monitoring activities and managing dependencies, notifications and implementation of corrective measures. We shall deal with many of these issues in the following sections:

- **P. Ovaska et al. (2003)** study the coordination of interdependencies between activities including the figure of a chief architect to coordinate the work and maintain the conceptual integrity of the system.
- **S. Setamanit et al. (2007)** describe a simulation model to study different ways in which to configure global software development processes. Such models based on empirical data, allow research into and calculation of the impact of coordination efficiency and its effects on productivity.
- **J. D. Herbsleb et al. (2001)** suggest that multi-site communication and coordination requires more people to participate, which causes a delay. Large changes involve multiple sites and greater implementation times. Changes in multiple distributed sites involve a large number of people.
- **C. R. de Souza et al. (2007)** presents the tool Ariadne which analyzes software projects for dependencies and help to find coordinations problems through a visual environment.

4.6 Collaboration

Concurrent edition of models and processes requires synchronous collaboration between architects and developers who cannot be physically present at a common location. Software modelling requires concurrency control in real time,

enabling geographically dispersed developers to edit and discuss the same diagrams, and improving productivity by providing a means through which to easily capture and model difficult concepts through virtual workspaces and the collaborative edition of artifacts by means of tools which permit synchronized interactions.

A. De Lucia (2007) proposes STEVE, a collaborative tool that supports distributed modelling of software systems which, provides a communication infrastructure to enable concurrent edition of the same diagram at the same time by several distributed developers.

A further approach is presented by J. Suzuki and Y. Yamamoto (1996) with the SoftDock framework which solves the issues related to software component modelling and their relationships, describing and sharing component models information, and ensuring the integrity of these models. Developers can therefore work analyzing, designing, and developing software from component models and transfer them using an exchange format, thus enabling communication between team members. S. Sarkar et al. (2008) develop CollabDev, a human assisted collaborative knowledge tool to analyze applications in multiple languages and render various structural, architectural, and functional insights to the members involved in maintenance.

J. T. Biehl (2008) present IMPROMPTU, a framework for collaborating in multiple display environments which allows users to share task information across displays via off-the-shelf applications.

In another direction, W. Xiao et al. (2007) study Galaxy Wiki, an on-line collaborative tool based on the wiki concept which enables a collaborative authoring system for documentation and coordination purposes, allowing developers to compile, execute and debug programs in wiki pages.

4.7 Project and Process Management

Due to high organizational complexity, scheduling and task assignment becomes more problematic in distributed environments because of volatile requirements, changing specifications, and the lack of informal communication and synchronization. Managers must control the overall development process, improving it during the enactment and minimizing the factors that may decrease productivity, taking into account the possible impacts of diverse cultures and attitudes.

In this context, S. Goldmann et al. (1999) explains the main ideas of MILOS, a system orientated towards planning and scheduling which supports process modeling and enactment.

The maturity of the process becomes a key factor for success. In this sense, M. Passivaara and C. Lassenius (2003) propose incremental integration and frequent deliveries by following informing and monitoring practices. B. Berenbach (2006) describes different organizational structures that can overshadow technical problems caused by globalization, enumerating the problems introduced and the mitigation techniques that were effective.

R. J. Madachy (2008) deals economic issues presenting a set of cost models to estimate distributed teams work taking into account diffent environmental characteristics of the teams, localized labor categories, calendars, compensation rates, and currencies for costing.

4.8 Process Support

Processes should reflect the direct responsibilities and dependencies between tasks, notifying the people involved of the changes that concern them, thus avoiding information overload of team members. Process modeling and enactment should support inter-site coordination and cooperation of the working teams, offering automated support to distributed project management. Problems derived from process evolution, mobility and tool integration appear within this context. Process engines have to support changes during enactment. Furthermore, distributed environments usually involve a large network of heterogeneous, autonomous and distributed models and process engines,

which requires the provision of a framework for process system interoperability.

In relation to these problems, A. Fernández et al. (2004) present the process modelling environment SPEARMINT, which supports extensive capabilities for multi-view modelling and analysis, and XCHIPS for web-based process support which allows enactment and simulation functionalities.

S. Setamanit et al. (2007) describe a hybrid computer simulation model of software development processes to study alternative ways to configure GSD projects in order to confront communication problems, control and coordination problems, process management and time and cultural differences.

N. Glasser and J.-C. Derniane (1998) analyse CoMoMAS, a multi-agent engineering approach that describes different viewpoints in a software process, permitting the transformation of conceptual models into executable programs. In this context, the agents will be able to cover with the high mobility of the members involved in the development process, taking charge of the management of information and permitting artifacts to communicate both with each other and with human users.

4.9 Quality and Measurement

Quality of products is highly influenced by the quality of the processes that support them. Organizations need to introduce new models and metrics to obtain information adapted to the distributed scenarios that could be useful in improving products and processes. With this aim, K. V. Siakas and B. Balstrup (2006) propose the capability model eSCM-SP, which has many similarities with other capability-assessment models such as CMMI, Bootstrap or SPICE and the SQM-CODE model, which considers the factors that influence software quality management systems from a cultural and organizational perspective.

J. D. Herbsleb et al. (2000) work with several interesting measures, such as the *interdependence*

measure which allows the determination of the degree of dispersion of work among sites by looking up the locations of all the individuals. In this sense, F. Lanubile et al. (2003) propose metrics associated with products and processes orientated towards software defects such as: discovery effort, reported defects, defects density, fixed defects or unfixed defects.

Furthermore, software architecture evaluation usually involves a large number of stakeholders, who need face-to-face evaluation meetings, and for this reason adequate collaborative tools are needed, such as propose M. A. Babar et al. (2007).

4.10 Defects Detection

In distributed environments it is necessary to specify requisites with a higher level of detail. Software defects become more frequent due to the added complexity, and in most cases, this is related to communication problems and lack of group awareness. Defects control must be adapted by making a greater effort in relation to risk management activities.

To minimize these problems, F. Lanubile et al. (2003) define a process, specifying roles, guidelines, forms and templates, and describe a web-based tool that adopts a reengineered inspection process to minimize synchronous activities and coordination problems to support geographically dispersed teams.

An adequate model cycle must allow the localization and recognition of defect-sensitive areas in complex product development. In this line, J. van Moll et al. (2004) indicate that transitions between constituent sub-projects are particularly defect-sensitive. By means of an appropriate modelling of the overall project lifecycle and by applying adequate defect detection measures, the occurrence of defects can be reduced. The goal is to minimize the amount of defects that spread to the subsequent phases early in the software life cycle, and reuse existing components or the appli-

cation of third-party components, thus minimizing product quality risks by using tested components.

5 SUCCESS FACTORS

From the experimental studies analyzed, we have extracted the following success factors of DSD.

- Intervention of human resources by participating in surveys (Babar, Kitchenham, Zhu, Gorton, & Jeffery, 2007; Herbsleb, Mockus, Finholt, & Grinter, 2000). Their problems, experiences and suggestions can be very helpful.
- Carrying out the improvement based on the needs of the company, taking into account the technologies and methodologies used (Akmanligil & Palvia, 2004). The tools employed at the present must be adapted and integrated (Sarma, Noroozi, & van der Hoek, 2003).
- Training of human resources in the tools and processes introduced (Herbsleb, Mockus, Finholt, & Grinter, 2001). Their skills are an important factor for a successful application of both tools and processes.
- Registration of activities with information on pending issues, errors and people in charge (Biehl, Czerwinski, Smith, & Robertson, 2007) and provide awareness of software development activities (Storey, Čubranić, & German, 2005).
- Establishment of an efficient communication mechanism between the members of the organization, allowing a developer to discover the status and changes made within each project (Baentsch, Molter, & Sturm, 1995; Biehl, Czerwinski, Smith, & Robertson, 2007).
- Using a version control tool in order to control conflictive situations (Pilatti, Audy, & Prikladnicki, 2006).

- There must be a way to allow the planning and scheduling of distributed tasks, taking into account costs and dependencies between projects, application of corrective measures and notifications (Froehlich & Dourish, 2004; Madachy, 2008).
- Application of maturity models and agile methodologies (Lee, DeLone, Espinosa, 2006) based on incremental integration and frequent deliveries.
- Systematic use of metrics tailored to the characteristic of the organization attending to the different types of distribution (Herbsleb, Mockus, Finholt, & Grinter, 2001).

6 CONCLUSION

In this work we have applied a systematic review method in order to analyze the literature related to the topic of DSD within the FABRUM project context whose main objective is to create a new DSD model to manage the relationships between a planning and design center and a software production factory, this work serving as a starting point from which to establish the issues upon which subsequent research will be focused.

Results obtained from this systematic review have allowed us to obtain a global vision of a relatively new topic which should be investigated in detail. However, every organization has concrete needs which basically depend on its distribution characteristics, its activity and the tools it employs. These are the factors that make this such a wide subject, and lead to the necessity of adapting both the technical and organizational procedures, according to each organization's specific needs.

Generally, the proposals found in the analyzed studies were mainly concerned with improvements related to the use of collaborative tools, integration of existing tools, source code control or use of collaborative agents. Moreover, it should

be considered that the evaluation of the results obtained from the proposed improvements are often based on studies in a single organization, and sometimes only takes into account the subjective perception of developers.

On the other hand, it should be noted that maturity models such as CMM, CMMI or ISO, which would be of particular relevance to the present investigation, represent only 17% of all analyzed works. The fact that almost all experimental studies that employed CMMI and CMM applied a maturity level 2 suggests that the cost of implementing higher maturity levels under distributed environments might be too high. The application of agile methodologies based on incremental integration and frequent deliveries, and frequent reviews of problems to adjust the process become important success factors.

Finally, we must emphasize that the search excluded studies which addressed the subject of DSD but did not contribute any significant method or improvement in this research context. However, since this is such a wide area, some of these works present interesting parallel subjects for the development of this investigation, which is why their study would be important in a future work.

KEY TERMS AND DEFINITIONS

Nearshoring: Transference of an organizational function to geographically closer countries, thus avoiding cultural and time differences between members and saving travel and communication costs.

Offshoring: Transference of an organizational function to another country, usually where human resources are cheaper.

Outsourcing: Is a way to contract a particular function to a third-party organization defining how the client and the supplier will work together.

Primary Study: Individual studies obtained by applying an inclusion and exclusion criteria whose information is extracted and synthesised to contribute to a systematic review.

Relevant (or Secondary) Study: Studies related to a particular research question but which has a secondary interest.

Software Factory: is an organizational structure that, automates parts of software development through an assembly process, decentralizing production units, and promoting the reusability of architectures, knowledge and components.

Systematic Review: Literature review focused on a research question which tries to identify, evaluate and interpretate all high quality studies to answer the question following a well-defined method.

Virtual Team: Group of individuals who work physically separated across time and space and who primarily interact through electronic media and may meet face-to-face occasionally to achieve a task.

Chapter 37
Making Room for E–Government through Succession Planning

Kim Loutzenhiser
Troy University, USA

ABSTRACT

Few innovations have more impact on government's work culture and the delivery of public services than e-government. E-government is a global phenomenon that is much researched, but researchers often neglect to research the demands it places on the human resources, the administrative infrastructure, and training and development. There is very little written on e-government and why it matters in succession planning. Those who design and implement well executed e-government systems need technological and culturally relevant competencies to make e-government responsive to e-citizens. In addition, there is no shortage of articles on government budget overruns tied to IT projects. The rush to have needed technologies has outpaced recruitment and training strategies to manage the technology infrastructure that makes e-government work. The infrastructure of e-government includes concepts tied to the provision of a seamless flow of services, logical one-stop-shops, efficiency, and an ability to do more with less. These concepts, however, will not support e-government indefinitely without adequate succession planning. The succession planning for this year and beyond must include training, maintaining and transitioning employees in a world where technical competencies need to be addressed and citizens clamor for more direct involvement. Succession planning can train employees to create a work culture that promotes accountability, transparency, efficiency, and build an appreciation for a competent representative bureaucracy. Succession planning, more than any other tool, can tap into the diversity pipeline, something that could narrow the digital divide. Human resources in the public sector faces fierce competition for talent. Talent is recruited nationally and internationally. Thus the public service is at risk if it persists in holding onto 20th century technology and 20th century cultural world-views.

INTRODUCTION

Government public relations no longer happens solely through public relations professionals. It is now decentralized through blogs, social networks, text messaging, photo sharing, wikis and virtual worlds – the Web 2.0 World. Succession planning can address the benchmark strength in human resource capacity tied to e-government. The thrust of e-government requires a closer look at employees and the kind of talent needed to communicate through technology in a way that is usable, helpful and easy. E-government thus requires that management employ its talent differently. Without a tool to identify talent management needs and how to address them, e-government or any other kind of service delivery, will not meet the complex challenges currently posed by globalization, economic woes, unprecedented retirements, and existing challenges in the competition for talent. A skilled public work force and one trained for a world of globalization and increasing diversity will be needed in a twenty-first government that will have to govern with the aid of civil society (Huddleston, 2000).

E-GOVERNMENT RECRUITMENT

The practice of e-government will not achieve best practices status until it addresses systems of recruiting, maintaining, training and planning for the provision of public services. No doubt e-government is an integral part of public service delivery for many governments, particularly in the United States. Public Human resource organizations, however, have not been quick to take the lead in using Web 2.0 technologies that could benefit them including LinkedIn, Facebook and Twitter – this is not an exhaustive list. Web 2.0 technologies are interactive and important to learning the communication venues frequented by Generation X. Recruitment of this generation will not be easy without embracing the online places

they frequently visit. The Obama administration is noted for attempting to revamp the federal government and making it "cool" for young people to work for the public service. Without embracing Generation X communication venues, however, it is tough to make government a desirable place for young professionals to work.

The recruitment benefits using Web 2.0, social media and social networking are not fully known. Still there is no better time to learn relevant social media tools. The variety of communication outlets means that there are many different ways to connect with talent and people looking for jobs. There are myriad online ways to learn about what the competition is doing in terms of recruitment. There are blogs (http://www.recruitingblogs.com/), web sites (http://hrmtoday.com/), wikis (http://thehumanresource.wikispaces.com/page/diff/Home/88551151) and more. In London for example, there is a civil service live network (http://network.civilservicelive.com/). These technologies bring dramatic changes in communication, which can be static, interactive, transactional or transformational (Melitski, 2003). The transformational usages of e-government are also evident where succession planning takes center stage.

e-government cannot exist without e-Public Servants to provide services to its e-Citizens. Each of the e-Players exists in concert. They are networked in a communication system that may include an e-Manager, e-Planner, or e-Collector of revenue working from their office or their home to offer a government service. Succession planning can assess whether a government has a workforce capable of facilitating the delivery of services in a networked system. If the prediction of unprecedented number of retirements does not move succession planning to the fore, the economy and technology will be a couple of major reasons to move to take an in depth review of succession planning and e-government (Roberts 2003; Roddy 2004).

Succession planning is a tool to continuously and systematically identify, assess and develop

personnel to enhance performance (Kim, 2003). Initially it focused on leadership gaps left by baby boomer retirements and developed to identify and develop leaders to replace those leaving. It has evolved into a tool for an organization-wide effort to continuously assess competencies and skills gaps throughout an organization. It also offers an opportunity to plan for the future and work toward a diverse workforce to address nontraditional working arrangements and a multigenerational workforce (Helton and Jackson 2007; Fillichio 2006). Succession planning was initiated following predictions that baby boomer retirements would lead to a knowledge gap of crisis proportions in the public service. It goes beyond the baby boomer talent retiring from the workforce. It is now about being able to compete for talent with the private sector, have a preparedness to meet technology demands, work easily with a diverse work force, and have cross training to do more with less (Fillichio 2006). Without infusing technological skill sets into succession planning, the competition for talent may be lost. This is a world that few could have envisioned a decade ago (Roddy 2004.)

Nearly ten years ago, Congress addressed the need for investing in IT to build competency and capacity in the government infrastructure and human resource pool (Seifert, 2008). The Clinger-Cohen Act created the Office of Electronic Government to manage security, build capacity and address issues of access (Government Accountability Office, December 2004). The Act addressed the need to include citizens, improve government operations, communications and public services (Government Accountability Office, March 2004). In 2007 Congress passed the eGovernment Re-Authorization Act.

Beyond these acts of Congress, it takes real leadership to make dramatic change manageable within organizations. It is important to have a leader that has the ability to change an organization to succeed in a modern world. Organizational culture does not adapt easily to change even

if needed changes represent an improvement (Hartley & Allison, 2000) Leadership is part of a clear succession plan, one that results in major organizational change. Strong and effective leadership can ameliorate the culture clashes that come with rapid change. Such leadership can provide the vision necessary to help employees experience the benefits of a diverse workforce. Dimensions of diversity include demographics such as race, culture, gender, sexual orientation, ethnic origin, body shape, disability, etc. Another dimension includes career patterns, mobility, and an ability to work any place and any time (Fillichio 2006) Within this diverse workforce, those who are most comfortable with technology are workers from Generation X. This generation has a work orientation that puts their age cohort at odds with other cohorts, such as Baby Boomers who enjoy more structured, traditional work and workplaces.

HOW MIGHT THE OBAMA ADMINISTRATION INFLUENCE E-SUCCESSION?

President Barack Obama campaigned through texting, Facebook, email and other electronic communication forms. This is evidence that mastering technology and its benefits builds an effective organization. President Obama could be dubbed the first Web 2.0 president. The White house Web site includes Facebook, YouTube, Twitter, Flickr, MySpace, iTunes, Vimeo, and LinkedIn (http://www.whitehouse.gov/2010). Clearly for this president, the time has come to embrace a more open Internet, a *connected* system of representation, technology in schools and world-wide-web (www) use to promote transparency. It seems remiss to not talk about what public management has to do with a networked system, especially when the World Wide Web is being promoted as a tool to achieve transparency. The morale of public servants has suffered after decades of Reagan like government bashing. Any study of e-government

and the personnel system behind it benefits if we ask, "what does trust have to do with it?" Succession planning is important to keep the personnel system sound and can address employment gaps that would preclude transparency from becoming a best practice in government (2010 Talent Management). The training necessary to use technology in an honest, efficient and transparent way can lure talent into the public sector. Linking technology to employee recruitment and development serves as a talent management plan.

It may be unrealistic to suggest that e-government can solve issues tied to the public trust. The tension or distrust between leaders and their public is a historic one (Taylor & Burt, 2005). Divided government, checks and balances, a two chamber legislature and separate but shared powers were written into the Constitution because of distrust in government. Madison is repeatedly quoted for saying "If men were angels, no government would be necessary." Thus trust issues are an ongoing incentive to work on the government's relationship with its citizens. Succession planning is one tool and e-government is another to improve the relationship between government and the citizens. Both succession planning and e-government in tandem can serve as a vehicle to help achieve the ideals of justice, equality and freedom.

What does the availability of e-government do to the quality of the exchange between e-Citizens and e-Public Servants? It means the capacity to change the nature of the relationship between leaders and their public has to do with the ability of public servants to develop an electronic platform that enhances transparency and accountability (Roy, 2003). If public trust matters and contributes to the quality of the exchange, it is important to recruit, train and develop people to make e-government serve as a true paradigm shift toward transparency and strengthening social capital (Carter & Belanger, 2005; Farazmand, 2002).

E-government offers an opportunity to make government more transparent and accountable – variables that correlate to public trust. While it is hard to get at the precise meaning of quality for public services, in a democratic system it has something to do with being honest, trustworthy, civic minded, and be responsive to humanity in shared public and virtual spaces (Hard, 1989). Political machine run governments such as in nineteenth century New York City, Kansas City and Chicago, were able to deliver services, but not able to do so in a way that was transparent or accountable. These governments were associated with distrust and corruption. It follows that citizens are more satisfied with a service if they receive it through an exchange that is courteous, service oriented and honest. The New Public Management focused not only on services but also on civility, customer services and running government more like a business. The culture of civil service had to change with the values ushered in by the New Public Management. From the 1990s to the present, governments at all levels have focused on performance, customer service, diversity, and doing more with less. Current public servants need to provide a high level of customer service through exchanges in the online world. However, what does service with a smile look like when there is no face-to-face interaction? The answer to this goes back to leadership, training and development.

Leadership and organizational change go together. Succession planning started out with an effort to address a gap in leadership. It has expanded to include efforts to prepare for workforce changes throughout an organization. E-government involves technological and cultural changes that reconfigure the world-of-work. Today the disappearing bureaucrat might have something to do with retirement. But it can also have something to do with the fact that e-government means many bureaucrats can do their job from home. Now that public employees engage in everyday communication via the World Wide Web, it is important to assess the benchmark strength provided by knowledge workers inside government and the technology needed to provide services. Just what kind of leadership, training and person-

nel are needed to provide e-government that is customer service friendly? This question relates e-government to the customer-oriented values of the New Public Management.

E-government means that all types of current public employees are using e-Communication or assisting with digital service delivery to some degree. E-government utilizes information technology (IT), information sharing and access, and changes the definition of what constitutes public knowledge (Freidman, 2007). The challenge therefore is to train public servants to first address security issues and make use of technology to achieve transparency goals; then it becomes an issue of leadership to instill the change in the organizational culture. Public officials engaged in budgeting need skills to post a budget online in a user friendly way. One of these skills is the ability to communicate online. The hierarchy of communications flattens when more people engage in Web 2.0 technologies, e-government, or other technological innovations. E-government, along with new media networking, changes and strengthens pluralism as we know it. The distinction between the knower and the known is no longer distinguishable. Public managers need to manage information networks and know the implications of citizens having ready access to public information. Thomas Friedman's flat world (2009) plays out through e-government. Today more than ever, the public has come to expect a responsive government. As journalist Friedman demonstrated throughout his book *The World Is Flat*, the public is expecting more information in a faster amount of time. Being constrained by a system largely designed before the proliferation of the Internet into mainstream culture has caused the public sector to fall considerably behind the private sector in terms of responsiveness and also on many other levels. Again, this is another situation where public administration leaders will have to encourage the use of technology to increase responsiveness, while at the same time ensuring

subordinates abide by what may appear to be antiquated regulations and laws (Friedman, 2007).

How do public managers insure a process that monitors information to guarantee that e-government works to arrive at public interest? How do they receive the competencies to do this? The knower and the known become less distinguishable because citizens have blogs, as do government entities. Public servants need to not only manage service delivery but also manage information on the World Wide Web. Knowledgeable citizens are preferable but it requires that people working on the other side of the exchange also have the skills and competencies to provide an added value to the exchange. Training, leadership, and succession planning have much to contribute to bringing about these changes.

E-government also introduces a new technology, a new work culture and new environment to the public workforce. Hence it radically changes the nature of work. Without planning for the development and recruitment of talent, e-government loses its potential to provide short and long term improvements to the quality of the exchange between citizens and their government. The rise of e-government presents fundamental reasons to do succession planning. For example, instead of looking for the top three candidates who apply for a position, succession planning works to get the right persons into critical positions. At a time when there is mandate to manage diversity, a massive flood of retirements, and the perennial need for talent, the changes imposed by e-government offers one more reason for succession planning to be the vehicle for managing multiple engines of change.

E-government can enhance transparency and also offer accountability. It can keep multiple stakeholders informed. Information, communication and citizen engagement can lower public distrust in government (Marlowe, 2004). E-government needs leadership to shepherd support for investment in the proper information infrastructure and related training to prevent budget

overruns and facilitate implementation (Taylor & Burt, 2005). Another important aspect of IT is that makes communication across vast distances easy and inexpensive. Networking within and between countries requires a new skill set and worthy of studying further. The United States is no longer in the lead here and can learn from developing nations who have had a long history of collaborating between states (Freidman, 2007). Early adapters in technological innovations have a resource that other countries may not have in that technological skills and resources are definitely a sought after commodity. For instance, India is a resource rich nation with a large population of technically competent citizens. There is thus a regrouping of nations that would not have been predictable without easy communication across large distances through the Internet. People are now one click away from each other. The world is a smaller stage like never before. Nations that use e-government to enhance transparency and accountability open communication with citizens and with each other. The United States may have its first Web 2.0 Presidency, but someone needs to manage the change that not only requires a regrouping within the government bureaucracy but also a skilled facilitator to address the changes that must also occur in the organizational culture within government.

WHY E-GOVERNMENT NEEDS SUCCESSION PLANNING

Employees trained in the practice of e-government can work to give it better definition. Government is still lagging when it comes to working with technology that builds relationships in new ways and forms. By viewing e-government as a process and not an outcome, it still comes down to people forging relationships within government and outside. Just like the man behind the curtain representing the Wizard of Oz, there is a person behind the computer, smart phone, or other technology. Again, the new types of relationships formed as a result of e-government mean that someone has to manage organizational cultures that prove resistant to public service delivery modes such as e-government. Succession planning offers yet another opportunity to lead organizations through change in a way that makes government organizations more adaptable to e-government.

Succession planning has evolved to plan for diversity, train for new modes of delivery, and to create an organizational culture that works beyond today. Succession management is currently done in conjunction with a strategic plan to identify competencies that will meet with the mission and goals of the organization. Human resources capacity, for example, can be measured in terms of *bench strength.* This bench strength encompasses training, development and recruitment, which are tied to technology. Technology is thus one way for organizations to keep current. It also takes time, money and resources to be current in the field. The fast evolution of e-government parallels the retirement of Baby Boomers. This is fortuitous, particularly since the implementation of E-government meets with the resistance of the Baby Boomer organizational culture (Crumpacker 2007). The transition of old and new talent can ease the pains associated with e-government's rise (Holden, Norris & Fletcher, 2003). Almost by definition e-government conjures up an image of someone plugging-in government to illuminate it further. More research needs to be done on how e-government is more than just a technological innovation. People providing e-government services need to be brought on board to bring about improvements in the public service. Reform is another one of those elusive terms that could be applied to e-government, but any innovation that increases citizen participation is bound to be an improvement.

E-GOVERNMENT, PUBLIC TRUST AND SUCCESSION PLANNING

Without public trust, it will be harder to mobilize public support for huge investments in technological infrastructure at a time of IT project cost overruns, budget deficits and daily news accounts of states going broke across the U.S. This does not bode well for the public's support of continued funding for such projects. Succession planning could help get the right people in the right positions to make more accurate estimates of technology projects. It makes sense to call for training programs and assess staffing needs tied to IT projects (Roddy, 2004; Kim & Kim, 2003). It also makes sense to highlight the benefits of e-government. Today more than 70% of taxpayers filed taxes on line. Driver's license renewal is another example where citizens are participating in increasing numbers (Baumgarten and Chui 2009). This is a time saver and it reduces citizen's aggravation with government red tape. Trained employees at all levels are the key to being proactive and to spread the word about useful technologies that make working with government easy, time saving and effective (Davis, 1989). It is unlikely that citizens will go out of their way to promote technology, but employees can promote e-government services through their own web site, facebook, wiki's, blogs or other resource. The greatest shift in organizational culture lies in the citizen participation that is allowable in blogs, wikis and mashups. This may be where technological innovations meet the resistance of organizational culture.

Along with these technological changes, everyone across the world is adapting to the unprecedented ethnological changes. There are major benefits to training employees to stretch and build their skills in adaptability, technology and diversity (Kim & Kim, 2003). Succession planning offers a road map to government organizations today. Today it is a tool to build a future that embraces diversity, technology and shared ownership in civic and organizational culture. Succession planning is all about adaptability and therefore should address issues that minimize the digital divide (Justice, Melitski & Smith, 2004). Within this digital divide there are social justice issues present in statistics showing poorer and less educated citizens not participating in technological innovations (Justice, Melitski & Smith, 2004).

The investment in technology provides mounting justification to advocate succession planning. E-government will lose support if it does not give universal benefits to all (Holden, Norris & Fletcher, 2003). However, cost limits to implementation of technological and succession planning for e-government will present leadership challenges (Chen & Perry, 2003). Organization capacity requires constant attention to who is retiring and who needs to be hired to allow for continuity where necessary, and accommodate change when required (Helton & Jackson 2007). Human resources information systems (HRIS) offer many types of systems to assist with succession planning.

The fears over technology and technological security fit in the complicated balancing act between liberty and order. It takes training to be able to make decisions in areas that have no easy answers. Trained employees are important to effective implementation of e-government. These employees must uphold values inherent in the United States Constitution. Liberty and technological security are both important. There is no doubt that technological security is an issue. Fraud, Internet viruses, identity theft and other crimes that have been yet to be invented are all security considerations. In designing e-government service delivery it is important to allow for discussions, communications and feedback in a world that requires internal and external communications (Kim & Kim, 2003). However, adequate security must also be maintained, which requires a delicate balancing act for government,

E-GOVERNMENT IS A TOOL OF PUBLIC ADMINISTRATION

E-government can be an effective tool for public administration. At the same time, however, change does not come easy, particularly when it does not fit with an existing organizational culture. For this reason, ongoing succession planning must accommodate the ever-changing organization. Baby Boomers will retire; Generation Xers will come on board. One way to accommodate these changes is to use a *stages* approach, which offers a continuum for training through change that is static, interactive, transactional and transformational (Melitski, 2003). Subsection planning can take government employees through this continuum to incorporate and prepare for change. This same concept of *stages* can be applied to the citizens embarking on the new world of e-government. E-government has been designed to be user friendly, but many citizens will struggle with understanding and institutionalizing the technology and subsequent changes in the way they formerly dealt with their government (Marlowe, 2004). The relationship between citizen satisfaction, government performance, public trust and social capital are part of civil society. The question is what a networked society does to civic culture

The stage analysis of change suggests that transformation will not occur without thinking through the ways public servants make e-government happen. This process includes a discussion of what enhanced citizen engagement and communication would look like and how employees might play a role using e-government as a tool for building civil society. At a minimum it is necessary to know the competencies necessary for citizens to participate in e-government. In order for e-government to be successful, the IT infrastructure requires an investment to build capacity in human resources through training and development and by building a pipeline for diversity (Roddy, 2004; Siegel 2007). Public managers must work jointly with human resources to address competencies tied to succession planning in e-government. Government organizations can streamline planning efforts to build organizational capacity. Succession planning fits nicely in the effort to implement e-government infrastructures. Large-scale change of any kind requires assessment methods, scheduled evaluations and alignment (Melitski, 2003).

Succession planning addresses entire organizations in terms of innovations, retirements and diversity needs and the usual buzz words such as efficiency and effectiveness, demand adaptability as well as cultural and technical competencies. E-government adds value to an arena that already has plenty of technical competencies (Justice, Melitski & Smith, 2006). E-government can improve the relationship between the governed and those who govern, but it takes planning to have any hope that the public finds it in their interests (Marlowe, 2004). There are a lot of forces at play and without adequate planning; public officials will not be able to utilize e-government to capacity.

When governments address succession planning, they also must address globalization at the same time. Globalization makes competition for knowledgeable employees paramount (Kudo, 2008). Since the U.S. is at a juncture to re-evaluate what it means to be a strategic player in a "flatter" world and simultaneously address financial woes, the justification for human resource planning, succession planning and the investment in an e-government infrastructure matter greatly. E-government and e-services are producing other global super powers (Jreisat, 2004). In order to make e-government an asset, it is timely to hire and train talent to make digital services convenient to everyone (Holden, Norris & Fletcher, 2003). The search for new talent works to build organizational capacity and adaptability (Chen & Perry, 2003). E-government therefore adds a new dimension to what we already know about outsourcing and succession planning (Chen & Perry, 2003).

E-government technology offers HR professionals an ability to do more with each government

professional and offer more services while spending less money the potential to do more with less (Eoyang, 2008). In essence, with e-government citizens are performing administrative tasks and are administrators by proxy (Brown, 2005). The distinction between routine and nonroutine, however, is where the public employee matters once more. The public employee is the professional pulling strings behind the curtain that handles matters of administrative discretion. In keeping it simple, participation and engagement must come with assurance of security and ease (Kim & Kim, 2003). Public administrators need to either be IT specialists or work closely with IT professionals to be keenly aware of the digital divide. Employees must work to broaden access at every innovation. The mantra becomes make online services accessible, convenient and user friendly to everyone (Justice, Melitski & Smith, 2006). Security measures, however, can get in the way of simplicity but this is where the public administrator exercises his or her craft (Kim & Kim, 2003). Information sharing is part of representative government. Integration and data sharing goes with the territory of technology and e-government (Melitski, 2003). Here investment in an e-government infrastructure offers opportunities for civil society.

CONCLUSION

The process of e-government is an evolving one. It requires leadership in public administration, investment in human resources and IT infrastructures and adaptability. The newer versions of succession planning require proponents to justify its need, particularly in today's economic hard times. E-government enthusiasts need to argue for the investment in technology, time and human resources to overcome barriers to implementation. Change happens in stages and requires strong leadership and organization to guide it (Kim & Kim, 2003).

Ultimately the investment in succession planning and e-government infrastructure offers promise. Not only does it allow for global networking but it also shifts the emphasis toward citizen driven service delivery, which helps civil society (Brown, 2005). The new public administration draws from private sector values to run governments more like a business. In this sense, it means treating citizens more like customers and employing user-friendly service delivery mechanisms (Brown, 2005). The emphasis on customer service requires a culture shift – a transition that can be achieved through succession planning, new technology, training and strategic planning. Business values, however, do not always work especially where participatory government is encouraged and valued. There are times where the cacophony of citizen voices can keep a citizen from ever being treated like a customer. It is an example of the ongoing need to offer the best customer service possible in a way that is tailor made to fit with competing values in the public sector.

E-government has taken over so rapidly that it is surprising to say that it is still in the early stages. It radically changes everyday life in the government work force. It changes the government and citizen relationship and plays out differently depending on the level of government size and target audience served (Holden, Norris & Fletcher, 2003). Instead of sharing usable knowledge, the government is offering usable technology to be used by the public work force and those they serve. The ease of use is related to those who use it. The theme of useable technology goes along with the need to adapt networks used by growing numbers of citizens. The Obama campaign and now the Obama administration mastered the various social networks, such as Facebook, MySpace, and YouTube. While this is far from an exhaustive list, it is exemplary of the growing number of users in both public and private sectors. The adaptation toward multiple versions of e-government services is another chapter in reinventing government. The idea that public

employees are behind e-government also deserves more acknowledgements. E-government produces research questions that can keep academics busy for a long time.

Chapter 38

Assessing Adequacy of Leisure and Recreation Facilities in KFUPM Campus:
A Futuristic Need–Gap Perspective

Adel S. Aldosary
King Fahd University of Petroleum & Minerals, Saudi Arabia

Kh. Md. Nahiduzzaman
King Fahd University of Petroleum & Minerals, Saudi Arabia

ABSTRACT

Leisure and recreation facilities are strongly intertwined due to their mutual dependencies. Thus, they build up invisible networks. Leisure and recreation facilities are one of the imperative components for socio-cultural, psychological, and economic development. In the spectrum of sustainable development, it is not possible to initiate development process without strategically planning for leisure and recreation activities. KFUPM was developed with specific leisure and recreation facilities for its community members. This paper examines their adequacy and possible set of actions to minimize the inadequacies in relation to growing and changing needs of the diversified-culture based community. Preparation of a proposed alterative (strategic) action plan to improve leisure and recreation facilities is based on conducting an internal assessment of current and forecasting amenities, and the need-gap analysis. The proposed action plan covers the estimated cost and urgency level for each of the alternative leisure and recreation improvement options. KFUPM must be committed to embracing the vision and strategies presented by this study, and allocate resources to implement strategic plans for improving leisure and recreation facilities that foster productivity and help shape systems for human resource development.

INTRODUCTION

Leisure and recreation activities are one of the critical dimensions that determine quality of life (Cushman & Alan, 1990). There are common leisure and recreation facilities through which people spends time, and develop skills and competencies as well. Traditionally, leisure and recreation activities are given low priority against the support and assistance provided for socio-cultural and economic development (Kaiser, Godschalk, & Chapin, 1995; Kraus, 1966). Therefore, many development initiatives are only limited to sporadic recreation and leisure choices. When other opportunities are offered, they often involve taking group of people to large public settings (e.g., community centres, shopping malls, theatres, restaurants, etc.) while very little support is offered for individual participation in community settings that offer greater opportunities for social connections and relationships (Nelson, 2004; Pigram, 1983).

In order to assist people to get involved in leisure and recreation activities, one must be aware of the available and possible opportunities within confinement of the community (Centre on Human Policy, 1990; Centre for Urban Affairs and Policy Research, 1988). This awareness includes the following information,

(1) Use of various neighbourhood and community places (i.e., who uses them, when, for what purposes);
(2) Local organizations and associations (e.g., where and when do they meet, what does it mean to be a member, etc.); and
(3) Where people go and what they do who are of various ages, genders, racial/ethnic groups, religious affiliations, share similar interests, etc.

Such information can be gathered through a wide range of scientific means, such as observation of people and surrounding settings, through spending time in the neighbourhood, reading community newspapers, bulletin boards, and directories, and talking to a variety of people (e.g., key informants) who know something about the neighbourhood and the community (Amaratunga & Sarshar, 2000; Alexander, 1996).

The University, as a campus town and a community, provides required amenities and services to its residents (e.g., faculties, students, staffs, etc.), such as housing, health, transportation, leisure and recreation, safety and security, etc. Leisure and recreation facilities, including public space, parks, green areas, playground, sport facilities, and community space for social interaction, etc. constitute an important part of daily lives of the campus residents (Cushman & Laidler, 1990). Likewise, KFUPM (King Fahd University of Petroleum and Minerals of Saudi Arabia) campus town have been designed by taking into account the daily needs for leisure and recreation facilities. The campus is a host of people from wide range of socio-cultural and ethnic backgrounds, and ongoing planning and development efforts by the university administration are to accommodate their diversified needs. In this campus town, though there is an established set of leisure and recreation facilities, it is a strategic task to evaluate them against the increasing demand and adequacy of those facilities. A research project is carried out to evaluate KFUPM's current leisure and recreation facilities with the goal of identifying improvement needs and suggesting alternative and improved actions. This paper, however, is the outcome of that project.

DEFINITIONS: LEISURE AND RECREATION

Leisure

According to Australian Council for Health (1980), leisure is a state of mind, which ordinarily is characterized by un-obligated time and willing

optimism. It can involve extensive activity or no activity. The key ingredient is an attitude, which fosters a peaceful and productive co-existence with the elements in one's environment.

Leisure is also considered primarily as a condition, sometimes referred to as a state of being, an attitude of mind or a quality of experience. It is distinguished by the individual's perceived freedom to act and distinguished from conditions imposed by necessity. It is assumed to be pleasurable and, although it may appeal because of certain anticipated benefits, it is intrinsically motivated: it is an end in itself and valuable for its own sake (Cushman & Laidler, 1990).

Recreation

Kraus (1966) defines recreation as an activity or experience, usually chosen voluntarily by the participant, either because of the immediate satisfaction to be derived from it, or because he perceives some personal or social values to be achieved by it. It is carried on in leisure time, and has no work connotations, such as study for promotion in a job. It is usually enjoyable and when it is carried on as part of organised or community services, it is designed to meet constructive and socially worthwhile goals of the individual participant, the group and society at large. Other researchers like Pigram (1983) views recreation primarily for pleasure and he defines

"...recreation is considered to be activity voluntarily undertaken, primarily for pleasure and satisfaction, during leisure time" (p. 3).

Recreation is also an act or experience, selected by the individual during his leisure time, to meet a personal want or desire, primarily for his own satisfaction (Yukic, 1970).

Generally, leisure and recreation activities are seen synonymously and complementary to each other. Also, sport events are considered as an integrated part of leisure and recreation domain.

However, the above definitions imply that leisure and recreation are strongly connected to each other where, strategically, one could not be thought of without the presence of other one.

OBJECTIVES

The following objectives constitute the focus of this paper,

- Identification of current leisure and recreation facilities in KFUPM campus
- Assessment of these facilities by taking user's opinions and perspectives
- Examine and design alternative improvement options against the inadequacy of existing leisure and recreation facilities.

LITERATURE REVIEW

University, as the highest educational institution, is aimed at developing physical environment to facilitate the education mission. In the learning paradigm, physical planning and development encompasses a sheer part to satisfy the learning objectives (Nelson, 2004; Kaiser, Godschalk, & Chapin, 1995). Physical facilities include leisure and recreation facilities that are generally recognized and accepted as important components in the higher education system (Brignall & Ballantine, 1996; Varco, 1996). For physical facilities to support the educational mission of any institution there are five tenets, which they must satisfy (Kaiser & Klein, 2006; Kincaid, 1993),

- Institutions must have adequate facilities referring to both the availability of different facilities and to the adequate provision of each facility and infrastructure to meet the demand for it. Facilities need to be adequately provided to meet the needs of all the members of the institutional society.

- Facilities should be provided at a quality level that meets established education facilities standards. Facilities should meet health, safety, access and other code requirements.
- Facilities and infrastructure should be provided and configured in a flexible way to accommodate growth and change.
- Physical facilities should overall be well integrated together and configured to create an environment that is conducive to learning. The environment must serve both as a context for learning, as well as be a part of the learning process, by enabling both curricular and extra-curricular activities and interactions, and endowing a sense of 'place identity' and belonging.
- Finally, institutions need to establish efficient and effective systems for maintenance to prolong the life of facilities and support their optimal use.

The following are the key standards that can be used for judging leisure and recreation facilities in an institutional setting (Nelson, 2004; Poinsatte & Toor, 2001):

- *Adequacy (capacity) of physical facilities and infrastructure,* particularly taking into account the growth of the university with time, and the wide variety of needs and interest that have to be catered for.
- *Quality of facilities* in terms of meeting established codes and standards for educational facilities, such as those of safety, health, and access for the physically impaired.
- *Expendability and flexibility in configuration* – is it flexible to accommodate change.
- *Ability to support the mission of the university in terms of teaching and learning* – are facilities designed and configured to support the activities, interaction and

socialization needs of the members of the university community.
- *Planning and management* – the facilities have to be well managed and maintained to prolong their life and enable optimal return on investment.

RESEARCH METHODOLOGY

This section presents the methodology of the project in two parts; the first part reviews the project tasks and the second part reviews the approach to the execution of the project task. A total 650 self-administered questionnaires are distributed among the KFUPM community members including officials of concerned Departments (e.g., KFUPM Master Plan Committee, Projects Department and Financial Department) at KFUPM. Though delayed a bit, but the response rate is very good.

Project Tasks

To facilitate the achievement of the project objectives, the project has been divided into four defined tasks to address the objectives outlined. The tasks are as follows.

Task 1. Survey and documentation of currently available leisure and recreation facilities used by all segments of the University community including faculty, staff, students and their dependants. These include identification and documentation of,
1. Existing children playgrounds
2. Existing sport and recreation facilities on and off campus
3. All students' leisure and recreation facilities
4. Any other social interaction, leisure and recreation facilities used by the university community

Task 2. Assessment of the available leisure and recreations facilities to identify the needs for improvement,

1. Assessment of the existing leisure and recreation facilities in terms of need, availability and quality, and taking into consideration any other criteria arising from the standard practices.
2. Establishment of the need for improvement of available facilities and for new facilities to satisfy the requirements of all segments of the University community

Task 3. Based on the result of task 2, synthesis and develop alternative improvement plans for campus leisure, recreation and sport facilities in a way that address needs of all age ranges of the university community. These include,

1. Identification of the various alternative courses of action for improving facilities to satisfy all the members of the community
2. Evaluation of the implementation potential and impact of the various alternatives
3. Development of alternatives for integrated leisure and recreation facilities improvement plans that address the needs of the community.

Task 4. Choose the most appropriate integrated alternative improvement plan and develop an action plan for implementation. These are,

1. Comparison of the alternative integrated improvement plans and selection of the most appropriate for implementation
2. Refinement and making detail of the leisure and recreation facilities improvement plan
3. Proposal for an action plan for the implementation of the chosen and refined alternatives

Execution Approach

A variety of techniques and approaches have been adopted to address the project tasks as follows,

1. Collection of information and documentary materials on existing leisure and recreation facilities;
2. Collection and analysis of all related surveys, measures and indicators conducted at KFUPM in the last five years on leisure and recreation facilities and activities;
3. Review of interaction, leisure and recreation facilities from published materials to establish global standards in terms of what is provided, quantity and appropriate configuration;
4. Comparison of KFUPM's leisure and recreation facilities with global standards in terms of what is available, quantity and configuration to identify gaps and areas for improvement;
5. Conduct a structured consultation sessions with the KFUPM Master Plan Committee, Projects Department and Financial Department to identify both constraints and opportunities of the developed alternative improvement options;
6. Funds to be allocated for improvement of the existing support services and the provision of needed future services and amenities;
7. Available physical spaces for the needed support services;
8. Develop and design alternative improvement options based on the outcome of studies and consultations; and
9. Develop an action plan for the selected viable alternatives to improve leisure and recreation facilities on KFUPM campus

Table 1. Availability of leisure and recreation facilities at KFUPM campus

Facilities	Current Available Facilities
Children play ground	Play areas in faculty housing
Sport facilities	The University stadium Football and play courts in student dorms Football and play courts in faculty housing
Recreation facilities	Community centre Student recreation centre
Jogging trails	Informal jogging trails in academic area and faculty housing
Social gathering and interaction areas	None

FINDINGS OF THE STUDY

Major Leisure and Recreation Facilities in KFUPM Campus

Since the establishment, KFUPM keeps its ongoing efforts to make community life more lively and enjoyable by developing standard leisure and recreation facilities. Yet, some of the required facilities are absent or inadequate compared to the aggregated demands. Table 1 gives a synopsis on the leisure and recreation facilities available at the campus community.

Recreation facilities are also tied with formal and informal events take place during the year round academic session (Sanoff et al., 2001). Therefore, the university arrange a host of regular sport events during different times that are,

1. Recreational sport; 2. Play by the children; 3. The annual 5 km run (popularly known as Rector's cup); 4. The 2 km Walk; and v. Inter-collegiate games

Spatial Dimension of Current Leisure and Recreation Facilities at KFUPM Campus

As this study is concerned about future needs of the KFUPM community members, it is imperative to identify leisure and recreation facilities on the space with their existing coverage and capacitates. This paper finds the following inventory of current campus leisure and recreation facilities along with the spaces allocated to each of these amenities, as presented in Tables 2 and 3.

Assessment of Current Leisure and Recreation Facilities: User's Perspectives

Assessment of Parks and Green Areas

Adequacy of parks and green areas are assessed by taking users' opinions through questionnaire survey. Around 28 percent respondents mention that KFUPM parks and recreational facilities satisfy their needs, while 42 percent are dissatisfied and 30 percent remained neutral. 84 percent of the respondents would like to use the recreational park at least once a week if it is available in the university campus while less than 3 percent respond to use it less than once in a month or never.

Table 2. Inventory of current campus leisure and recreation facilities at KFUPM campus

Location	Facilities
Building 11	Consists of one handball court, 3 basket ball courts, 3 volley ball courts, taekwando room, judo room, 4 squash court, 2 table tennis room, a recreation swimming pool, 10 badminton courts, lockers and bathrooms for student to change.
Building 36 & 33	Consist of a football pitch, athletic tracks, physical education office with training rooms, physiotherapy room, stores, lockers and bathrooms for student to change. Consists of indoor swimming pool,4 squash courts, weight lifting room, circle training room, 5 lawn tennis courts, 3 table tennis courts, 1 handball court,3 five aside football courts, 4 volley ball courts, 4 basket ball courts, 4 badminton courts, 2 FIFA standard football pitches one with light and the other without light.

Table 3. Current spaces allocated for leisure and recreation facilities at KFUPM campus

Name of the buildings		Area (Sq. m.)	Total Area (Sq. m.)
BLDG 09 (Academic Building)			
	Plateau Level	696.00	
	Mezzanine Level	109.28	
	Second Floor Level	1172.00	1977.28
BLDG 39 (Physical Education Centre)			
	Lower Floor	1894.00	
	Upper Floor	146.00	
	Tennis court	3415.00	
	Volley Ball	2149.37	
	Practice Area	372.16	
	Foot Ball	10670.38	
	Six A Side Soccer	2488.50	
	Hand Ball	1679.75	22815.26
BLDG 29 (Families Recreation Centre)			
	Ground Floor	4750.00	
	First Floor Plan	608.00	5358.00
	Swimming Pool	3405.20	
	Playing Court	3603.32	
Sport facilities in Farooq Court		700	
Sport facilities in Ferdaws Court		861	8569.52

A large number of suggestions are received on the desired recreational features in a future park that are important for future planning and development. Those features are, 77 percent respondent wants grass areas; 64 percent from swings, slides, climbing frames, etc.; 63 percent want to have a café; 62 percent want a lake and/or water features; 59 percent is for picnic and BBQ areas; and 57 percent would like to have another restaurant in KFUPM campus.

Assessment of Children's Play Ground

More than 90 percent respondents state that the parks and play areas are very important for their children. This is not only for their daily amenities but also for their healthy mental upbringing. However, a large portion of the campus residents (i.e., 52 percent) are not satisfied with existing provision for parks and play grounds.

Assessment of Sport Facilities

The respondents are satisfied with the play grounds in different residential neighbourhoods and central stadium having regular opening hours for different sports and adequate accessories facilities including gym, swimming pool, etc. In the beginning, the stadium had only one entrance causing problem for people's movement during different events (e.g., sports and graduation ceremony, etc.) Later, with the introduction of another gate, the circulation problem is solved during the rush hours.

Assessment of Recreation Facilities

The Faculty Recreation Centre

There is one recreation centre known as 'KFUPM community centre', which is designed for faculties and staffs and their family members. Assessment of the usages of community centre is based on a survey of 650 persons.

A total 186 (74 percent) male and 176 female (adults) (79 percent) use the community centre on regular basis. These figures indicate their high degree of interest in community centre as one of the most important amenities within the campus. This is also one of the most enjoyable and gathering (social) places after their homes reflecting in the fact that nearly 79 percent male and 74 percent female children use the community centre on daily basis.

Quantitative Assessment of the Community Centre

For quantitative assessment of KFUPM community centre, some criteria are designed beforehand. Results of this assessment are illustrated below,

- 53 percent respondents state that they are satisfied with the Community Centre facilities, while 27 percent are not satisfied.
- 67 percent are satisfied with regard to the opening hours of the Community Centre, while 14 percent disagreed.
- 60 percent of the users of the Centre are satisfied with the services and facilities offered by the Centre, and 21 percent have rates it as poor
- An overwhelming number of respondents (85 percent) state that the community centre should provide services and facilities with a view to different age-cohorts and gender. Likewise, 69 percent of the people state that the community centre should offer more recreation, educational and sport

program, while 31 percent did not mention anything on the sufficiency as they do not provide any specific suggestion for improvement

- When asked which are the programs/services community centre should offer, most requested provision are: trips and sight-seeing visits to historic and important places (61 percent), language courses (55 percent), fitness and weight-reducing programs (52 percent), computer and technology classes (49 percent), summer programs (48 percent), Islamic studies (45 percent), arts and cultural programs (44 percent).
- Around 57 percent of the respondents are interested in hiring rooms and services of the community centre to hold private parties, weddings, etc., while 44 percent are not interested in making use of these facilities.
- Similarly, 57 percent desire to borrow items, such as carpets, tables, chairs, lighting, etc. from the centre for holding private parties at their houses, while 43 percent did not express any interest
- Respondents who state that they never use the community centre are asked the reasons for it. 60 percent opine that they have no interest, while 55 percent say it does not provide required services and facilities or they do not know enough about the Community Centre. Likewise, less than 50 percent respondent mention that there is neither adequate nor updated information on what is available at the community centre, which makes them unaware about its potential use.
- More than 83 percent respondents express that library service at the centre is very important and around 66 percent of them use library frequently (at least more than 10 times a year). However, 23 percent respond that they go to library once or twice in a year. But most of the library users

(69 percent) recommend for more books. Among them 49 percent wants more children's books, 47 percent want more magazines and around 35 percent want more best sellers, newspapers, educational toys and internet computers.

Qualitative Assessment of the Community Centre

A large number of respondents would like to have better swimming pool facilities at the community centre and they would like the swimming pool to be available all-day and later in the evening, especially in the summer. In particular, many respondents raise concern about its closing hours in the early-afternoon. Moreover, a fair number of comments were made regarding problems faced by some users of the ladies pool, particularly the attitude of the staff. Moreover, many residents ask the pool areas and changing rooms to be renovated and new poolside furniture to replace old and damaged items.

The library collection of children's books and contemporary adult fiction, especially literary works and bestsellers, should be expanded. In addition, there is a demand for more newspapers and magazines. The possibility of providing educational toys on loan should be investigated as a significant number of residents would like this service. Many respondents commented on the poor state of many facilities and equipments, including many broken or damaged exercise items, and the bowling alley. Various respondents suggested that the cafeteria should be improved both in terms of quality, selection of food and the décor. A number of residents express a strong need for the provision of Arabic classes and some pointed out the benefits of it for expatriates, not just to speak Arabic but also to understand the local culture and Islam. Some respondents state that charges made for borrowing items, such as balls, should be discontinued as it creates a wrong impression. Finally, many respondents congratulated the University on giving them a chance to express their opinions about level of satisfaction with the community centre and recreational facilities through this study (Figure 1).

Assessment of the Student Recreation Centre

There is no particular community or recreation centre for the students, but there are mostly all required facilities, such as gymnasium, swimming pool, stadium, play grounds, cafeteria, etc. in different places of the university. 90 percent of the respondents are satisfied about these facilities, but they raise the questions about maintenance, which, in many ways, is poor. For instance, once any equipment is out of function, it takes long time to make it re-operational, even some times it remains non-operational for 2-3 years as if they are abandoned.

Assessment of Jogging Trails

Within KFUPM there is long network of jogging trails for the university residents. Many people including women and children use this network for every day walk as a daily exercise, especially

Figure 1. Residents' responses on the degree of satisfaction of community centre in catering their family needs

Satisfaction with Community Center Facilities

No Opinion 4.7%
Strongly Disagree 9.3%
Disagree 17.3%
Neutral 16.7%
Strongly Agree 13.3%
Agree 38.7%
at night time when the weather is comfortable. 85 percent of the respondents say their experience of walk in different KFUPM neighborhoods is not very pleasant as often small pieces of glasses, canes, bottles, papers, etc. are found here and there along the jogging trail. This is due to the fact that there are no trash boxes along the long trail. While walking, therefore, most of the joggers are bound to throw juice packs, cans, papers, glasses, etc. in and around the trail.

WHAT IS LEARNT FROM THE FINDINGS?

On the basis of quantitative and qualitative survey results, there are three important areas where the community centre should pay more attention for efficient use of these facilities that are in the list of high demand and more frequently used by the community members. These are:

Community Centre Swimming Pool

The findings suggest that existing operating times of the swimming pool need to be extended in order to serve the community members better. The swimming pool requires better maintenance especially in relation to flooring (it needs replacement and repainted) in order to overcome avoidable injury to users and also to improve the aesthetics of the pool. The users of swimming pool should be requested not to indulge in smoking, eating and drinking near the pool as this will spoil the atmosphere and create problems for other users. In addition, children under the age of 12 should not be allowed to use the pools unattended. Control of children at the swimming pool is the responsibility of respective parents and it is essential to keep specific timings for regular swimmers, both in the morning and in the evening, for a period of 2 hours when no children will be allowed in the pools. However, children above 12 years of age can be allowed as they do not pose any nuisance or problems to

other users. Finally, the ladies should respect the dress code imposed by the University.

Cafeteria at the Community Centre

After taking over the management of the cafeteria by KFUPM Food Services Department, the quality of food served has deteriorated considerably. There is no variety of items available and limited menu is offered. In addition, the cafeteria is not open in the morning, meaning refreshments are not available to the member who comes in the morning. Therefore, the respondents strongly feel that the catering services at the cafeteria should be handed over to private operators so as to provide better quality food and to cater for different tastes and requirements of the users. This will attract a large number of people visiting the centre and also provide a more varied and extensive menu to the users.

Community Centre Library

This paper affirms community centre library is well used by the community members. But there is a lack of new books both for children and adults. The existing collection of books should be thoroughly revamped and a large number of new books should be added to the collection. In particular, new literary works by leading authors should be purchased and it should be taken as an ongoing process. On this view, the librarian should be invited to a meeting of the committee in order to get more information about the existing collections and the need for new additions. Moreover, faculty members from the English Language centre should be contacted to get specific information on suitable books in English to be purchased for the centre library and the Islamic & Arabic Department faculty members for adding more literary works in Arabic including religious texts as well as story books and other works. Not only that, the KFUPM School Principal could be contacted to obtain his feedback on the purchase of books

meant for children in both Arabic and English. The library should have an eclectic, international and contemporary book collection.

Since the community centre library functions directly under the control of the KFUPM Main Library, the Dean of Library Affairs could play a vital role in providing the centre library with a better collection of books and journals.

Scenario of Leisure and Recreational Facilities Against Built Structures and Human Resource Development

An internal assessment of current leisure and recreation facilities has been conducted with respect to adequacy and future needs. All related surveys, measures and indicators conducted at KFUPM with regard to recreation and leisure services have been thoroughly investigated and analyzed. Moreover, in order to compensate for the unavailable information the authors has conducted personal interviews with KFUPM key personnel at all levels of management related to

the following recreation and leisure facilities. The results of these surveys are portrayed in Tables 4 and 5 along with insights on 'what could be done' against the inadequacies.

COPING WITH THE FUTURE NEEDS: NEED-GAP ANALYSIS

Extrapolating KFUPM Population for 2010

Planning facilities for an area requires study, analysis, and forecasting of its population. This can be achieved by analyzing the nature and rates of past changes in the area's population, together with a careful appraisal of the probable effects of more influential factors to provide valuable clues about the size of future population. Planners use several approaches for forecasting future population (Guo, 2002; Tolley, 1997). Forecasting student population at KFUPM can be done by 'trend extrapolation'. This approach examines trends and

Table 4. Status of leisure and recreation facilities against 'built structures' in KFUPM campus

Current Problems	What could be done?
Need to have a couple of tennis courts (perhaps, close to Ferdaws/ Nakheel courts) outside community Centre.	
Lack of recreational facilities for teenage kids and girls as most facilities in community centre are for boys as such including girls in those plans is necessity	
Need to equip community centre with a modern look	
Need to provide shading in the shallow side of the pool to avoid children getting sunstroke, especially during hot and humid summer months.	
Need to install at least one more toys area on the right hand side of Nuzha Residential area	Introduce additional play areas including games, toys, etc., for the children.
Need for new books especially for children in community centre library.	
Need for proper fencing of children of playground close to the main road in Ferdaws court. Additional playgrounds with grasses should be provided in Ferdaws court where more than 60 percent of the KFUPM community members reside. By creating additional playgrounds for children far away from the main roads, small children can play care-free.	Install hedges instead of fences around the play areas where games and toys have been recently commissioned. Introduce appropriate playground in Ferdaws court
Need for women sport centre which will benefit them both physically and mentally. They will have the option to spend their leisure time by playing different sorts of sports.	

Table 5. Status of leisure and recreation facilities against 'human resource development'

Current Problems	What could be done?
Need for ladies activity group to be listed under the community centre heading. It would be better if there is a separate link under community centre where ladies can access directly.	
The need to improving the community centre and the services, to make it more attractive to kids, youth, and families by organizing activities such as for the weekends, summer programs, etc. that are appealing to the community.	
Need for KFUPM swimming instructors to use the pool facilities to teach children swimming lessons with affordable charges and adhere to community centre's rules and regulations.	Draw up suitable programs to be conducted in the community centre for the current academic year by contacting the Physical Education teachers at KFUPM school as well as by meeting with children living on campus to seek their views. The committee also recommends paying suitable amount to the physical education teachers from the schools for their efforts in designing suitable programs for the children and also for their supervisory work for implementing such programs.
Need to stop restriction of certain staffs and their families to get access to the community centre.	Allow access to the community centre by the University employees (together with their dependents) with Grade #10 and above, irrespective of whether they live on Campus or outside of the Campus.
Need to abolish (SR 2) fees per game introduced at the recreation centre, considering children that will like to play different games. It will be too much for a child's budget if he wants to play three or four games a day during the vacation.	
Need for more sport and kids channels on TV.	Some new sport channels, which are available free of charge, should be included in the sport channel package of the University.
Need for a coach to give continuous training courses for children in the recreation centre or in building 10 or others.	

extends them into the future. According to Guo (2002) extrapolation may be based on judgment, visually fitting lines to the data on graph paper, or by mathematical formulas. Trend extrapolation is one of the simplest means of extrapolating past trends in population size by graph. For this forecast, the geometric or exponential change model is applied. This model assumes that the amount of population growth over a time is proportional to the size of the population at the beginning of the period. The rate of growth remains the same for each period and the absolute addition to population gets bigger and bigger with each passing period because the rate is applied to a bigger and bigger population. In this geometric or exponential model the rate is constant, whereas in the linear model it is the amount of growth that is constant for each period.

The form of geometrical model is:

$$P_{t+n} = P_t (1 + r)^n$$

where P_{t+n} = projected population size in a future year, n is the units of time beyond base year t, r = is the rate of growth per unit of time.

By converting the geometric model to an equivalent logarithmic form:

$$Log\ P_{t+n} = Log\ [P_t * (1 + r)^n]$$

$$= Log\ P_t + nLog\ (1 + r)$$

Relating logarithmic form to general linear equation form

y = a + bx

Then

$y = \text{Log P}_{t+n}$

$a = \text{Log P}_t$

$n = x$

b = constant (we can obtain b by plotting *log P* against *time*)

Extrapolating 2010 Enrollment of KFUPM Undergraduate Students

The population of KFUPM undergraduate students during the period of 2001-2006 is shown in Table 6 while the plot of logarithmic project population (log P) against units of time (n) for KFUPM undergraduate students is illustrated in Figure 2.

$\text{Log P}_t = 3.735279$ (log of 5436)

b = 0.0066 from the above graph

Substituting this value in to the geometrical model

$\text{Log P}_{2010} = \text{Log P}_t + n\text{Log}(1+r)$

$= 3.735279 + n\,0.0066$

Therefore

$\text{Log}(1+r) = 0.0066$

$1 + r = 10^{0.0066}$ if $10^{0.0066} = 1.015313$

Then

$1 + r = 1.015313$

$r = 1.015313 - 1 = 0.015313$ is the rate of increase in population of KFUPM undergraduate enrolment

The forecasted population can be obtained by putting in the above rate of population growth in the following formula: $P_{t+n} = P_t(1+r)^n$

$P_{2010} = 5436 * (1+0.015313)^{10} = 6328.181$

Hence, the forecasted population of undergraduate student enrolment at KFUPM by 2010, if all conditions remain the same, will be 6328 students.

Figure 2. Plot of logarithmic project population (log P) against units of time (n) for KFUPM undergraduate students

Table 6. Population of KFUPM undergraduate students during the period 2001-2006

Year	Interval = n	Population = P	log P
2001	1	5436	3.735279
2002	2	5366	3.729651
2003	3	5585	3.747023
2004	4	5823	3.765147

2006	6	5664	3.753123

Population change Rate

y = 0.0066x + 3.727
R^2 = 0.5787
Extrapolating 2010 Enrollment of KFUPM Graduate Students

The population of KFUPM graduate students during the period of 2001-2006 is shown in Table 7 while the plot of logarithmic project population (log P) against units of time (n) for KFUPM graduate students is illustrated in Figure 3.

$\text{Log } P_t = 2.357935 \text{ (log of } 228)$

$b = 0.028$ *from the graph* Figure 11 (y = 0.028x + 2.3296)

Substituting this value in to the geometrical model

Table 7. Population of KFUPM graduate students during the period 2001-2006

Year	Interval = n	Population = P	log P
2001	1	228	2.357935
2002	2	227	2.356026
2003	3	285	2.454845
2004	4	278	2.444045
2005	5	286	2.456366
2006	6	313	2.495544

Figure 3. Plot of logarithmic project population (log P) against units of time (n) for KFUPM undergraduate students

Population Change Rate
$\text{Log } P_{2010} = \text{Log } P_t + n\text{Log }(1 + r)$

$= 2.3579 + n\,0.028$

Therefore

$\text{Log }(1 + r) = 0.028$

$1 + r = 10^{0.028} \text{ if } 10^{0.028} = 1.066596$

Then

$1 + r = 1.066596$

$r = 1.066596 - 1 = 0.066596$ is the rate of increase in population of enrolled graduate in KFUPM

The forecasted population can be obtained by putting in the above rate of population growth in the following formula: $P_{t+n} = P_t (1 + r)^n$

$P_{2010} = 228*(1+0.066596)^{10} = 463.3768$

Hence, the forecasted population of graduate student enrolment at KFUPM by 2010 if all conditions remain the same will be 463 students.

Extrapolating 2010 Enrollment of KFUPM Part-Time Graduate Students
